THE
GARDENERS' CHRONICLE

A Weekly Illustrated Journal

OF

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL. XXX.—THIRD SERIES.

JULY TO DECEMBER, 1901.

LONDON:
41, WELLINGTON STREET, COVENT GARDEN, W.C.
1901.

INDEX OF CONTENTS.

JULY TO DECEMBER, 1901.

A

Abies bracteata, 56; *A. (Pseudo-)* Douglasii seedlings, 313
Acacia armata seedling, 313; *A. melanoxylon* (?), 378
Acme Rose-bloom protector, 19
 Adelaide Botanic Gardens, 301
Aeranthos grandiflorus, 220
 Africa, flora of German S.W., 230
 Africa, South, gardeners and gardening in, 280, 459
 Africa, the Tree *Lobelias* of tropical, 116
Agave americana with flower-spike 20 feet high and over 2000 flowers, 215; *A. recurvata*, 366
 Agricultural College, the Harper Adams, 277
 Agricultural College, the South Eastern, 187
Alyssum argenteum, 411
 America, agricultural education in, 311
 American notes, 352, 118
Anorhophallus titanum at Kew, flowering of, 11
Anectochili in Holland, 163
Anclusa sp., 6
 André, M. El., an Officer of the Mérite Agricole, 115
 Andrews, Mr. Jno., presentation to, 82
Anguloa dubia, 106
Antirrhinum, malformed, 376
Apera arundinaria, 378
 Apiary, the, 100, 213, 355, 393
 Apple Allington Pippin, 282
 Apple-culture in Canada, 276
 Apple-stems attacked by caterpillars, 59
 Apple, the Ice, 190
 Apple-tree blossoming thrice in a year, 282
 Apples and Peaches in United States, 75
 Apples, Tasmanian, 325; theft of, 206
Arabis alpina, double-flowered, 239
Arachnanthe Loveli, 200
Arachnanthe Cookii, 387; *A. exelsa*, 32
Arbutus "Fredo," fruits of, in Covent Garden Market, 321; in France, 353; fruiting in East Lothian, 358
Arctotis grandis, 111; *A. Gambetoni*, 177; *A. strobilifolia*, 108, 369
 Ardgowan House Gardens, 301
Aristolochia gigas var. 312
Asparagus Sprengerii, 419
Aspidistra lurida, the seedling of, 98
Aster Amelins, 301, 325; *A. carnosus*, 218; *A. grandiflorus*, 313, 411; *A. multiflorus*, 218; *A. sinensis*, 232; *A. Vilmorini*, 6
 Asters, China, from M. Roemer, 115; perennial, 165, 286, 111, 127
 Australian seed catalogue, an, 367
 Avenue, a novel, at Paddockhurst, 129; the Hatfield, 135; planting an, 330
Azalea and *Rhododendrons* for northern smoky towns, 160
Azolla filiculoides, 378

B

BACTERIA in plants, 325
 Banana culture, sub-tropical, 232; trade in Jamaica, 180
 Barham Court, hardy fruit at, 255

Bark-stripping, 262
 Barley, prolificous, 266
 Barr, Mr. Peter, 16, 155, 321
 Basic slag, uses of, 151, 176, 230
 Bath, an improvised, 262
 Bean, French Centenary, 153
 Beans, garden, 71; Veitch's climbing French, for forcing, 160
 Bedding, the, in Hyde Park, 210
 Beech leaves, galls on, 312, 378
 Bee-keeping in the West Indies, 336
 Beetle, the Colorado, 186
Beconia Forgetiana, 66; *B. Ideala*, 411; winter-flowering, 138
 Belvedere House, Mullingar, 118
 Benevolent Institution, Gardeners' Royal, 56, 96; next annual dinner, 309; Prince of Wales President of, 151
Berria ammoniaca, 320
 Birds and insect life, 358
 Birds, the food of some, inhabiting an orchard, 197, 217, 217
 Blackberry, a white, 333, 111
 Blackbird, the food of the, 197
 Blackmore, the late R. D., memorial to, 333
 Boat garden, a, 228

BOOKS, NOTICES OF: Agricultural Bulletin of the Straits and Federated Malay States (*H. N. Ridley*), 311, 415; *A. Glimpse of Cranbrook* (*W. S. Martin*), 356; *A Practical Text-book of Plant Physiology* (*D. T. Macdonald, Ph.D.*), 367; *A Symposium on how to Grow and Show Tea Roses (National Rose Society)*, 415; *Botanical Magazine*, 111, 187, 277, 310, 435; *British Trees*, with illustrations (*Hon. Pearson*), 115; *Wall and Water Gardens (Gertrude Jekyll)*, 97; *West Indian Bulletin*, 396; *What is a Kindergarten (Geo. Hensen)*, 75; *Wiener Illustrirte Garten-Zeitung*, 215; *Workmen's Compensation Act (W. A. Wallis)*, 76

Books, sale of old gardening, 136, 155
 Boston, U.S.A., horticultural exhibition at, 51; Horticultural Hall, 71
 Botanic Gardens, Adelaide, 311; Brisbane, 161; Brussels, 326; Madras, 311; Melbourne, 216, 337; Missouri, 135; Montreal, 221; St. Petersburg, 395
 Botanical specimens, 376
Bougainvillea glabra growing outdoors, 265

Bourreria succedanea, 110
Boussingaultia baselloides, 155, 169, 191, 410
 Boycott, the proposed Dutch, on British trade, 111
 Brazil-nut, germination of, 11
 Brisbane Botanic Gardens, 161
 Brockwell Park, 262
Brodiaea crocea, 126
 Bruges, horticultural show in the market square, 219
 Brussels Botanic Garden, 326
Bryonia dioica, skin irritation from, 78
 Budding, Rose-stocks and, 164
 Bulb garden, the, 312, 388, 439
 Bulbs, Dutch, in English auction-rooms, 319; that have once flowered, the replanting of, 22, 54
 Bullfinch, the food of the, 98, 218
Bupleurum croceum, *B. difforme*, 325
 Butter from Cocoa-nuts, 119

C

CABBAGES bolting, 4, 12, 35, 78, 98
 Caeti at Holly Point, Heaton Mercury, 255
Calanthe Veitchii and *C. vestita*, 116
Calceolaria polyrhiza, 6
 California, notes from, 266
Calorhachis euloptera, 277
Calyptra lasiocarpa, 366
Campanula isophylla alba, a fine plant of, 136; *C. Grosseckii*, 398; *C. rapunculoides*, 328, 398
 Canadian Bulletin (Apples), 276
 Canadian Roses, 8
 Canna Mrs. Kate Gray, 227, 366, 416
 Cannas, Orchid-flowering, 227
 Cape Gooseberry, the, 221, 247, 471
Capparis spinosa, 319
 Carbone of calcium, 282
 Cardiff library and horticultural periodicals, 245
 Carnation Sir R. Waldie-Griffith, 111
 "Carnation," what is?, 105, 155, 161
 Carnations, border, 80; diseased, 59
Carpenteria californica plena, 70
Cassia glandulosa, 431
 Caste in the garden, 319
Castilleja virgata, 218
Catsetum fibrosum, 220
Cattleya Dowiana aurea, 318; *C. Gaskelliana*, 86; *C. Hardyana Lindenii*, 200; *C. Imperator*, Wigan's variety, 318; *C. Iris*, 318; *C. "Jupiter"*, 1; *C. labiata* and Warren House, Stammers, 319; *C. Mossie comdensiore*, 21; *C. M. "Earl Leofric"*, 24; *C. Warszewiczii* "J. J. Richardson," 86
 Caucasus, gardens in the, 1; notes from the, 70
 Cauliflower, Sutton's Favourite, 80
Cephalotaxus drupacea, tufted branches in, 436, 436
Ceratostigma Polhillii, 6
Ceropogon confusus in, 100; *C. stapelioides*, 358

CERTIFIED FRUITS AND VEGETABLES.—Apple Norfolk Beauty, 298; *A. The Houblon*, 462; Blackberry Wilson Junior,

142; Bottle for Preserving Fruits, 102; Cabbage Best-of-All, 120; C. Little Queen, 120; C. Improved Nonpareil, 120; Gooseberry Howard's Lancer, 120; 142; G. Cobham (Gunner), 102; Grape Reine Olga, 330; Kidney Bean Fawn, 120; K. B. Surrey Prolific, 120; Lettuces New York and Jumbo, 26; Melon Victoria, 36; Peas Dwarf Telephone, Danby's Stratagem, Sharpe's Queen, Prolific Marrow, The Sherwood, Sutton's Perfect Gem, Defiance, Centenary, Duke of Albany, Sutton's Prizewinner, 36; Pear General Wauchepo, 163; Plum Brown's Crimson Drop, 298; Potato Carltonia, 463; P. Dobbie's Improved Kidney, 163; P. Early Ruby, 120; P. Ellington's Prolific, 163; P. Fyde Wonder, 163; P. General Buller, 266; P. General French, 266; P. Glory of Denbigh, 120; P. Ker's B, 163; P. King of the Earlies, 120; P. Sharpe's Express, 120; P. The Factor, 266; Strawberry Givon's Late, 16; S. Queen Alexandra, 61.

CERTIFICATED PLANTS:—Acer Negundo (var. aureum Odessaanum, 171); Eranthis dentiens, 16; Anarrhisis belladonna maxima, 111; Aretotis grandis, 60; Aster cordifolius profusus, 296; A. "Emchamstress," 296; Begonia Agatha, 462; B. Idealia, 101; B. Turnbull Hall, 330; Berberidopsis corollina, 209; Campanula lactiflora curulea, 60; Candytuft Rose Cardinal, 61; Canna Mrs. G. A. Stroheim, 111; C. Mrs. Kate Gray, 11; C. Reichskanzler Fürst Hohenlohe, 209; Carnation Chas. Martel, 101; C. E. Crocker, 209; C. Ensign, 61; C. Heroine, 101; C. Lady Bristol, 101; C. Lady Constance Buller, 81; C. Maggie Hodgson, 11; C. Mrs. Guy Sbright, 81; C. Mr. M. V. Charrington, 81; C. Mrs. S. J. Brooks, 219; C. Seymour Corcoran, 61; C. Sir R. Waddie - Griffith, 111; C. Wasp, 101; Cattleya - Bactia, 330; C. "Brownie," Veitch's variety, 330; C. fulvescens, 250; C. germanica, 210; C. Hardyana Rochfordiana, 210; C. Iris, 250; C. Iris var. aureo-marginata, 297; C. labiata G. G. Whitelegge, 330; C. I. glauca, 330; C. Lady Ingram "Marion's variety," 297; C. Lottie, 297; C. Luddemanniana Stanley, 250; C. mollis var. Lois, 360; C. Portia, 101; C. Warscewiczii "Wigan's variety," 330; Chrysanthemum Bossie Godfrey, 314, 330; C. Bessie Canning, 422; C. Bronze Soleil d'Octobre, 314, 330; C. C. J. Mee, 122; C. C. Penford, 331; C. Duchess of Sutherland, 359; C. Edward VII., 298; C. Ethel Fitzroy, 359; C. Exmouth Crimson, 314, 330; C. General Hutton, 383; C. Geo. Lawrence, 332; C. Goacher's Crimson, 209; C. Godfrey's King, 359, 331; C. Golden Princess Victoria, 162; C. Harmony, 296; C. Masterpiece, 296, 314; C. Pet, 219, 266; C. Pride, 331; C. Thrice Martin, 219, 298; C. H. E. Hayman, 331; C. Kimberley, 332; C. Little Jewel, 120; C. Madame Herrewege, 330; C. May McBean, 162; C. Miss Amy Williams, 330; C. Mr. E. Hummwell, 332; C.

Mrs. Geo. Lawrence, 332; C. Mrs. T. W. Pickett, 296; C. Mychett Pink, 266; C. Orange Masse, 209; C. Pink Mary Anderson, 314; C. Pluie d'Or, 314; C. Queen Alexandra, 298; C. Robert Hairsine, 383; C. Rycroft Crimson, 298; C. Sensation, 298, 330; C. Triumph, 296, 314; C. Violet Lady Beaumont, 332; C. William Higgs, 383; Clematis Ville de Lyon, 171; Cypripedium Helen, 401; C. Hit-hinsie, 101; C. Kimballianum, 60; C. Maudie magnificum, 102; C. Mrs. Alfred Fowler, 401; C. Mrs. Ralder "Oakwood variety," 102; C. Rolfei, 172; C. Salus, 101; C. Troilus, 462; C. Univa superba, 172; C. Yrilla racemiflora, 111; Dahlia Alpha, 209; D. Aunt Chlor, 219; D. Beauty of Sevenoaks, 219; D. Clara Stredwick, 219; D. Cleo, 219; D. Columbia, 219; D. Crusoe, 209; D. F. W. Bolding, 209; D. Florencia, 219; D. Freedom, 219; D. Gabriel, 209; D. Genista, 209; D. Goldfinger, 219; D. Hesperia, 219; D. Khaki, 209; D. Lilac, 209; D. Mme. Lucie, 209; D. Madge, 219; D. Maid of Athens, 219; D. Mariner, 219; D. Mars, 209; D. Mildred, 219; D. Montague Wootton, 219; D. Mrs. A. F. Perkins, 219; D. Mrs. E. Mawley, 219; D. Mrs. H. A. Neels, 219; D. Mrs. H. J. Jones, 209; D. Mrs. Hohart, 219; D. Mrs. C. Mortimer, 219; D. Mrs. Winstanley, 209; D. Merlin, 209; D. Nana, 219; D. Ophir, 209, 219; D. Richard Dean, 209; D. Ring-dove, 219; D. Robin Adair, 219; D. Royal Sovereign, 219; D. Sailor Prince, 219; D. Spotless Queen, 209; D. Standard, 219; D. Sylvia, 219; D. Dactylanthus Warril, 219; Delphinium Dorothy Daniel, 11; Delphinium purum, 210; Gladiolus Duc d'Abruzzi, 111; G. (Childsii) Columbine, 171; G. hybridus princeps, 171; G. Lemoinei Eclipse, 171; G. Lamineux, 111; Gloxina, 101; Gypsophila paniculata, double-flowered variety, 101; Helianthus mollis, 209; Kochia scoparia, 209; Laila Olivia, 330; D. Omen, 101; Laila-Cattleya Digbyana-Mendeli, "Hesse variety," 330; L.-C. Digbyana, Veitch's var., 172; L.-C. Galatea, 299; L.-C. Haroldiana, 172; L.-C. H. Charlesworth var., 297; L.-C. Hione, 101; L.-C. Laminosa, 360; L.-C. Madame Charles Maron, 250; L.-C. Ophir, 330; L.-C. prestantis-bicolor, 250; L.-C. Robin Measures var. Ena, 172; L.-C. Semiramis superba, 101; L.-C. Wilsonia, 297; Lilium Burbanki, 61; L. concolor Coridon, 61; Loniceera Hildebrandiana, 111; Lycaste Tunstalli, 162; Mombestia Germanica, 101; Mormodes Oberlanderianum, 250; Nelaubium speciosum album plenum, 171; N. speciosum roseum plenum, 171; Nepenthes ventricosa, 296; Nerine Mrs. Elliot, 296; Nymphaea Devonensis, 209; Odontoglossum bictonense album, 250; O. crispo-Harryanum roseum, 260; O. Crawshayana, 60; O. maculatum Thompsonianum, 60; O. Wallisii, 250; Pelargonium Endlicherianum, 111; Pennisetum Ruppelianum, 219; Phragmites communis foliis variegatis, 209; Pink Mrs. H.

Young, 11; Pleurothallis lateritia, 297; Poppies, Shirley strain, 11; Quercus dentata, 219; Rose Bellefour, 11; R. Eugenie Lamosch, 101; R. Mme. Berkley, 202; R. Salmona, 209; Sagittaria japonica fl.-pl., 141; Sarraecenia Dorneri, 111; Schomburgkia Thomsoniana, 15; Scolopendrium vulgare var. Drummondie superba, 101; S. vul. sagittata-eristatum, 141; Sophro-cattleya Nydia, 260; Sophro-Laila Gratrixia, 210; Spiraea astilboides var. Silver Sheath, 11.

Ceylon, 371

Chamaerops humilis var. filiroo, 370; C. cochinchinensis, 196
Cherry-tree, Morello, at Stoneleigh Abbey, 117, 110
Cherry, Morello, the, 110
Christmas, Ivy at, 117; Roses, 171; wares in the streets, 155
Chrysanthemums, a large grower of, 472; germination of the seeds of the, 261; literature, recent, 115; C. maximum "Lord Roberts," 287; rust, 262, 120, 160, 171; C. R. Hooper Pearson, sporting, 133; show of early-flowering, at Tamworth, 266; sporting, unusual, 293; culture of, 256, 273, 158; in America, 118; insect powder from, 311; leaves withering from bottom to top on, 277; new varieties of, 312, 370, 158; preserving the blooms of, 318; ripening the wood of, 200; show, early, at Tamworth, 266; some continental varieties of, 313; taking the buds of, 126; the keeping of the blooms of, 305
Cineraria pentactina, 277
Cirrhopetalum appendiculatum, 116
Citiharexylum lucidum, 173
Citrus tritoliata fruiting, 376
City gardens, 263
Clematis brachiata, 267; C. Davidiana, 210; C. graycolens, 210; C. smilacifolia, 195
Clerodendron tallix, 291, 311; trichotomum, 325
Clivia miniata, well grown, 289
Cocoa-nut butter, 119
Coos Blumenthal, 370; C. campestris, 371; C. macrocarpa, 370
Colletia Benthamiana, 378
Colonial notes, 180, 320, 330, 371, 407, 139, 173
Colorado beetle, the, 186
Confusion, the manufacture of, 313, 110
Continental novelties, 221
Cook, presentation to Mr. T. H., 152
Cordia cylindrostachya, 110
Coronation day, 135
Cosmos diversifolius atrosanguineus, 272
Cotoneaster horizontalis, 110; C. microphylla, 313
Cotyledon nana, 270
Covent Garden Market at Christmas, 151, 151
Crassula rubicunda, 170
Crataegus, species of, 110
Crepin, Prof., 135
Crimm crassifolium, hardness of, 218; C. crassipes, 117, 139; C. seeds, 317
Crimmums, hardy, and their culture, 221, 139, 160
Croceus from Greece, 317
Cryptomeria in Japan, 389
Cuckoo, the, and other birds, 310
Cucumber disease, 313
Cucumber-roots, fungi attacking, 166
Cucumbers, culture of, 170; pro-Herous, 229

Currants for Christmas, 156
Cymbidium giganteum, 318; C. Lowianum, C. eburneum, 25
Cypripedium Charlesworthi, 406; C. Doris, 126; C. FAnsoni, 107; C. Leeana-Chamberlainianum, 86
Cypripediums, &c., from Morpheth, 406
Cyrilla racemiflora, 198

D

Dahlia Merckii, 201; D. show at the Royal Aquarium, 233
Dahlia, the Cactus, and its evolution, 210
Dahlia viridiflora, 291
Dahlia with ray florets, bearing strap-shaped petals at base, 153
Dahlias, Cactus, 231; D. Loreley and Brena, 369; two new forms of, 260
Davallia bullata, made up into balls in Japan, 301
Dean, testimonial to Mr. R., 309
Decorations, floral, 157
Delphinium scopulorum, 218
Delphiniums, Dorothy, Daniel, and William Kelway, 139; from Messrs, Kelway, 31
Dendrobium coronatum, 162, 201; D. mutabile, 162; D. noble, 329
Devon, Notes of a walk in South, 275
Diantsia polyiformis, 97
Diascia Barbera, 278
Dimorphanthus-and-shuricus-albumarginatus, 70
Dimorphism of the fruit of Pears, 113
Dinner-table decorations, two London, 57
Dogs, the muzzling of, 155
Dracena fragrans var. Lindenii, 168
Durantia Plumieri, 110
Dutch bulbs, proposed boycotting of, 325
Dye plants, British, 313

E

EARTHWORM, the, 368
Edinburgh nurseries, some, 118
Edinburgh seed trade assistants, 136
Edinburgh's head gardener, a morning with, 137
Eledendron quadrangulatum, 336

WEST DEAN.

THROUGH the courtesy of W. James, Esq., the lovely grounds of West Dean are open to the public on Tuesdays and Thursdays during the month of June, when the arboretum is in its pride and glory. Owing to the unusually dry season, the show has this year fallen below the mark; but a visit, even under these circumstances, is greatly to be desired. West Dean lies almost midway between Chichester and Midhurst, on the direct road leading from Selby Bill to Hazlemere and the North. As the house and church have many interesting associations, the visitor whose tastes run in the direction of archaeology and local history, as well as natural scenery, botany, and floriculture, will find much to please him here. The situation is delightful, nestling as it does in a charming valley or dene (whence the name of the village), with splendid forest trees, and a rich profusion of wild plants on every hand.

West Dean House was erected just a century ago by the second Lord Selsey. It is quite hidden from view as one drives along the road, and only the back or sides can be seen when it is approached from the church. The front faces the east, and looks

away across a magnificent domain, whose charms are such that the King has found delight in a visit here; and the Duke of York, in 1890, had some excellent shooting on the estate. Behind the house the trees form a charming background, as they cover the rising ground to the west, and produce a most pleasing effect by contrasting strikingly with the white masonry of the mansion.

Supposing the visitor to approach the village from Chichester, he will first drop down the quiet lane which runs off at right angles from the high road, and at a distance of 100 yards he will find the church, with the house adjoining. That there has been a sanctuary here for many centuries is certain from the fact that a doorway on the north side of the nave is of the Saxon style of architecture, and probably dates from the middle of the 11th century. The main part of the church is in the Early English style, but it has been frequently restored, especially during those ages when architecture was little understood; hence it is wanting in that beauty which no other village church can boast. None the less, it has much of interest for the antiquary. The tower is curious, and still has its spire on the south face, but at such a height that the date cannot be made out without the aid of field-glasses. The main feature within the church is the monument on the north side of the chancel, with effigies of three of the Lewknors. It was doubtless in this neighbourhood that the royal villa of Dene was situated, at which King Alfred was wont to reside. In 1525 William Alwyn directs his body to be buried in the chancel of St. Andrew, of West Dean, and gives to the silver cross of West Dean *xxd.*, and to every light being in the church half a quarter of Barley.

Some memorable names have been in times past associated with the manor. The Rev. L. Vernon Harcourt for some time resided here. Lord Selsey, who built the house, was a member of the Peachey family; the Peacheyes and Lewknors figuring largely in the history of the district in the days of yore. One Christopher Lewknor, M.P., was Recorder of Chichester during the Civil Wars, and had to suffer a good deal for the part he played therein; having been voted guilty of treason to the Commonwealth, his lands were ordered to be sold in 1651. Three quarters of a century earlier, Thomas Lewknor of Selsey was suspected of popery. It was for his charge against Lewknor and others that Curtis, Bishop of Chichester, had to defend himself in 1577.

To visit the arboretum, one passes through the beautiful gates of ornamental iron-work which abut on the main road, and just before reaching the house takes a footpath across the fields facing east. Here, after passing a little stream, the mansion comes into full view. The naturalist finds himself in the midst of a choice variety of plants, insects, and birds. The Downs run through here, and yield the Rock Rose, several Orchids, the wild Mignonette, salad Burnet, stemless Thistle, Canterbury Bells, with numberless flowers, shrubs and trees, which the botanist delights to see. The Burnet Moth and Humming-bird Moth abound, and every tree is alive with feathered folk. The preserves are extensive, and so well stocked, that during the shooting season, waggons-loads of game are brought into Chichester as the result of a day's sport.

The present feature, however, is the ar-

boratum; while it is chiefly attractive on account of its choice and varied assortment of Rhododendrons, it does not lack other trees and shrubs. The Pines seem rather to encourage than hinder the growth of flowering shrubs, and the following is a list of some of the trees and plants which may be observed: the Rhododendrons, Lilac, Syringa, Laburnum, Hawthorn of various colours, single and double; Horse-chestnut and Gueldres Rose blossom together. The Oak, Ash, Birch, Copper Beech, Sycamore, a choice variety of Conifers, including the Sciadopitys, Yew, Crab, Box, flowering Currant, and Holly with last year's fruit giving colour to the sombre foliage, are carefully blended, and produce a rich effect. The green sward is beautifully kept, and the whole effect on a warm day in June is most pleasing and refreshing. The people of Chichester greatly appreciate the privilege of visiting these lovely grounds. *A Sussex Naturalist.*

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM CRISPUM "MARGERY."

A VERY remarkable novelty in spotted Odontoglossums, and which, if not equal to the best in size and marking, it is more remarkable than most of them in the peculiar form of its flowers, which is as peculiar as the distinguishing features of *O. c.* Oakfield Sunrise, illustrated in the *Gardeners' Chronicle*, March 21, 1900, p. 181.

The sepals are broad, and in form more like the petals of the species usually are, being crimped and slightly fringed, white, slightly tinged with rose, and bearing distinct reddish-purple blotches; the lateral ones having also red-purple bands at their bases. The petals in form are a wide departure from the type; at the base they are slightly stalked, and expanding into a broadly ovate blade, which at the margin is incurved, the slightly apiculate tips forming a cavity. The colour is pure white, with an irregular row of reddish-purple spots near the margin, which is bright purple. The lip is very short, the margin and apex being slightly turned in; disc and crest yellow, margin marked with purple lines as though made with a pen, and forming an irregular band. The short space between the front of the crest and the apex is occupied by a brown blotch. The singular variety has again flowered with Richard Ashworth, Esq., Ashlands, Newchurch, Manchester (gr., Mr. E. C. Pidsley, who sends a flower of it, together with the information that he obtained the plant some time ago from Messrs. Backhouse, of York, *J. O'B.*

GARDENS IN THE CAUCASUS.

(Continued from p. 100, vol. 757E.)

As I have already mentioned, good gardens in Chalchis are very few, and of those I visited I will mention the principal ones, where I found Palms and other trees and shrubs planted out in the open ground growing to such perfection of robustness and height as I would not have believed, unless I had seen it myself. One of those few "naturalisers," who has done anything in the horticultural line in the Caucasus is Mr. Tartarionoff, of Sushum, a man greatly interested in his work, and who at the same time knows a good deal about plants, botanically as well as geographically. Mr. Tartarionoff's garden, with its many different kinds of Palms, of which several reach the height of from twenty to thirty feet, reminds me more of subtropical America than Asia.

Among the Palms I noticed among others:—*Sabal Blackburniana*, *Trithrinax Mauritiifolia*, *Raphis flabelliformis*, *Juleca spectabilis*, *Cocos australis*, *Washingtonia robusta*, *Cocos Gaertneri*, *Cocos Yatay*, *Brahea edulis*, and *Latania borbonica*, not to mention *Chamaerops humilis*, and *Chamaerops excelsa*. Of the other trees I will mention, *Acacia melanoxylon*, *Magnolia fuscata*, *Magnolia grandiflora*, *Parrotia persica*, *Brachyhiton acerifolium*, *Rhus semialata*, *Eucalyptus coccifera*, *E. Globulus*, *E. viminalis*, *E. melliodora*, *E.*

Pittosporum Tobira, *Viburnum odoratissimum*, *Liquidambar styraciflua*, *Cycas revoluta*, *Lonicera brachypoda*, *Prunus lusitanica*, and many others.

Although Tartarinoff's garden is yet young, and although it is very difficult here to interest people in horticulture, yet it has become a real centre for the dispersion of subtropical plants in this part of the country. His twelve species of Bamboo, his *Eriobotrya*, and other plants, are now appreciated in other gardens also.

den as those two above-mentioned, and more good gardeners; or better still, were it less far from England, then I am sure that the shore of the Black Sea would quickly have been covered with villas surrounded with gardens of fine Palms and winter-flowering shrubs, and not any Nice in the world could in any way have compared with the luxurious and robust vegetation of the subtropical district of Russia. But alas! lovers of gardens and of horticulture are here very scarce, and I can only cite one more garden—that of Mr.

FIG. 1.—ROSE ALFRED K. WILLIAMS (H.P.): CRIMSON.

polyanthemos, *Photinia serrulata*, *Ilex macrophylla*, *Mahonia Fortunei*, *Asimina triloba*, *Osmanthus*, *Callitris quadrivalvis*, *Quercus glabra*, *Chamaecyparis obtusa*, *Pinus palustris*, *P. macrocarpa*, *Phyllirea*, *Daphniphyllum*, *Thuja gigantea*, *Xanthorrhoea*, *Eurya japonica*, *Coccoloba laurifolia*, *Elaeagnus pungens*, *Cinnamomum pendunculatum*, *Illicium anisatum* and *I. religiosum*, *Psidium Cattleianum*, *Citrus Bigaradia*, *Acacia dealbata* and *A. Farnesiana*, *Daphne japonica* and *indica*, *Choysia ternata*, *Jasminum officinale* and *J. grandiflorum*, *Magnolia grandiflora*, *M. fuscata*, *M. pumila*, *M. Lennei*, *Olea fragrans ilicifolia*,

Near the monastery Neu-Athas, there is a really wonderful garden, especially celebrated for its Cypresses, Phoenix *dactylifera*, evergreen hedges of gigantic *Neriums*, *Eriobotrya*, and lovely plantations of Oranges and Citrons.

To see the subtropical trees develop to their highest perfection and tullest beauty, the garden of Mr. Wodensky must be visited. Gigantic evergreen Oaks, *Thuja gigantea*, *Chamaerops*, and *Wellingtonia*, besides the above-mentioned trees, will prove that there is reason for the question about naturalising subtropical trees and plants here.

If Calchis had had more such lovers of gar-

Stajanow, not far from Chakva, the first station from Batum. Here may be plainly seen how the great humidity of the climate favours the development of fine trees and Conifere, which have grown to such dimensions that nothing like it can be found anywhere else in Europe.

Chamaecyparis pisifera, *Gardenia florida*, *Acacia dealbata*, *Cedrus Deodara*, *Pittosporum Tobira*, *Melia Azedarach*, *Kolreuteria paniculata*, *Pinus Pinea*, *longifolia*, *canariensis*, *Cunninghami*, and *lanceolata*; *Aucubia japonica*, *Cryptomeria elegans*, *Draecena indivisa*, *Lagerstromia indica*, and *Phonmium tenax*, would

not be better in their native countries. The Camellias along the walks in the garden are a very interesting and pleasing sight when the large bushes, some of which reach to the

garden where they can be planted out in the open ground and grow into large ornamental trees, covered with hundreds and thousands of blooms, is ideal. Worthy of notice also are

Germany but as small plants grow here to the highest perfection, and form very large specimens. The pyramidal Taxus are true giants, like church-steeple. The climate of

FIG. 2.—NEW ROSE, "CONRAD FERDINAND MEYER"; FROM A CROSS BETWEEN R. RUGOSA AND A H.P. COLOUR LIGHT ROSE.
(See p. 351, June 8 last, and p. 19 in present issue.)

height of from 15 to 20 feet, are covered with their lovely blooms. Camellias were always universal favourites, and those little trees which are cultivated in pots or tubs are a delight to all who see them; but to have a

Mr. Stajanow's Cryptomerias; Cryptomeria elegans here reaches in ten or twelve years between 20 and 30 feet in height.

Generally speaking, Conifers grow wonderfully well. Sorts never seen in England or

Batum suits the Eucalyptus. In England this is a greenhouse plant, planted out in summer. In Mr. Stajanow's garden I saw groves of Eucalyptus, some plants only five years old, and from 60 to 70 feet high. A. K. Anderson.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

CATTLEYA - JUPITER.

A FLOWER of a very showy form of this pretty hybrid between *Cattleya Warscewiczii* and *C. Lawrenceana* is sent us by Messrs. Charlesworth & Co., Heaton, Bradford, who have a few seedlings of the plants, raised at their nursery, flowering for the first time. The original form, much lighter in colour than the present one, was raised and exhibited at the Royal Horticultural Society, October 13, 1896, by Mr. T. W. Bond, gr. to C. L. N. Ingram, Esq., Godalming. The present variety has flowers as large as those of a *Cattleya labiata*, but the lip, though larger and broader, is displayed as in *C. Lawrenceana*. The sepals and petals are of a silvery white, tinged with purplish-rose, and similar colouring appears on the side lobes of the lip. The disc of the lip is arranged as in *C. Warscewiczii*, the yellowish patches being arranged on each side. Front and broad margins of the side-lobes of the lip bright purple.

LAELIA PURPURATA KROMERI.

A noteworthy albino taken from an importation of *Laelia purpurata* received by Mr. E. Kromer, Roraima Nursery, London Hill, Croydon, was recently in flower as a strong plant in Mr. R. L. Measures' garden, Cambridge Lodge, Camberwell. The flower is pure white, with the exception of the inevitable fine dark lines radiating to the centre of the lip, always found in forms of *Laelia purpurata*; these dark lines change to a very slight pencilling of pale rose colour towards the front lobe of the lip, and a slight yellow tinge is noted at the base of the lip, but in no part of it is there evidence of colour sufficient to make it any other than a white flower.

THUNIA ALBA.

Flowers of this graceful and variable Orchid are sent by Mr. John Cole, gr. to X. Small Page, Esq., Craigmoor, Little Orme's Head, Llandudno, who states that a number of plants from an importation made by Messrs. F. Sander & Co. are now in great beauty there. The flowers are in every instance of the same form, and borne on drooping heads from the tips of robust, Bamboo-like growths. The sepals and petals of all are pure white, but the lip differs in colour and marking, some having the fringed lamellae on the disc of a yellow colour, others having light rose stripes, and the form which is known as *Bryneriana* having a very bright purplish-rose reticulation over the whole of the front of the lip, and markings of the same tint on the lamellae, the base of the lip being tinged with yellow. *Thunias* are very easy to grow and flower in an ordinary plant-stove; but after the leaves turn yellow, and indicate that the resting season has come, they should be placed in a cool greenhouse or vinery, and kept dry until growing time.

CABBAGES BOLTING.

I MET Mr. Pope of King's Norton recently, and in conversation he asked me if I had seen the correspondence in the *Gardeners' Chronicle* on the bolting of Cabbages, including his letter. I told him that I had not, for I had not read my *Chronicle* for two or three weeks. Now, on my return home, I have just read the first letter by "A. D." on the Reading trials of Cabbages, and also Mr. Pope's reply, in which my name is mentioned. They are both written by very practical growers, and I quite agree with the substance of "A. D.'s" remarks, that some varieties always bolt, such

as Early York, Large York, and all varieties with York blood in them, such as Leeds Market, &c., and Express.

Of course, I am now referring only to autumn sowing (middle of July to August 8), for the very varieties I have mentioned as sure runners when autumn-sown are perhaps the best, or at any rate the quickest to form Cabbages, when sown in the spring; and some few other varieties, such as Ellam's Early, Little Pixie, &c., are almost sure to have a percentage, small or large, of bolters, while others (if good, select stocks) are scarcely likely to have any, or but very few. However this, I am sure, depends considerably upon seasons. I have known, as everyone with much experience in Cabbage-growing must have proved very often, that the same seed sown two years running may not show a runner the one year, and the other year 5, or even 10, per cent. may run.

Old Mr. Kemp's secret of keeping his Cabbage-seed for four to six years under his bed before sowing, recorded by Mr. Pope, is interesting, and I should be sorry to endeavour to spoil Mr. Pope's pretty story. But certainly, it would never do for a seedsman to sell four to six year old seed, as it would be sure to get him called to account for selling weak-growing seed. Nor does my experience help me to think it necessary, as unquestionably new Cabbage seed can be had which does not bolt.

It must now be close on twenty years since I first supplied Mr. Pope with our Early Market Cabbage, and which he has always spoken of very highly, and has never yet complained to me of its bolting; nor do I find any of the usual sorts of market-garden Cabbages bolt if but one or two years old, and older than this it is seldom sold, although I admit that given a really good harvest, when the seed has been well ripened in the sun, and thrashed out and sacked in the sun, Cabbage seed, like all oil seeds, will keep good for four or five years. But, and it is a big but, if not well harvested and thrashed, and it is sacked in damp or foggy weather, new seed will not grow nearly so well as that of a previous year's good harvest, be it three or four or five years old. Good seed years are generally good vintage years, and *vice versa*. I think it was in 1891, a very bad harvest year, when the germination of few new seeds was greater than 50 to 60 per cent.; but some Brussels Sprouts seeds I had in stock of 1886 harvest (a good vintage year) then (in 1891) grew 85 per cent. The one remark of Mr. Pope's I take particular exception to, and I feel sure he has not conveyed his true meaning to, is that in which he states, speaking of my "Early Market,"

"I rogued the entire bed, leaving about nine plants for seed." This might be read to mean that all the bed were rogues except the nine, but I feel certain the meaning is this, that they were all good Cabbages, but nine of them took his fancy as being something extra special, and worth fixing for stock. This is what, I presume, most growers do. When I select Cabbages for stock seed, I put sticks to those which I consider the *crème de la crème*, only the rest are cut for market, and these with sticks are grown on for stock seed.

It is a pity that cheap Cabbage seed should be a necessity in the trade.

All Cabbage for seed should be sown in July, and what is called stump-seed, only produced, but this takes twenty-five to twenty-six months to produce, from July to the following August or September two years, and every stump being transplanted after the Cabbages have been cut, at of course considerable extra expense; whereas, Cabbage seed can be got

(and must be got for cheap seed) by sowing in April or May (not transplanted), and seeded at the same time as the stump-seed—seed sown eight or nine months previously, viz., in the following August or September twelve-month, and possibly not having formed a perfect Cabbage—only therefore taking sixteen to seventeen months to produce. Naturally the seed in the one instance can be produced much cheaper than in the other, and the stump-seed must be the better because perfect Cabbages have been produced on the stumps, and all runners, if there were any, were destroyed the first year. The ordinary seed produced from March or April sowings cause no tendency in the plants to run in the cool autumn; and when the following spring comes they run of course for the seed crop. *Affred Watkins, Tavistock Street, London.*

FORESTRY.

SPONTANEOUS GROUPS OF SEEDLINGS.

(Continued from p. 100, vol. LXXI.)

Those who live among the Beech-woods of Bucks, or the heathy commons and wastes of Surrey and Hampshire, are familiar with the case with which the Beech reproduces itself in the former, and the Scots Fir in the latter. There is this difference between the two instances, however, that while in the former this reproduction means the regeneration or renewal of the wood, in the latter case the species only reproduces itself on bare ground or heath, and not in the woods in which it was first introduced, until these approximate to the condition in which they formerly existed. These two instances demonstrate the importance of suitable conditions before natural regeneration can be successful, and that these conditions vary with different species. We might sow artificially Beech-seed on the heath or Scots Fir-seed in the wood, but the results would be equally disappointing on a large scale. On the other hand, Birch, Chestnut, Oak, and many other species, reproduce themselves as freely in moderate shade as in the open, although they cannot stand such a prolonged spell of shade as Beech or Silver Fir. These peculiarities of different species have to be studied wherever natural regeneration is attempted at all; but where attempted in the presence of rabbits, something more is necessary.

In the first place, germination of the seed on the best possible seed-bed is of little use unless some other growth is present to protect and hide the seedlings from the rabbits. On bare ground every seedling is eaten off the first winter, unless they come up in such numbers as to literally cover the ground, as we sometimes see Sycamore and Beech. The present season is an almost unprecedented one for Beech seedlings in the south of England, the soil being literally carpeted with them wherever a Beech tree stands. On a square yard of ground we counted no fewer than 1,000 healthy seedlings, and in patches such as these, there is every prospect of a proportion reaching rabbit-proof size. In such instances it would seem that their very number is a protection in itself, for the rabbit is rather an epicure than a gourmand, and prefers a choice variety to a surfeit of one particular food. Ash, again, sometimes comes up in thick patches, and escapes general destruction from the same cause; but the chief reason why these dense clumps of seedlings survive when thinly scattered plants perish is because they offer in their thickly arranged stems an obstacle to the rabbit's progress through them. This animal likes a beaten track, and rarely

pushes its way through thick growth without a definite object. Unless compelled by hunger therefore, stems which stand only an inch or two apart are avoided by them, or only partially barked, if barked at all. But away from these thick patches, which in the ordinary course of things cannot extend over a large area, the only chance of the seedling escaping lies in the protective covering of herbage. This must be something which effectually covers the seedling, and is at the same time not dense enough to smother it. Brambles are of little use, for they become hollow below, and rabbits can move about freely below their stems. Most herbaceous

protection on account of its thorny growths and low habit, but does not come up to the grass, and both kinds are only found on fairly good soil. A. C. Forbes.

(To be continued.)

GLASGOW AND SIR WILLIAM HOOKER.

The new botanical department of the University was opened by Sir Joseph Hooker recently in the presence of a distinguished company. Sir Joseph Hooker presided the ceremony with a description of the work done by his father both before and after he became

as in all other Universities in the Kingdom, the botanical chair was, and had always been, held by a graduate in medicine. Owing to these disqualifications his appointment was naturally unfavourably viewed by the medical faculty of the University. But he had resources that enabled him to overcome all obstacles—familiarity with his subject, devotion to its study, energy, eloquence, a commanding presence, with urbanity of manners, and above all, the art of making the student love the science he taught. Continuing, Sir Joseph Hooker said:—

I was asked what I regarded as of most importance to the student in the manner of my father's teaching. I would answer that it taught the art of exact observation and reasoning therefrom, a schooling of inestimable value for the medical man, and one that is given in no other profession, but which ought to come in this country, as it does in Germany, early in the education of every child. There were many of my father's pupils abroad, in India and the Colonies, who have told me that these botanical lectures gave them the first ideas they had ever entertained of there being a natural classification of the members of the vegetable kingdom. Then with regard to the results in a botanical point of view, the magnetism of the lecturer and the interest of the subject rubbed many of his pupils with a love of science that proved permanent and fruitful. They made observations and collections in tropical climates of both hemispheres, some of them throughout their lives, which have very largely contributed to a knowledge of the flora and vegetable resources of the globe. After twenty years of professorship my father retired, and undertook the directorship of the Royal Gardens, Kew. Since that method of botanical teaching in all our Universities, on the one hand, to a vastly advanced comprehension of the structure of plants and of the functions of their organs, and on the other, to a recognition of the fact that the study of the animal and vegetable kingdoms cannot be considered apart. Furthermore, chemistry, physics and greatly improved microscopes are now necessary for the elucidation of the elementary problems of plant life. The instruction in these two sciences—chemistry and physics has with all others a keener in this University *pari passu* with that of botany, and I kept it in the forefront of the educational establishments of the kingdom. The addition of the building in which we are assembled is evidence of the resolve that it shall not relax its efforts to maintain its high earned position, and with the exception that the botanical laboratories will prove an invaluable aid to research under the eyes of its distinguished director, I now, under his authority, declare it open. *Nature*.

In this notice but slight mention is made of the recent living plants introduced into the Glasgow Botanic Garden and described by Sir William Hooker. There are, we hear, many university gardens where new plants from foreign climes are never introduced.

FRUIT SALES.

WE extract from a recent number of the *Kentish Gazette* the following particulars relating to the sale of fruit on the trees, which may be of interest to some of our readers:—

"Several of the leading firms of auctioneers conducted their annual sales of soft fruit, and on the whole fair prices were realised. Messrs. R. Wainman & Sons, at their 42nd annual sale at Maidstone, the second sale of cherries and other soft fruit for a total of £290, which, considering the drought and the market prices, was very satisfactory. The previous day Mr. W. R. Tompsett, of Tonbridge and Paddock Wood, succeeded in selling a good quantity at Paddock Wood. Buyers were somewhat backward in bidding for cherries, but black currants sold well. At Messrs. Jackson's sale of cherries in the Sittingbourne district there was a better trade than was the case at Newington. Only a few lots were passed. The cherries, at stable Orchard, Milton owned by Mr. J. Hulde, made £115; Mr. J. Stager had an orchard at Borden which made £120. Mr. R. Chapman's cherries at Chilton, Sittingbourne, made £191, and Mr. M. Chapman's at the 'Red Bull' orchard, made £158. The district there was a better trade than was the case at Newington. Only a few lots were passed. The cherries, at Bapchild, made over £100 each lot. Messrs. Northedge & Honeyball held their annual sale of cherries in the Lysted district on Wednesday, at the 'Black Lion' inn, Lysted. The cherries on the well-known Noods Estate made £200 10s., which is a record price for the Kentish district. At Messrs. W. Finck & Sons held their annual sale at the 'George' inn, Boughton-under-Blean, when some of the finest orchards in East Kent were offered. Trade was good, and it will be seen from the following figures that good prices were realised. Cherries in Large Orchard, opposite Natch Court House, Boughton, £174,

FIG. 3.—INNOCENCE PEROLA (L.).

Nearly pure white, occasionally tinted with pink—a very popular exhibition Rose.

growth dies down in the winter when it is most needed, and many kinds of grass do the same. The best protective growth, according to our experience, is formed by the Tussock grass (*Aira caespitosa*), and the smaller varieties of the Dog Rose, Oak and Ash being frequently found in patches of these growths, which have grown up uninjured. The Tussock grass is especially useful for this purpose, on account of its stout growth and erect position through the winter. Old-established tufts of it prevent the seed getting down, and have too strong a hold upon the ground to give anything else a chance; but when only a year or two old, or thinned by taking out the old tufts, it forms a good matrix for strong seedlings such as these. The Dog Rose acts as a

Professor of Botany in the University in the first quarter of the last century. He had not been educated for the medical, or indeed any other learned profession. Having inherited ample means, and having been from childhood devoted to the study and collection of objects of natural history, he determined to devote his life and his fortune to travel and scientific pursuits. Early in 1820, reduced circumstances requiring him to turn his botanical attainments to material account, he obtained, through the influence of his friend Sir Joseph Banks with George III., the chair of Regius Professor of Botany in the Glasgow University. It was a bold venture for him to undertake so responsible an office, for he had never lectured, or even attended a course of lectures; and in Glasgow,

last two years, £98 and £155. Cherries in Small Orchard, £150; last two years, £56 and £130. Cherries in orchard at back of Bondon Street, £65; last two years, £65 and £50. Cherries in orchard at back of Parsonage Farm (late Duncann), £31; last year, £56. Cherries, Plums, and Apples, in Old Orchard, Ten-acre Field, Boughton; and Cherries in Ten-acre Field, £40; last two years, £27 and £28 10s. Cherries growing in Norham Orchard, Selling Court Farm, £24 10s.; last two years, £169 and £140. Middle Orchard, ditto, £25; last two years, £80. Lower Orchard, ditto, £29; last two years, £31 and £33. Cherries at Gosmere Farm, Selling, £178; last two years, £122 and £140. Cherries growing in Farndun Orchard, Stippington Farm, Canterbury, £109; last year, £90. Cherries in Hog Orchard ditto, £10; last year, £31. Cherries in Six-acre Orchard, ditto, £73; last year, £75. Cherries in Poplar Orchard, ditto, £90; last year, £11. Cherries in Cow Pasture Orchard, ditto, £108; last year, £129. Cherries in Wood Orchard, ditto, £121; last year, £80. Cherries in Twenty-acre Orchard, ditto, £122; last year, £116. Cherries in New Pasture Orchard, ditto, £41; last year, £31. Cherries growing in Merton and Eight-acre Orchards, Canterbury, £60; last year, £60. The Cherries growing at Chim Farm, Harbledown, £71; last two years, £66 and £53. Cherries in three orchards, Sole Street House, Selling, £81; last two years, £68 and £84. Cherries in Lees Court Orchard, Sheldwich, £82; last year, £56. Cherries, Apples, and Pears in Large Orchard, Staple Street, £255; last two years, £256 and £180. Cherries, Damsons, Apples, Pears, and Walnuts, Old Orchard, ditto, £71; last two years, £37 and £65. Cherries, Pears, &c., in Church Orchard, Hembill, £73; last two years, £47 and £60. Cherries, Apples, Pears, Plums, and Damsons in Oast Orchard, Mount Farm, £16; last two years, £10 and £13. Six acres Cherries, Upper Ensing, Clitham, £41; last year, £43. Cherries in Preston Orchard, Faversham, £59; last two years, £86 and £13. Cherries in Poplar Hall Orchard, Goodnestone, about 6/2 acres, £121; last two years, £130 and £110. Cherries in Denory Orchards, Chatham, £22 10s.; last two years, £22 and £20. Cherries and Walnuts, Wellbrook Orchards, Boughton, £19; last two years, £33 and £39. Cherries, South Street Orchard, Boughton, £12; last two years, £47 and £30. Cherries in three orchards at North Street, Sheldwich, £125; last two years, £100 and £120. About 3 acres Black Currants, next Farm House, Scissaler Cross Farm, Whitstable, £28; last two years, £22 and £25. Ditto, on another 3 acres, £28; last two years, £19 and £24.

In East Kent the absence of adequate rains has caused a large falling off in the promise of a plentiful Strawberry crop. The show of Apples and Plums varies a good deal in different districts, and Damsons will be short. There are plenty of Cherries, Gooseberries, and Red Currants; but Pears only promise half an average and Black Currants will be scarce.

PLANT NOTES.

VERONICA TEUCRIUM.

The brightest flower in Edge Hall garden in the last week of June was perhaps *V. Teucrium* (Linnaeus). What may be taken as the type is a plant of stiff shrubby growth, and many divergent stems and branches, covered with bright blue flowers borne on small axillary spikes, each stem having a terminal tuft of leaves. The height of this type is about 12 inches. But *V. Teucrium* is a very wide species, as anyone may see who now visits the Veronica-beds in the hardy herbaceous garden at Kew. There is a dwarf prostrate Veronica, generally known as *V. prostrata* (Linnaeus), and in nurseries by the unauthorised name of *V. rupestris*; this is now called at Kew *V. Teucrium* var. *dubia* (Chaix). Between this small prostrate form, and a form with robust stems nearly 2 feet high, and broad leaves, called *V. latifolia* (Linnaeus), there is every gradation in size, and the leaves vary from narrow lanceolate in var. *dubia*, to broad ovate in *V. latifolia*. Seed ripens far too abundantly, and causes some trouble in weeding; but the brightness of the blue in the flowers varies a good deal, and it is a good plan to sow some in a spare dry corner, and select the best colours. The colours seem always better in dry soil, especially on limestone or chalk. It is a great merit that no variety of this plant ever requires watering, or artificial support. I have never seen more than one form with white flowers—this belongs to var. *dubia*,

and was found by me fifteen years ago at Gavarnie; but though I have done my best to raise a stock from it, it continues scarce and "miffy." C. Wolley Dod, Edge Hall, June 27.

ASTER VILMORINI.

A fine dwarf Aster, from 11,000 feet altitude in Western China. It differs from *Aster alpinus* in the much bluer colour of the ray florets.

BULEIUM CROCEUM.

A very showy plant from Asia Minor. The flowers and involucre are bright yellow, and produce an effect similar to that of an *Euphorbia*. I do not yet know whether it is hardy.

CERATOSTIGMA POLIHILLI.

A dwarf-creeping plant from a high altitude in Western China. I think this will be a very notable shrub. The flowers have the delicate lavender colour of *Plumbago capensis*. I did not dare to trust my solitary plant out-of-doors last winter, but as I have succeeded in striking cuttings this spring, I shall test it next winter. Coming, however, from 10,000 to 12,000 feet altitude, it is practically certain to be hardy.

CALCEOLARIA POLYRHIZA.

A dwarf, tufted plant from the Patagonian Andes. The flowers are yellow, inclining to orange. I have not yet tested its hardiness.

PENTSTEMON CERULEUS.

A hardy dwarf Pentstemon of great beauty. The foliage is glaucous. The flowers at opening have the tube suffused with an objectionable mauve colour. Soon, however, this passes, and the whole flower-spike becomes of the exquisite colour of *Delphinium Belladonna*. My plants passed through last winter unprotected. Seed can be procured from Mr. D. M. Andrews, Boulder, Colorado, U.S.

RODGERSIA PINNATA.

This fine plant is one of Dr. Henry's Yunnan finds. It differs from *R. podophylla* in the leaves, which are hairy when young, more or less pinnate, and in the inflorescence, which is of a beautiful rose colour.

ONOBRYCHIS VIOLEAFOLIA.

A dwarf, spreading alpine, with pinnate foliage, and innumerable spikes of brick-red flowers.

SALVIA PRZEWALSKII.

A rather showy plant, 3 feet high, with numerous spikes of large purple flowers.

ANCHUSA SP.

This plant came to me from Mr. Smith, of Newry, and seems to be quite one of the finest of herbaceous plants. It has not here exceeded 1½ ft. in height, and for a month it has been loaded with flower-spikes bearing flowers with a white eye, and with a limb of the very purest and deepest gentian blue. In the amazing mass of its splendid colour, I know of nothing to equal it. It is hardy, and is ripening seed in quantity.

LINARIA PELOPONNESIACA.

Hardy perennial, 4 feet high, bearing closely-packed spikes of very pale lemon-yellow flowers. A. K. Bulley, Neston, Cheshire.

BOTANICAL VEGETABLES.—While almost every kind of vegetable is enjoyed in Southern Italy, cut into slices and fried in oil or fat, *Lagenaria longissima* is preferred, the young cylindrical fruits being cut into slices of a uniform thickness, the easier to prepare them for table. The varieties *L. minima* and *L. depressa* make pretty climbers, and are extraordinarily fruitful, and have a good effect. The dried fruits are used to decorate the windows of shops, and when cut in half to form suitable boxes for the seedsman's writing-table. *Die Gartenwelt*.

NURSERY NOTES.

PEAS AT SLEAFORD.

IN the midst of a fertile county, that produces an immense amount of seed for field and garden crops, is the quiet little town of Sleaford, where Messrs. Chas. Sharpe & Co., Ltd., have their headquarters. To this interesting place we were invited on June 28 to inspect a representative trial of culinary Peas.

The trials have been made on three acres of ground that only two years ago was under grass, and is situate just at the back of the residence of Mrs. Sharpe, widow of the late Chas. Sharpe, who died about four years ago. There are 897 rows and 150 varieties of Peas, some exceedingly dwarf in growth, others as tall as Duke of Albany and Telegraph. There are wrinkled and round, blue and white seeds, and very considerable variation between varieties in respect to the date at which they commence to yield a crop.

But they had all the same appearance from one point of view; they were equally well cultivated, and notwithstanding the little rain that has fallen during June, they were in first-rate condition. The soil is sandy, about 2½ feet deep, and though it is of a kind that may be most easily worked, and in any weather, it possesses a fair amount of moisture. The first and second early varieties were sown on March 14. One of the very earliest to yield is Best-of-All (McLenn), of the type of the old Saugster, but a fortnight earlier than that variety. The haulm is 3 feet high, and the seeds white and round. Next was Earliest-of-All, very early, but having blue seeds, also round; it is of the type of Kentish Invieta, and grows about 3 feet high. William the First grows a little taller, but is not so good.

One of the first of the wrinkled Peas to yield was May Queen, a very good variety with greyish pods, channelled on both sides. The first of all the wrinkled varieties was Oxonian, which appears to be a selection from Alpha or Dr. Hogg; it is a good variety, but has small pods. Very little later is Gradus (Laxton), and this has larger pods, which are much curled, and very handsome; it grows 3 feet 6 in. high, and yields as early as May Queen, which has white Peas, whereas those of Gradus are green. Ameer may be regarded as a direct successor to Ediphe, but it has bigger pods, which are more curled; the Peas are round and blue, and the haulm about 4 feet high. Bountiful is a light-coloured form of Ameer, crops more heavily, and may be kept true more easily. Duke of York is rather later than Gradus, grows about 4 feet high, and is a first-class Pea. Of the semi-dwarf wrinkled varieties with large pods, Gradus was fit to gather first, then came Duke of York, and afterwards Prince of Wales. Prince of Wales has a haulm of 3½ feet.

We next looked at some rows of Serpette, a French variety, something after the style of the old Avengeur, and Scimitar, so named because the pods resemble in shape the curved sabre of that name used by the Persians and other Mohammedan peoples. Messrs. Sharpe & Co., who do a considerable business in France, declare that the French like an attractive pod; but the variety is of no use in England, and was by no means ready to gather when these notes were taken. A much better variety than that noted above has been sent to Messrs. Sharpe under the name of King of the Serpettes, but this much resembles the variety Gladiator, being at present indistinguishable from it. There is also a variety of this French type which has blue Peas, and is known as Serpette Bleu.

Next to these French Peas was the variety *Invincible*, raised by Mr. Culverwell, late of Thorpe Perrow gardens, and distributed by Messrs. Sharpe & Co. twenty-three years ago; and Dickson's *Favourite*, known also by several other names, the earliest Pea grown by the Essex market gardeners for the London market. *Fillbasket* was said to be a better Pea than either *Invincible* or *Gladiator*, but for some reason or other is not grown so extensively. *Supreme* is a first-class round white Pea, originally introduced by Messrs.

Sharpe declare that they obtained a parcel of seeds of this variety from America, from which there was only one true plant raised, all the others being rogues, and from that one plant the firm's stock has been raised. *Sharpe's Queen* is a large-podded, blue, wrinkled Pea, with a haulm of about 2½ feet high. It is exceedingly prolific, and one of the best of late Peas. *Late Queen* (Sutton) was also bearing a heavy crop of pods, but they were not filled. This variety appears to be of the *Omega* type.

but the pods were not filled. It is a wrinkled Marrow Pea; and *Stanley* is of the same type, but commences to yield a little earlier. Next we saw *Charles I.*, a good wrinkled marrowfat Pea 3½ feet high; and *Blue Peter*, a round-seeded variety, useful for frame culture, not yet fit to gather. Beyond these were rows of a number of varieties of Peas introduced last season by various firms, such as *King of the Earlies* (Carter), *Daylight* (Carter), *Diamond* (Carter), *The Herald* (Barr), a dwarf Marrowfat 12 inches high; *Little Marvel* (Sutton), an excellent variety; *Green Gem* (Sutton), *Nonsuch* (Sutton), *Nonparcél* (Sutton), *Ideal*, suggestive of *Sharpe's Old Paragon*; *Aene* (Veitch), an improvement upon *Exonian*; *Thos. Laxton*, with square-ended pods, in some respects much like to *Gradus*; *Incomparable* (Hurst), and others.

The varieties we shall mention now were sown on April 15, or rather more than a month after those already mentioned, and consequently few of them were full podded, whilst others were just in profuse bloom. We remarked the popular *Daisy* (Carter), briefly described as a valuable green form of *Stratagem*, *Telegraph*, *Telephone*, *Duke of Albany*, and *Monarch*, the variety last-named being an improvement upon *Duke of Albany*, and a heavy cropper. Next was an excellent sample of *Standard*, a variety raised by Messrs. Sharpe. It was sent to Chiswick for trial last year, and in the autumn was awarded an Award of Merit by the Royal Horticultural Society. It is a late-yielding Pea of strong growth, about 1½ feet high, branching habit, and bears very long pods, usually produced in pairs. Of the Alderman type, and therefore of capital flavour, this variety is one of the best late-yielding Peas in existence. Other varieties included *No Plus Ultra*, and some of the same type; *British Queen*, *Veitch's Perfection*, an old semi-dwarf, wrinkled Pea of good flavour; *Nutting's Dwarf Marrow*, with five or more Peas in a pod; *Pioneer* (Webb), a good Pea of the *Gradus* type; and *Glory*, a blue Pea grown for use in winter.

Messrs. Sharpe have grown for them a very large quantity of blue Peas, and these are sold for use when green Peas are not obtainable; but there is evidence of what the restaurant-keepers can do with soda and sugar, in the fact that there is more demand for these dried Peas in June, when the earliest fresh Peas should be coming in, than at any other period of the year.

La Rapide, from France, is an unusually quick grower; some that were sown on April 19, were fit for gathering on June 29, but the pods are of very small size; *British Empire* is a most distinct looking late Pea with haulms and pods of sea-green colour, the shape of the pods being similar to those of *Telephone*.

In addition to all these trials, there were duplicate rows of most of the varieties, representing the actual selected stocks of each, which have been sent to different localities to be cultivated for seed, under contract for Messrs. Sharpe & Co. The plants in these rows were unusually even, it being exceedingly difficult to find rogues. In a field also, where there were larger quantities of each variety, the same uniformity was observable, and there was every evidence that the firm seeks to keep every variety true to name, and selection is continually practised with a view to fixing and developing their best characteristics.

The work of such wholesale firms as Messrs. Sharpe, who cultivate and sell Peas from so many raisers, would be materially lessened if

FIG. 4.—ROSE SOLEIL D'OR (PERSIAN YELLOW) — ANTOINE DUCHER.

Received an Award of Merit at the Temple Show to Messrs. W. Paul & Son, and shown also on Thursday last. (See p. 10.)

Laxton. It is a most difficult variety to keep true to type, and we have seldom seen so even and true a sample. *Triumph* (Sharpe) is a white wrinkled Pea, well known for the peculiar shape of the pods, which have what is termed a "finger mark" upon them. This malformation in the pods results in a smaller number of Peas being developed, and the yield is therefore less than that of the *Prince of Wales* already mentioned, and of the same type.

Fortyfold is a second early wrinkled Pea of excellent cropping qualities, an improvement probably on *Champion of England*. Messrs.

Of *Beck's Gem*, or *Tom Thumb*, the best selected strain appears to be one known as *Nain d'Amouney*. It is a white, round-seeded variety of very dwarf-growing habit, and one that may be recommended for cultivation in frames. *Witham Wonder* is a wrinkled Marrow Pea, scarcely 2 feet in height; it has pale green haulm and pods, the latter well filled. *W. Hurst* resembles the last variety, but is much deeper in tint, and therefore more appreciated by certain purchasers. *English Wonder* is of the same type as *Witham Wonder*, but has obtuse rather than pointed pods. *Excelsior* (Sutton) was 2 feet high, and well cropped,

raisers refrained from distributing a variety until it has been perfectly fixed.

A few rows of Pens that are the product of cross-fertilisation showed a surprising amount of variation in height and habit of growth, season of flowering, and other characteristics.

In a field where a number of varieties of Potatoes are grown, we noticed Dealhigh Castle, a first early kidney (A.M., Royal Hort. Soc.), and Early Porter (A.M., Royal Hort. Soc.), a second early kidney.

Messes. Chas. Sharpe & Co., Ltd., of whom Mr. Jessop is the principal shareholder, having married the only daughter of the late Chas. Sharpe, are mainly wholesale seedsmen; but they have also a retail trade, especially in Lincolnshire.

We are much indebted to Mr. Seymour, who superintends the Pea trials, for the trouble he took to make our visit to the "Pens" as interesting as possible.

CANADA.

CANADIAN ROSES.

ACCORDING to the recently issued supplementary Report on Canadian experimental farms, the Rose still enjoys a favoured place in the flower-testing garden—the most recent importations from the old homeland and the continent being regularly placed under trial with accompanying results. It would appear to be a work of love—favourable results lending beauty and charm to the home life. Amongst the Roses held in high esteem by the best amateur growers in Canada we find Mrs. R. G. Sharman Crawford (pink), Magna Charta, Ulrich Brunner, Mrs. John Laing, Gloire de Margottin, and Madame Gabrielle Luizet. On a bush of Margottin, in the possession of Mr. Alderman Black, of Ottawa, some 211 fully exposed blooms have been counted. La France, dwarf, is also a favourite. By the way, Mr. Black's method of protecting Roses in winter is worthy of notice—adopted, we believe, at the Central Experimental Farm, where R. P. Roses have in the past suffered greatly in winter. After the surface soil freezes, the roses are bent down to the ground and securely boxed in between 16-inch boards. Dry leaves are then packed loosely among and over the branches and stems, and a cover nailed closely to the sides. The plants are thus completely encased, and snow and rain, which cause more damage than frost, are excluded. The leaves and canes are removed on the first warm day of early spring, and the plants came out perfect in their very latest growth, and quite uninjured by the mould which has wrecked the hopes of so many Rose-growers. Writing on culture, an American writer says:—"It is an astonishing thing to see that year after year the chances of obtaining the most beautiful Rose-blooms are frittered away through unintelligent pruning of the plant, even in gardens of great reputation. There are thousands of Rose-bushes all over the country which, in spite of being found in spring to have made fine growth during the previous season, never produce good flowers; and the explanation is generally to be found in the fact that no reasonable plan is followed in pruning. The commonest mistake is the leaving of the older branching strong wood, which has already flowered. Dwarf Rose-bushes at the beginning of the year generally consist of several much-branched stems, which carried bloom in the previous summer, with several strong straight canes springing from the base of the plant. In the case of Hybrid Perpetuals, these older-branching stems should be cut completely out, leaving only the new shoots from the base, which themselves should be then considerably shortened.

The Week's Work.

THE HARDY FRUIT GARDEN.

By C. HERBES.

The Fig.—The shoots of out-door Fig-trees have already grown to some length, and will have been disbudded in some gardens, and Fig-trees generally should have early attention paid to this matter, as some reduction of the number of the shoots will now be very necessary. Those of which are short jointed should be retained, and the long and sappy ones removed. Each should be afforded as much space as will allow full development of the foliage without crowding, the leaves not overlapping each other, or the wood will be ill-ripened. Shoots bearing fruit should be shortened for the space of two or three nodes beyond the uppermost fruits.

Out-door Vines.—Regulate and stop all leading growths, and keep all laterals pinched to one leaf. Shoots bearing bunches should be stopped at two joints beyond the bunches. Make shoots secure to the wall or fence against which the Vines are placed, before their weight causes them to bend downwards. Where the main rods are unsightly, and the fruit-bearing spurs of great length, young strong shoots coming from the bases of the fruiting shoots should be laid in, in order eventually to replace them. A little extra attention in the early stages of out-door Vine-culture will aid considerably in the ripening of the fruit.

Summer Pruning.—This operation should not be commenced too early, still some amount of stopping and regulating of strong growths may be carried out forthwith. Plums may be the first manipulated, the operation in their case being carried out gradually, so that no check is given to growth. Where early disbudding was practised, the work of this kind will now be of a light nature. Shoots not required should be closely cut back, and fore-right shoots for the formation of spurs shortened to three or four joints; and long shoots should be temporarily tacked in, or otherwise secured to the wall. The Plum crop appears to be generally a fairly good one, and in some instances a thinning of the fruits will be necessary. Where the crop of fruit is not a heavy one, only the thick clusters of fruit should be slightly thinned. If rain is not general and abundant, water should be liberally afforded the borders, otherwise the fruit will be of a small size, or drop off. Trees carrying heavy crops will be benefited with an alternate application of liquid manure. An occasional washing of the foliage will keep the trees clean and free from insects, and if clear water fails to dislodge aphids, a weak quassia-water, or other insecticide should be used for this purpose.

General Work.—The land on which are Strawberry-plants for the supply of runners, should be afforded water freely. Newly made plantations of old forced Strawberry-plants will also need copious applications of water until re-established, and a mulch of short manure will also be of much assistance. Raspberry plantations should receive water copiously if the weather keeps dry, otherwise the fruit crop will be small.

THE KITCHEN GARDEN.

By J. MAXNE, Gardener to the Hon. MARK ROLLE, Trecton, East Radcliffe, Devonshire.

"Winter-sown" Cauliflowers.—From seed sown in warmth the third week in January last we were enabled to cut useful heads at the end of the month of May, or about four months from the date of sowing, which is good work for such a cold late spring as that of this year. When the ground on which these grew is cleared of the crop, it will be dug, levelled, trodden evenly all over, and drills drawn at a distance of 15 inches apart, and sown with Endive. Cauliflowers still to be planted should be afforded well-manured ground, which should be made firm before planting it. Do not let the plants

suffer from lack of water, or the produce will not be worth much; and do not neglect to mould up the stems when the plants are about half-grown.

Turnips.—A good breadth should now be sown of the varieties Red Globe and Orange Jelly, the drills being previously moistened. The ground for this sowing should be in good heart, quick growth being very desirable as affording a better chance of the plants to survive the attacks of the Turnip-fly. Then earlier sowings before the plants become crowded, leaving them at 6 inches apart.

Capsicums.—If the climate is warm enough for their successful cultivation, plant them out rather than grow them in pots. For planting out harden off the plants in cold frames, or in some protected corner, and do not let them lack water at the root. Having dug the ground deeply at the foot of a south wall, or forming a part of a south border, and made it moderately firm, set out the plants at 2 feet apart, and afford water copiously to settle the soil about the roots, and afterwards whenever the soil is getting dry. Those who cannot plant out may grow them in frames, either in pots or planted out, or in any spare forcing-house. The plant is liable to be overrun with red-spider if it be not frequently syringed.

Lettuce.—Make sowings at intervals of fourteen days, where the plants may stand till they are fit for consumption, moistening the drills, dropping a few seeds in groups at a distance of 1 foot apart. If the weather is showery when thinning has to be done, the thinnings might be transplanted, otherwise it is wasted labour to plant in this month and early in the next.

THE FLOWER GARDEN.

By T. H. STANK, Gardener to Lord Baltimore, Baltimore Park, Exeter.

Cistus, Rock Roses.—Rock Roses make a pretty display where the soil is light and sandy, the position open and sunny, and the spot a fairly dry one in winter; they are therefore most at home on rockeries and warm, dry banks. The flowers do not last long, but they come in long succession, and are of bright and pleasing tints. The plants vary in height from 2 to 5 feet, and the best are *C. laurifolius*, white; *C. formosus*, yellow; *C. ladaniferus*, white; *C. albidus*, rose. The white-flowered species have their flowers marked with purple, red, or yellow blotches, and are very attractive, while the rose-coloured flowers have a yellow centre, with numerous stamens. Cuttings of half-ripened shoots will root without difficulty in a cold frame, or under a hand-glass shaded from the sun; and if a few be struck annually, the loss of a plant or two is of but little consequence.

The Bog Garden.—Gunneras should have their growths reduced, if encroaching on the weaker plants. Patches of *Tiarella cordifolia* are beautiful objects when planted in this part of the garden, and make lovely masses; it is a plant not often met with. The bronzy-red leaves form a pleasing contrast with the small spikes of white flowers. I have it in different positions, but the plants are not happy if in too dry a spot, or in too tight a soil.

Philadelphus.—Young plants will not require much attention in thinning the shoots, but older flowering plants are the better for having some of the older shoots removed. *Philadelphus* present the best appearance when afforded plenty of space, or as solitary specimens on the turf. Of newer varieties, the following may be mentioned, viz., *P. grandiflorus*, one of the best and largest-flowered; *P. Keeteleeri*, a good double variety; *P. Gordonianus* is an excellent variety; while the small flowered *P. microphyllus* makes a small, neat bush. These varieties are not so strongly scented as the old *P. coronarius*; and all are worthy of a place as solitary plants on turf, or planted among low growing plants, where the branches can arch over almost to the ground.

Clematis.—Frequently regulate the growth, for while they form pretty pictures in tangled masses, they are more gaudy than when their shoots receive some amount of training. They are moisture-loving plants that suffer in the size of their blooms if stinted of water at the roots. A slight mulch also assists them.

Flower-beds.—Peg down trailing plants, previously stirring the surface of the bed with a small single-handed hoe or hand-fork. If the flower garden display is not required till late in the season, remove the flowers from Pelargoniums, Fuchsias, Tropaeolums, and fibrous-rooted Begonias.

Brompton Stocks.—Seed should be sown for next season's flowering, sowing in pans or boxes, and standing them in a cold frame till germinated, and then freely exposing them.

PLANTS UNDER GLASS.

By D. BOMPERS, Gardener to HERSEY PARK, Eps.,
Pre-stwood Hall, Longhborough.

The Conservatory.—Continue to give regular attention to the tying and regulation of the growth of climbers, generally removing or reducing the number of weak growths. Heliotropes and Pelargoniums growing against walls should be pruned sparingly, so that new growths will be made in good time for flowering in the winter season. The Camellias, Oranges-trees, and other permanent occupants must be kept clean, and free from insects by sponging the foliage with sapsuds containing a winglessful of petroleum to 2 gallons of water. Achimenes in pots and baskets may be brought into this house when the first flowers open, and the remainder of the plants in successional batches. Begonias, Fuchsias, show and zonal Pelargoniums, *Cosmia plumosa* and others, Balsams, and *Coleus* will now be available for decoration. A weekly change of flowering plants is desirable at this season. Afford ventilation day and night, more being applied by day.

Leaf-veined Pelargoniums.—As the plants grow in size, afford supports to the young growths in the form of neat sticks, for which purpose a tripod of Bamboos, 3 to 4 feet in height, is excellent if securely fixed together at the apex with tar-twine. By the autumn such plants form pyramids of great beauty for use in the conservatory. Continue to pick off all flowers from plants intended for flowering in the autumn, and apply manure-water after the pots are filled with roots. Pinch the points of the more vigorous shoots, and maintain a balanced growth by frequently turning the pots round to the light. Sprinkle freely after hot days, using a little soft-soap in the water occasionally to prevent infestation by thrips and aphides. Like zonal Pelargoniums, these plants are better for full exposure out-doors at this season.

Mignonette.—A sowing made now will be ready for autumn flowering in large 18's, filled with a compost consisting of good turfy loam three-quarters, leaf-soil quarter, adding a little dry cow-manure rubbed to a fine powder, and some mortar-puddle. Make the soil very firm, and fill to within an inch of the rim. Sow a dozen seeds in a pot, and when germinated, reduce to four or five; place in a frame, and apply shade until the seedlings appear, affording water at all times when the surface of the pots indicates that the soil requires it. The plants must have abundance of air, the lights at night being pulled off. A sowing may be made a month hence. Pick off the flowers from the earlier plants, and put sticks in the form of a tripod if pyramids are wanted. When plenty of roots are formed, afford manure-water.

FRUITS UNDER GLASS.

By MITCHELL 26, ESTERIE, Gardener to SIR CHAS.
LESLIAN, The Glen, Inverlathie, Peebles-shire.

Pineapples.—It will soon be time to take suckers from off the summer-fruiting plants, and make provision forthwith for rooting them, so that they may have the benefit of summer

heat for as long a period as possible. The chief essentials are a hot-bed made of leaves and stable-manure, a low pitched house or pit, a steady bottom heat of 50 at 6 inches below the surface, a few degrees higher (say 95) being allowable at the start. The suckers should be separated from the mother plants with a twist, be divested of a few of their lower leaves before planting them in 5 or 7-inch pots according to size, and affording them water once in order to settle the soil about them. Good fibrous loam torn up by hand, and unmixed with anything, is the most suitable compost. It should be made firm about the sucker, which will tend to cause speedier rooting. The house or pit must be kept rather close and humid for ten days, or a fortnight, and the suckers well shaded from the sun, and dewed over with a fine syringe or water-can once or twice a week, according to their needs. As soon as growth has begun, ventilation should be increased by degrees, and less shade applied, till the plants become inured to the sun, when ordinary Pine-stove treatment should be afforded. The young plants should not be allowed to become pot-bound, but the growth should be accelerated so far as is consistent with a sturdiness; consequently there must not be any delay in shifting into larger pots, immediately the roots have taken a firm hold of the soil, and before they become matted together on the sides of the pots, which for Queens and Black Jamaica may be 10 inches, and for others 11 or 12 inches, using fibrous loam with the fine particles sifted out of it, more lumpy than for suckers, adding a sprinkling of Thomson's Plant Manure; and to prevent worms entering the pots, a handful of fresh soot should be sprinkled over the crocks.

Water to Melons. The soil of a Melon-bed should not lack moisture, nor should the plants ever be allowed to flag from that cause, as when this occurs a harmful check will have been given to the plants. Too much watering is even more injurious, and that being so, water should not be applied before the soil has become too dry for the support of the plants, but before they flag. Plants with growing fruit on them will require water at the root once a week, even such as have large rooting-space; whilst those in small, confined beds may need water twice a week; plants in boxes on alternate days, or still more often; and those grown in large pots will need water or liquid-manure once or twice a day. When setting the blooms, it will be sufficient to keep the foliage from flagging; and if water becomes necessary, it should be applied without wetting the surface more than can be helped. A poor growth is not good either for setting or ripening the fruit, but a drier condition of the soil is more desirable at those times than when the fruit is swelling.

THE ORCHID HOUSES.

By H. J. CHAYMAN, Gardener to R. J. MEYER, Esq.,
Cambridge Lodge, Golden Road, Croydon.

Calanthes. These plants are now at a stage of their growth when means should be afforded as will enable them to fully develop the pseudo-bulbs. In some gardens, where large numbers of Calanthes are grown to furnish flowers for cutting, no special facilities exist; but the plants must be accommodated in houses in a certain degree unsuitable, and I have often been surprised at the excellent results obtained. It is true that the needs of the plants when potted in the spring are easily met, but it is when growth advances, and more space is required, that difficulties occur, and the shelves in the houses are filled with plants that are being forced, or with newly propagated plants. It becomes necessary as soon as space can be found to place the Calanthes in positions in which the maximum amount of light, combined with a hot, humid atmosphere, are obtainable, and the shelves in vineries and other forcing-houses afford these conditions. If the plants have not been exposed to plenty of light, but little shading, if any, will be called for, but if otherwise, the glass should be coated with whitening outside. The

plants, when thus grown, need considerable quantities of water; and when the soil is filled with roots as often as twice or three a day in hot weather. At that period clear, weak liquid-manure is of great benefit to them, especially that from a farmyard, which may be applied twice and three a week. In dull weather care must be taken not to afford excessive quantities of water, or the black spots that give so unsightly an appearance to the leaves may make their appearance. This spotting being also detrimental to growth, should be avoided most carefully. A close watch should be kept for red-spider and scale, and as soon as either is apparent, the leaves should be cleaned with a sponge dipped in warm soapy water.

Seedling Orchids.—The seeds which were sown in the month of February, March, and April did not germinate so quickly as usual, owing probably to the lack of sunshine, but the plants have made satisfactory progress lately. The seedlings of Cattleya and Laelia should be removed as soon as they can be conveniently handled, and transplanted into those tiny pots that are purposely made for this kind of work. A few small crocks should be placed in the pots, and over these some finely chopped sphagnum-moss and turfy peat, in the proportion of two of the first to one of the second, and to this a little rough sand or finely-broken crocks may be added. I find a pointed stick the best implement wherewith to transfer the seedlings from the seed-pan to the pots. The materials should be pressed as firmly about the roots as is safe with such tender things. Apply water with a fine spraying-syringe, and place the pots where rapid growth may be assured. The plants will begin to make roots when the first leaf reaches maturity, and sometimes sooner. Dendrobiums grow more quickly, but the seedlings should be afforded exactly similar treatment to Cattleyas, excepting that more light may have access to them after the formation of roots has begun. Miltonias, Cymbidiums, Zygopetalums, and *Aplopodiums* are not so difficult to manage, neither do they germinate to anything like the same extent as Cattleyas; but the seedlings grow more rapidly, and as a consequence they are more easily brought on. It is not advisable to remove these from the seed-pan before the first leaf is matured or the roots have pushed forth; they may be picked out a number together in a pot, although I prefer to establish each in its own pot, doing this as soon as practicable, the plants making more progress by so doing. Bell-glasses or close cases may be placed over the tenderer species, these affording the regular conditions of heat and moisture. *Pterocarpus* must be taken to prevent the seedlings becoming dry, or being washed out of the compost when applying water. In bright weather the seedlings should be very lightly sprayed twice a day.

WEATHER AND PLANT LIFE.—According to an elaborate report, based on the most recent knowledge, just issued by the United States Weather Bureau, it is nihilism (the chemical action of sunshine) that is the dominant factor in plant growth. "The temperature of the air," we are told, "has apparently little to do, in and of itself, with the duration of time from sowing to ripening. This depends principally on the sunshine. The temperature of the air controls the chemical composition of the seed somewhat, but the effective sunshine is the productive climatic element, for it furnishes the total energy at the disposal of the plant." An example is given in the case of Maize. The temperature of parts of England is quite as high as in places in North America, where Maize grows freely and ripens well. It is regarded as absurd that such an insignificant item as a deficiency of two degrees Fahrenheit on the mean of a single summer month, as compared with the Western States, should exclude this crop from the British Isles, where it seldom matures its grain. The reason seems to be, that the English climate is hostile to this plant solely owing to its greater amount of cloudiness.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, and as early in the week as possible, and fully signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the revised communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 6	Royal Botanical Soc. Meeting. Society Française d'Horticulture de Londres, Meeting.
SUNDAY, JULY 7	Great Horticultural Exhibition
TUESDAY, JULY 9	Wolverhampton Horticultural and Floral Fête (3 days)
WEDNESDAY, JULY 10	Horticultural and Rose Shows at Tambridge Wells, and Furnby, Lancashire.
THURSDAY, JULY 11	Bath Floral Fête and Rose Show.
SATURDAY, JULY 13	Manchester Royal Botanical and Horticultural Society, Rose Show.

SALES.

TUESDAY, JULY 9.—Sale of Orchids, Palms, &c, by Mr. Rendell, 26, Bucklersbury, E.C.

FRIDAY, JULY 12.—Sale of Orchids, at Protheroe & Morris's Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick.—63.3

ACTUAL TEMPERATURES.—

LONDON.—July 3 (P.M.): MAX. 73; MIN. 57.
July 4.—FINE, WINDY. Rose-show weather.
PROVINCES.—July 3 (P.M.): MAX. 70, Home Counties; MIN. 53, N.E. Scotland.

WE KNOW the dire consequences that ensued when PLANTAGENET plucked a White Rose from off a Briar in the Temple Gardens, and SOMERSET gathered a Red Rose from a Thorn in the same pleasure. Little could those warriors have anticipated a tented field in the Twentieth Century put to such very different uses as those which the National Rose Society effected on Thursday last. Struggle and rivalry indeed were there, but without strife or ill-feeling. Red Roses and white Roses were at the Temple in far greater profusion and variety than they could have been in SHAKESPEARE'S time, as well as yellow Roses, and Tea Roses, and Roses of forms and hues undreamt of by him. Briefly, we congratulate the National Rose Society on the success of their enterprise, and we heartily thank the secretaries and the executive for the excellent way in which they fulfilled their arduous task. In another column we give a Report of the show, and if it is not so complete and free from error as it might be, we must remind the reader that these pages were actually passing through the press at the time that the show was held, so that adequate revision was almost an impossibility.

One most gratifying feature is the growing tendency, as evinced at the Temple, to show the flowers to advantage in vases and in picturesque groups, as well as in the hideous boxes, which, if it were possible, would detract even from the beauty of a Rose. They render a Rose-show as monotonous and unattractive to the public as a—well, as a Dahlia show. Sympathy, intelligent admira-

tion, interest, and appreciation vanish at the sight of those dreadful boxes. We have always been told that the accurate comparison required by the judges can only be obtained by following the old-fashioned method. This is a dictum from which we respectfully venture to dissent; or if it be true, we should prefer either not to have such minute analysis, or, if that is inevitable, that it should be done in private. The glorious groups of Chrysanthemums, and the beautiful arrangements of single Dahlias, show what can be done without in any way obstructing the scrutiny of the judges.

The Temple Rose show was favoured with brilliant weather, and was honoured with a visit from H.M. the QUEEN. As was fitting, a bouquet of Roses was presented to her by the granddaughter of Dean HOLE, the President of the Society. The bouquet consisted of the new Rose Queen Alexandra, raised and supplied by the Messrs. VEITCH, and of the better-known Rose Her Majesty, raised by the late HENRY BENNET.

The show was very large, the special features being the garden and decorative Roses. Hybrid Perpetuals seemed to us to be scarcely up to the mark, but Tea Roses were in good form. Table decorations, too often heavy or uninteresting, were on this occasion very beautiful, as may be gathered from our report.

When we heard of the enterprise of the National Society in conducting a grand Rose show in the Temple Gardens—an ideal place to hold such an exhibition—we determined to have a Rose show of our own, and to lay before our readers illustrations of the very newest Roses that are to be seen, and a selection of exhibition Roses of such acknowledged merit that they are to be met with in every Rose show of the kingdom. In carrying out this idea, we have to express our acknowledgments to Messrs. W. PAUL & SONS, to Messrs. PAUL & SOX, BEN CANT, GEORGE PRINCE, and to Miss GIRDLESTONE, who kindly placed at our disposal a series of photographs from the collection of her late brother a rosarian as discriminating as he was enthusiastic. Of the older well-known Roses we need say little; let the illustrations tell their own tale. Of the newer ones a few notes of description are requisite.

The variety Conrad Ferdinand Meyer (see fig. 2) was exhibited from the gardens of LEOPOLD DE ROTHSCHILD, Esq. (gr., Mr. HUDSON), at a meeting of the Royal Horticultural Society on June 4. It is said to have been raised by Dr. MÜLLER, and by successive crosses, in which were used Gloire de Dijon, Duc de Rohan, Maréchal Niel, and Rosa rugosa. It has bloomed abundantly this season from the old wood, and the flowers are nearly 4 inches across, very fragrant, and of the beautiful colour characteristic of La France. It is a strong and clean grower, and throws up strong shoots from the root stock. It is expected that the variety will bloom in the autumn as well, but this remains to be proved. The Floral Committee of the Royal Horticultural Society awarded the variety an Award of Merit by a small majority when it was exhibited under the name which accompanied the variety from Germany, namely, Rosa rugosa germanica Conrad Ferdinand Meyer.

Soleil d'Or (see fig. 4) has been exhibited by Messrs. W. PAUL & SOX as plants in pots.

The variety was obtained by crossing Persian Yellow and Antoine Ducher. In character it most resembles a hybrid perpetual, and produces double flowers 3 to 4 inches across, of very deep apricot colour, shaded in the centre with orange. The foliage is like that of Persian Yellow, and the variety will be found a distinct and valuable novelty. It has been awarded an Award of Merit by the Royal Horticultural Society.

The Lion (see fig. 5), is a new large single-flowered Rose, shown by Messrs. G. PAUL & SOX Chesham, at the National Rose Society's show at Richmond, where it was commended. In colour it is bright rosy-crimson with a white centre. It is a seedling from Crimson Rambler crossed with Beauté Inconstante.

Ben Cant (see fig. 6), is a new H. P. variety shown by Messrs. B. K. CANT & SONS, and awarded the National Rose Society's Gold Medal. The flower has exceedingly broad petals, a characteristic well displayed in our illustration, and this virtue in company with its brilliant crimson colour, shaded with violet, are the points that obtained the Gold Medal. A good bloom was shown at the Drill Hall on Tuesday, 2nd inst., in Messrs. CANT'S 1st prize exhibit of twenty-four Roses distinct.

Longworth Fairy, figured in our special supplement, as its name implies, is a Rose from Mr. GEO. PRINCE, of Oxford, who succeeds so well with Tea-scented Roses generally. The variety we now illustrate is a new Tea-scented Rose that blooms early, is very deep pink in colour, approaching that of Mrs. W. J. Grant, and very fragrant; it has very large rough-surfaced leaves. The other Roses figured are Innocente Pirola, The Bride, Souvenir d'Elise Vardon, Princess of Wales, Climbing Devoniansis, A. K. Williams, Comtesse de Nadailac, and Susanne-Marie Rodocanachi.

ROYAL HORTICULTURAL SOCIETY. — At a general meeting of the Royal Horticultural Society, held on Tuesday, July 2, thirty new Fellows were elected (making 614 since the beginning of the present year); amongst them being Lady MARGARET BOSCAWEN, Lady BICKERSFITH, Lady TESSANT, Lady WHITEHEAD, and Surg.-Col. ARTHUR SANDERSON, A.M.C.

LILY SHOW AND CONFERENCE. — The Royal Horticultural Society will hold an exhibition of Lilies in their gardens at Chiswick on Tuesday and Wednesday, July 16 and 17. The committees will meet at 11 A.M., and plants, &c., for Certificate will be placed before them as at the usual meetings in the Drill Hall. The gates will be open at 12 noon on July 16, closing at 7 P.M.; and at 11 A.M. on Wednesday, closing at 6 P.M. Fellows admitted free on showing their tickets. A Conference on Lilies will be held at 2 P.M.

CRYSTAL PALACE FRUIT SHOW.—Schedules of the eighth annual fruit show to be held at the Crystal Palace, Sydenham, on October 10, 11, and 12, are now ready, and may be obtained on application to the Secretary, 117, Victoria Street, Westminster, S.W. Applicants should enclose a stamp.

THE WEATHER.—We sometimes hear of the weather "breaking-up" when a change is impending. Now printers have found a method of breaking the weather which suffers from climatic evils might envy. As our weather paragraph was passing through the press last week, "The Weather" was smashed in the printing machine, and appeared in a maimed condition in our last issue—another instance of the power of the press.

THE INTERNATIONAL ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, ARTS, AND EDUCATION, will hold its second international meeting at Glasgow, in the University and to the International Exhibition, from July 29 to September 27, 1901. Besides serving as a link among universities and learned societies, &c., one of the most important functions of the meeting will again be, as at Paris last year, to study and interpret the matters of scientific,

Methods of Science Study, Modern Language Study, Manual and Technical Education, Museums, Geographical Education, History and Organisation of Secondary Education, the whole concluding with a series of conferences on immediately "Realisable Progress in Education." The General Secretary is M. LIARD, Permanent Secretary of State for Higher Education, Paris; assisted by Prof. PATRICK GEDDES.

Rose, grows near an Apple-tree! One hypothesis is as good as another (till it is disproved, and so we insert, as an hypothesis (not as fact), that a horse belonging to one of our correspondents has developed two horns and a dewlap from being kept in the same field with his cow. The five "perfect" Apple-blossoms were no doubt superfluous flowers, such as characterise proliferous Roses. If the journalists who are tempted to insert such statements would previously consult some expert who would give the information, if not as a matter of professional courtesy, at least for a trifling remuneration, how greatly they would add to the confidence which their readers would repose in their utterances.

GERMINATION OF THE BRAZIL NUT.—Mr. WATSON describes in the *Annals of Botany*, March, 1901, the germination of the embryo plants in this species. The fruit, as is well known, is a globular, woody fruit with an aperture closed by a plug formed by the hardened calyx. The seedlings begin to germinate within the fruit, and under natural circumstances they displace the plug and push through the aperture. While within the bony fruit there is a fierce struggle for existence, and the young plants become compressed as they emerge from the aperture to such an extent as in some instances to die back. Adventitious shoots were, however, formed in some cases. Roots are sometimes not formed, the young embryos obtaining in the first instance their nourishment from the kernel of the nuts.

THE FLOWERING OF AMORPHOPHALLUS TITANUM AT KEW.—Mr. N. E. BROWN writes:—"For the second and only times of its flowering in Europe, visitors to Kew Gardens during the past few weeks have had the chance of seeing the flower of this giant Aroid develop. A full account of the discovery and first flowering of the plant will be found in the *Gardeners' Chronicle* for 1878, x., p. 596, 788; for 1889, v., p. 759, figs. 119, 120; and vi., pp. 12, 19-21, figs. 3, 5, and 6, which may be thus summarised. It was discovered in 1878 by the Italian traveller, Dr. BRECCIA, who sent tubers and seeds of it to Florence. Owing to the absurd Phylloxera laws, the tubers were not allowed to enter the country, and so perished; but the seeds germinated, and one that was sent to Kew in 1879, after ten years' successful cultivation, flowered in June, 1889, an achievement greatly to the credit of the Kew staff, since all the plants grown on the continent died without having flowered. About two years after flowering, the Kew plant also died, possibly because the limit of its existence had been reached. The tuber of the plant that has just flowered was received at Kew two or three years ago, and this year showed signs of flowering. At the beginning of June the flower-bud was only 3 or 4 inches high, 13 inches on the 8th, 11 inches on the 21th, and 19½ inches high on the day of opening, June 28, the rate of growth being nearly 2 inches per day. It began to open in the afternoon, by 6 P.M. it had fully expanded, and was partially closed the following morning; as, unlike the other species of this genus, it only remains fully expanded for the one night. The spathe of the present flower when fully open was 18 inches deep, and 23 feet in diameter; the outside is smooth, and light green, spotted with whitish on the basal part, above which it is strongly ribbed and deeply fluted, the margin being irregularly plaited and toothed; the ribs are white, the folds between them being light purplish. Inside the spathe is rich dark purple, overspread with a "bloom" or velvety sheen, the basal

FIG. 5.—NEW SINGLE-FLOWERED ROSE "THE LION"; COLOUR ROSY-CRIMSON, WITH A WHITE CENTRE. MUCH REDDED. (SEE P. 10.)

geographic, and other interest afforded by the exhibition, by means of lectures and conferences, with demonstrations and visits under skilled guidance. The various national groups which co-operated last year at Paris will again be represented at Glasgow; and their lectures and conferences, &c., will include Pure and Applied Physics and Chemistry, Electricity and Engineering, Agriculture and Forestry, Geography and Colonisation, Hygiene, Scottish History and Archeology, Fine Art, &c. Much attention is also being paid to education in its many branches—Child Study, Nature Study,

THE BIG GOOSEBERRY SEASON appears to have set in with prematureness and severity. In one provincial journal we read of a cat sitting on pigeon's eggs, having displaced the mother on two occasions. In another—indeed, in several (for the copyists rarely think either of verifying their quotations or of substantiating their "facts")—we read that five perfect Apple-blossoms grew in the centre of a Rose. The Apple-blossoms opened as the petals of the Rose developed, the two forming a strange contrast. That is the statement of fact—now for the hypothesis. It, that is the

part being smooth, and greenish-yellow in colour. The columnar spadix is 3½ feet long, and 7 inches thick, of a dull olive colour, bearing dark purple ovaries with long styles, and yellow stigmas at its base. As seen from above, the form and colour of the spathe are very pleasing and effective. The odour, however, is not quite so enticing, being very disagreeable if the nose is held directly over the spathe, and to some people is nauseating if near the plant; but it is not nearly so offensive as that of some other species. As evidence of this, I may say that myself and four others, one of them a lady, were shut up in the house with and close to the open flower for just one hour, whilst photographs of it were taken, without feeling the slightest inconvenience or trace of nausea. The odour ceases when the flower closes the next morning. With regard to temperature, the spadix and interior of the spathe was decidedly warmer than the surrounding air, but I am informed that a clinical thermometer only showed a difference of a few degrees, and it was certainly much less heated than I have found several species of *Philodendron* to be. From the dimensions given, it will be seen that this flower is very much smaller than that of 1889. As it is likely to be rarely seen in flower under cultivation, and then remains expanded for one night only, very few people can hope to see this giant Aroid flower in its most perfect condition."

A FATAL GUN ACCIDENT AT EVESHAM.—Early on Saturday morning, BERTHA WIDOWS (twenty-eight), wife of WILLIAM JOSEPH WIDOWS, market gardener, of Evesham, was accidentally shot by her son OWEN, aged eleven, and received such terrible injuries that she died a few hours later. Mr. WIDOWS, about seven o'clock in the morning, took his gun to the garden adjoining the house for the purpose of scaring birds. His attention was called to the back of the house, and he placed the loaded gun against a wall, telling his son not to touch it; the boy, however, in his father's absence, carried the gun to the house, out of the way of his two younger brothers, who were playing near, and as he was entering the door, he states that the muzzle caught the woodwork, and the gun was discharged. Mrs. WIDOWS was sitting by the kitchen fireplace, and she received most of the charge in her face, both eyes being destroyed. At the Coroner's enquiry, held on Monday, the jury returned a verdict of "Accidental death," and a vote of condolence with deceased's relatives was passed.

HOME CORRESPONDENCE.

THE HOUSE SPARROW.—I quite sympathise with my old friend Mr. Harrison Weir in his opinions concerning sparrows. I have watched them somewhat carefully, and can only put down their depredations to a quarrelsome temper, as I have frequently found feathers scattered near where the flowers are bitter. The way that the pieces of Crocus, &c., are thrown about and not eaten, shows that it is not for food or medicine that they bite them. When the weather is going to be colder they invariably attack the Polyanthuses and Primroses, as if the cold made them uncomfortable and cross. But when the weather is warmer, it seems to be more by way of mischief; nothing but black thread keeps them off the Crocuses. Two or three settled down one morning on a patch of *Arabis alpina*, and another of *Alyssum saxatile*, and began picking off the flowers and flower-buds and throwing them about and not eating them. *Anemone angulosa* has no chance unless covered with glass, so long as the air is cold. One day I

found they had bitten pieces out of a flower-bud of the Tenby *Daffodil*; and only a week ago, I found they had got amongst the bog plants that I keep in pots in a shallow tank, and had pulled up and tossed about *Helleborum verticillatum*. That was the last straw. It is now war to the knife! or any other instrument of destruction that I can use against them. The birds were quite young sparrows, and seemed to enjoy the fun. Greenfinches are almost as bad, but do not visit me often. As soon as they get their dismal long-drawn screech, I go out and stow them, as they have a habit of pulling up and laying on the ground Lettuces and other seedlings. With respect to other birds, starlings, thrushes, blackbirds, and hedge-sparrows, all visit the garden, and I regard them as friends. The small blue-tit never does any harm to the Currant or Goose-berry bushes, as they bear quite freely after it has visited the bushes in winter. I am not sure which tit it is that samples the Pears near the stalk before they are ripe, and spoils them for keeping; but I do not think it is the small blue-tit—probably the greater tit. But I saved my *Dryopteris* *Comice* last year (pyramid tree) by tying a muslin bag round each of the young Pears. The bullfinch has not tried the fruit-hedges since I anointed them with a mixture of eucalypt powder and flour paste. This I do before the severe frosts come in December. *Serpentaria*.

BOLTING OF CABBAGES.—As John Pope, of King's Norton, has fully let "Old Kemp's" of Cabbages, seedsmen will now be able to dispose of their old stock of Cabbage-seeds without going to the trouble of having them properly mixed with new seed. Out of a hundred bags of seeds rightly are sold, and twenty are left unsold, which are a considerable loss if not mixed with fresh stock. Therefore there will be no difficulty of that matter now. In my lifetime of over fifty years a head gardener, having always dealt with respectable seedsmen, I cannot say that I have been much troubled with bolting Cabbages. My sorts were generally the following: Little Pixie first, then Elham's, Sutton's Flower of Spring, and Enfield Market. There used to be a Downton Hall Cabbage supplied by the Dicksons, of Chester. Rather a light green variety, a very tender and an early sort, it never had many flaky leaves about it. It began to bolt at once. I grew it as long as I could get the seed. I never yet saw a bolter amongst them. The Messrs. Dicksons must have known the secret then, that it is quite safe to sell old Cabbage-seeds. It will be thirty years since this variety was lost to the trade. I think the variety was raised by the late Mr. Mackie, of Downton. *From the Banks of the Mole.*

FROST IN NORTHAMPTONSHIRE IN JUNE.—On Wednesday, June 19, we registered 7° of frost here, which blackened Runner Beans and second Early Potatoes, also Dahlias, Heliotropes, Begonias, *Fuchsia*, *Zinnias*, &c., also the top young growths of Laurels nearest the water. The gardens round this neighbourhood facing south-east have escaped, but facing north-west they have suffered most, especially in low-lying districts. On several occasions we have had frost here in June; for instance, in 1892, on June 14 and 15, we had 5° and 7° respectively; in 1895, on June 15, there was 5°; and 1898, on June 15, we had 4°. In 1892, when crops were more forward, they suffered more than now. In 1895 all the early Potatoes and Vegetable-Marrows were cut down, and likewise some of the bedding-plants. My thermometer stands 3 feet from the ground facing north-east, 10 feet above the water. *H. Thayer, Fineshade Abbey Gardens, Stamford.*

GREENHOUSE HEATING.—If petroleum be used in the simple manner explained on p. 291 of a recent issue, it would certainly be a very great boon, and where the gardener has not a large house or a number of houses to be heated, it should, I think, answer for small boilers; but I fear it would be useless to nur-

serymen and others who have coke furnaces, heating some thousands of feet of 3-inch hot-water pipes. And, then, does Mr. Ward understand he cannot obtain patent rights for a broad, general idea, such as he sets out, and which I doubt very much would be found to be a new idea? When he himself has tried the plan he so well describes, and finds it to answer, he can then take out a provisional patent and go on experimenting with it until at the end of nine months he has to make a final specification, stating exactly what he claims as new in the apparatus. Unless he does this, someone else, meanwhile, might take out a patent. Mr. Ward has no protection in stating, as he does in the last paragraph of his note, that "I reserve to myself all rights, &c." *Alfred Chandler, Torquay, June 16, 1901.*

THE DRILL HALL MEETINGS.—Under no conditions of pressure could the walls of the James Street Drill Hall expand and allow of more room within that somewhat capacious building at the first June meeting, in spite of every effort to crowd in all the material sent for exhibition, and as a consequence very much had to be taken home again. That was to be deplored, but under the circumstances could not be helped, although much disappointment and complaint resulted. If that state of things is to be often repeated, it is evident that some drastic course will have to be taken by the Council to meet the difficulty. We may put aside the provision of a large Hall at present. Even if practicable, a long time must elapse ere it could be furnished. Then there is the course open of securing the adjoining large Drill Hall for the overflow of the present Drill Hall. That may or may not be practicable. There is also a remedy to be found by holding the meetings weekly during some three months of the year, and in preventing those persons who sent groups in one week from sending in the ensuing week. This would, of course, be a matter of some expense, though not great; but the chief difficulty would be found in getting the members of the committees to attend so frequently. Failing that arrangement, there seems to be no other course open but to intimate that only a certain space can be allotted to any one firm or exhibitor at each meeting, taking care in that way that it be not excessive. But it should also be arranged that no entries will be received or space granted unless the entries were posted not later than the Friday preceding. These entries ought to go direct to Mr. Wright at Chiswick, for if sent to Victoria Street they often do not reach Chiswick until midday on Monday—certainly much too late. *A. D.*

Obituary.

JONATHAN SQUIBBS.—We briefly announced in last week's issue the death of Mr. Jonathan Squibbs and his wife Felicité Squibbs, who died within twenty-four hours of each other after forty-three years of married life, both having endured great suffering during the last three years. The former was a member of an old and well-known family of gardeners. He was apprenticed and gained a material part of his professional knowledge under a well-known gardener, the late Mr. Cox, of Redleaf, Penrhurst. From thence he went as foreman to Kimmel Park, Abergole, under Mr. Mumford, which situation he filled most satisfactorily. At the death of his father, William Squibbs, who had been head-gardener at Rooksnest, Godstone, for forty years, he succeeded him, and remained there upwards of thirty years; and for ten years he was gardener to the late Mrs. Wilkinson, of East Hill, Oxford.

Mr. Squibbs leaves five sons and two daughters. Two sons follow their father's profession, one being gardener to the Dowager Lady Wynn, at Llangsdwyn, and the other to Sir Matthew Wilson, of Eshon Hall, Gargrave, Yorkshire.

The deceased was for thirty-seven years a

subscriber to the Gardeners' Royal Benevolent Institution, and also collected a substantial amount towards the funds of that admirable institution. He held the certificate of the Royal Horticultural Society for having been

a highly successful florist and fruit-grower in Aberdeenshire and Kincardineshire. Born in 1821, Mr. Sim chose gardening as his profession. Early in his career, he showed a strong inclination for botany, and made an

nection. About forty years ago Mr. Sim removed to Gateside, Strachan, on Deeside, where he commenced on an extensive scale the cultivation of Strawberries. So successful was he in his enterprise that his example was

FIG. 6.—NEW H.P. ROSE "BEX CANT."

Awarded National Rose Society's Gold Medal at the Richmond Show, and exhibited at the Drill Hall, July 2. (See p. 10.)

the first to flower *Rhododendron argenteum* in England; and was well-known and sought after as a judge at many provincial horticultural shows.

JOHN SIM.—The death occurred on Monday evening, the 21th ult., at his residence, West Cults, a suburb of Aberdeen, of Mr. John Sim,

exhaustive study of phanerogamic, and subsequently of cryptogamic botany, more especially of the sphagnum. Some forty years ago he published a complete botanical survey of Scotston Moor (near Aberdeen), and Dr. Alexander Walker, in his *Commonly of Periwinkles*, makes hearty acknowledgment of the valuable work done by Mr. Sim in this con-

nection. About forty years ago Mr. Sim removed to Gateside, Strachan, on Deeside, where he commenced on an extensive scale the cultivation of Strawberries. So successful was he in his enterprise that his example was followed by scores of farmers and crofters in his district, who by these means discounted the severity of bad times, and gave the district its present well-known reputation as a centre of Strawberry culture. Remaining at Gateside for some twenty years, Mr. Sim purchased a small property known as The Temple, near Stomchaven, Kincardineshire, where he con-

timed his business of florist and fruit-grower. In his botanical researches, Mr. Sim came into contact with most of the prominent botanists of the day, by whom he was held in much esteem. His eldest son, Thomas, was educated in Oxford at Chiswick, Kew, and afterwards at Harvard University, United States. He was appointed to the Forestry Department in South Africa, where he was lately joined by his brother James, who is also an enthusiastic botanist. Another son has taken up the seed trade. Mr. Sim, who wrote much on botanical and kindred subjects, was an amiable and attractive man, and his passion for flowers remained with him to the end of his life. His death will be regretted by a large and attached circle of friends.

T. BUTTON.—Thomas Button, thirty years of age, and for some years foreman in the Peach-houses at Mr. James Walker's fruit-growing establishment, Ham Common, near Kingston-on-Thames, met his death on the 25th ult. under unusual and distressing circumstances. Deceased has finished his dinner, then gone out on to the common close by, where some of his assistants were playing cricket. He asked to have a hit, and was bowled to by young Mr. Hearsam, of Kingston, who is a pupil under Mr. Walker. After being served with several balls, one which happened to be a full pitch, struck Button on the side of his head just behind the ear, he having a habit of turning his head from the ball. Deceased fell, and very soon expired. Mr. Hearsam, who entertained for Button the warmest good feeling, was terribly distressed at the unfortunate occurrence. At the inquest held two days later, a verdict of accidental death was recorded. Mr. Walker, in thus so suddenly losing his house-foreman, merits much sympathy, for he has long been very ill. Deceased leaves a widow, but no children.

LAW NOTE.

ORCHID WARRANTY CASE.

Mr. JOHN RUTHERFORD, M.P., brought an action in the King's Bench, on July 3, against L'Horticole Coloniale of Brussels, to recover damages for breach of warranty of an Orchid purchased by him four years ago as *Odontoglossum crispum* var. *Rambouillet*. He gave £80 for it, but when it bloomed two years later, it turned out to be a variety worth less than £5. A verdict was given for the plaintiff for £114 damages and costs.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 2.—The Drill Hall had quite an unusual appearance on Tuesday last on the occasion of the usual fortnightly meeting, for, excepting plants and fruits that were shown for Certificates, the display was purely a Rose show. On previous occasions when the National Rose Society has offered prizes for Roses in connection with the Royal Horticultural Society, there has been such over-crowding in the Drill Hall as was inconvenient to everyone. To prevent a recurrence of such a condition the Council this year resolved that apart from the Roses, no exhibit would be received except if it was shown for Certificate, and therefore there were no groups of plants.

THE ORCHID COMMITTEE recommended a Botanical Certificate and an Award of Merit to plants shown by Sir TREVOR LAWRENCE.

THE FLORAL COMMITTEE recommended a First-class Certificate to the Rev. W. WILKS' strain of Shirley Poppies; and Awards of Merit to a Pink, a Carnation, a Delphinium, a Rose, an *Astilbe*, a *Canna*, and a *Scopolendrium*.

THE FRUIT AND VEGETABLE COMMITTEE recommended an Award of Merit to a new Strawberry.

ROSES.—The competitive classes for Roses were well furnished with exhibits, and generally the quality was high, but it was noticed that some of the blooms had sustained injury by travelling, owing to the petals having been softened by the recent rains. The new Gold Medal H. P. Rose Ben Cant (see fig. 6, p. 13), was better shown by Messrs. B. CANT & SOSS than at Richmond 5 weeks previously.

The Roses staged in vases presented a very much more beautiful effect than those in boxes, and we hope the system will be extended. The only non-competitive group of Roses was one from Messrs. W. PATE & SOSS, Waltham Cross, to which a Gold Medal was awarded.

In the afternoon an interesting lecture was delivered by the Rev. GEO. HENSLOW, detailing the relations between the appearances of plants and the conditions in which they grow, and showing that the same general appearances were presented by widely different plants if grown under the same circumstances.

Floral Committee.

Present: W. Marshall, Esq.; and Messrs. CHAS. T. DUNEY, H. B. MAY, R. BEAN, H. SELF LEONARD, JOHN JENNINGS, J. F. McLEOD, W. HOWE, J. FRASER, C. DIXON, JAS. HUDSON, CHAS. E. PEARSON, H. J. JONES, CHAS. E. SHEA, W. P. THOMPSON, E. H. JENKINS, J. D. PAWLE, ED. MAWLEY, and C. J. SALTER.

MR. JAS. DOUGLAS, Edenside Nursery, Great Bookham, Surrey, exhibited cut flowers of Carnations and Pinks, amongst which we noticed the following:—Old Chelsea, white and purple-coloured Pink; Exile, a lovely rose-coloured Carnation; Pearl, white, very good form; Tabley, very deep crimson; Don Carlos, yellow ground, marked with pink; Cecilia, the large yellow-flowered variety, frequently mentioned in these pages, and some others.

Lilium elegans, variety Lady Polly, shown by Sir TREVOR LAWRENCE, Bart., Enford, Dorking (gr. Mr. BAIN), was rich yellow coloured, with a very few brown spots.

MESSRS. BARR & SOSS, King Street, Covent Garden, London, exhibited several good varieties of Delphinium, also *Coronilla rosea* alba.

MESSRS. KELWAY & SOSS, Langport, Somerset, showed some choice Delphiniums, including one named William Kelway, a double flower of a delicate native colour and a light shade of blue.

Several good varieties of Carnations were shown by Messrs. W. CURTISH & SOSS, one of which obtained an Award of Merit.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. W. NIEL), showed a plant in bloom of *Anaryllis proserpa*, a pale lilac-flowered species (Vot. of Thanks).

Border Carnation Joseph Lawrence, shown by Mr. Sheriff LAWRENCE, M.P., Kenley, Surrey (gr. Mr. J. BANNERMAN), is a good yellow ground variety, with reddish-purple marking in the form of stripes. A group of plants was shown in pots, and they were very well flowered.

MR. H. YOUNG, Pansy Nurseries, Chesnut, exhibited about a dozen pretty varieties of Pink, and several plants in pots. One of the varieties is noticed under Awards of Merit.

MESSRS. W. PATE & SOSS, Waltham Cross Nurseries, Herts, made a display of cut Roses on one of the side tables, and on one side of a central table. There were probably as many as one hundred varieties, and these included a large number of the decorative Tens and H. Tens. Messrs. PATE'S new Tea Rose *Baudica*, a distinct variety, colour pink and white, was represented by a large boxful of blooms; *Tennyson* (H.T.), a large pale bluish variety; *Blushing Bride* (H.T.), *Souvenir de Catherine Guillot*, white *Maman Cochet*, *Exquisite* (H.T.), *Empress Alexandra* of Russia, *Antoine Kivoire* (H.T.), *Callina*, a decorative Tea Rose, of very bright but rich rose colour, William Allan Richardson, *Madame Jules Grolez*, *Chloé P.P.*, bluish, very pretty; Mrs. Ed. Mawley, *Enchantress*, *Clara Waterer* (H.T.), pink and bronze colour; and *Madame Abel Gatenay*, were some of the best Roses in this very large group of cut blooms.

A plant was shown of the new Rose *Soleil d'Or* (see fig. 4), from a cross between *Persian Yellow* and H.P. *Antoine Ducher*. This new Rose, which is very distinct in colour, yellow, with orange shaded centre, was exhibited at the Temple Show, and awarded an Award of Merit. In habit of growth it is rather more rampant than is *Persian Yellow* (Gold Medal).

MESSRS. JAS. VEITCH & SONS, King's Road Nurseries, London, exhibited two dozen bunches of blooms of *Rose Queen Alexandra*, a variety obtained by crossing Turner's *Crimson Rambler* with *Rosa multiflora*

simplex. The inflorescence is much the same in character as those of *Crimson Rambler*, but the blooms are semi-double, some almost single, and rich rose coloured with whitish centre. In growth it is quite a Rambler.

MESSRS. VEITCH also showed a new single tree named *Lily*, from a cross between *R. macrantha* and the variety *Charles Lawson*. The blossoms are quite four inches across, and rich pink colour. Also fine spikes of *Delphinium Monument*, semi-double, good bold spike, and pretty mauve-coloured flowers; and *D. Strada*, semi-double, large, and very rich purple colour. Some inflorescences of *Isatis glauca* were very showy.

Awards.

Canna Miss Kate Gray.—This is a very fine variety of the *Orchid-flowered* section of *Canna*. It grows from 2 to 4 feet high, and has very large showy flowers, with broad petals of much substance, and brilliant scarlet in colour. There are yellow markings on the throat. Shown by Mr. H. J. JONES, Ryeport Nurseries, Hither Green, Lewisham (Award of Merit).

Carnation Maggie Hodgson.—An exceedingly deep crimson-coloured *Carnation* of the *Souvenir de la Malmaison* type, of large size and excellent form. *Calyx* non-splitting. Shown by Messrs. W. CURTISH & SOSS, Highgate Nurseries, London (Award of Merit).

Delphinium Dorothy Daint.—A single-flowered variety, more than 2 inches across, deep purple in colour, with creamy white centre. Shown by Messrs. KELWAY & SOSS, Langport, Somerset (Award of Merit).

Pink Mrs. H. Young.—This is a large Pink of pale rose colour, with deep purple hand around the centre. Shown by Mr. H. YOUNG, Pansy Nursery, Chesnut (Award of Merit).

Poppies, Shirley strain.—The Rev. W. WILKS, M.A., Shirley Vicarage, Croydon, exhibited two lovely bouquets of the beautiful Shirley Poppies; and the strain was awarded a First-class Certificate. The flowers shown were of large size, some pink and some white; all of them equally attractive.

Rose Bellefleur.—A semi-double Rose, 4 inches across, of the colour of *Paul's Carmine Pillar*. From Mr. GEO. PINCKE, Longworth Nurseries, Berks (Award of Merit).

Scopolendrium vulgare sagittato- cristatum.—This is a variety of the common *Scopolendrium*, with two crested lobes at the base of each flower, and another at point. Shown by Mr. C. T. DUNEY, H. Slia Road, Acton (Award of Merit).

Spirea astiboidea var. Silver Sheath.—The correct name of this plant is *Astilbe japonica* var. *Silver Sheath*. It is a first-class variety of the plant known as *Spirea astiboidea*, grows 3 feet high, and has very freely-branched inflorescence, with less dense spikes than the type, and a faint shade of pink. Shown by Mr. H. J. JONES (Award of Merit).

COMPETITIVE ROSES.

GENERAL CLASSES.

The 1st class for twenty-four trusses, distinct, was won by Messrs. B. CANT & SOSS, Colechester, with a collection of the following varieties. *Back row*: *Gustave Pignanneu*, *Caroline Testout*, *Ulrich Brunner*, *Madame de Watteville*, *Maurice Bernardin*, *Catherine Mermel*, *Helen Keller*, *Her Majesty*; *middle row*: *Marchioness of Downshire*, *Alfred Colomb*, *Maman Cochet*, *Ben Cant* (the new purple-crimson H.P.), *The Bride*, *Comtesse de Laire*, *Innocente Pirota*, *Comte de Rambaud*; *front row*: *Marie Verdier*, *White Lady*, A. K. Williams, *Madame Hoste*, *Lady Helen Stewart*, *Ethel Brownlow*, *Horace Vermet*, and *Bridesmaid*. Messrs. D. PAJOR & SON, Myland Nurseries, Colechester, were 2nd, and included very lovely specimens of *Maman Cochet*, and *Gustave Pignanneu*. There were two additional exhibits.

Eighteen Single Trusses, distinct.—MR. CHAS. TURNER, Royal Nurseries, Slough, won the 1st prize in this class from two other exhibitors, showing a collection of bright blooms of moderate size. The prettiest were *Maman Cochet*, Mrs. J. Grant, *Caroline Testout*, *Gustave Pignanneu*, *Marchal Niel*, *Prince Arthur*, *Ulster*, one of Messrs. DICKSON'S new Roses; and *Bessie Brown*, 2nd, Mr. GEO. PINCKE, Longworth, Berks, whose collection contrasted with that which obtained the 1st prize, owing to the number of H.P.'s in Mr. Turner's stand and of H.T.'s in that from Mr. Prince.

AMATEURS.

Eighteen distinct trusses.—The largest class open only to Amateurs, was won by O. G. ORRIS, Esq., West Beighold, Colechester, with the following varieties. *Back row*: *Maman Cochet*, very fine; *Bessie Brown*, a lovely blossom; *Francis Michelon*, *Her Majesty*, *Ulrich Brunner*, and Mrs. E. Mawley. *2nd row*: *Mar-*

chioness of Londonderry, Mrs. Jno. Laing, Mrs. R. G. S. Crawford, Marquise Litta, White Maman Cochet, and Madame de Watteville. *Front row*: Killarney, a new pink-flowering H.T.; Innocente Pirola, Cleopatra, The Bride, Souvenir de S. A. Prince, and Catherine Mermet. The Rev. J. H. PEMBERTON was 2nd, and there were two unsuccessful exhibitors.

Twelve single trusses.—There were seven exhibits of collections of twelve single trusses, and the 1st prize was won by J. HALSTEAD, Esq., Oak Lodge, Keigate. His selection was Caroline Testout, Etienne Levet, Marie Finger, Comte Raimband, A. K. Williams, the lovely lemon-coloured K. A. Victoria, Chas. Lefebvre,

to a collection of blooms of Marchioness of Londonderry, shown in very fine condition by J. BATEMAN, Esq., Rosevale, Archway Road, London, N. The Rev. F. PAGE ROBERTS, Halstead Rectory, Sevenoaks, won 2nd prize with his blooms of Mrs. K. G. Sharman Crawford. The varieties Caroline Testout and Mrs. Jno. Laing were also shown in this class.

TEAS AND NOISSETTES.
OPEN CLASSES.

The 1st prize for eighteen trusses, distinct, was won by Mr. GEO. PRINCE, Maman Cochet again showed up to much advantage, as did the good and useful variety Catherine Mermet. White Maman Cochet, Fridesmaid,

Catherine Mermet, &c. The Rev. F. R. BURNSIDE, Great Stanbridge Rectory, Rochford, Essex, was 2nd, and there were two other collections.

A class for six single trusses, not fewer than four varieties, was won by Miss BEATRICE H. LANGTON, Raynoid, Hendon, N.W., and she showed fine and very pretty specimens of Maman Cochet, White Maman Cochet, Madame Cusin, Comtesse de Nadailac, Sylph, and Fridesmaid. Of seven other exhibitors, the successful one for 2nd place was G. A. HARMON, Esq., Cambrian House, Burgess Hill.

New trusses of one variety.—The variety Maman Cochet was awarded 1st prize in this class, from Mr. O. G. OFFEN; and Innocente Pirola, from G. H. BAXTER, Esq., was placed 2nd.

Six Trusses of One Variety.—Maman Cochet was again awarded premier honours, from E. M. BETHUNE, Esq.; and Muriel Graham, a pretty tinted Rose, from the Rev. F. R. BURNSIDE, was 2nd.

GARDEN ROSES.

There were two excellent displays made in the class for thirty-six distinct varieties, not fewer than three trusses of each. The 1st prize was won by Messrs. PAUL & SONS, Old Nurseries, Ches-hunt. Particularly noticeable were Pink Roamer (Wichuriana), Leuchtstern, Killarney, Marquise de Salisbury, Lady Battersea, Ma Capucine, Crested Moss, William Allan Richardson, Paul's Caroline Pillar, and Rosa Mundi. The bunches were large, and most effectively put up, but too crowded. Messrs. FRANK CANN & Co., Braiswick Nursery, Colchester, were 2nd. Very striking in the stand were the bunches of R. unguiculata, a large single blush Rose, and R. Tumalona.

ROSES IN VASES.

There were four classes for Rose blooms in vases shown with long stems, and they had a very pretty effect. The 1st prize for nine distinct varieties, seven trusses of each, was won by Mr. GEO. PRINCE, and the collection was not to include any variety the National Rose Society regard as belonging to the garden section. Those shown were Kaiserin A. Victoria, Marquise Litta, Souvenir de S. A. Prince, Mrs. W. J. Grant, Fridesmaid, Fisher Holmes, Bessie Brown, Innocente Pirola and Madame Cusin, the flowers were beautifully arranged and set off by a backing of black velvet. 2nd, Messrs. B. CANN & SONS, whose group or tinted much deep colour, there being the varieties Duke of Wellington, General Jacquemont, Fisher Holmes, A. K. Williams, &c. Two other competitors were unsuccessful.

Six distinct varieties in bouquets.—This class was won by the Rev. J. H. PEMBERTON, who had a very pretty exhibit.

Teas and Noisettes.—An open class for six distinct varieties, seven trusses of each garden Rose exhibited, was won by Mr. GEO. PRINCE, his varieties being Maman Cochet, white Maman Cochet, Muriel Graham, Comtesse de Nadailac, Catherine Mermet, and Innocente Pirola, 2nd, Messrs. B. CANN & SONS.

Mr. O. G. OFFEN won a similar class open only to amateurs. His flowers looked very pretty in tall glass vases. The varieties were Souvenir de S. A. Prince, White Maman Cochet, Innocente Pirola, Anna Olivier, Madame Hoste, and Madame Cusin.

The Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), E. Ashworth, F. A. Reider, H. T. Pitt, J. Douglas, W. A. Binney, T. W. Bond, J. W. Potter, H. J. Chapman, H. A. Tracey, W. H. Young, J. G. Fowler, H. Ballantine, H. M. Pollett, and W. H. White.

Sir TREVOR LAWRENCE, Bart., Burford, sent several interesting things, one of which, Schomburgkia Thomsoniana, secured an Award of Merit. Schomburgkia Thomsoniana first made its appearance in a fine specimen exhibited by W. J. Thomson, Esq., Glyllbank, St. Helens, at the show held at Liverpool under the auspices of the Royal Horticultural Society in 1886; and it was the most interesting plant exhibited. The late Prof. Reichenbach described it in the *Gardener's Chronicle*, July 9, 1887. At that time no information was forthcoming as to its native habitat, but since then it has been stated that it grows on the Great Cayman, and possibly in some of the other West Indian Islands. The plant has, however, continued to be very rare, and its re-appearance at the Royal Horticultural Society records it as the most botanically interesting plant exhibited for the second time. The plant has hard, hollow stems, as in S. tuberosa, although both the plant and the inflorescence are smaller than in

FIG. 7.—ROSE "SUSANNE-MARIE ROBOCANACHI" (H.P.); BRIGHT ROSE COLOUR. (SEE P. 10.)

Clio, Souvenir de President Carnot, Alfred Colomb, La France, and Marchioness of Londonderry. The 2nd prize was won by F. WELLSLEY, Esq., Westfield, Woking (gr. Mr. J. Gilbert).

The smaller class for six blooms, distinct, was won by Mr. G. H. BAXTER, Hutton Park, Brentwood (gr. Mr. H. Holloway).

Nine single trusses of any variety of H.P., H.T., or H.B.—The 1st prize was won by five blooms of Her Majesty, shown by Mrs. HAYWOOD, Woodhatch Lodge, Keigate (gr. Mr. C. J. Salter); and the Rev. J. H. PEMBERTON, with the variety A. K. Williams, obtained 2nd prize.

Six trusses of any H.P., H.T., or H.B. Rose.—There was as many as thirteen exhibits in this class, and rather close competition. The 1st prize was awarded

Mrs. E. Mawley, and Madame Hoste were others in this collection that deserve mention. 2nd, Messrs. B. CANN & SONS, whose best blooms were Maman Cochet, Fridesmaid, and a very attractive blossom of Innocente Pirola.

AMATEURS.

O. G. OFFEN, Esq., won the class for eighteen trusses, not fewer than twelve varieties. There were beautiful blooms of Maman Cochet and white Maman Cochet, Madame Cusin, Comtesse de Nadailac, Marchal Niel, and Bride-maid.

Twelve single trusses in not fewer than nine vases. E. M. BETHUNE, Esq., Denne Park, Husham, Sussex, won 1st prize in this class, and showed a very large bloom of Mrs. Ed. Mawley, Maman Cochet, very pretty, also Messrs. W. Paul's Medea, a lemon-coloured Tea;

that species. The sepals and petals are pale yellow, with a tinge of purple on the reverse side. Lip whitish at the base and side lobes, the front lobe being of a bright purple colour. Sir TAYLOR LAWRENCE also showed *Rennettiana Buscoidesiana superba*, with the large lateral sepals of a rich rufous crimson, setting lighter towards the edges. *Cypripedium* *s.* *Wuertziannum* 'Barford variety,' *Solandra incarnatha superba*, a very fine and richly coloured form; and the very singular *Epipactis dentifera*, with a curiously formed greenish flower, borne on a long slender stem (Botanical Certificate).

Sir FREDERICK WEAN, Bart., Clare Lawn, East Sheen cr., Mr. W. H. Young, showed *Galettia Mendelii* abstersis, for which an Award of Merit had formerly been given. The plant here a three-flowered inflorescence, the blooms being clear white, with a scarcely perceptible bluish tint on the sepals and lip; also a splendidly open *Galettia Gaskelliana* alba, with nine flowers, for which a Cultural Commendation was given.

Mr. ED. KIRBY, Roxania Nursery, Bandon Hill, Croydon, showed a good example of the dwarf *Zoepelephium Scantlingii* (Promeris extrima), with eleven bright yellow flowers.

J. A. TOMBS, Esq., Stone Hall, Oxford, showed *Galettia Mossiae* and *C. lobata* Warner.

Fruit and Vegetable Committee.

President—Geo. Bunyard, Esq., Chairman, and Messrs. H. Esling, Jos. Child, W. Fair, S. Mortimer, A. Deau, W. Eyre, Geo. Kell, E. Beckell, A. Ward, Jas. Smith, Edgar S. Baker, H. Balderson, and Rev. W. Wilks.

MESSrs. LAMDIS BROS., Bedford, showed a large quantity of their new late fruiting strawberry, 'Climax,' a wedge-shaped fruit of large size and of a shining crimson hue, having the seeds embedded in the flesh. It was obtained by crossing Latest-of-All with Waterloo. An equal quantity of the new late variety 'Redgair,' the fruit of which is cockscomb-shaped, obtained from Latest-of-All crossed with Frogmore Late Pine was shown. It has a flavour reminiscent of British Queen, due to the influence of Frogmore Late Pine. In shape it is generally more wedge-shaped than central, and the colour is scarlet, the tip being of a light tint. Plants of both varieties were shown, which indicated great fruitfulness. A plant was likewise shown of the variety 'Fillsack,' a late fruiting variety, with conically shaped fruit, produced in great profusion. It has for its parent Royal Sovereign and Latest-of-All.

Mrs. ANTONIA, South Villa, Regent's Park cr., Mr. G. Kell, showed strawberry Waterloo of large size and perfect in every point (Cultural Commendation).

Mr. PETERS, gr. by R. P. SURGERS, Givons Grove, Leatherhead, showed a Strawberry = Waterloo crossed with Latest-of-All as plants lifted from the open ground. The first named was the seed parent.

MESSrs. BUNYARD & Co., Hursley, near Maidenhead, showed a dish of strawberry Latest-of-All, which consisted of extra large fruits.

Mr. G. WYLLIES, gr. to His Grace the Duke of Northumberland, Syon House, Brentford, showed Melon Victoria, *Sylbes* = Sutton's Epimée, *Sylbes* Melon, a nice-looking, netted green flesh variety, of the middle size.

Mr. Jas. Verrill, gr. to Lord BRYANBORO, Audley End, Suffolk, likewise showed a green fleshed variety of Melon. No award to Melons was made by the Committee.

Mr. R. SEWARD, gr. Buresfield, Walton on Thames, showed Pea obtained by crossing Perfection with William I. The pods were large and well filled, and of a dark green colour, as was likewise the seed.

Mr. E. Beckell, gr. to Lord ALDENHAM, Altham Hall, Elyshire, showed a new Pea Edwin Beckett, a very large podded variety, possessing nine and ten seeds in a pod (Cultural Commendation).

Awards of Merit.

R. P. SURGERS, Esq., Givons Grove Gardens, Leatherhead cr., Mr. PETERS, showed Strawberry Givons Late Prohibe, a fine large cockscomb-shaped fruit, of a rich crimson colour, but as regards the flavour we are unable to speak.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 29.—This was not a large meeting on this date, the months of June, July, and August being slack months so far as orchids go.

S. GRADLEY, Esq., Wadley Rectory cr., Mr. G. CYPHER, exhibited half a dozen good things. *Galettia Gaskelliana* var. *humboldtii* from this collection, was very fine, and received a First class Certificate. *Galettia*

Mendelii 'West Point var.' received an Award of Merit. It is a fine large flower, with pale native sepals and petals, the lip being similarly coloured with a few dark lines running through it, throat of lip very dark. *Galettia Mendelii* 'West Point var.' received an Award of Merit; it is a finely shaped flower with a richly coloured labellum. *Galettia Mossiae* var. *Arnoldiana* also received an Award of Merit; the same award going to *Odontoglossum crispum* West Point var., a flower of good shape and substance.

A. WARDEN, Esq., Haslingden cr., Mr. T. LOUTHOUSE, received a First class Certificate for *Cypripedium* *s.* *Currieri* x *Moraniana*, a good hybrid between the two above-mentioned parents.

Mr. A. J. KEENE, exhibited a good group of plants, comprising *Catleyas*, *Labias*, *Cypripediums*, &c. Bronze Medal, P. II.

GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL.

JUNE 26.—The annual show of the county of this Society was held at the Montpellier Gardens under diminished patronage. The groups of flowering and foliage plants, arranged for effect on a space of 200 square feet, were worthy of a close study, both for arrangement and the variety and excellence of the products. In the class open to all England, Mr. J. CYPHER, of Cheltenham, holds the crown; Mr. VAUSE, of Lennington, taking 2nd place; and Messrs. PALMS & SHARPE taking 3rd. The prize for the amateur group was awarded to Mr. J. HORRIK, of Cowley Manor, Gloucestershire. Mr. CYPHER was also the leading exhibitor for stove or greenhouse plants (open, zonal *Pelargoniums*, group of magnificent *Orchids*, and a collection of herbaceous perennial cut flowers).

Mr. H. O. LOUIS, secured the amateur prize for stove or greenhouse plants, beating his neighbour of Cowley Manor, Colonel ROGERS, ex Mayor of Cheltenham, took several prizes, notably with a group of *Pelargoniums*, zonal *Pelargoniums*, and herbaceous perennial plants.

MESSrs. TOWNSEND & SONS, Worcester, took 1st in three classes for cut Roses; and Mr. COSMA JONES, of Gloucester, a well-known judge and ex' judge, a 2nd. The tasteful table decorations and bowls were a feature of the show.

Fruit made a tempting display, and Colonel ROGERS was successful with Grapes, Peaches, and Newberries; while Messrs. HALL & SON, placed on the tables some monster Strawberries, and secured a justly deserved 1st prize.

Vegetables.—In this section the Rev. G. COVELL nearly swept the board.

Miscellaneous.—Messrs. HALL & SON made a fine display of flowers, not for competition; and Mr. J. JACKSON showed a capital collection of fruit. Messrs. FEELER & MAYNARD also figure prominently among the prize winners. The show was regarded by competent judges as the best the Society has held for many years.

BRISTOL & DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

JUNE 27.—The monthly meeting of this Society was held at St. John's Parish Rooms on the above date; Mr. E. BRETHERTON occupied the chair. The paper for the evening was on the "Culture of Orchids," being the essay that obtained the prize kindly given by Mr. GREEN, Redland, and won by Mr. F. LEE, of Redland.

Mr. Lee mentioned the rapid strides which Orchid culture has made during the past few years, the large importations into this country, as well as the reasonable prices for which they can now be bought, causing many horticulturists to make them their special hobby. The lecturer gave a selection of the best varieties of *Cypripedium*, *Pendrobrum*, *Galettia*, *Odontoglossum*, and others to be grown, together with all cultural directions.

HANLEY HORTICULTURAL.

JULY 3, 4.—The exhibition in Hanley Park on the above dates was a magnificent one in all respects. Every section of the show was admirably filled, and in many classes the competition was very keen. Groups were superb both in the competitive and non-competitive sections; while fruit, with the exception of the white Grapes, was splendidly staged. Vegetables, too, considering the weather and the early date, were very nice. Pressure upon our space prevents our giving notes of any, except the most important classes in the open section. Needless to say, the growers of Stafford, Chester, Derby, and Salop, showed some splendid produce in all departments.

OPEN TO ALL GARDENS AND PLANTS.

The promoters of the Hanley Fete make a great feature of their groups, for which they offer handsome prizes. The principal class is for a group of plants,

in or out of bloom, arranged for effect on a space not exceeding 200 square feet. There were four competitors, of whom Mr. J. CYPHER, Cheltenham, was an easy 1st standard. The arrangement took the form of a central sides rose with a noble knot on the summit. From the knots, *Caladiums*, *Lilium Harrisii*, *Isotria*, *Crotons*, *Caladiums*, and Ferns. There were four corner motifs, each surmounted by a graceful Bamboo, and having *Caladiums*, *Odontoglossums*, *Aralias*, with Ferns and *Asparagus deltoicus*. Tall specimen *Crotons* and *Alumina elegans* were judiciously employed. Into the groups *Mosses* were judiciously placed. *Seriera depressa*. Mr. W. VAUSE, Lennington, was 2nd with his charming arrangement of the customary foliage plants, with *Anthuriums*, *Hydrangeas*, *Catleyas*, *Odontoglossums*, and other flowers. Mr. J. Read, gr. to the Earl of CAIRNARON, Reddy Park, was 3rd. This group lacked brilliancy.

In the class for a group of *Orchids*, arranged in a space of 100 square feet, Mr. J. CYPHER was placed 1st, with a splendid collection which included *Catleyas*, *Lelia tenebrosa*, *Sophronitis grandiflora*, *Miltonias*, *Oncidiums*, *Epipedium tricolor*, *Miltonia majas*, and others. Mr. W. STEVENS, gr. to W. THOMPSON, Esq., Walton Grange, Stone, Staffs, was 2nd, the group comprising splendidly grown *Odontoglossums*.

In the class for twelve plants, six to be in flower, Mr. J. CYPHER was easily 1st, with *Phaenocoma proliera* Barnesii, *Kentia*, *Leucocoma*, *C. Forsteriana*, *Stachis profusa*, *Cotton queen*, *Veronica*, *C. Martiana*, *Oenothera*, *Isora salicifolia*, *Bougainvillea glabra*, *Erica verticillata*, *Bothwelliana*, and *E. Cavendishiana*. Mr. W. VAUSE was 2nd.

The *Orchids* in the class for eight distinct were splendid. The premier prize went to Mr. J. CYPHER, who staged *Catleya rigas*, *C. Mossiae*, *Brasavola* *pubescens*, *Cypripedium Lawrenceanum*, *C. superbum*, *Odontoglossum crispum*, *O. Cordatum*, and *Epipedium pistillatorum*. Messrs. DESKINSON & SONS, Newcastle, Staffs, were 2nd.

Mr. J. CYPHER was 1st for six *Palms* distinct, with grand examples of *Kentia Behmoraiana*, *Lantania borbonica*, and *Thrinax elegans*, as his best. Mr. W. VAUSE was 2nd.

ROSES.

Seven classes were scheduled in this section, and considering that the opening day immediately preceded the Temple Show of the National Rose Society, the display was excellent. The principal class was for seventy-two distinct single bushes, and the premier place was taken by Messrs. ALEX. DICKSON & SONS, Newboulds, whose best blooms were Mrs. W. J. GARD, Comtesse de Salabille, Ernest Metz, Muriel Graham, Mildred Grant, Bessie Brown, *Archives*, *Souvenir d'Elisabeth*, *Archives*, *Archives*, and *The Bride*. Messrs. J. TOWNSEND & SONS, Worcester, were 2nd; and Messrs. HARKNESS & SONS, Redale, followed very closely.

In the class for forty-eight distinct, the KING'S ACBE NURSERY Co., LTD., Hereford, was placed 1st, and a moderately good stand, in which were very fine *Mardi-grasse* of *Indorum*, *Nyxites*, Mrs. W. J. GARD, Mildred NIEL, Duke of Teck, and *Souvenir d'Elisabeth*, *Vardon*; Mr. FRIEFTINGHAM, Boston, Notts, was 2nd; and Messrs. HARKNESS & SONS, 3rd.

The class for thirty-six bushes resulted in a win for Messrs. A. DICKSON & SONS, who were 1st with flowers that showed signs of the weather. Messrs. HARKNESS & SONS were a good 2nd, and the KING'S ACBE NURSERY Co., LTD., 3rd.

Messrs. A. DICKSON & SONS were 1st for twelve new Roses, distinct, introduced since 1891, or seedlings, with several unnamed light coloured varieties. Mr. FRIEFTINGHAM was 2nd.

For twelve distinct varieties Messrs. A. DICKSON & SONS were easily 1st, with *Gustave Pigmanent*, *A. Lind* cell, *Fister*, *Bessie Brown*, *Florence Pemberton*, *Tom Wood*, *Mildred Grant*, *Nyxites*, Mrs. W. J. GARD, and *Glas Letehyre*. Mr. FRIEFTINGHAM was 2nd.

There was only one class for Teas, this being for twelve distinct, three blooms of each. Messrs. J. TOWNSEND & SONS were the only exhibitors, and showed Ernest Metz, *The Bride*, *Francesca Kruger*, *Marie Van Houfte*, *Marian Cochet*, and *Innocente Paula*.

For twelve blooms of any one variety Messrs. J. TOWNSEND & SONS were 1st with *Bessie Brown*; and Messrs. A. DICKSON & SONS 2nd, with *Mildred Grant*.

NEW CENTURY CLASS—BRITISH GARDEN PRODUCE.

This general class called for nine dishes of fruit, not fewer than six kinds; nine dishes of vegetables, not less than six kinds; nine plants in pots not exceeding 6 inches in diameter, with cut flowers to the taste of the exhibitor. The three points were quality, harmonious blending of colour, and general effect. A table space 15 feet by 1 feet was allowed. There were three competitors, but Mr. J. McINROE, through inadvertently including one dish of fruit over the requisite number was disqualified. He had a splendid exhibit, and a special prize equal in value to the 1st will be awarded. The premier award went to the Earl of HARKINGTON, Ely, Cambs. The 2nd, Mr. J. H. Dymond, who scored 62 points out of a possible 121. He showed Grapes Foster's Seedling, and Black Haulburg, Peaches Prince of Wales and Dymond, Apple Lady

GARDEN OR DECORATIVE ROSES.

The exhibits of this type of Rose, which includes more variation than any of the types, become more attractive each year. So much attention has been given to the raising of brilliant Rambler, Pillar Roses, single flowered, and Polyantha Roses, that freedom to flower and brilliance of colour characterise almost all of them, and they offer greater variety of colour also. The best exhibit of—

Thirty-six distinct varieties on Thursday were shown by Messrs. PAUL & SONS, The Old Nurseries, Chesham, and they staged a magnificent display, in which the following varieties were conspicuously effective. Madame Pernet Ducher, Dawn (a lovely H. T. rose, pink in colour), R. macrantha, Grass, an Tepitz, Camoens, R. Inida plena, Lady Battersea (richly coloured H. T. Rose), Madame A. Clotuyan, Old Red Danusk, Madame P. Cochet, Reine Olga de Wurtemberg, R. rugosa atropurpurea, Wallflower, Jules de Mersant (Moss), &c. Messrs. COCHRAN & SONS were 2nd, and had a very slow display, inclusive of a considerable variety of types. There were three exhibitors in the class, and the remaining one, which was disqualified, owing to an exhibition Tea Rose having been inadvertently included, would possibly have been 1st, but for the mistake.

Eighteen distinct varieties—There were three exhibitors in this class, and the 1st prize was won by Mr. GEO. PRINCE, who had grand bouquets of the following showy varieties: W. A. Richardson, Gustave Regis, Killarney, Allister Stella Gray, R. Moschata alba, Turner's Crimson Rambler, Papillon, Claire Jacquinet, White Provence, Souvenir de Catherine Guillot, Rambour, Climbing White Pol, &c. 2nd, Messrs. FRANK CANT & Co., and 3rd, Mr. CHARLES TURNER.

PREMIER BLOOMS.

The Silver Medals for the three premier blooms in the Nurserymen's Classes were awarded as follows:—For the best H. P., a very fine bloom of Mrs. Jno. Laing, shown by Messrs. D. & W. CROFT, Dundee. For the best H. T., Mildred Grant, shown by Messrs. A. DICKSON & SONS; and the best T. or N. Souvenir d'Elise Vardon, shown by Mr. MATTHEW.

OPEN CLASSES.

OPEN TO ALL NURSERYMEN AND AMATEURS.

Class 22—Twelve blooms of Hybrid Teas, distinct varieties. Six competitors staged in this class, Messrs. ALEX. DICKSON & SONS, Newtownards, Co. Down, winning with a good stand; Caroline Testout, Comte de Cadolun, Mildred Grant, Mrs. W. J. Grant, Marquise Litta, and Lady Mary Fitzwilliam, were the best flowers. 2nd, Mr. H. P. DICKSON, Royal Nurseries, Belfast; 3rd, Messrs. D. PRIOR & SON, Colchester.

Twelve blooms of any White or Yellow Rose.—The best in this class proved to be the variety Bessie Brown, which has been shown well this season. These blooms were from Messrs. D. PRIOR & SONS; 2nd, Comtesse de Nardaille, from Messrs. B. R. CANT & SONS, and 3rd, Marie Van Houfte, from Mr. JOHN MATTHEW. There were fifteen entries in this class, but only ten exhibited.

Twelve blooms of any light or dark crimson Rose.—In this class the 1st prize was won by the variety A. K. Williams, shown by Messrs. B. R. CANT & SONS; 2nd, Captain Hayward, from Messrs. J. TOWNSEND & SONS; 3rd, Duke of Edinburgh, from Messrs. D. & W. CROFT.

Twelve Blooms of any light-pink or rose-coloured Rose.—The 1st prize in this class was awarded to excellent blooms of Her Majesty shown by Messrs. G. and W. H. Burch, Peterborough; 2nd, Her Majesty from Messrs. PERKINS & SONS, Coventry; and 3rd, Caroline Testout from Mr. HUGH GIBSON, Royal Nurseries, Belfast.

Twelve blooms of any Tea or Noisette.—There were as many as seventeen exhibitors who entered in this class, but not all of these put in an appearance. Excellent blooms of the variety Mrs. Edward Mawley gained 1st prize, the dozen blooms being shown by Messrs. ALEX. DICKSON & SONS; 2nd, the beautiful variety Maman Cochet, from Messrs. HALEKNESS & SONS; and 3rd, the same, from Mr. GEO. PRINCE.

Class 23—Nine blooms of any new Rose. A beautiful stand of the variety Mildred Grant won for Messrs. ALEX. DICKSON & SONS, Newtownards, Ireland, the 1st prize, and the National Rose Society's Silver Medal for the best Hybrid Tea exhibited by a nurseryman, a beautifully-formed, bluish-tinted Rose; 2nd, F. CANT & Co., Colchester, with Bessie Brown; 3rd, Messrs. B. CANT & SONS, with Papa Lambert.

The next class for twelve blooms, distinct varieties of Roses, offered for the first time in English nurserymen's lists in the spring of 1898, and subsequently found Messrs. A. DICKSON & SONS again to the front, with the following: Mamie, Lady Myra Beanchere, Robt. Scott, Mildred Grant, Bessie Brown, and Ulster,

among the best; 2nd, Messrs. PERKINS & SONS, Park Nurseries, Coventry, Mrs. E. Mawley, Exquisite, Ulster, Mrs. E. Garrett, and Bessie Brown, being the best in their stand; 3rd, F. CANT & Co., Colchester, a bloom of Killarney in this stand being very good.

GOLD MEDAL ROSES.

In class 20, for new seedling Roses, or distinct sports, there were two Gold Medals awarded. One of these was to the fine pink-flowered Rambler Rose, from Messrs. JAS. VEITCH & SONS, described in our report of the Royal Horticultural Society at the Drill Hall, on Tuesday last (see p. 10). It is from a cross between Turner's Crimson Rambler and R. multiflora simplex. The other variety awarded a Gold Medal was the new Tea Rose, Mrs. B. R. CANT, shown last year, and again this, by Messrs. B. R. CANT & SONS. It is a fine Teascented variety of rich rose colour, and possessing broad, good petals.

AMATEURS.
MIXED ROSES.

Speaking generally, it can be said of the amateur's Roses they were in not a few instances deficient both in size and colour. Those who grow on light lands affected by the drought were the greatest sufferers in this respect; some residing in parts of the country where there had been a greater rainfall were able to show fresher and brighter blooms, though large size appeared to be the exception rather than the rule.

The class for 25 Blooms, distinct varieties, was entitled the Amateur's Champion class—There were four entries. Mr. E. B. LINDSELL, Bearton, Herts, was placed 1st. His blooms were clean and bright, but certainly below size. Chief among them were Her Majesty, Maman Cochet, Earl Duferin, Marie Baumann, Prince Arthur, Innocente Pirola (T.), A. K. Williams, Comtesse de Nardaille, Madame de Watterville, Madame Cusin (T.), Merveille de Lyon, Dupuy Jamin, Bessie Brown (H. T.), Mrs. Mawley (T.), S. de Elise Vardon (T.), Marné Gradane, Mrs. J. Laing, The Bride, and Helen Keller. 2nd, Rev. J. H. PEMBERTON, Havering-atte-Bower, whose blooms were somewhat uneven in size. Chief among them were Ulrich Brunner, Caroline Testout (H. T.), Marchioness of Londonderry, Francois Michelon, Kaiserin Augusta Victoria (T.), Auguste Rigodard, Helen Keller, Xavia Orbea, Her Majesty, A. K. Williams, Comte Rainband, Mrs. W. J. Grant, Bessie Brown, Gen. Jacqueminot, Laurence Allan, Souvenir d'Elise, Mrs. Sharran Crawford, &c. 3rd, Mrs. A. SLAUGHTER, Jarvis Villa, Steyning.

The class for 10 Blooms, distinct varieties—There were six entries, and the competition was somewhat close, and pointing had to be resorted to, and considerable time was expended in doing so. Eventually Mr. W. BOWYER, Duffield Road, Derby, was placed 1st with small but bright blooms of Comtesse de Nardaille (T.), Madame Eugene Verdier, Gustave Piganeau, A. K. Williams, White Maman Cochet (T.), Auguste Rigodard, Medea (T.), Caroline Testout, Kaiserin A. Victoria (T.), Niphotos (T.), Horace Vermet, Madame C. Ramey (T.), Mrs. W. J. Grant, Madame G. Luizet, Innocente Pirola (T.), &c.; 2nd, Mr. GOSWAY JONES, Hunclecliffe, Gloucester, whose leading blooms were A. K. Williams, Maman Cochet, Mrs. W. J. Grant, Marchioness of Londonderry, Innocente Pirola (T.), Niphotos (T.), Bessie Brown, Caroline Kuster, Medea, Horace Vermet, S. de President Carnot (T.), and Souvenir de S. A. Prince; 3rd, A. TATE, Esq., Barnside, Leatherhead.

The next class was also for twenty-four Blooms, in which the Rev. J. H. PEMBERTON Prize was offered, and was open to all Landowners.—In this were four entries, and here, as in the previous class, the competition was very close, and again pointing was called into requisition; with the result that the 1st prize was awarded to the Rev. J. H. PEMBERTON, who had bright, though generally small flowers of Her Majesty, Comte Rainband, Mrs. J. Laing, Francois Michelon, Ulrich Brunner, Bessie Brown, A. K. Williams, Comtesse de Nardaille, Helen Keller, White Maman Cochet, Mrs. Sharran Crawford, Mrs. W. J. Grant, K. A. Victoria, Madame Hoste, Susanna M. Rodocanachi, &c. 2nd, Mr. E. B. LINDSELL; 3rd, Mr. O. G. OXFORD.

Twelve distinct varieties, three blooms of each.—Here there were five entries. Mr. E. B. LINDSELL was awarded the 1st prize, with good blooms of La France, Bessie Brown, Mrs. J. Laing, Maman Cochet (T.), Her Majesty, Madame Cusin (T.), K. A. Victoria (T.), Madame G. Luizet, A. K. Williams, Innocente Pirola (T.), Madame de Watterville (T.), and Ulrich Brunner; the Rev. J. H. PEMBERTON was placed 2nd, his leading blooms being Mrs. W. J. Grant, Marchioness of Londonderry, Her Majesty, Madame Hoste, Caroline Testout, Mrs. J. Laing, A. K. Williams, and K. A. Victoria; 3rd, Mrs. HAYWOOD, Woodhatch, Reigate.

Twelve blooms of any Rose, except Tea or Noisette, and there were five competitors. The Rev. J. H. PEMBERTON was placed 1st, with fairly good blooms of Her Majesty.

RESTRICTED CLASSES.

The following classes were only open to amateur growers of fewer than 2,000 plants. The principal class, 31, was for twenty-four blooms distinct, and there were three entries. Mr. E. BETHUNE, Denne Park, Horsham, was placed 1st, with somewhat uneven blooms, chief among them Mrs. J. Laing, Alfred Colomb, Madame G. Luizet, Maman Cochet, Bessie Brown, Ulrich Brunner, Bridesmaid, Madame Cusin, Catherine Mermet, Fisher Hollandes, Margaret Dickson, La France, Comtesse de Nardaille, Caroline Testout, The Bride, &c.; 2nd, Mr. A. SLAUGHTER, Steyning, whose best flowers were Mrs. J. Laing, Maman Cochet, K. A. Victoria, Margaret Dickson, Thos. Mills, Marie Verber, Killarney, Marie Kady, Medea, Ethel Brownlow, &c.; 3rd, Mr. W. C. ROMANIE, Old Windsor.

Class 31 was for sixteen blooms distinct, and I there were three entries. Mr. R. FOLEY HOBBS, Thorncroft, Worcester, was 1st with Her Majesty, K. A. Victoria, A. K. Williams, Marchal Niel, La France, Bessie Brown, Caroline Testout, Souvenir de S. A. Prince, white Maman Cochet, Killarney, Horace Vermet, Innocente Pirola, White Lady, Souvenir d'un Ami, Medea, &c.; 2nd, Mr. E. MAWLEY, Rosebank, Berkhamstead, who had a fine bloom of Marchal Niel, Mrs. John Laing, Ulrich Brunner, Marquise Litta, Marchioness of Downshire, E. Lovet, Madame Jules Finger, &c.; 3rd, Mr. R. E. WEST, Wray Park, Reigate. The blooms in the 2nd and 3rd stands were decidedly uneven.

In the class for eight distinct varieties, three blooms of each, there were six competitors. Mr. E. M. BETHUNE was 1st with medium-sized blooms of Maman Cochet, Madame Cusin, The Bride, Ulrich Brunner, K. A. Victoria, Catherine Mermet, Camille Bernardin, and Madame G. Luizet; 2nd, Mr. R. F. HOBBS.

Class 33 was for nine blooms of any Rose, except Tea or Noisettes, and there were five competitors; the 1st prize falling to Mr. R. F. HOBBS with Her Majesty, in very good character, Mr. F. W. TATE, HALL, Crookleigh, Morecombe, with Bessie Brown.

The two classes which follow were open only to growers of not fewer than 100 plants, and the leading class was for twelve blooms, distinct, the 1st prize falling to Miss BEATRICE H. LANGTON, Raynham, Headon, who had a very good dozen in Gustave Piganeau, Caroline Testout, Captain Hayward, La France, Mrs. J. Laing, K. A. Victoria, Mrs. W. J. Grant, Maman Cochet, Bridesmaid, Gen. Jacqueminot, Mrs. S. Crawford, and Horace Vermet; 2nd, Mr. W. J. PRINCE, Beeston, Notts; his best blooms were Horace Vermet, Bessie Brown, Mrs. W. J. Grant, Margaret Dickson, Marquise Litta, K. Ang Victoria, &c.; 3rd, Mr. JOHN BATEMAN, Archway Road. There were nineteen competitors.

In a class for six blooms of any one variety, not T. or N., there were nine competitors. Mr. M. WHITTLE, Belgrave, Leicester, was placed 1st, with capital blooms of Her Majesty; Mr. S. MOULTON, Bank Street, Leicester, was 2nd, with the same.

The three classes following were open only to growers of fewer than 500 plants. The leading Class 36, was for nine blooms, and there were sixteen entries. The 1st prize was awarded to Mrs. E. A. MOUTZEN, who had bright, clean, even blooms of Comte de Rainband, white Maman Cochet, Mrs. J. Laing, Innocente Pirola, Dupuy Jamin, and the Hon. E. Gifford. Mr. R. W. BOWYER, Hertford Heath, was 2nd; he had smaller, but charming blooms of Bessie Brown, Horace Vermet, Caroline Testout, Mrs. John Laing, Ulrich Brunner, Madame Cochet, Comtesse de Turaine. 3rd, Mrs. TIMES, Bedford Road, Hitchin.

Class 37 was for six blooms, distinct varieties. Mr. H. H. GIFFORD, Edensor, Sutton, was placed 1st out of fourteen competitors.

Class 38 was for six blooms of any one variety other than T. and N. Mr. G. A. HAXWOOD, Burgess Hill, was 1st, with Her Majesty; Mr. H. H. GIFFORD, Edensor, Sutton, was 2nd, with Mrs. John Laing; Mr. R. W. BOWYER was 3rd, with Caroline Testout. There were fourteen exhibitors.

EXTRA CLASSES.

In Class 39, for twelve blooms, distinct, Mr. C. J. GRADIANE's Challenge Cup was competed for, and there were fourteen competitors. The 1st prize was awarded to Mr. W. KINGSROX, Waterloo Road, Bedford, who had small but bright and well-developed blooms of Her Majesty, A. K. Williams, Marchioness of Londonderry, Charles Darwin, White Maman Cochet, Duke of Teck, Mrs. J. Laing, S. de President Carnot, Caroline Kuster,

and Prince Arthur, Mr. T. DENNISON, Handsworth Wood, Birmingham, was 2nd.

New Roses—The best six blooms of new Roses came from the Rev. J. H. PEMBERTON, who had Shandon, Bessie Brown, Killarney, Tennyson, Lady Mary Curry, and Ards Rover. Mr. F. W. TATTERSALL was 2nd, he had Mrs. E. Mawley, Tennyson, Ulster, Bessie Brown, Gladys Harkness, and Killarney.

MAIDEN EXHIBITORS.

Class 4 was for six blooms for amateurs who had joined the Society since the last exhibition. Mr. C. J. PAUL, Edfield, was an excellent 1st; and Mr. T. H. COOKE, Colechester, 2nd.

METROPOLITAN CLASSES.

Class 5 was for six blooms grown within 5 miles of Charing Cross, and here there was a good competition. Mr. E. R. SMITH, Mus-well Hill, was 1st, with very good blooms of popular H.P.'s; and Miss BEATRICE H. LANSTON, Hendon, 2nd.

TEA AND NOISLETTE SECTION.

Some very beautiful blooms were staged in the following classes, but speaking generally a thinness of flower was discernible, and in several the stormy weather of the past few days, rather detracted from the beauty of the flowers.

Class 4.—Eighteen Blooms distinct varieties. Trophy Class—Four exhibits were staged, O. G. ORPEN, Esq., West Fergel-ht, Colechester, coming 1st with a very good stand, comprising Maman Cochet, Mrs. E. Mawley, Cleopatra, The Bride, Ernest Metz, White Maman Cochet, Incoente Piroda, Souvenir d'Elise Vardon, Bridesmaid, Marcelle Niel, Catherine Mermet, Madame Cusin, Madame de Watteville, Madame Cusin, Marie Graham, Souvenir de S. A. Pimou, Jean Pouchet and sylvia. The Silver Medal for the best Tea or Noislette was awarded to White Maman Cochet in this stand. A. H. GRAY, Esq., Beahan, Newbridge, Rath, was a good 2nd with a very clean stand of flowers of less worth, 2nd, COSWAY JONES, Esq., Hinchinbrooke, Clonsilla.

Tea and Noislette Blooms, distinct varieties—Six good stands were staged, ALFRED TAYLOR, Esq., Downside, Leatherhead, gaining the premier position, his best flowers were Madame Cusin, Miss Ethel Brownlow, The Bride, and Souvenir d'Elise. 2nd, A. H. GRAY, Esq., 3rd, F. W. FLIGHT, Esq., Tayford.

Some beautiful blooms were staged in the next class, that for eight distinct varieties, three blooms of each. 1st, A. H. GRAY, Esq., his Maman Cochet, Confesse de Nadailae, Catherine Mermet, and Marcelle Niel being extra good. 2nd, O. G. ORPEN, Esq., 3rd, Mrs. F. W. CAMPION, Trumpets Hill, Reigate.

For nine blooms of any one variety, O. G. ORPEN, Esq., was 1st, with White Maman Cochet. 2nd, A. H. GRAY, Esq., with Maman Cochet (very good); 3rd, E. M. BETHUNE, Esq., Hoar-ham, with the same variety.

OPEN ONLY TO GROWERS OF FEWER THAN 500 PLANTS OF TEAS AND NOISSETTES.

Trophy Blooms, distinct varieties—Four exhibitors, the Rev. F. PAGE ROBERTS, Halstead Rectory, Sevenoaks, coming 1st, his best blooms were Souvenir d'Elise Vardon, Confesse de Nadailae, Madame de Watteville, Medea, and Maman Cochet; 2nd, the Rev. R. POWLEY, Upton, Sandonmore, Warrimster; 3rd, F. WELFESTER, Esq., Westfield, Woking.

In the succeeding class for nine blooms, seven exhibitors competed, the 1st prize going to R. FOLEY HOBBS, Esq., Thornloe, Worcester, his Souvenir d'And, Empress Alexandra of Russia, Cleopatra, Mrs. E. Mawley, White Maman Cochet, and Marie Van Bouille, being very good; 2nd, Miss H. H. LANSTON, Raymed, Hendon, N.W.; 3rd, MARION WHITTLE, Esq., Belgrave, Leicester.

Thirteen stands of six blooms of any one variety were staged, the 1st prize going to COSWAY JONES, Esq., for "The Bride"; 2nd, R. F. HOBBS, Esq.; 3rd, Mrs. E. HOBBS, Park House, Reigate.

OPEN ONLY TO GROWERS OF FEWER THAN 200 PLANTS OF TEAS AND NOISSETTES.

The small growers came out well, thirteen competitors staging in the leading class for nine distinct blooms. 1st, W. UPHON, Esq., 16, Clarendon Street, Belgrave, Leicester; 2nd, G. H. BAXTER, Esq., Hutton Park, Brentwood; 3rd, F. W. TATTERSALL, Esq., Crookleigh, Morecambe. Nine exhibitors staged six blooms of one variety in this section, the 1st prize going to A. MUNT, Esq., Hedgerley, Slough; 2nd, Mr. MOTTES, Hitchin.

Class 5 was devoted to amateurs who have never won a prize at an exhibition of the N.R.S., and eight credit-

able stands were in competition, the 1st prize going to T. B. GABRIEL, Esq., Elmstead, Woking; 2nd, W. R. HAMMOND, Esq., Burgess Hill, Sussex.

ROSES IN VASES.

New distinct varieties, five Blooms of each—Only two exhibitors competed in this class, the 1st prize being easily won by H. V. MACHIN, Esq., Gateford Hill, Work-up; 2nd, Mrs. F. W. CAMPION.

Six distinct varieties of Teas and Noisettes, seven Blooms of each—This class brought four competitors, the 1st prize going to O. G. ORPEN, Esq., for six handsome vases of blooms, Maman Cochet, Madame Cusin, and Madame de Watteville being very fine; 2nd, A. H. GRAY, Esq.; 3rd, Miss B. H. LANSTON.

DECORATIVE CLASSES.

A bowl of Roses lightly arranged with Rose-foilage only, not more than thirty-six blooms to be used, but small buds may be left on the added foliage. In this class, Mrs. LEWIS PAWLE was 1st among three competitors, with a bold stand of one variety, apparently Caroline Testout; 2nd, Mrs. O. G. ORPEN.

The two next classes were open to ladies only. A decoration of cut Roses for dinner-table, arranged with any cut foliage, Ferns, or grasses, on a space 3 ft. by 3 ft. Nine exhibitors competed, some very pretty arrangements being set up.

time Guanois-sau, Reine Olga, Macrantha, Crimson Rambler, W. A. Richardson, Honore, Gustave Reus, Marquise Balbrano, The Garland, Hobe's Lapp, Etrole d'Or, Revo d'Or, Anna Marie Montfray, Rosa Inula, Perle d'Or, and Gloire Lyonnaise; 2nd, H. V. MACHIN, Esq.; 3rd, Mrs. F. W. CAMPION; both of the last exhibitors also staging well.

With twelve bunches, Mrs. A. F. PERKINS, Oak Dene, Holne-wald, Surrey, was 1st, Marquis of Salisbury, and Paul's Surtaine Pallay, being very effective; 2nd, Mrs. DOROTHY A. ST-SHELD, Spidhaust, Trimbridge Wells; 3rd, Miss BEATRICE LANSTON.

Class 57—Six vases of Sweet Briar Roses in six distinct varieties. The 1st prize was well won by Mrs. F. W. CAMPION, and comprised the following varieties:—Anne of Giersten, Jennie Deans, Lucy Brittain, Julia Mannerling, Lady Penzance, and Amy Robsart. A very pretty exhibit. 2nd, O. G. ORPEN, Esq.

PREMIER BLOOMS.

The Silver Medals in the amateurs' classes were awarded to Her Majesty, shown by FOLEY HOBBS, Esq., as being the best Rose, other than H.T.T. or N., to Bessie Brown, shown by G. MOTTES, Esq., Hitchin as the best Hybrid Tea; and for a magnificent bloom of Maman Cochet, shown by Mr. O. G. ORPEN, as the best Tea Rose.

NON COMPETITIVE EXHIBITS.

Mr. W. SPOONER, Arthur's Bridge Nursery, Woking, showed a group of cut Roses, the three varieties, Her Majesty, Victoria, and The Bride being in greatest quantity. Bunches of the decorative section of Tea Roses were pretty. (Silver Medal.)

Messrs. GEORGE JACKMAN & SON made a very fine display of cut Roses, showing H.P.'s and T's and H.T.'s in great variety in boxes, also a fine background of decorative Roses in vases, with Gypsophila between them. They made a very fine effect. (Silver Gold Medal.)

Mr. J. FISCHER showed a wire archway suitable for Roses, also permanent labels for Roses, samples of the Anne Rose Bloom Protector.

Messrs. HUGH LOW, & Co., Bush Hill Park Nurseries, Enfield, exhibited a collection of cut blooms in boxes, which represented all the sections of exhibition varieties. The blooms were very fresh and of excellent colour. (Silver Medal.)

Messrs. GEO. BUNYARD & CO., Royal Nurseries, Mandstone, showed garden Roses in fine condition and a large number of varieties. H.P.'s and Teas in boxes were also of commendable quality. (Silver Medal.)

Messrs. JNO. LANG & SONS, The Nurseries, Forest Hill, London, S.E., showed some very large blooms of H.P.'s, the variety Mrs. John Lang being represented in quantity. The exhibit also included some garden varieties. (Silver Gold Medal.)

Messrs. FRED & SONS, Rompell Park Nurseries, Newwood, London, had an exhibit of H.P.'s, Teas, and H.T.'s, the decorative Teas being very pretty. (Silver Medal.)

Messrs. JAS. VITCH & SONS, Royal Exotic Nurseries, Kings Road, Chelsea, exhibited bunches of their new pink coloured Rambler named Queen Alexandra, as described in our report of Tuesday's show at the Drill Hall, and which was represented in the bouquet presented to Her Queen on this occasion.

FIG. 8.—THE NEW NAME—ROSE-BLOOM PROTECTOR.

PROTECTING ROSE BLOOMS.

Those who cultivate Roses for exhibition, as well as for the adornment of their gardens and homes, are often compelled to use some kind of protection in order that the flowers may not be injured by wind or rain during the time they are developing. If this matter be not attended to carefully, the flowers lose much of their attractiveness, and the petals are disfigured, consequently they are less likely to secure honours on the exhibition table. The need for this protection is, of course, greater in some seasons than others, but British weather is proverbially true to its reputation for inconstancy, and every Rose grower knows this fact only too well. We have, therefore, pleasure in illustrating in fig. 8 a new style of protector for Roses and other flowers, which has been invented by Mr. R. E. West, of Reigate, Surrey, well known to be a successful exhibitor. The covering material is calico, and the angle at which the protector is made is said to

Mrs. O. G. ORPEN was awarded the 1st prize for a low arrangement of single-white Roses (R. Himalaya) with a bush-tint, a few sprays of Rose-foilage only being added, a delicate, but not over light arrangement, and rather too devoid of colour for the dinner table. 2nd, Mrs. ARTHUR CANT, Reed Hall, Colechester, with an arrangement of the small Perle d'Or and Cecil Brunner. 3rd, Mrs. LUCAS C. FRANKS, Bardsmill, Reigate. In this arrangement a few colours of Tea Roses only were used with excellent effect, with smilax trails on the tables. This was preferred by many to the two preceding exhibits, and was decidedly very effective.

Class 6 was for a vase of cut Roses, lightly arranged with any cut foliage, Ferns, or grasses. Mrs. PAWLE was 1st, with long sprays of Asparagus Sprengeri, and the bright pink Mrs. W. J. Grant Rose. 2nd, Mrs. MAWLEY, Rosebank, Berkhamstead; 3rd, Mrs. ARTHUR CANT.

Garden or decorative Roses, to be arranged so as to show as far as possible the foliage and habit of growth of each variety, eighteen distinct varieties, not fewer than three bunches of each. Four exhibitors staged in this class, the bright bunches of flowers forming a good display. ALFRED TAYLOR, Esq., Leatherhead, came 1st, with Gloire de Rosa memo, Aster Stella Gray, Angus-

render it waterproof, as the most severe rain is found to run off at the edge rather than through the material. The height may be fixed instantly by a galvanised steel spring, and by means of a square socket and a square stick, similar to that shown in the photograph, a steel spring secures the amount of rigidity that is essential to keep the protector in position during high winds. It is durable, portable, and very light, and is said to withstand winds better than any existing protector. These matters, however, may easily be tested by Rose growers themselves, who, we doubt not, may obtain particulars from Mr. West.

CARNATION FLOWERS OF TWO DIFFERENT COLOURS ON ONE PLANT: W. P. B. This form of reversion is by no means uncommon in the Carnation; the reversion revealing itself variously. The same thing occurs in Chrysanthemums and other plants of composite origin, and the "sport" remains constant for a great number of years.

GALLS ON HAZEL: No Note. These out-growths are caused by the puncture of an insect, which sets up irritation and over growth, and provides a nest for the eggs and food for the young grubs when they appear. If you cut one open, you will find numerous flies therein.

GRAPES DISEASED: *Anxious, A. H., J. M. S., G. M., Enquirer, and others.* The fruit is affected by the spot fungus, *Gleosporium heliocola*. Cut out forthwith and burn every affected berry, and then apply sulphate of potassium (liver of sulphur) at the rate of $\frac{1}{2}$ oz. dissolved in 1 gallon of water, syringing the whole of the Vines therewith, repeating the application a fortnight later.

INSECT ON IMPEASTRUM BULL: J. W. Miles. The maggot on Impeastrum bull is the larva of a species of dipterous insect or fly, but of what species it is not known. If you will send us a further supply we will endeavour to rear the perfect insect, and finally fix the species. The decay is probably caused by the maggots, and is not unlike the decay caused by the Onion-fly, *Anthomyia ceparum*. R. X.

INSECTS: F., Son & S. Undoubtedly a species of Tortrix, and probably *T. ribana*; but the specimens were so battered that it is impossible to definitely fix the species.

MILLER'S GARDENERS' DICTIONARY: J. C. The seventh edition is of little or no value.

MULBERRY-TREE NOT FRUITING: E. W. The sexual arrangements are very variable in the Mulberry. Sometimes the whole of the flowers on a tree are male or wholly female; sometimes this occurs on only one part of the tree. This may go on for years, and then alter to the normal without apparent reason. Nothing can be done that we know of.

MUSHROOM SPAWN IN TURF: Alpha. The present season, when the soil is warmer than at any other, is the most suitable. It need not be put deeper than 6 inches, as at that depth the spawn would not be liable to suffer from fluctuations of warmth and moisture endangering its germinating capabilities. Wet soils are not favourable to Mushrooms. The bricks of spawn should be chopped or sawn into squares of $1\frac{1}{2}$ in., and be placed at the depth named (in heavy soils at a lesser depth), and the earth returned, and made firm in the holes. A drainer's spade of the usual curved shape is a good tool wherewith to make the holes.

NAMES OF FRUIT, GRAPES: C. Abbot, Black Alicante.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.* ROSES: *Correspondents* are requested to remember that we cannot undertake to name Roses or other florists' flowers. They should be submitted to some specialist who grows them on a large scale.—J. S. We cannot undertake to name Roses or other florists' flowers. Send them to some grower.—*Inverness.* 1, abnormal form of *Calendula sp.* (material not sufficient to determine which); 2, *Crepis virens*.—*Chas. C.* 1, *Dianthus deltoideus*; 2, *Saxifraga trifurcata*; 3, *Campanula rhomboidalis*; 4, *Antemum montana* var. (discooid form); 5, *Linaris pallida*; 6, *Ambretia deltoidea* var. *taurica*; 7, *Acaena myriophylla*; 8, *Sedum selckianum*; 9, *S. roseum* var. *limifolium*; 10, *Saxifraga Geum*.—*J. E. H.* The cut-leaved Alder (*Alnus glutinosa* var. *laciniata*).—*R. B.* *Lonicera Ledebourii*.—*Combrion.* *Asperula orientalis*.—*J. M., Devon.* *Ilemaanthus magnificus*.—*J. T. B.* *Verbascum Thapsus*.—*K. T.* 1, *Comptonia asplenifolia*; 2, *Artemisia abrotanum*.—*S.* 1, *Streptosolen Jamesoni*; 2, *Hieracium aurantiacum*; 3, Too wretched a specimen to be named.—*F. E.* 1, *Cacalia ficoides*; 2, *Cypripedium Lawsoniana*; 3, *Sciadopitys verticillata*; 4, apparently *Diospyros Lotus*.—*Major B.* *Diplacis glutinosus*.—*J. T.* 1, *Lycaste Skinneri*; 2, *Vanda tricolor*; 3, *Oncidium luridum*; 4, 5, 6, varieties of *Odontoglossum crispum*.—*F. J. M.* *Tsuga canadensis*, "Henlock Spruce".—*Picea.* 1, *Pseudotsuga Douglasii*; 2, *Picea ajacensis*; 3, *Pinus*, we are not sure which one; 4, *Pinus*, send cones; 5, *Picea polita*; 6, *Prumnopitys elegans*, alias *Podocarpus andina*.—*W. & Sons.* One of the numerous forms of *Pyrethrum trutescens*.—*F. D. & Co.* *Hibiscus rosa sinensis*.

PITCHER PLANTS: *Pitcher Plant.* This would be rightly shown in a class for foliage plants.

ROSE W. A. RICHARDSON: Alpha. See "Propagation of Roses," p. 419, in our last issue; by budding on the Dog Rose, *La Griffeiraie*, Manetti, or Polyantha Rose stocks in August and September; or by cuttings of ripe wood in sandy, loamy soil, 6 to 8 inches deep, and protruding 2 inches from the soil, inserted late in October, preferably whilst with the leaf on, and thirdly, from young immature shoots of forced plants, struck in late winter and early spring, in bottom-heat of 75° to 80°, and top-heat of 60°, under a bell-glass; or better still, in a close frame. These various methods are suitable for almost all sections of Roses.

SCOTS FIR SHOOT: G. W. The larva, probably of one of the Pine-shoot moths *Retinia buoliana* or *R. turionella*. When the trees stand in small isolated areas, the tips of the shoots may be cut off and burned, and the moths may be kept off small patches by lighting smother-fires on the windward side in the evening early in the present month; as at this time of day and season the moths lay their eggs. See "Report of the R.H.S. Conifer Conference," p. 166.

SHRUB: W. G. S., *Swanley.* We are sorry the matter cannot be cleared up after this period of time. Can you not send another specimen.

SPANISH IRIS: G. H. We cannot name the variety.

ST. JOHN'S WORT AND THE ORDER OF ST. JOHN OF JERUSALEM: R. *McIntosh.* The connection of the St. John's Wort with the Order of St. John of Jerusalem may have arisen from the common practice in Germany of wearing an amulet of the plant on St. John's eve, the plant being credited with the magic property of revealing witches, and of exposing them engaged in their nefarious calling. In Italy it is called the "devil-chaser." In many countries it is supposed to preserve the possessor from the evil designs of witches, pixies, and spirits of the air.

STOPPING CHRYSANTHEMUM PLANTS: C. B.

Paukouché, if struck in January or earlier, if first crown buds are wanted, should not be stopped. The others you name are better from second crown buds, the colours being better, and there is less coarseness than in first crown buds, and the plants struck in late December, or early January. If a variety is apt to show an eyed flower from a late bud, take up only on stem to the second break, but in some varieties this causes coarseness.

TWELVE EXHIBITION VEGETABLES IN SEASON IN AUGUST: A *Nine Years' Reader.* Peas, Runner Beans, French Beans, Cauliflowers, Cabbage, Globe Artichoke, Turnips, Turnip-rooted Beet, Carrots long and short, Leek, and Onion, Potatoes, and Vegetable-Marrow, which may take the place of the Globe Artichoke and Leek if so desired. Herbs and salad plants are not included, these not being considered culinary vegetables in this country.

VINE LEAVES SPOTTED: *Ignominus.* The leaves are thin and weak, which shows that the Vines are growing in a border deficient in feeding properties, or that they have lost most of their roots. There are two sorts of spots on them—one due to the perforations of an insect or insects, and the other consisting of the excreta of insects.

VINES: *Constant Reader.* Scalding, brought about by neglecting to afford ventilation early in the morning, or by deficiency in amount during bursts of sunshine. No fungus or disease.

WIREWORM IN THE GARDEN: J. Millard. In the early winter, dress the land heavily with gas-lime, and trench it, most of the wireworms harbouring near the surface being shovelled off, together with the lime, into the bottom of the trenches. Meanwhile, you might insert Carrot and Parsnip roots into the ground where plants they mostly infest are growing; these will form baits, and immense numbers can be caught on them. Sowing Lettuce-seed alongside such crops is another means of attracting them, wireworms favouring Lettuce-roots. Land heavily dressed with gas-lime should not be cropped for four months, or a longer time.

GARDENING APPOINTMENTS.

MR. HENRY R. WHITEHEAD, for the past four and a half years Head Gardener and Bailiff at The Priory, Royston, Hertis, as Head Gardener to ISAAC LEWIS, Esq., Bedgebury Park, Goudhurst, Kent, entering upon his duties on July 29.

MR. G. SEPPARD, for the past five years Gardener to the Rev. C. E. ROBERTS, M.A., The Chifferts, Hallow, Trin., as Head Gardener to L. M. CASSELLA, Esq., Bedgebury Park, Goudhurst, Kent.

MR. E. DEE, for the past five years as Foreman in the Gardens at Highlands, Minchinhampton, as Head Gardener to A. T. PLAYNE, Esq., Longfords House, Minchinhampton, Glos.

MR. W. H. LAWRENCE, until recently Foreman at "The Graperies," Bishops Stortford, and two and a half years previously at Hagley Hall, Worcester-shire (under H. B. DIXON), as Gardener to C. K. PROCTOR, Esq., Avenue House, Heaton, N.W.

MR. F. WOODFIELD, for the past three years Foreman in the gardens at Betty Hill, Mansfield, as Gardener to WALTER CUNLIFFE, Esq., Headley Court, Epsom.

MR. JOHN MACLEAN was unanimously appointed, at a meeting of the Paddington Borough Council, held on Tuesday, to be the Head Gardener of Paddington Green and St. Mary's Churchyard, in succession to Mr. George Burley, who is retiring. Mr. Maclean had been for the last seventeen years Mr. Burley's principal assistant.

A MIDLAND GARDEN.

RATHER too late in the autumn of last year, it was in the middle of November, I planted a bed of *Narcissus* bulbs, the variety "Cynosure," for the purpose of testing the market value of the flowers in the spring. They did not come into full bloom till April 23, when I offered them to the leading florist in Leicester, and was told that they were not worth more than a penny a dozen wholesale price. At this figure I declined to sell, and gave them away to my friends. A neighbour, who is a professional market gardener, tells me that he grew the same variety, but by forcing he got them into bloom before the rush of foreign flowers came in, and sold them in the retail market at 2s. per single bloom, which paid well. He says also that even after the foreigners were in the market his old customers preferred his blooms at a higher price, because they were fresher and lasted longer. *Cynosure* is a good sort, one of those with the crown half the length of the perianth; it remains fresh for a fortnight if left growing, and for a week when cut. The *Emperor* is also a good variety, one of the *Dalldodil* section, with a long crown; it is a large but one flower.

A tree about 12 feet high of the yellow-berried Holly has been attacked by some small insect *Phytomyza ilicis*, Holly leaf-miner, which has laid an egg on nearly every leaf, about the centre of the upper

surface. The egg has hatched into a grub, and the grub has eaten the soft cellular tissue under the skin, causing a whitish patch of irregular shape about the size of a sixpence, with a brown spot in it containing the empty case of the chrysalis, about one-tenth of an inch long, from which the fully-formed insect, a small fly, has escaped. All the other Hollies, including the variegated forms, have been partially disfigured in the same way.

The art of designing, whether in form or colour or material, is to some extent a natural gift; but it may be largely cultivated by tuition and practice. Do any of our Schools of Art and Design teach landscape gardening? It is a beautiful and most interesting art. I remember reading long ago of a small suburban garden so artfully laid out with hill and valley, winding walks, grass, shrubs, rockery, ponds, fountains, and arbours, that in seeing it all you would fancy you had been wandering over many acres, instead of a few hundred square yards. To produce an effect like this you want a long purse, and the result is not quite satisfactory after all. A well-designed garden requires open spaces and flat lawns, as well as more picturesque details. To design flower gardens was a boyish amusement of mine, and in the course of my life I have laid out perhaps a dozen gardens for myself and friends, in simple and inexpensive fashion; but I have had no tuition, and am not an "expert." It greatly amuses me, however, in the intervals of other work, to try on paper what can be done within the limits of this one-acre garden, to give it the greatest possible charm; supposing always that I had as many sovereigns to play with as there are stones on the gravel walks, a hundred different schemes occur to me. Each has some desirable effect, but I have never yet succeeded in getting all the delightful things I should like to have into this limited area.

I want a lawn with a few cut-out flower-beds, surrounded with flowering shrubs and two or three shade trees. I want a winding walk wide enough for two abreast through a thick shrubbery, and with a small arbour overgrown with creepers, where you may be quite secluded, and see only leaves and flowers, and hear only the birds. I want a rippling streamlet with grassy banks open to the sun in some places and shaded in others; and a quiet pool where the water goes to sleep, and water-loving plants may live and be happy. I want a sunny rockery for alpinists, and a shady wood for Bluebells and Wind-flowers, and plenty of fruit trees, and strawberry beds, and a picturesque thatched fruit-house girdled with leopards, to store the Apples and Pears in, cool in summer, and warm in winter. I want a fountain with goldfish, and a square old sundial, and a small observatory, and some frames and propagating houses. I do not want a tennis-court, I hate to see the sweet green grass scored over with chalky squares, and I have not much sympathy with "games" of any sort, for adults. They seem to me to waste time so terribly. Physical exercise can be got in much more useful ways.

What has become of the old-fashioned nossegay? It was a word familiar to the last generation, but it seems to be obsolete now. Every bunch of flowers used to be called a nossegay, though the correct form was fan-shaped, with a background of greenery,

Nossegay was a good old Saxon word, but French has prevailed, and we call everything now either a bouquet or a buttonhole. Bouquets have various forms, but the fan-shape is dead. In the country the approved form is a hemispherical mass in the carpet-bedding style, with the stalks tightly bound together; but in good houses there is much more taste displayed than there used to be in the arrangement of flowers in vases of many patterns. A fine Rose with foliage never shows better than in a specimen glass by itself.

Both nossegay and bouquet seem to imply that flowers represent fragrance as well as form and colour, and indeed a fragrant flower is like a smiling face, beauty crowned with its divinest charm. Scentless flowers, however lovely, seem always cold and formal, like the waxwork *Camellia*, or the pepperbox double *Dahlia*. It is a little surprising that there is no recent work on sweet-scented flowers. Sixty years ago my first literary venture was a small volume of 130 pages entitled *Flora Odorata*. It has long been out of print, and is rarely seen in the second-hand catalogues; but so far as I know, it remains the only work dealing with the sweet-scented flowers alone. See "Odorographia," by J. C. Sauer; Gunney & Jackson, "Enteromorpha Row"; and the "Art of Perfumery," by G. W. S. Plessor; Longmans & Co., London. At that time the scientific cause of fragrance was very little understood. I remember that though I was anxious to put into my little book some explanation of odour, I could find none, nor was I able to make even a plausible guess at it. In *Balton's Class Book of Botany*, published ten years later, it is stated that "the sources of odours in flowers are very obscure." But reference is made to some French experiments in 1827, showing that though some flowers secrete volatile oils which evaporate and spread through the air, there are others in which no such oil can be detected, and whose fragrance can only be explained physiologically, or, as we should probably now put it, on the supposition of some vibratory emanation communicated through the ether, as in heat and light. Neither in Sachs' Text Book nor in Kerner's *Natural History*, is there any reference to this subject. Whether there is any truth in the physiological theory, or whether all odours are due to gaseous emanations, I am still unable to say. An attempt has been made to construct an "odophone" scale, like the musical scale, and to show that certain odours harmonise like the notes of a chord. This may be a correct idea, but the present state of our knowledge seriously warrants such an attempt.

Among the few herbaceous plants that will thrive and flower in shady places, the pretty *Desmodium* eximia may be included. It does equally well in full sun-shine, but a rather heavy shade does not seem to affect it, so I am planting it in a "nuttery," where the nut bushes have grown tall, and the ground below is bare, in company with *Anemone nemorosa*, *A. ranunculoides*, *Pulsatilla*, fragrant, and *Primrose*. It is rather curious that the *Primrose* loves the shade, while its cousin, the Cowslip, will only flourish in the sunny meadows, and the hybrid *Polyanthus* likes a little of each.

I sowed our Scarlet Runner Beans on May 10, in accordance with the popular notion in these parts, that this is the exact date on which they ought to be put in the

ground. The Dwarf Beans were sown a few days previously, after being soaked in cold water for six hours. Our first Potatoes were planted on April 2, three sorts, viz., Ring-leader and Windsor Castle for kidneys, and British Queen for round ones.

A well-kept garden is a great delight, but it involves continual labour—digging, planting, sowing, watering, weeding, mowing, rolling, pruning, training, protecting, gathering and preparing for use—these, and all the addenda which they imply, furnish occupation for every season, delightful occupation, healthful and educational, both for body and mind, but imperative and not to be neglected with impunity. Old men who retire from business and have nothing to do but eat and sleep, and read the papers, die off rapidly. They should take to gardening, and do part of the actual work themselves. It is refreshing and invigorating to be at work on the fresh soil and among living plants. The back may ache sometimes, and the perspiration gather, but these little expiations will be disregarded in the satisfaction of "some thing attempted, something done;" and in watching for results the fact that we have laid the train ourselves gives double interest.

"Genius, it has been said, is the power to do more than the average of work. It is so, because the more the work the intenser the life, and genius is that which sees what is admirable and burns to pursue it. No noble soul desires rest. Labour is the joy of existence, and he is the nearest to angelic life who wastes no moment of time, who needs the fewest hours of sleep, to whom an easy chair is no luxury, who works persistently with brain and hand for noble purposes, rejoicing in his toil, sure that he is doing holy service to his God, his brother-man, and himself." F. T. Mott, F.R.G.S., *Birstal Hill, Leicester.*

THE REPLANTING OF BULBS THAT HAVE ONCE FLOWERED.

COLONEL WHEATLEY, in a lecture delivered before the Royal Horticultural Society on June 18, gave the result of his experience with regard to the use of bulbs for spring bedding. I quote the following passage from the report in the *Gardeners' Chronicle* (p. 414):—

"Preparations for spring bedding were made in the autumn, bulbs being planted in November, after the beds had been trenched and manured. . . . Old bulbs ever so well cared for were indifferent, and did not flower so finely or so early as new ones did. After blooming, they had to be lifted before the foliage was matured; hence were not capable of giving good flowers the second year."

As a matter of practical gardening, it may be admitted that this statement contains a certain amount of truth; but it does not by any means finally dispose of the question. The difficulty which Colonel Wheatley describes is undoubtedly real; but it is one which I think we may claim to have successfully surmounted to a large extent at Kew; and the result of our experience may be useful to others who wish to make a display of bulbous plants in spring at a moderate expense.

I must premise that Kew being primarily a scientific establishment, the funds available for decorative display are very inconsiderable, compared with those which Colonel Wheatley commands. If we were to use each year "new" (by which I presume is meant purchased) bulbs, the cost of the tens of thousands which we plant would be enormous and pro-

hibitive. I took the trouble some years ago to estimate at the current price, the cost of a single bed of "Emperors," and found it ran to £400; and even if we were willing to buy, we could not obtain in quantity the numbers of the rarer and more valuable kinds, especially of Tulips, which we require.

As purchase, so far as Kew is concerned, is entirely beyond our means, we attain our results by growing the bulbs ourselves. We never purchase except to secure a stock to breed from, and the entire cost of our present annual display has been insignificant. When we started in 1886 we made a very modest beginning, mostly with small parcels of bulbs, for which we were indebted to the generosity of friends.

Mr. Herbst, of Richmond, gave us in that year 200 Emperors. We now possess at least 20,000, all derived from the original stock.

As our Daffodils and Tulips at Kew have to be replaced, as elsewhere, by bedding-out and other plants, the bulbs have to be lifted when the foliage is still green. They are then "heeled in" in beds of ashes; this allows the foliage to slowly ripen off. The nutriment contained in the leaves is gradually transferred to the bulbs. The process is complete when the leaves have dried up to the consistency of thin paper. The bulbs are then lifted again, cleaned, and placed on shelves in a dry and airy shed, where they remain till they are planted in the autumn.

When the bulbs are cleared, the offsets, or "chats," are carefully removed. These are planted in a nursery, and after a year or two are fit for use in the public grounds.

So far as my observation goes, I am unable to see any deterioration in the quality of the flowers produced now on the system pursued at Kew. In the case of Tulips, I am disposed to think that we even get better results than with purchased bulbs. It is, I believe, well known that in order that these may have a taking appearance, they are put on the market before they are thoroughly mature.

With Hyacinths we have not been so successful. Occasionally the bulbs will flower fairly the second year, but after this, the parent bulb breaks up, and the shoots require many years' cultivation before they are good for anything. Probably, however, in this case we should have been equally successful were not the young bulbs liable to be destroyed in great numbers by winter frost.

But as regards Daffodils and Tulips I may mention, as a proof that bulbs raised at Kew are quite equal to the commercial standard, that we have frequently been asked to sell portions of our stock to the trade at remunerative prices. W. T. *Thiselton-Dyer.*

LILIES AND THEIR CULTURE.

(IN ANTICIPATION OF THE LILY CONFERENCE.)

LILIES, long regarded among the most important groups of garden plants, practically extend in their range of distribution throughout the northern hemisphere, and are found growing under nearly all conditions of climate save the extreme arctic and tropical. The plants are mostly found on cool sites, even in sub-tropical countries, and in association with trees and shrubs, which serve two purposes in the interests of the Lilies—(1) they provide them with useful shade, a cool rooting medium, protection from winds, and their leafy canopy assists in keeping the atmosphere about the plants damp and congenial; (2) the roots of trees, shrubs, and other vegetation play an important part in preserving Lily-bulbs, by encircling them and removing excessive moisture from among the scales. Moreover,

the falling leaves of trees, &c., form a new soil, into which the stem-roots of the Lilies (where such roots are present) could work, and thus help them to build up the floral axis without undue strain upon the bulb.

A few types grow on mountain slopes, in schist and other *débris* of rocks, invariably in cool rifts where the roots can find moisture, even if the bulbs themselves are frequently dry. Others grow on the banks of small streams in such a manner that, whilst the bulbs are but moderately damp from the natural moisture in the soil, their roots are reveling in the more abundant moisture beneath. Many of the so-called "bog" Lilies grow in this manner; and one reason why these frequently fail to grow well and establish themselves, is because their bulbs, as well as their roots, are continually very wet, and that the moisture about them is stagnant and sour. The bogs and swampy places in woods in these islands may be accepted as fair samples of the conditions under which the American Lilies grow, and the margins of such places afford excellent sites for plantations of these charming Lilies.

The teachings of observant collectors, combined with the experience cultivation gives, enable the cultural requirements of Lilies to be summarised in a few words. They require a cool rooting medium, shade from strong sunshine, and some means must be employed to preserve the bulbs from injury whilst in the soil, either by reason of lack or from excess of moisture, or great heat; furthermore, the bulbs meet with enemies under cultivation that would not be found in their native habitats, and these must be guarded against.

Lilies cannot be established in every garden unless special sites are selected, and special soils prepared for them. Practically, they may be flowered once anywhere, given a sufficiency of water, if sound mature bulbs are planted, but it will be at the expense of the bulbs. A few species have powers of endurance sufficiently developed to enable them to live for some years without suitable cultivation, but the majority have not. The key to successful cultivation and establishment of any species of Lily will mostly be found in the formation of the bulb and a study of its rooting peculiarities, and if I dwell lengthily on the subject of roots, it is because I feel certain that a study of the bulb and roots of any *Monocotyledon* will help the cultivator to understand its wants, the more so if he is able to seek the cause of this or that peculiarity in the records of the climate in which the plant grew in a wild state.

The North American Lilies require the shade of trees and a peaty soil approaching wetness, not a bog, unless the bog be covered with a layer, 1 foot or so in thickness, of clean, sweet vegetable deposit. Lilies provided with abundant stem-roots, are best planted so that shade may be afforded for some distance up their stems, in order that such roots may grow and develop to the fullest extent. It is not necessary to shade the whole plant. Such familiar types as *L. auratum*, *L. speciosum*, and *L. tigrinum*, are examples of stem-rooting plants which grow infinitely better with a full exposure to the sun's rays, provided they are moist and shaded below. In fact, the abundance of stem-roots is governed by the degree of shade in which they (the stem-roots) grow.

Lilies of the Martagon group, *L. monadelphum*, and *L. excelsum*, will frequently produce serviceable stem-roots if planted among shrubs in a cool spot, or if grouped together in pots, with a cool, damp atmosphere about the roots and abundant sunshine overhead. *Lilium Browni* and *L. odorum* are particularly well

served if given this kind of treatment, sunshine above being essential to bring out the warm colours on the outside of the flowers, whilst the roots only thrive in a shady place.

THE KIND OF BULB TO PLANT.

It is a remarkable fact that hundreds of tons of Lily-bulbs are annually imported into this country, and that our stock of established plants does not materially increase from out-

for a temporary display as pot plants; they force well, because they have greatest amount of nutriment in their fat scales, and can produce a stout stem and support it till it produces stem-roots. A medium-sized bulb, compact, and sound in texture, is the best for general planting. These have two or three years ahead of them in which to reach their full size; they start to root earlier in the season (as witness the behaviour of an offset growing

the first year's inflorescence being reduced to one or two flowers, or entirely removed to reserve strength.

In order that the cultural requirements of this large group of plants may be the better understood, I propose to classify them according to their requirements, disregarding for the while the botanical groups based on structure alone, for these groups frequently contain two given species which, though allied botanically, cannot possibly be grown together.

PEAT-LOVING LILIES.

The only members of this group are *L. auratum* and its many garden forms. *Lilium auratum* thrives in peat, it will also thrive in a compost prepared to resemble peat as nearly as possible. A suitable mixture would be the sweepings of parks and roadsides—rough leaves and grit—turned two or three times to free it from worms and grubs, and mixed with half its bulk of friable turfy loam. The position in which to plant is of more importance than the compost—a place among *Rhododendrons* suits them admirably, or a place among other shrubs where the roots receive some shade, and moisture is available throughout the summer. The beds or sites of the groups should be dug fully 18 inches in depth, and the holes at planting time should be half filled with the compost; tread this firmly, and place each bulb on a handful of sharp sand, and about 9 in. distant from its neighbour, and cover all with more sand or grit to keep away slugs and any eelworms that may infest the adjacent soil. Finally, fill in the remainder of the compost, tread it firmly, and cover with a layer of half-rotted leaves to keep out severe frosts, and they are safe for the winter. Another layer of leaves should be spread over them in May, to cover and feed the stem-roots, and occasional waterings should be afforded if the weather be dry. If necessarily planted in beds with a sunny exposure, a few low-growing plants should be introduced among them, such as would shade the roots. Annuals will do for the purpose. The garden forms of *L. auratum* succeed under similar treatment, among them we have *rubro-vittatum*, a grand form with a broad band of rich red down each petal, and similarly coloured spots elsewhere; *picturn*, a similar flower, but with the band confined to the apical half of the petals; and *Wittei*, a pure white flowered variety, with a central band of yellow—one of the most beautiful, but of delicate constitution. These, with *platyphyllum*, *platyphyllum virginale*, and a new richly coloured variety called "Crimson Queen," are the best of the group. Numerous forms occur in collections, scarcely two being exactly alike in coloration and spotting. Grouped here and there among *Rhododendrons*, *Bamboos*, &c., they afford glorious effects. Two years ago the new Himalayan-house and the *Rhododendron*-beds beside the broad walk at Kew contained numbers of these plants in fine condition, their big spikes of massive flowers, carefully associated with the surrounding greenery, were the admiration of all who saw them; moreover, it afforded a useful lesson of the manner in which these plants should be grown and displayed to the best advantage.

THE SPEROSEM GROUP.

This is a group of Lilies well adapted for general planting; it includes *L. speciosum*, *L. tigrinum*, and their beautiful garden forms. All that they require is a fairly strong soil, and plenty of water whilst growing; a sunny position suits them well, but if the roots are shaded, either by close planting or by interspersing other plants among them, so much

beside, but detached from its parent), and are thus able to replenish the food store as fast as it is depleted by the ascending spike, and to increase such store when the stem is self-supporting, or nearly so.

Lilies that produce no stem-roots, or very few, should be planted as soon as growth ceases, in order that the basal roots, their only support, may make headway before the new axis starts to flower. They are the most difficult Lilies to force on this account, and are rarely satisfactory in pots, unless they are planted a year before they are wanted;

FIG. 9.—PROFESSOR C. S. SARGENT AND MR. H. H. BENNELL, AT THE OPENING OF THE HORTICULTURAL HALL, BOSTON, U.S.A. (SEE P. 26.)
(The Professor is the right hand figure of the illustration.)

ward sources. It was the case ten years ago, as now. Why this should be so is a little difficult to determine. Many, such as *L. longiflorum* and *L. auratum*, were destined for pot-culture, and shared the fate of Hyacinths grown for the same purpose. Some, particularly the large bulbs, could not be expected to live long. In the first place, they had reached their largest size; and secondly, these large bulbs feel the removal, transportation, and incidental exposure more severely than those of a medium size, most of the trouble being the decay of the basal disc. Large bulbs are best adapted

the better. They all force well, and may be regarded as most accommodating Lilies, such as the unskilled amateur may grow without fear of failure. The bulbs should be planted fully 6 inches deep in a well worked soil, placing sand above and below the bulbs to keep away slugs. The garden forms of *L. speciosum*, numbering about a dozen, are very showy plants, and are a great advance on the old types imported from Japan twenty years ago. The best of these is *album novum*, a lovely pure white-flowered form with yellow anthers and massive petals of great substance and considerable breadth. It is one of the best white Lilies in cultivation; it succeeds best when planted in a sheltered, warm spot, as it flowers late in the year, and at a period when cold nights may be expected, such as would check its later buds. *Melpomene* is another grand form with equally large flowers of a dark crimson colour, elegantly margined, and freely spotted with white or a pale shade of pink. This is the best of the coloured forms, the flowers being exceptionally rich and bright. Scarcely less choice, and equally useful, are such varieties as *Kreutzeri*, an improved *album*; *macranthum*, a large-flowered, rich-coloured roseum; *punctatum*, a lovely white flower, delicately shaded and heavily-spotted pink. A very dwarf variety named *cruciatum*, is most suitable for pot culture, or for planting in the foreground of the taller groups; its flower resembles that of *Melpomene*, but it is not nearly so large. The older forms of *L. speciosum* are too well known to need mention here; their hardiness, freedom of flowering, and telling tints of colour, render them useful for massing in large beds, and for more or less "wild" gardening.

Lilium Henryi, a very fine Lily of recent introduction, and one which possesses all the good qualities one could wish for, and more besides, belongs rightly to this group. Botanically, it is nearest *L. speciosum*, and by some has been considered to be only a variety of that variable species. As a garden plant of exceptional merit, it has come to stay. It is one of the few Lilies that may be raised from seed with ease, and once planted, it comes up year after year with increased vigour. When fully grown, it attains a height of 10 feet (I have measured one 15 feet high), and carries an inflorescence of twenty or more elegantly-reflexed, orange-coloured flowers, on branched pedicels, the centre of each flower being covered with numbers of petaloid processes, and the margins are handsomely spotted a richer colour. Excepting a clear lemon-yellow coloured flower, and practically all shades of orange with much diversity of spotting, as well as of leafage, no marked break of colour has yet appeared, but each succeeding year extends the range of colour this stately Lily manifests. Culturally, it requires a strong, preferably a virgin soil, and that the bulbs should be planted 8 inches deep, with the usual envelope of sand around them. In scores of Lily gardens that I have seen throughout the country, I have not met with a single plant of *L. Henryi* doing badly, save where the mode of cultivation was obviously faulty. One point in its cultivation should be remarked here. Its stem-roots are very strong and numerous, and they may be encouraged to form several inches up the stem with the aid of a little damp moss. They should be covered early in the season with rich soil and a mulch of very old manure, the tall, strong stems depending largely for their support upon these. Moreover, such a tall Lily as this, even when well staked, often becomes loosened in windy and wet weather, so that the better root-anchorage it has, the better will it be able to bear the strain.

Hybridists should make note of the fact that this Lily is an excellent seed bearer, and that it has many good qualities few other Lilies possess. Some work is already being done in crossing this Lily with others, but of this it is yet too early to speak. It forces well, and at all seasons. *G. B. Mallott*.

(To be continued.)

LILY AND OTHER EXPORTS FROM JAPAN.

I beg to send you herewith a very interesting statement showing the exports of horticultural articles from Japan during the last twenty years. You will perceive therein that the exportation of Lily bulbs since 1896 took a sudden rise, which was principally owing to the great demand for *Lilium longiflorum*. Until then there had been but little demand in the European market, and what there was, *Bermuda* supplied; but when the demand increased, and the *Bermuda* Lilies showed signs of decrease, we began with the exportation of *L. longiflorum*, which has increased from year to year, and promises, as this statement shows, to become of great value. The second item of importance is *Lilium auratum*, which is followed by *Lilium speciosum*, the white and red variety, and in addition to these all the other Japanese Lilies. Under the heading of plants and trees come also trunks of *Cycas* and dried *Cycas* leaves, as well as the dried inflorescence of *Eulalia*, two articles of which sometimes large quantities are exported:—

ORCHID NOTES AND GLEANINGS.

CATLEYA MOSSIE COUNDXONIENSIS.

A flower of this extraordinary variety is sent by Mr. Collier, jr. to Geo. Singer, Esq., Compton Court, Coventry, who is the fortunate possessor of the plant. The last phenomenal flower always appears to be the most wonderful, but it is scarcely possible that any advance on this one can be expected, for it is not only of great size, but of a very rich colour. The flower measures 10 inches across the extended petals, each of which is 3½ inches in width at the widest part; the sepals and petals are of

a bright, light purplish-rose colour, but the latter have a white midrib in the lower third part, and silvery veining towards the edge of the deeply crimped and slightly fringed margin. The base of the lip on the exterior is of the same colour as the petals. On the inner side it is prettily marked with purple and orange at the base; the front lobe, which is 3 inches wide, is marked with violet-tinted purple, deeply margined with a frilled irregular band of rose colour.

CATLEYA MOSSIE "EARL LEONIC."

This is a most beautiful flower from the old florist's standpoint, its segments being broad, and forming a circular flower. It measures a little more than 8 inches in diameter, and the petals are 3½ inches in width. The flower, which has crimped and fringed petals and lip, belongs to the light-coloured section, the sepals and petals and side-lobes of the lip being white, with a distinct shade of pale lilac-pink over the whole surface. The base of the lip is purple, with a white veining; the centre and front of the side-lobes orange; and the centre of the front lobe of a light purple tint, with marbling of a darker purple tint, and the margin of the crimped lip is white, fringed with rose for about a quarter of an inch wide. This very distinct companion plant to *C. M. coudroniensis* flowered with Geo. Singer, Esq., Compton Court, Coventry.

PROLONGING THE SEASON OF THE STRAWBERRY.

Late Strawberries are always valued, and specially so in a dry season like the present. It is a praiseworthy practice to have beds of the latest varieties on borders facing north, and screened on the south by walls or tall hedges, and where the plants do not suffer so much from drought in a season like this one. Some of the later varieties are not very strong growers at Syon. The soil in which Strawberries are grown here is suitable enough, and is well manured, and not too clayey. For many years I have relied upon young plants for the earliest crops of dessert fruit, but in the case of the late varieties sufficiently good returns are not obtained from these the first season. The late Pine Strawberries do well generally in the second year after planting, being mulched, and also afforded liquid-manure when obtainable.

The best of British Strawberries may be grown on a north border in a soil that would not grow them well in the more open quarters of the garden. As most gardeners know, north borders have drawbacks, such as loss of plants in winter; but this may be met by planting rather closer than usual, or by filling up vacancies in the lines with strong reserved plants. As regards cultivation, I have nothing new to note, but will briefly point out how the Strawberry season may be extended by growing certain varieties, and in diverse positions. The perpetual fruiting varieties, *St. Joseph* and *St. Antoine de Padoue*, will do much to lengthen the season, though these lack the size of the older varieties, and *Alpines*, grown from seed annually, would assist to extend the season till October. *Alpines* are grown readily from runners, but seedlings furnish the best fruit, and as *Alpines* are small growers, they may be planted much closer together, say 9 inches by 1 ft.

I have grown the variety *Eleonor*, *syn. Oxonian*, for several years on account of its lateness, not for its quality. It is large and showy and useful. I do not know of any variety later than *Oxonian*, and few are more hardy, or that will succeed as well in the autumn.

As late varieties of good quality, Filbert and Frogmore-Pine may be recommended, the second being the better fruit of the two, but it is not so heavy a cropper, and at Syon it succeeds only on a north border, owing to the lightness of our soil. The Filbert Pine succeeds in light soils, having ample foliage, and it scarcely ever fails to fruit satisfactorily. In order to do it justice, the plants should be treated like British Queen, that is, a quarter should be planted each year, and destroyed after it has fruited for two years.

Doubtless the Latest-of-All Strawberry has come to the front quicker than any other, but it is not suitably named, it being not so late as several others. The fruit of Latest-of-All

CYMBIDIUM LOWIANUM × C. EBURNEUM.

ALTHOUGH crosses have long been known in Europe between *C. Lowianum* and *C. eburneum*, in which both have been used as the seed-bearing parent, the one which we illustrate (fig. 10) in the present issue is the first, so far as our knowledge goes, of a cross raised and flowered in Australia. According to information kindly furnished by Messrs. F. Sander & Co., of St. Albans, the seed of artificially-fertilised flowers was sown by Mr. Godwin, gardener to John Hay, Esq., of the Crow's Nest, North Sydney, in the month of July, 1896; and a plant of this sowing flowered in April of last year.

FIG. 10.—*CYMBIDIUM LOWIANUM* × *EBURNEUM*, IN THE GARDEN OF J. HAY, ESQ., CROW'S NEST, NORTH SYDNEY, NEW SOUTH WALES.

is of good quality, resembling one of its parents, viz., British Queen, which it exceeds in size. The plant not being robust, it should be planted rather close together, and on a heavy soil. It also succeeds here on a north border, being treated similarly to British Queen.

Another novelty is Trafalgar, and though like Royal Sovereign in size, shape, and colour, it is much later than that variety, and possesses a much finer flavour. It makes also a more vigorous plant.

My note would not be complete unless I included Waterloo, although Latest-of-All and Oxonian are preferred here to follow the Pine Strawberries. The new race of perpetual fruiterers should give us fruit till November, for the fruit is produced in succession on the young growth. Though small, it is well flavoured. *G. Wylthes, Syon Gardens.*

As Mr. Sander remarks, "It is evident that the climate of Australia is favourable to the raising of Orchids; and in fact, in this particular instance, a record is established in rapid growth." The flowers measured 5½ in. across, which is quite equal to the standard in point of size.

THE MIXED FLOWER-BED AND ITS EDGING.

The same causes which led to the substitution of plants in mixture for the massing method of planting is now becoming apparent in the stereotyping of the fashion of planting in gardens generally. There is far too much uniformity of practice, so that go where you may the *mélange* is the same. As regards the bedding-out pursued by the various park superintendents in the metropolis, the mono-

tony is fearful to behold, few of them having the least idea of altering their methods or of striking out a line for themselves.

These beds being seen by country gardeners, the latter straightway make copious notes, and put into practice the same year or the next, the methods observed, so that the country gentleman's flower-garden is more or less a replica of the beds in Battersea, Regent's, Hyde, and other town parks. To my idea the geometrical garden, if it be the only one, is a mistake, its very formation, the relative smallness of the beds, and the narrowness of the intervening walks and spaces of turf and gravel, often compelling the gardener to employ dwarf plants in order to preserve or indicate the outlines of the beds. Such a garden might be tolerated as an adjunct close to the house, out of sight of the principal rooms, and away from the main garden-front of the house, constructed on a small scale, and having some relation to the space at command, and separated from the rest of the garden by an ornamental iron fence, covered with creeping flowering plants, a low wall of an ornate character, or one consisting of a balustrade merely, or an evergreen hedge of Thuja, or one of *Pyrus japonica*, or of climbing Roses, *Jasminum officinale*, or *Honeysuckles*.

To return to the mixed flower-bed, which can be more incongruous than a stiff, formal line, such as may be seen in every London park, of *Echiveria secunda glauca*, *E. Peacocki*, *Sempervivum tabuleforme*, a stiff-looking grass, a row of dwarf Lobelia or of Golden Feather, and similar plants, which, whilst appropriate enough on a rockery, are out of place when thus arranged as edgings to mixed flower-beds. If the mixed bed be adopted, let us have no such incongruity as a formal line of these plants, but rather something which, whilst dwarf of stature, shall fittingly indicate the outlines of the beds in an irregular manner.

The edging that I would recommend for the mixed bed are Pansies, Violas, Verbenas, *Arabis albidia*, *Armeria cephalotes alba* and *rubra*, *Ambrosias*, *Campanula isophylla*, *C. pulla*, *C. pusilla*, *C. carpatia*, *C. garganica*, *Cerastium tomentosum*, *Helianthemus*, *Corydalis lutea*, *Cyclamen europaeum* and *C. neapolitanum*, *Dactylis glomerata variegata*, *Draba aizoides*, *Gentiana acaulis*, *G. affinis*, *G. bavaria*, *Geranium argenteum*, *Hepticia triloba* in all colours, *Heuchera sanguinea*, *Heberis corneifolia*, *I. gibraltaria*, and *I. sempervirens*; *Lithospermum prostratum*, *Lysimachia Nummularia*, *L. N. aurea*, *Myosotis* in variety, *Nierembergia rivularis*, the dwarfed *Enotheras*, as *macrocarpa*, *marginata*, *Pilgrimi*, and *faraxifolia*; the dwarf *Phloxes*, as *amena*, *subulata*, *procumbens*, *canadensis*, &c.; *Saponaria ocyroides*, *Polyanthus*, double-flowered *Primulas*, *Violets*, *Pinks*, and *Auriculas*.

These plants should be planted sufficiently wide apart for their full natural development, and should not be kept to rigid lines, either within the boundaries of the beds, or when allowed to grow beyond them if such luxuriance met with approval. The flower-beds I have in my mind, are such as consist of suitable mixtures of hardy and half-hardy annuals; hardy herbaceous perennials, chosen for spring, early or late summer, and autumn flowering, as may be desired; or beds consisting of one or at the most two species. Sub-tropical bedding lends itself to this kind of treatment, but the plants being chiefly tender exotics, many of which require housing in roomy houses, scarcely come within the scope of an ordinary garden. Still, there are many for which space could be found, as for example *Cannas*, *Phloxias*, *Plumbago capensis*, without mentioning *Wigandias*, *Himene*, *Hemp*, *Amaranthus*, *Solanums*, &c. *M.*

UNITED STATES OF AMERICA.

OPENING OF BOSTON (MASS.) NEW HORTICULTURAL HALL.

The formal opening of Boston's splendid new Horticultural Hall took place on the evening of June 3, when one of the finest exhibitions ever held in America was given. The arrangements for the opening show were entirely in the hands of Professor Charles S. Sargent (fig. 9, p. 23), whose fame as a horticulturist and arboriculturist is world-wide, and the result of his earnest and persevering work was exhibited in a very gorgeous, and at the same time æsthetic flower-show we have ever had in the United States. No premiums were offered by way of inducement, Professor Sargent secured all the exhibits from amongst his personal friends, and the best New England collections sent their choicest material. No exhibitors' names were allowed to appear, nor were any of the plants named, the latter arrangement being considered a mistake. The various Orchids, Palms, &c., were utilised by those having the arrangements in charge, irrespective of ownership; all the pots, baskets, &c., having special marks of identification. The result of all this was a superb show, such as we are unlikely to see in America for many years. That the Massachusetts Horticultural Society has done well in building new quarters was amply demonstrated by the crowd of people who attended on the opening evening, and by the attendance of some 35,000 persons on the eleven days the show remained open. Prices were 2s. until 7 P.M.; from 7 till 10, 1s. The exhibition, by special permit of the legislature, was open from 12 A.M. to 10 P.M. on Sunday, June 9, when nearly 1,000 attended. A specially pleasing feature was the attendance of hundreds of school children with their teachers, these came in at reduced rates. The opening show will long be remembered in the annals of American Horticulture, and it will net a good sum for the grand old society which has done so much for its advancement.

The main feature in the principal exhibition hall, which is 122 x 50 feet, and 43 feet high, was a magnificent display of Azaleas from Prof. C. S. Sargent, comprising some 200 plants, many of them specimen plants; these were sunk in the ground, the surface being neatly turfed over, and being arranged in large beds for colour effect (backed next the walls with large Palms), they were very effective. A huge sloping bank of Rhododendrons, some 20 feet high, from Mr. H. H. Hunnewell, of Wellesley, Mass., was another feature in the same hall. In the large lecture-hall, a large group of immense standard Wistarias also from Prof. Sargent, carrying thousands of racemes of flowers, was greatly admired; as was a similar and fine group of *Trachelospermum jasminoides* from the same gentleman, the latter specimens 6 to 8 feet high, and smothered with bloom. A large bank of seedling *Hippeastrums* from Dr. C. G. Weld, Brookline, Mass., of superb quality; also large displays of *Gloxinias*, fancy and zonal *Pelargoniums*, and *Hydrangea otakusa*, were shown in this hall.

In the small exhibition hall, which was entirely devoted to Orchids, arranged with Palms and other foliage plants, was by far the most extensive and choicest display of these plants ever seen in the New World. The plants were arranged according to genera, and made a much more impressive display in this way, than when mixed up in promiscuous groups. There were specially large and fine groups of *Cattleyas* Skimmeri, Mossie, Mendelii, and gigas, *Laelias purpurata* and cle-

gans, *Miltonia vexillaria*, *Cymbidiums*, *Odontoglossums*, *Dendrobiums*, *Epidendrums*, and *Cypripediums*. Some 600 specimens in all were staged. The leading exhibitors of these were Mrs. F. Q. Ames, North Easton, Mass., and Mr. H. H. Hunnewell, Wellesley, Mass. (fig. 9, p. 23). Smaller, but choice assortments came from all the other leading New England Orchid-growers, including Bayard Thayer, and E. & R. Thayer, Lancaster, Mass.; J. E. Rothwell, Dr. C. G. Weld, and Prof. C. S. Sargent, Brookline, Mass.; C. Lothrop, Esq., North Easton, Mass.; J. S. Bailey, Roxbury, Mass.; and W. P. Winsor, Fairhaven, Mass. Many rare and valuable *Cattleyas*, *Lælio-Cattleyas*, *Odontoglossums*, and other species were shown.

No faded or unsightly plants were allowed to appear in the exhibition during the eleven days it was open. As soon as any plant showed signs of being past its best, it was removed, and loads of fresh plants were added almost every morning. The foliage on the hundreds of Palms (many of them big specimens) was frequently sponged, and everything possible was done to make the exhibits appear inviting; the result being that most of the exhibits were as fine on the closing as on the opening night.

No cut flowers, coloured leaf of stove or greenhouse plants, fruits, or vegetables had any part in this exhibition, which was rather planned and carried out to show people how a flower show should be arranged, and to endeavour to educate people above the formal, stereotyped arrangements newly always seen on such occasions. While only a few varieties of plants were exhibited, the whole space, 210 by 91 feet, was occupied, and the paths were none too large for the perambulation of the crowds which attended. Music was provided by an orchestra in the afternoons and evenings; and a restaurant in the dining-hall on the lower floor was well patronised. Altogether, the opening of Boston's new hall, the finest of its kind, we believe, in the world, was very auspicious, and many of us trust that London may soon possess a similar building. W. Y. Craig, North Easton, Mass., U.S.A. [On p. 23 we give a presentation of Professor C. S. Sargent and Mr. H. H. Hunnewell, to whom the chief share of the success of the gathering was due. Ed.]

NOTICES OF BOOKS.

STRAY LEAVES FROM A BORDER GARDEN, by Mary Pamela Milne Home. With eight illustrations, by F. L. B. Griggs. (John Lane, The Bodley Head, London; and New York.)

HAIR though the words seem, it must be owned that there is little that is new to be found in this book. Not that it is not original, so far as it goes, but that there are already so many similar records by ladies of their thoughts and feelings in a garden. Lovers of flowers and plants are many, but their observations, unless chronicled with real inspiration and adequate knowledge, are not particularly interesting to others than themselves.

In these *Stray Leaves* we have the usual remarks about the seasons, the plants and their names, and habits and surroundings. The following is an extract characteristic of the book:—"Southey admired the Holly-tree very much, and wrote a charming little poem about it. It used also to be called Holme and Hulver; this last is, I believe, a corruption of the French word *Oliver*, as it did duty for Olive branches in old church festivals. The catkins are out in the June now, how pretty they are, like drops of snow caught on the bare brown branches of the saughs! This

word is probably a survival of the Anglo-Saxon 'sealh-sallows,' a name, I think, from the Finnish 'salawa.' 'Cattlings' and 'pussies' the children here call them, and sometimes 'goslings;' 'pussy willow' is the American name. It is odd that the German name should be also Katzechen, or 'little cats.' In Hans Andersen's *Story of the Year* . . . Fairy Andersen says, 'It was a beautiful spring, but the Willow-trees wore woollen mittens over their blossoms, they were exceedingly careful, and that is tiresome.' 'Mittens' is an old Scots term for woollen gloves, and woollen gloves without fingers are called 'Doddie mittens.'

So the author discourses concerning the characteristics of the seasons. Much of her experience has been gained in America, and the book is filled up by chapters at the end about her "Friends in their Gardens," these "friends" being of various stations in life and in widely separated localities. The illustrations are rather pleasing than remarkable; and, to revert again to the text, the frequent allusions to "boy" are scarcely interesting, save to the mother of the young hero. The chronicles of the *Border Garden* would, we repeat, be more charming had they been the first, not the latest of their kind; as it is, they will surely please the large and not too critical public not yet satiated with this style of book. There is an Appendix, with lists of flower names, and of bird names, in different languages, and a vocabulary of the vernacular of the *Border*. These are not specially valuable nor exhaustive, but we are bound to take the information ungraciously as it is humbly offered. "Hoping you will, of your courtesy, gentle reader, give it gentle judgment, remembering it hath been said, the province of a woman is to chronicle small beer."

FLORA BRASILIENSIS. Fasciculus xxxv. Orchidaceæ VI. Expositus Alfredus Cogniaux. Pp. 181—384, tab. 50—81.

ALL things must come to an end, and each succeeding fasciculus of this monumental work may be regarded as a milestone marking of another stage of the seemingly interminable journey to the end of the *Flora Brasiliensis*. Of the part under notice it may emphatically be said that it is well worthy of its predecessors, for it bears on every page the most convincing evidence of the patient and clever work bestowed on it by Mr. Alfred Cogniaux, whose labours on this portion of the monograph have been rendered exceptionally arduous by the immense amount of research and reference necessary to produce such a complete enumeration of varieties, the forms of *Lælia purpurata* and some of the varieties of the *Cattleya labiata* section each including from fifty to one hundred names. The usefulness of the work is considerably enhanced by the enumeration of all published varieties and sub-varieties, but the amount of work entailed thereby is incalculable.

The genus *Epidendrum* is continued, and *Cattleya*, *Leptotes*, *Brassavola*, *Lælia*, *Schomburgkia*, *Sophranitis*, *Elleanthus*, *Sobralia*, *Bletia*, *Cyrtopora*, *Cyrtopodium*, *Warrea*, and *Govenia* dealt with in the same exhaustive manner as that pursued in previous issues, description, all available references, synonyms, habitat, time of flowering, &c., being given.

The greater part of the showier species are well known, and highly appreciated in gardens in Europe where Orchids are grown; and the enumeration discloses a large number of pretty species not known in gardens, but which would find favour if introduced.

The plates are excellently well done to facilitate identification, analytical drawings of the parts of the flowers being given in most cases to the minutest detail. Many of the

subjects are familiar to us, but the singular plant figured as *Laelia Regnelli* is interesting on account of its remarkable structural differences from others of the genus. The plants

L. flava, *L. rupestris*, *L. cinnabarina*, *L. harpophylla*, *Leptotes unicolor*, *L. Panamaensis*, *Brassavola flagellans*, *B. Gardneri*, *B. Martiana*, *B. nevoluta*, *Elleanthus crinipes*, *E. brasili-*

Rodriguezii, *S. yanaperyensis*, *S. pubescens*, *Sophranitis coccinea*, *S. cernua*, *S. Wittigiana*, *S. rupestris*, *S. Rossiteriana*, *Schomburgkia crispata*, and *Warrea tricolor*.

FIG. 11.— NEW RAMBLER ROSE, "QUEEN ALEXANDRA"; COLOUR, PINK WITH WHITE CENTRE.

(Awarded a Gold Medal of the National Rose Society, on July 4, when shown by Messrs. Jas. Veitch & Sons. See p. 30)

illustrated are *Cattleya elongata*, *C. intermedia*, *C. Harrisoniana*, *C. Walkeriana*, *C. velutina*, *C. Warneri*, *C. Eldorado*, *C. violacea*, *C. bicolor*, *Laelia pumila* Dayana, *L. Regnelli*, *L. crispata*, *L. amantia*, *L. longipes*, *L. caulescens*,

ensis, *E. b.*, var. *Hookerianus*, *E. graminifolius*, *Bletia Rodriguezii*, *Cyrtopogon longifolia*, *C. l.*, var. *amazonien*, *Cyrtopodium yanaperyense*, *C. Brandonianum*, *C. charneum*, *Goyenia Gardneri*, *Cyanorechis Arundina*, *Sobralia*

THE BOOK OF ASPARAGUS. By Charles H. G. F.R.H.S.

THIS is one of a series of handbooks on practical gardening being issued by John Lane, The Bodley Head, London and New

York. The author of this manual has had a long experience as a gardener, and is eminently qualified for the task he has undertaken. Recently he has been engaged by the County Council of Cornwall in experimenting on a large scale, with a view to determining the most suitable crops for extended culture in that county, and the best methods of cultivation of those crops. His lectures throughout that county have already borne good fruits. An important chapter in his book is that which is concerned with the cultivation of Asparagus on various soils, good and bad. He is, of course, in favour of soils that are friable, porous, easily worked, and well enriched by manure, and the deeper the better, as then the plant is unimpeded by drought.

Varieties such as Sutton's Perfection and Giant French, Late Argenteuil (wrongly spelled Argenteuil), and Early Argenteuil, the author considers distinct; but he thinks that cultivation has much to do with the so-called varieties, with which remark we are in agreement.

The necessity for sowing Asparagus seed on clean ground is very rightly enforced, the seed germinating irregularly in regard to time, and land foul with weed seeds would give endless trouble to free it from weeds without injuring the small, delicate plants. The seed-bed should be dug in the autumn or early winter, and the surface left as rough as possible. After January, it should be forked over without touching the manure, and the surface left for the weed seeds to germinate. When the weeds appear, it should be harrowed or raked a few inches deep, and again left. If possible, allow a second crop of weeds to spring up, and proceed as before. Work the land so that there are no clods underneath the surface. Sow in March.

In a like careful, thorough manner the cultivator is instructed in every operation involved in the cultivation of the plant.

We gladly notice a tool used in Cornwall for "getting out" drills in which to plant young Asparagus. It is in reality a small spade, rather narrower at the mouth than at the tread, made with a socket set at a conveniently obtuse angle for receiving a straight long handle. With this tool the drills are made of an uniform depth, as deep at the side as in the middle, which is not possible with a hoe.

After cultivation, we find a chapter on forcing, with hints on bundling; a history of the plant, and methods of cooking.

Celeriac comes in for a chapter to itself, and we hope Mr. Hott will get our countrymen to take up the cultivation of this useful winter culinary or salad plant. Some chapters on Scorzoneria, Sea-kale, and decorative species of Asparagus follow.

The Week's Work.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HISSKEY PACE, Esq.,
Prestwood Hall, Loughborough.

Euphorbia (Poinsettia) pulcherrima.—Plants which were struck from cuttings early should be shifted into large 18's, the potting-compost consisting of loam three-quarters, and leaf-soil one-quarter. The potting should be firm, and the plants placed in a pit having a temperature of 60 by night, not necessarily from fire-heat. Afford shade from bright sunshine till fully re-established, then by degrees expose them to the light, and give more air. The objective of the grower should be a dwarf plant and well ripened wood, which will furnish fine large heads of bracts. Continue to propagate the plant by means of cuttings till the required

number is secured, and shake out of the old soil and place in smaller pots the "cut-backs" of last year.

Chrysanthemums.—Recently-potted Japanese and incurved varieties should be carefully afforded water, and after sunny days a heavy syringing of the foliage several times a day. During heavy showers of rain lay the plants on their sides, or the soil may become sodden at a critical season. Tie-in the necessary number of growths after the natural break has occurred, and in the event of black or green aphid appearing on the points of the shoots, sprinkle them in the early morning hours with Tobacco-powder. Shoots of Pompons should be stopped for the last time. The late-flowering varieties of W. H. Lincoln, Princess Blanche, L. Canning, and Niveum, should be permitted to grow without any stopping or pinching, merely thinning the buds when the season is more advanced. Early summer-flowering varieties may now be afforded liquid-manure, in the ratio of one of manure to six of water twice a week.

The Greenhouse.—Hard-wooded New Holland plants being at this season well advanced in growth, may be repotted if this be required. Before repotting any of these plants, loosen the roots at the sides with a pointed stick, doing this with as little injury to the plants as is possible. After repotting, keep the plants in close quarters for a few days, damping the foliage twice a day, and keeping the air moist. Afterwards they should be afforded more and more air, and in a fortnight they may be plunged in coal-ashes out-of-doors, or kept under glass, as may best suit the locality. Winter-flowering Heaths and Epacrises may be placed outdoors in an open situation at the end of the month, if not earlier, and such late-flowering plants as Pimeleas, Aphelexis, and Leschenaultias, &c., which are now out of bloom, may be kept in a house facing north, where they may remain till growth recommences, affording the foliage a gentle syringing daily. Pick off the remaining blooms, and thin out the weak shoots previous to training the plants at the finishing of their growth. The growth of Lapagerias now being at an end, the shoots should be trained previously to flowering, and the plants afforded water at the root as may be required and diluted liquid-manure occasionally.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK ROLLE,
Bacon, East Baulleigh, Devonshire.

Celery.—The earliest rows will be all the better for another stirring of the soil, and a dusting of the tops with soot at weekly intervals, catching the foliage when moist with dew or rain, the Celery-fly usually making its appearance at about this time. Examine the leaves during the next three months, and remove any parts in which the mining grub is seen, throwing those into a basket for burning. Celery should be planted for succession as ground becomes vacant, making the trenches less deep than those filled with the early plants.

Coleworts.—The first sowing being fit for planting, afford the plants 1 square foot on which to grow. Strew soot or wood-ashes frequently on the later-sown plants, in order to keep green-fly from them. The homiful rain which fell a fortnight ago dislodged many of these, as well as the Turnip-fly, and as a consequence the plants are making progress.

Carrots.—The last sowing for the season may now be made in the south, the land being dressed moderately with soot and quicklime, and afterwards dug one full spit deep, breaking up all the bigger clods in the process. Make it firm by evenly trampling it all over, and sow in shallow drills drawn 1 foot apart. The varieties Model, Early Gem, or Early Horn, are suitable for sowing at this date.

Endive.—Thin out and transplant Endive at 1 foot apart, and make another sowing shortly.

Cabbage.—In northern districts it is usual to sow about the 15th inst., but in Devon the

25th is soon enough, with another sowing made fourteen days later. Sow in shallow drills made at 1 foot apart, away from the shade of trees; and put a net over the bed, raised a foot from the ground, as various kinds of birds are partial to Cabbage-seed.

Shallots and Garlic.—When the tops begin to wither, pull up the bulbs, and place them on a hard, dry path, or on boards, to dry, and after a week's exposure, hang them up in bunches in a cool shed.

Sea-kale.—The dry weather having been injurious to this vegetable in many parts of the country, it will assist growth if a light dressing of salt be afforded the soil between the plants, hoeing the ground afterwards to bury the salt.

Late Broccoli and Sprouts should be planted between, and in some gardens the old Strawberry-beds may be planted without much preparation beyond that required for grubbing up and clearing away the plants and the mulching materials. The land already planted should be well hoed before being earthed up, whilst it is possible to do this.

Peas.—Owing to the long drought, thrips made their appearance in many gardens, and last week I saw a long row of Sutton's Improved Duke of Albany completely ruined by this pest. The recent rains have done much good to the Pea crops. Where the rainfall has been light, afford water copiously twice a week, and a mulch of some kind. Where the rows of Peas stand wide apart, and the intervening space is cropped with low-growing vegetables, the land under Peas gets a little shade, which will have stood the Peas in good stead during the late hot weather. The latest sowings should be mounded up and staked. The points of the haulm of those that have reached the tops of their stakes should be pinched off; and this applies also to Scarlet and other Runner Beans.

THE ORCHID HOUSES.

By H. J. CHURMAN, Gardener to R. I. MEASURES, Esq.,
Cambridge Lodge, Finsden Road, Camberwell.

Miltonia spectabilis is one of the most beautiful of the late-flowering Miltonias, and requires warmer conditions and more sunlight than most of the species to induce it to flower freely; the place our plants succeed best is at the cool end of the Cattleya-house, suspended from the roof. Only sufficient shading is used to protect them from scorching during the brightest hours of the day. The natural colour of the foliage has a somewhat yellow tint, but this is not increased by exposure to light, and the plants do not suffer in any way from exposure to the degree of light necessary to flower them satisfactorily. During the present season the plants are emitting new roots from the base of the growths, rapidly maturing, and the flower-spikes will soon be conspicuous. Any repotting that may be necessary should be done now, and the plants will then quickly establish themselves in the new material, and the flowers will open without any apparent check. This species succeeds best in well-drained baskets, and the potting material should consist of equal portions of fibrous-peat and sphagnum-moss. The plants require an abundant supply of moisture during the summer season, but after they have finished their growth and have flowered, let them be removed to cooler conditions, and kept comparatively dry. *M. Moschiana*, *M. bicolor*, and *M. flavescens* require similar treatment to that advised for the type. The smaller straw-coloured flowers of *M. flavescens* are produced earlier in the season than those of the other species, and repotting should therefore be done earlier. *M. festiva*, the supposed natural hybrid between *M. spectabilis* and *M. flavescens*, is very pretty and distinct. It is somewhat rare, but should be afforded a place where Miltonias, such as *M. candida*, *M. Clovesii*, *M. cuneata*, *M. Regnellii*, *M. Peetersiana* (which is a supposed natural hybrid between *M. spectabilis* and *M. Regnellii*), and the rare and beautiful

M. Bluntii Lubbersiana, should be grown in pots or pans, using the compost already described, and should be afforded a light position at the warm end of the intermediate-house. During the growing season the plants require the same treatment as recommended for *M. spectabilis*, but they may be syringed overhead two or three times a day in warm, bright weather. When growth has finished, treat the plants in the same manner as *M. spectabilis*. Care must be taken to keep the above sections of Miltonias free from insect-pests. The greatest pests are thrips, which attack the leaves in a very young stage. If once they establish themselves in the centre of the growth, they are very difficult to dislodge, and may cause permanent disfigurement in a very short time. Where thrips are observed, dip the plants in XL-All wash, which must be diluted according to the directions on the bottle. The house should also be fumigated at regular intervals. The heavy rains during summer are apt to dislodge thrips from outside vegetation, and some being conveyed to the interior of the house through the rain-water pipes, get distributed upon the plants when dipping them. It is a good plan to fumigate immediately after summer rains.

FRUITS UNDER GLASS.

By MALCOLM MCINTYRE, Gardener to the CHAS. TENNANT, The Glen, Inverlathie, Peeblesshire.

Figs.—When the first crop of fruit has been gathered, recommence to syringe the trees twice daily, and spray the borders and other surfaces as advised before the fruit commenced ripening. Thin out the fruits in degree according to the crop, removing those nearest the base of the shoots. Stop and tie the growths as they advance, removing those not required, and regulating those retained so that they may receive the benefit of light and air. Trees that are planted in borders of limited extent, having good drainage, will require abundance of water at frequent intervals. On each occasion use weak liquid-manure from warm tanks, or guano at the rate of 1 lb. to 20 gallons of water. Before finishing the watering, I generally afford the border a good sprinkling of Thomson's Vine and Plant-manure. This manure contains a combination of elements, as does the liquid-manure from stables, &c., and it is safer than simple salts, such as sulphate of ammonia, nitrate of potash, and nitrate of soda, which promote too much leaf growth in the Fig. Maintain a circulation of air in houses where the crops are ripening, and keep the atmosphere warm and rather dry. Avoid wetting the fruits, but an occasional damping of the house will benefit the foliage. A moderate degree of moisture in the soil is necessary for ripening Figs, but excess must be avoided. Trees in pots for early forcing should be syringed occasionally, and afforded the necessary supplies of water and liquid-manure.

Cucumbers.—The plants in the Cucumber-house will now be growing and fruiting freely. Spray the plants in sunny weather at least twice a day, and stop the shoots as growth proceeds, tying the line to the trellis. Plants in bearing will require to be afforded liquid-manure three times a week. As soon as the roots show themselves through the compost, afford a top-dressing of loam, with rotten dung well incorporated. This compost should be made in readiness some days before it is required. Make fresh sowings as required, remembering that it is prudence to be provided with surplus plants in pots in sufficient numbers to meet any probable requirements. Plants that have been fruiting for some time, and are nearly exhausted, should be turned out, as it does not pay at this season to keep those which have lost their vigour.

Setting Melons in Frames.—During moist, warm weather the flowers do not set freely, especially when the plants are growing strongly. A moist atmosphere, closeness, and crowding the foliage or shoots are adverse to a good set. Keep the shoots rather thin by removing every alternate lateral whilst quite small. Removing them after they have grown

large often causes gumming and canker. The laterals retained generally show fruit at the second or third joint; if not, stop them at the second joint, and the sub-laterals will show fruit freely, when water should be applied sparingly, taking care not to wet the surface of the bed any more than is necessary. Place linings of hot dung against the sides of the frames; this will raise a gentle heat, and allow of a small volume of air being admitted day and night. Fertilise the flowers when fully expanded, and stop the shoots one joint beyond the fruit at the same time. Admit air freely when weather permits, increasing the ventilation at 70°, allowing it to rise to 80° or 85°, at which keep it throughout the day, and closing at 80°. When the plants have set two or four fruits each, and these are of the size of a pigeon's egg, commence affording water by sprinkling the foliage at closing time, always keeping the water from the necks of the plants. In hot weather afford plenty of water twice a week, but once in the same period will be ample in dull weather. When the fruit is advanced for ripening, keep the bed well lined with hot dung or grass-mowings, and ventilate the frames freely.

THE FLOWER GARDEN.

By T. H. SLADE, Gardener to Lord Poltalloch, Edinburgh Park, Easter.

Spanish Iris.—Clumps showing signs of exhaustion will be benefited by being lifted after flowering is over, planting the bulbs in some other part of the garden. The plant likes a moderately light soil, and one not too wet during the winter, and as it is not prudent to disturb this section of the Irises often, the ground should be well prepared, affording it a liberal dressing of half rotten manure if it be poor; and unless the soil is sandy, road-grit or coarse sand should be incorporated with it. The bulbs should be kept out of the soil but for a short time, the new growth starting quickly after the flower-stems have died down. While they are ornamental as clumps in mixed borders, unless the clumps are labelled in some manner, the bulbs are liable to be disturbed during the resting time. I prefer to plant them in rows behind the espalier fruit-trees separating the vegetable quarters, on slightly raised ground by the side of the alley or narrow path, and in this position on heavy loam they thrive very well. If not shaded, and they are planted a little higher than the surrounding ground, the plants get the baking or drying necessary for the ripening of the bulbs, and essential for their flowering. A similar position will also suit the English Iris, but as these flower at a little later date than the Spanish, any necessary planting will also follow later. The English Iris are also very suitable for growing in pots.

Dahlia.—These will now be growing apace, and if the plants were of a good size when planted, some disbudbing of the shoots should be done where large fine blooms are wished for. The plants should be forthwith staked, and the main shoots made secure. It is a prudent course to put several stakes to a plant to make them quite secure against wind, and admit sunlight to the inner growths. The stakes should be high enough to afford support, but not to be themselves prominent objects. The plants should be liberally treated in regard to manure and manure-water.

Carnations.—These plants in beds or borders, unless "coil" stakes are used, should have their flower-stems fastened to thin painted sticks, and for large blooms the flower-buds should be freely thinned. When in flower, some slight protection against hot sunshine is needed, or the blooms will endure but for a short period of time, and for this purpose light tiffany stretched on two wires and secured to posts placed at each corner of the bed or border is as good as any.

Wallflowers, and other Spring-flowering Plants.—*Myosotis*, *Linum catharticum*, and *Silene*, if sown at the time advised, will now be large enough for transplanting into nurse-beds, in rows at 1 foot apart, and 6 or 8 inches from

plant to plant in the rows. If the seedlings are left in the seed-bed, thin them to about 6 inches apart. The early planting of Wallflowers is necessary if really good bushy plants are desired, for small plants make a poor display in the spring, and during the winter they make little or no growth.

General remarks.—Take cuttings of choice Antirrhinums. The rain which fell last week was very acceptable to the gardener, and although the storm destroyed many of the flowers in the herbaceous perennial border, it saved many more which must have perished if the drought had lasted much longer. Remove spent flowers; keep the soil stirred. Asters, Stocks, and early *Chrysanthemums* give promise of a fine display. Bedding plants which have not yet been allowed to flower are much improved since the rains, and are going to flower profusely.

THE HARDY FRUIT GARDEN.

By C. HERON.

Layering Strawberries.—The time has now arrived when layering must be carried out, if good plants for forcing or for making new plantations are to be obtained. Providing Strawberry plants were planted last autumn, specially for the production of runners, the blossoms of which have been pinched off, and water afforded occasionally during the dry weather, they should be numerous layers ready at this date. For cultivating in pots the layers, if placed on 3-inch pots, will be fit for the fruiting-pots as soon as the layering-pots will throw roots, that is, at the end of the present month or early in the next at the latest. For forming permanent beds, or for treatment on the annual system in the open, the middle of August will be soon enough to sever them from the mother plants. The latter method should be adopted, on a small scale at the least, in every garden where early fruit is required, as fruit can be obtained thereby quite ten days in advance of that from plants of the same variety that have been in bearing for several years. But and layering-books should be got in readiness as soon as possible, it being well to have everything needed in readiness for a start. The soil used in the layering-pots should be a rather adhesive loam; that which has grown a crop of Melons, together with some spent Manchester-hed manure, will answer very well. Let it be sifted through a sieve having an "inch mesh, and use the strings for placing at the bottom of the pots. The soil should be pressed firmly, and an inch deep below the rim, so as to allow of plenty of space to hold water. The pots may be plunged in single or double lines in alternate alleys, and to the extent of half their depth. The strongest plant on a string should be selected for the layer, and the others removed. If the weather is dry, afford water as soon as a number of layers are laid, and keep the soil in the pots uniformly moist. When well rooted remove the layers, and stand them for a few days in a shady place. Let no secondary runners remain on the young plants.

Affording Water to Peach Borders.—The fruits of Peaches, Nectarines, and Apricots are, in the case of early varieties, approaching ripeness. Although some rain has fallen recently, it in quantity is insufficient to reach the roots of the trees, more especially those of wall fruit-trees, and while the fruits are still capable of growing in size a heavy application of water should be afforded the borders once or twice a week. Where the trees are heavily cropped, liquid manure may be afforded alternately with clear water.

CONVICTIONS FOR FERN STEALING.—Two men, named WILLIAM KING and BENJAMIN HALL, were recently sentenced at Ashton County Police Court to three months' imprisonment for stealing ferns from the gardens of C. T. BRADBURY, J.P., at Riversdale, on June 28.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 13.	Manchester Royal Botanical and Horticultural Society, Rose Show.
TUESDAY, JULY 16.	Royal Horticultural Society, Exhibition and Conference on Lilies at Cliswick (2 days). Kiddinminster Horticultural and Rose Show.
WEDNESDAY, JULY 17.	National Rose Society's Northern Exhibition at Ulverston, in connection with the North Lonsdale Rose Society, Cardiff and County Horticultural Society's Show (2 days).
THURSDAY, JULY 18.	Royal Botanical Society, Meeting.
FRIDAY, JULY 19.	National Carnation and Peacock Society, Exhibition at Crystal Palace.

SALES.

FRIDAY NEXT.—Imported *Odontoglossum crispum*, in fine condition; Cattleyas, *Oncidium*, &c., at Protheroe & Morris' Rooms.—The beneficial interest in lease of Edgewickbury Farm, Edgeware.—Mr. J. B. Slade, for Protheroe & Morris, at the Mart, at 2 o'clock.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Cliswick—63.4.

ACTUAL TEMPERATURES.—

LONDON.—July 10 (6 P.M.): Max. 52°; Min. 57°.
July 11.—Fine, warm.
PROVINCES.—July 10 (5 P.M.): Max. 77°; (Home Counties); Min. 57°; N.E. Scotland.

Those who have been witnesses of the manner in which lads from the village school-room at Harpenden can pick out and identify from a heap of hay, put before them for the purpose, practically all the fragments belonging to the particular species constituting the sample, must have looked with an envious eye at the keenness of vision and accuracy of determination possessed by these trained though untutored lads. It will be remembered that there is a large number of grass plots at Rothamsted, each treated with a different kind of manurial agent, with the exception of one or two control plots left in their natural condition. At stated intervals a careful analysis is made of the hay grown on these plots, with a view of ascertaining what plants are favoured by particular manurial combinations, and what are unaffected or injured by them. This analysis is made by the lads aforesaid, who separate each little fragment of hay and allot it to its proper species, so that, at the end of the analysis, few indeed are the morsels that are left undetermined. Most professional botanists, we venture to say, would be quite unable, without preliminary training, to approach the accuracy and rapidity with which the separation is

thus carried out. Speaking generally, we may add that the separators are not always able to say why they select this or that scrap, as it seems to be chiefly a matter of accurate vision. When, however, the results are checked by the more critical methods of the botanists, it is found that the work of the lads is surprisingly correct. In like manner, the former experiences no difficulty in distinguishing the young seedling plants of Wheat, Barley, Rye, or Oats, which the ordinary botanist, unless his attention has been specially directed to the subject, would not find it easy to do. What the Rothamsted lads or the farmer compass by the eye alone, Dr. MARSHALL WARD now instructs his pupils to carry out by more critical methods. His book, entitled, *Grasses, a Handbook for use in the Field and Laboratory*, published by CLAY & SONS, Ave Maria Lane, is intended to furnish students with a practical handbook, by the assistance of which they may recognise the grasses of the field, study their internal structure, and co-relate that with the conditions under which the plants grow. In successive chapters the outward conformation and the classification of grasses are first dealt with. The internal structure or histology is then reviewed, and another mode of classification given, founded on the anatomical conformation of the leaf. Grasses in flower and fruit are treated in a similar manner, a third system of classification being likewise given from this point of view also.

We have thus three systems of classification from three more or less different standpoints, which seems a purely artificial arrangement, useful indeed for practical purposes, but relatively imperfect from a scientific point of view. Glancing through the little volume, we find many "characters" or points of distinction mentioned which are not included in the ordinary text-books; such, for instance, as the form of the leaf-shoots when seen in section, and other matters which betoken careful personal observation rather than systematic compilation from other books, which is what we are usually furnished with in books on wild plants.

The chapter on anatomy and histology is particularly valuable, as we do not know any book in English that furnishes so many structural details. The relation of structure to functions and to external conditions of soil, climate, &c., is a fascinating study for the student, and the results should have great practical value.

Chapter IX., in which the forms of the so-called "seeds" are described and figured, will be valuable to seedsmen and others, to whom the identification of the "seeds" of grasses is a matter of cardinal importance.

If a second edition could be accompanied by an atlas of plates showing the characteristic mode of growth of the several grasses, and their general appearance, we should have an "up-to-date" grass manual of the utmost utility. In the meantime, we think students are under such a great obligation to Dr. MARSHALL WARD for what he has already given us, that we heartily commend his little book to their notice; the more so as it is usefully illustrated, and possesses an adequate index.

OUR ROSE ILLUSTRATIONS.—The illustrations of Roses we publish in our present issue, taken from exhibits at the National

Rose Society's Show, in the gardens of the Inner Temple, of which we gave a full report last week. Fig. 11 represents the new pink-flowered Rambler Rose, named after Her Majesty Queen ALEXANDRA, and shown by Messrs. JAMES VEITCH & SONS, Chelsea. As we have already stated on p. 11, this variety is the result of a cross between Turner's Crimson Rambler and *Rosa multiflora simplex*, and it appears to possess much the same habit as Crimson Rambler, but has flowers of pink colour. The variety was recommended a Gold Medal by the National Rose Society's judges, and it received the notice of Queen ALEXANDRA. The illustration on p. 31, shows a group of twelve varieties of Roses, exhibited in vases, by Messrs. HARKNESS & SOX, Bedale and Hitchin. It will be seen from our report on p. 17, that the varieties "Mrs. W. J. Grant, Alfred Colomb, and Madame Cusin, were grand in this exhibit, which had a very glorious effect." Those who were present and saw the exhibits of Mr. PRUXCE, and of Messrs. HARKNESS, in classes nine and ten, could hardly have failed to recognise the better effect produced by staging the blooms in this way, rather than in flat boxes arranged in lines, where the flowers are brought down to a level, and natural grace is displaced by a flat monotonous arrangement. The beauty of the single flowered Roses, and their usefulness for decoration, is shown by the tasteful arrangement exhibited by Mrs. O. G. ORPEN, see fig. 11, in a class open only to ladies, and which was awarded 1st prize among nine competitors. The varieties shown are those of *Rosa macrantha* and *Mosehata alba*, the flowers of which are almost white, but have a delicate blush tint. It is noteworthy that when most of the Roses in the exhibition showed evidence of suffering from the intense heat in the tents, these fragile-looking blossoms appeared the freshest. The remaining photograph, see fig. 13, shows a 1st prize collection of twelve blooms of the Tea Rose Mrs. Edward Mawley, a very beautiful variety named in compliment to the wife of our valued correspondent Mr. MAWLEY, one of the Secretaries to the National Rose Society. The exhibit obtained 1st prize for the best twelve blooms of a Tea or Noisette, and was shown by Messrs. A. DICKSON & SONS, Newtownards, Ireland. Our publisher begs us to say that copies of our Rose Supplement can still be had on application.

PLEASANT GATHERING AT NORWICH.—On Thursday, July 4, Messrs. DANIELS BROS., LTD., Norwich, entertained at dinner upwards of 200 of the leading gardeners in the Eastern Counties. The occasion was that of the Norwich Rose Show, which was this year held in close proximity to the nurseries. The visitors, after inspecting the show, visited Messrs. DANIELS' trial grounds, and were there shown upwards of 100 of the newer varieties of Sweet Peas, grown in separate rows, and with the names attached to each row; after that a visit was paid to the culinary Pea trials, of which there were noticed over 150 varieties; but owing to the lateness of the season only about eighteen or twenty of the earliest ones were in full character. The visitors afterwards walked round the nursery, where there are fine breadths of fruit-trees, and a collection of zonal Pelargoniums in full flower. At 6 o'clock the company assembled at dinner, and the chair was taken by Mr. CHAS. DANIELS, managing director; supported by Mr. W. ROGERS SMITH, secretary; Messrs. WATSON, Letton Gardens; Mr. Field, Ashwellthorpe; Mr. CLEMENTS, gr. to Lord BATTERSEA; Mr. MUSK, gr. to Lord de RAMSEY; Mr. BATCHELOR, Catton Park; Mr. JONES, Carrow House; and about 150 others.

FIG. 12. GROUP OF FINEST VARIETIES OF ROSES EXHIBITED BY MESSRS. HARRISS AND SONS.
(From a photograph taken by our artist at the "Temple" Show of the National Rose Society, July 1, 1901.)

"BOTANICAL MAGAZINE."—The plants figured in the last part of this publication, edited by Sir JOSEPH HOOKER, are—

Rhododendron cilicidalys, of Franchet, tab. 7782. A Chinese species allied to *R. formosum*, Kew.

Chelempsis moschata, of Miquel, tab. 7783. A Japanese and Chinese herbaceous plant, similar in appearance to our *Melittis Melisso-phylum*, but differing from it in structural characters. Introduced to Kew by A. K. BULLY, Esq.

Iris chrysantha, of Baker, tab. 7781. A fine self coloured yellow Iris of the bearded section, introduced by M. VAN TUBERGEN, but of uncertain source.

Cyanotis hirsuta, Fischer and Meyer, tab. 7785. A Telescentif-like plant, with linear ciliate leaves, pinkish flowers, and blue stamens. It has globose tubers about the size of a Chestnut, which are eaten by the Abyssinians.

Impatiens chrysantha, of Hooker, f., tab. 7786. A yellow flowered annual species; native of the Western Himalayas. Kew.

THE STOCKPORT AND DISTRICT CHRYS-ANTHEMUM SOCIETY has just issued a schedule of prizes to be offered for competition on November 11. The show will be held in the Volunteer Armory, and will remain open for three days. The Secretaries are Messrs. W. RALPHS and J. M. HAWKES, St. Peter's Square, Stockport.

AN HEROIC GARDENER.—A courageous attempted rescue of two persons from drowning, by Mr. J. CAVANAGH, gardener, of Blarney, co. Dublin, deserves to be recorded. A little girl was taken off her feet by the ebbing tide, and a governess who attempted to save her was likewise carried away, and Mr. CAVANAGH, seeing their danger, ran 200 yards down to the beach, and plunging in just as he was, he managed to bring them to the shore, but unfortunately life in both cases was extinct.

ROYAL NURSERYMEN.—Messrs. WILLIAM PAUL & SON, of Waltham Cross, who for many years held the appointment of Rose-growers to her late Majesty Queen VICTORIA, have now been appointed by Royal warrant Rose-growers to His Majesty King EDWARD VII.

ROYAL SEEDSMEN.—The KING has granted Messrs. JAMES CARTER & Co., of 237, 238, and 97, High Holborn, London, the warrant of appointment as seedsmen to His Majesty.

—The *Times* of July 6 announced that Messrs. SUTTON & SONS, who have been seedsmen to the Crown for many years, have now been appointed by Royal Warrant seed merchants to His Majesty King EDWARD VII.

ORCHID CULTURE IN ENGLAND AND IN FRANCE.—A writer in the *Revue Horticole*, dealing with the Orchids staged at the last Temple Show, considers that the French Orchids exhibited at the Tuileries Show in Paris were superior in point of culture to the English-grown plants, but that the British collections were superior in "richesse des tons."

STOCK-TAKING: JUNE.—The Trade and Navigation Returns for the past month do not afford much encouragement, there being a lessening of the values of both imports and exports, though both are easily accounted for. Imports have decreased by £295,209, and the value of our exports has decreased by £2,150,911, as compared with those for June, 1890. Given the factors of actual warfare and the pressure in the political atmosphere, and

the figures quoted are easy of understanding. The imports for last month foot up at £41,711,038, against £12,016,307—decrease £295,209. The following figures are extracted from the "summary" table usually quoted here:—

IMPORTS	1890.	1901.	Difference.
	£	£	£
Total value	42,056,507	41,711,038	-345,269
(A) Articles of food and drink—dairy	14,226,456	14,141,343	-85,113
(B) Articles of food & drink—dittable	3,164,530	2,582,721	-582,018
Raw materials for textile manufactures	4,167,522	5,529,694	+1,362,172
Raw materials for smelting, min. prod., and manufactures	6,298,353	5,671,081	-627,272
(A) Miscellaneous articles	1,378,167	1,329,834	-48,333
(B) Parcel Post	2,054	78,797	+76,743

The reader will find the "differences" in the table connected with the imports of fruit, roots, and vegetables of even more than ordinary interest:—

IMPORTS	1890.	1901.	Difference.
	Cwt.	Cwt.	Cwt.
Fruits, raw	681	2,004	+1,323
Apples	16,209	24,004	+7,795
Apricots and Peaches	2,974	2,076	-998
Bananas—bunches	121,816	197,116	+75,300

The total imports for the past six months are placed at £262,506,790, against £255,656,999, or an increase of £6,849,791. Of course, reverting for a moment to the decrease on the month, it must be understood that values are frequently affected as well as bulk; but these are matters not strictly in any way either horticultural or agricultural. Passing now to the—

EXPORTS.

We come face to face with the great industries of the country, some of which have to face competition on the part of the United States and Germany. That great alterations will have to be made in some of our business modes is admitted to be true; also that some are already made, and others are about to be made. Manufacturers are busy with labour-saving machinery; and more consideration is now bestowed on the tastes, habits, and customs of foreign buyers, and the belief is getting firmer hold of capitalists, manufacturers, and traders that at the very least we shall hold our own the world over by-and-by. The exports last month reached a total of £22,111,121, against some £21,895,335 for the same

period last year—showing a decrease of £2,150,911. In the past six months a loss of £5,580,366 has to be recorded, the figures being £114,376,764 for the first six months of last year, against £138,796,398 for the same period in the present year of grace.

ROYAL GARDENERS' ORPHAN FUND.—Her Majesty Queen ALEXANDRA has graciously consented to continue the patronage to the Royal Gardeners' Orphan Fund, which Her Majesty formerly extended to the Institution as Princess of Wales.

TREES AND SHRUBS.—Messrs. HOUGHTON, MIFFLIN & Co., Boston, U.S.A., have arranged to begin during 1901 the publication of plates, accompanied by brief descriptions, of new or little known trees and shrubs. The work will be edited by Professor C. S. SARGENT, the author of the *Silva of North America*, and the Director of the Arnold Arboretum of Harvard University, with the assistance of a number of specialists; and the plates will be reproductions of original drawings made by Mr. C. E. FAXON, whose work is familiar to the readers of Prof. SARGENT'S *Silva* and *Garden and Forest*. The material which will serve as a basis for this work will be derived largely from the living collections and herbarium of the Arnold Arboretum. The book will not be confined wholly to North American plants, but will include also the woody plants of other regions, especially those of the northern hemisphere, which may be expected to flourish in the gardens of the United States and Europe, and those of special commercial or economic interest and value. The work will be published in parts at irregular intervals. Each part will contain twenty-five plates, and a volume will consist of four parts, of which it is hoped that at least two will appear each year, the first in the fall of 1901. The parts will be sold separately. A title page and index for each volume will be furnished with the fourth part.

THE TEMPLE SHOW attracts attention on the Continent as well as here. The current number of MOLLER'S *Deutsche Gärtner Zeitung* contains a freely illustrated account of the exhibition.

BATTLE ABBEY.—Owing to the death of the Duchess of CLEVELAND, this estate will shortly be sold.

ARAUCARIA EXCELSA.—Among the more cheerful green foils to floral decorations in apartments and shop windows, and even on the eills of windows, during the summer season, we would recommend this handsome Conifer. The habit of the plant is compact, the tiers of branches being separated by only 4 to 5 inches of stem, which is densely clothed with needles, and the branches possess a pleasing semi-drooping pose. With ordinary care the plant endures for a long time in a room during the warmer months. If much gas is burnt it injuriously affects the plant.

LEEDS PARKS.—We understand that Mr. A. J. ALTSOP, formerly head gardener to Viscount PORTMAN, has been appointed Superintendent of the public gardens of Leeds. There were no fewer than 218 candidates for the post.

MOTOR CARS AND STRAWBERRIES.—It will doubtless be of interest to purchasers of the luscious "English-grown" Strawberries from Messrs. KEARLEND MOLE to learn that the fruit, which finds so ready a sale at the well-known fruiterers in the Crescent, is conveyed direct to the shop from Farndon day by day in a motor van. The utilisation of this new means of conveyance for the carriage of such a perishable product as ripe Strawberries is the best.

possible proof of the wisdom of the contention of automobilists that for moderate distances from great centres the motor van, car, or waggon is invaluable, serving the purpose to which it is put most effectually. By the system adopted with regard to the transportation of the Farnon fruit direct to the city distributor, the Strawberries avoid the injurious handling necessitated by railway conveyance; and what this means, can be understood by remembering that the fruit would be loaded on to carts, wheeled to the station, unloaded direct into the railway waggon or on to trucks prior to being stowed on the waggon, run through with the incidental jars of a railway

great amount of material in this country which required codifying, and that since the London conference on similar lines it was advisable that the work should be done without much delay. The feeling has been that what was accomplished in London was but a starting point of what might be done in America. It will be recalled that the suggestion was thrown out during the conference in London that a similar event could, with advantage to all concerned, take place at some convenient point in America. The matter has not been allowed to drop, and at the suggestion of influential horticulturists and investigators the Horticultural Society of New York has

urns, is neutral to reagents, but shaking the urn, or introducing any foreign substance, renders it acid. The zymose which takes the active part in the digestion, must be regarded as a pepsin rather than as a trypsin. *Biol. Centrblatt.*, 21, 23 (*Pharmaceutical Journal*).

CHANGE HERE FOR THE WELWITSCHIA.—An interesting incident in connection with *Welwitschia mirabilis* is recorded in the *Deutschen Rundschau für Geographie und Statistik* (22nd year, 5th part), by our correspondent Herr KARL DINTER, the Superintendent of the Station Brakwater, near Windhoek, in German South-west Africa. While Herr

FIG. 12.—GROUP OF TWELVE BLOOMS OF ROSE "MRS. ED. MAWLEY" EXHIBITED BY MESSRS. ALEX. DICKSON AND SONS. (From a photograph taken at the "Temple" Rose Show, July 1. See p. 20.)

journey, unloaded from the railway van into carts or trucks, which in the latter case necessitates extra handlings, and finally arrives at the store to be sold. As it is, the baskets are loaded on the motor car at the Strawberry beds, and are delivered into the hands of the shopkeeper. This trial will doubtless lead to a wide adoption of the system throughout the district. *Liverpool Journal of Commerce*, July 8, 1901.

AN AMERICAN HYBRID-CONFERENCE. What it is hoped may be a very material contribution to American horticultural knowledge should be the outcome of a decision taken by the Horticultural Society of New York at its meeting recently. *American Gardening* tells us that the society, on the suggestion of the council, has instructed that body to take steps towards the holding at some future time of an international conference on hybridisation as applied to horticulture. It has been felt by American horticulturists that there was a

decided to take the initiative in this way. The possibilities of gathering together the results of economic hybridisation as practised in America should present a fascinating field, and it is hoped that from this preliminary announcement, those who can lend their aid to this scheme will not fail to do so. The council of the society will meet very shortly for the purpose of elaborating a plan of action, which will be upon the broadest lines possible, as far as to insure universal co-operation.

DIGESTIVE SECRETION OF NEPENTHES.—A series of experiments carried on by the late M. CLAIRIX on two species of *Nepenthes* in their native country, Java, seems to have set at rest the controversy respecting the digestive properties of the fluid contained in their pitchers. He states that the bodies of insects found in these urns are more or less completely digested, and that not by the agency of microbes, which were excluded during the experiments. The fluid, while still in the

DINTER was botanising for a few weeks in February, 1900, along the desert near the Swakopmund Windhoek railway, he reached the station Upper Kan, so called, but very inconveniently, to distinguish it from Lower Kan. The upper station is the only point on the railway which traverses the habitat of one of the most wonderful plants of the world (*Welwitschia mirabilis*), the original mention of which was made in our own columns on January 26, 1861, p. 75, 1007. This highly interesting plant grows in a narrow tract extending from Walvischbay in the south to Cabo Negro. At this latter place the plant was discovered in 1860 by the late Dr. FRIEDRICH WELWITSCH, and it was named by SIR JOSEPH HOOKER in his honour. SIR JOSEPH HOOKER tells us in his memoir of this plant, that when WELWITSCH first discovered it, and soon afterwards learnt its nature, as he knelt before it on the desert sand, in his astonishment he could scarcely believe that it was not a figment of his imagination. When Herr

DINTER reached Swakopmund in his wanderings, he had the opportunity of persuading Major POPHALL, the railway engineer, to alter the inconvenient name of the station to "Welwitsch." His suggestion was duly considered, and before many months had passed, the change of name was approved by the Imperial Government, and the station is hereafter always to be known as Welwitsch. The news will be received by all the botanical world, and more especially in Austria, with great satisfaction. WELWITSCH was born in Maria Saal on February 25, 1806, and died in London on October 20, 1872. He worked with unremitting energy for five years on the flora of the Portuguese possessions on the west coast of Africa. His tomb in Kensal Green Cemetery, where he was buried on October 24, 1872, is decorated with a Welwitschia in relief, and runs:—"FREDERICUS WELWITSCH, M.D., Botanici eximius, Floræ angolensis investigator principis, nat. in Carinthia, 25 Februar., 1806, ob. Londini, 20 October, 1872.

ICONES SELECTÆ HORTI THENENSIS.—This, as we have before stated, is a series of 8vo illustrations of plants cultivated in the garden of M. VAN DEN BOSSCHE, of Tirlenont. The representations are excellent, and the text, which is supplied by Dr. EM. DE WILDEMAN, of the Brussels Botanic Garden, is so conscientious and accurate, that it will be of great service to botanists. We have before us the third and fourth fascicles of the second volume, and the plants figured will be enumerated in our list of "Plant Portraits."

ERICA STUARTI.—Mr. LINDSAY kindly sends us specimens of a plant gathered in Comemara, during an excursion to that district, of the Scottish Alpine Club in 1890. It is named after Dr. STUART, of Chilnside, Berwickshire, who found it growing in proximity to E. Mackaiana. This last-named plant is considered by some to be only a variety of E. tetralix. The present plant also looks very like E. tetralix, but differs from it, the hairs of the stem not being gland-tipped, and the leaves are almost entirely destitute of hairs. The flowers are in rounded, somewhat secund clusters. The oblong acute sepals are ciliate at the margins, and about a third of the length of the pink corolla. The corolla-tube expands above, and then contracts abruptly into a short limb, whose oblong or rounded lobes are inflexed. The flowers are protogynous, the stigmas protruding from the tube of the corolla. The anther-lobes are purplish-brown, prolonged at the base into small whitish tails. From the general appearance and the shrivelled condition of the anthers, the plant has the appearance of a hybrid.

FLOWERS IN SEASON.—MESSRS. KELWAY & SOSS, Langport, send us flower-spikes of Delphiniums of great excellence, of which we make mention of the finer varieties, viz.:—Gen. Baden-Powell, single-flowered; Cerulean Blue, a long spike, and flowers of 1½ inches in diameter; Blanche Fitzmaurice, also single-flowered, rather brighter than the former; Lilla Mayo, semi-double, a light blue and violet flower, a large spike and flower; C. B. Fry, a semi-double flower, with outer petals of a deep shade of blue, and inner petals of a lilac tint; Imperial Majesty, slightly double, in colour royal purple, flower spike short; Clara Stubbs, single-flowered, bright blue in tint, a telling flower; Seneca, a semi-double flower, the lower petals of which are bright blue, and the inner ones of a deep violet tint; and The Queen, single flower of large size, blue. We think that no border of hardy herbaceous perennials is complete without these splendid flowers. For planting by

themselves in beds they are not so suitable, the flowering of the plants being of very short duration, and ugly gaps are apt to occur. The plants produce good effects planted on the banks of lakes and streams in good-sized clumps, the contrast of the blue spires of bloom with the level surface of the water being striking, and in such situations when the flowering season is over, they are not greatly missed.

EIGHTEENTH CENTURY HORTICULTURAL MEDAL.—A medal was struck in the year 1700 in honour of AGNETA BLOK, for growing Pineapples in her grounds at Vyverhof, near Amsterdam. This medal was struck in silver and in copper. M. VAN HELTHEM saw one in 1826 in the possession of M. DORNICK DE DEVENTER, member of the States General of Holland. On one side is the portrait of a lady with the inscription: AGNETA BLOK—Flora lattava; on the reverse, a woman in an antique dress, her bust bare, and supporting on her arm a horn of plenty in the middle of a garden of flowers. Beside her is a pot with a Pineapple plant with ripe fruit, and another pot in which is growing a Meloeacetus. Above the medal may be read: *Vijverhof*, and on the rim, *Fecit arsque laborque quod natura negat*, MDCI. We extract this from the *Revue de l'Horticulture Belge*, who asks if other examples of the medal are known?

CROYDON AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—MR. JOHN GREGORY, Secretary, desires to inform our readers that a meeting will be held at the Sunflower Temperance Hotel, on Tuesday evening, July 16, when a paper will be given by Mr. MASLEY on "Winter-Flowering Pelargoniums."

NEWLY PUBLISHED BOOKS.—Among the works on our table awaiting notice are:—*Flowers and Ferns in their Harms*, by MABEL OSGOOD WRIGHT (MACMILLAN & Co.); *A Garden in the Suburbs*, by MRS. LESLIE WILLIAMS (JOHN LANE); *Fields, Factories, and Workshops*, by PRINCE KRUPOTKIN (SWANSONSSENSCHEIN & Co.); *La Mosaiculture Pratique*, by ALBERT MAUMÉNE (S.L. Rue de Grenelle, Paris); *The Story of Wild Flowers*, by the Rev. Professor HENSLOW (GEORGE NEWNES); *Flowers and Gardens*, by FORBES WATSON, edited by the Rev. Canon ELLACOMBE (JOHN LANE); *Wall and Water Gardens*, by GERTRUDE JEKYLL (GEORGE NEWNES); *The Art and Craft of Garden Making*, by T. H. MAWSON; Second edition (BIVISFORD).

PUBLICATIONS RECEIVED.—Appendix to the Report of the Minister of Agriculture, Ottawa, Experimental Farms, Reports of the Director, Agriculturist, Horticulturist, Chemist, Entomologist, and Botanist, Poultry Manager, Supt. Experimental Farm, Nappan, N.S., and Horticulturist, Nappan; and of the Supts. of the Experimental Farms of Brandon, Man.; Indian Bend, N.W.T.; and Agassiz, B.C., For 1900.—A Paper on "The Narcissus," read at the Gardeners' Institute, Darlington, May 2, by Mr. B. S. Beckwith.—*West Indian Bulletin*, Vol. II., No. 2. Contents:—Agricultural Conference, 1901 (continued); Bush Fires, Rubber Planting, Marine Resources, Pineapples, and Cacao Drying.—*Michigan State Agricultural College Experiment Station, Horticultural Department. Report of South Haven Sub-station.* With the exception of Cherries and Grapes, all kinds of fruits on trial here heavily during the past season. Early Plums and Peaches were badly affected during the middle and latter part of summer by rot, induced by unusually heavy and protracted rains, which occurred during that period. . . . Spraying has been attended by unusually good results, especially in the control of the leaf-eater of the Peach, and the scale and codling-moth of the Apple and Pear. Arsenite of lime proved more satisfactory than Paris Green, heretofore used."

HOME CORRESPONDENCE.

RICHARDIA ELLIOTIANA AT WILTON HOUSE, SALISBURY.—Although the above plants, strictly speaking, cannot be classed as subtropical, yet, when used as such they are effective, especially when planted in proximity to Camas, to Ricinus (Gibsoni), and other plants having dark-coloured leaves. The brilliant sunshine of the last three weeks has not affected these Richardias in the least degree. H. J. H.

CHERRY-LEAF DISEASE.—I wrote you on this subject on March 16 (vol. xxix., p. 191). We are now in the midst of the Cherry-gathering, and I am glad to say that not only is the crop a magnificent one, both as regards quantity and quality, but also that the trees attacked by Guomonia, and which retained their leaves throughout the winter (indeed, many of these are still to be seen on the trees), do not appear to have had the fruit affected in any way. A. O. W., *Maldstone*.

PLANES.—I send you with this two branches of Platanus, and ask you to kindly name them for me. No. 1 is a very large tree; it stands by the edge of a pond. I send the dimensions:—16 feet 6 inches round the trunk 1 foot from the ground; 16 feet 6 inches round trunk 6 feet from ground; divided at 7 feet 6 inches from ground into eight branches 4 feet 6 inches to 8 feet 2 inches in girth at their base. Estimated spread of branches, 90 yards. Bark much rougher than in younger trees. Age unknown. Tradition says it was brought over by the Knights Templars, who had a preceptory here. Height estimated at 72 feet 6 inches. *Platanus* No. 2: Girth 1 foot from ground, 9 feet 3 inches; 6 feet from ground, girth 7 feet 6 inches; divided into two leads, 9 feet 6 inches from the ground. Spread of branches 45 yards; estimated height, 68 feet. This tree was planted between 10 and 50 years ago. *John McTearnt, Ribston Hall, Yorks.* [No. 1 is P. acerifolia; 2, P. orientalis, Eb.]

AN INTERNATIONAL HORTICULTURAL EXHIBITION.—It was hardly a matter for surprise that with such a splendid open expanse and abundant elbow-room, the subject of a great International Exhibition, its successor after the lapse of nearly forty years of the great one of 1886, should have cropped up in the Old Deer Park at Richmond the other day. It was a matter of intense satisfaction to find how unanimous were all interested in the subject, and in wishing to see in London one more of these grand reunions of the world's horticulturists. Naturally, the Council of the Royal Horticultural Society is looked to, to lead in this matter, but failing such movement, it seems likely that, as happened in 1886, a lead will be given from outside. That may either conduce to unpleasant complications, or force somewhat sluggish hands. If the Council really desire to give effect to the general wish, it cannot indicate such intention too soon. A powerful committee must be formed, on which the Council shall have representation; but to conduct so big a thing worthily, not only is a big general committee of one hundred members needed, but that this body should be broken up into some half dozen sub-committees. That Royal patronage could be secured for the exhibition should be assured; and with the wonderfully favourable conditions which now exist as compared with those in 1886, the show should be a magnificent function and success. But fully two years are needed to elaborate it. To hasten it is to be lost. A Fellow.

TEMPERANCE DRINKS.—It is often a matter of reproach to temperance workers that they fail to provide any substitutes for the alcoholic drinks which they deprecate. The charge is in some sense a just one, and the C.E.T.S. has therefore spent considerable effort in popularising cheap, easily-made beverages, which, though not intended to supplant other drinks, yet form effective thirst-quenchers, which will allow young men and women to keep from

beer in the harvest and hay-fields, &c., during the hot weather. They are nonrishing, are in no sense injurious, and may be freely partaken of. Bartikos is especially suitable for household use, while cyclists, cricketers, and others will find it most palatable. The following are the recipes:—1. Take 2 oz. Robinson's Patent Barley, 7 oz. sugar, one lemon. Mix the Barley to a smooth paste with a little cold water. Add the sugar and the juice, and thin rind of the Lemon; then pour over it a gallon of boiling water. Stand till cold. Cost 3d. per gallon. More Lemon or sugar may be added. This preparation of Barley is also sold, ready flavoured and prepared by most grocers, in 3d. and 6d. packets, and is known as "Bartikos." This is by far the most convenient form of the beverage, being made in exactly the same way as a cup of cocoa. It may be prepared in large quantities with very little trouble. 2. Take 2 oz. fine oatmeal, 6 oz. sugar, one Lemon. Mix the oatmeal to a smooth paste with a little cold water; add the sugar and the juice and thin rind of the

now scarcely needs roguing. In the remarks about Early Peas, Best-of-All should read First-and-Best, which is the earliest white Pea. May Queen has white pods, but the Peas are parti-coloured, the same as Gradus, and Supreme is a Blue Pea. Charles Sharpe & Co., Ltd.

THE LAST SHOW AT THE DRILL HALL.—Seeing that the Rose men were to have a big innings at the Temple on the 11th, there was hardly need for a minor show at the Drill Hall two days previously. Roses are very well for those who specially admire or win prizes by them, and rosarians are in relation to prizes just as human as other florists, it not a little more so. But we are not all mere rosarians. Some of us think quite as much of other things, and like to see everything possible that may be in season; but there is more. How greatly indebted is the Society as such first, and horticulture generally second, to all those many large-hearted persons or firms who exhibit so liberally at the Drill Hall all the year round, and for no prizes whatever. Is it

from seed supplied by a firm in the midlands, whose stocks of Cabbages are second to none. Four acres were planted in September last, and the remainder between September 25 and October 6, all in the same field, and from the same seed-bed. In the early planted portion at least 50 per cent. had run to seed, but in the remainder of the field only about 1 per cent. showed the least tendency to do so, the remainder showing fine solid hearts. I feel convinced that if the following points are carefully observed, it is possible in nine years out of ten to secure a crop of Cabbages early in the spring without any bolters in the crop, always supposing that the seed is of the finest stock, and has been saved from stamps. (1) Sow Myatt's Offenham, Ellam's Early, or a cross between the two, called Johnson's Market Garden; (2) Sow the seed from July 25 to August 10; (3) Transplant the first week in October. This enables the plants to make a fair amount of growth before severe weather arrives, so that in the spring they have little growth to make before they form

FIG. 11.—A PRETTY DINNER-TABLE DECORATION BY MRS. O. G. ORPEN, COLCHESTER.

(From a photograph taken at the "Temple" Rose Show, July 1. See p. 30.)

Lemon, then pour over it 1 gallon of boiling water. Stand till cold. Cost, 5d. per gallon. More oatmeal may be preferred, especially for workers. *George B. Charles, Clerical Secretary, Canterbury Diocesan C.E.T.S.*

PEAS AT SLEAFORD.—In your notes on "Peas at Sleaford" (p. 6), you say: "The first of all the wrinkled varieties was Oxonian." This is apparently a slip of the pen, and meant for Exonian. You then proceed to remark that "it appears to be a selection from Alpha or Dr. Hogg." It is, however, a full week or ten days earlier than either; the Peas are more tightly packed in the pod, and it is quite as good a bearer as Dr. Hogg, and better than Alpha. When generously treated on good soil, Exonian becomes robust, attains a height of over 4 feet, and is one of the very best of all the wrinkled first earlies. A. H. ["Ex" not "Ox" was intended. We recognised the better qualities of Exonian than Alpha or Dr. Hogg, but nevertheless it appears to possess some of the characteristics of both those varieties. Ed.]

—We have read with interest your able report of our Pea trial-ground. The paragraph in relation to the sending out of new seedling Peas is very much to the purpose. If the raisers would but keep them for two or three years until thoroughly fixed, it would save the trade a great deal of trouble. For instance, Dr. McLean sent out by Turner many years ago. This Pea has been nearly perfectly true ever since it has been sent out, and even

good policy to shut these out at a July meeting just when so many of them may have something of exceptional interest to show, and is it fair? I hope the mistake of the 2nd will not be repeated. *A Fellow.*

BOLTING CABBAGES.—This subject has been well discussed in the horticultural papers every season for many years past, but I do not remember having before seen it stated that to sow old seed is a preventive against Cabbages bolting. Although this theory may hold good with regard to certain other crops (Mangels for instance) where the process of saving seed differs from that adopted for Cabbages, it would surprise me very much to see next May that seed of, say, Myatt's Offenham Cabbage, harvested in 1900, and sown this month, produce a crop showing a greater tendency to bolt than one from seed harvested in 1896 or 1897, and saved from the same stock. I do not agree with Mr. Watkins with regard to Ellam's Early, which he says is almost sure to have a percentage of bolters. In my opinion, this variety as originally introduced, does not show a tendency to run to seed, and in this respect is equal to Myatt's Offenham, Early Market, or Wheeler's Imperial (Warrminster strain). There is, however, one point which I think has not yet been touched upon, and that is, that the time of planting affects the ultimate result. About two months since I inspected a field of fifteen acres of Myatt's Offenham, near Boston (in which district hundreds of acres are grown for the northern market(s), grown

from seed supplied by a firm in the midlands, whose stocks of Cabbages are second to none. Four acres were planted in September last, and the remainder between September 25 and October 6, all in the same field, and from the same seed-bed. In the early planted portion at least 50 per cent. had run to seed, but in the remainder of the field only about 1 per cent. showed the least tendency to do so, the remainder showing fine solid hearts. I feel convinced that if the following points are carefully observed, it is possible in nine years out of ten to secure a crop of Cabbages early in the spring without any bolters in the crop, always supposing that the seed is of the finest stock, and has been saved from stamps. (1) Sow Myatt's Offenham, Ellam's Early, or a cross between the two, called Johnson's Market Garden; (2) Sow the seed from July 25 to August 10; (3) Transplant the first week in October. This enables the plants to make a fair amount of growth before severe weather arrives, so that in the spring they have little growth to make before they form

LAW NOTE.

RUTHERFORD v. L'HORTICOLE COLONIALE.
JUDGMENT.

WE have already chronicled the result of this case, but in view of the great importance of the judgment both to seller and buyer, we think it desirable to print the summing-up of the Judge in full, from the shorthand notes, which have been placed at our disposal.

MR. JUSTICE BACEY.—This is an action in which the plaintiff seeks to recover damages for breach of a warranty on the purchase of a plant, the description of which is "Odontoglossum Tropicum de Rem-outlet," for the sum of 250. The defendants gave a guarantee or warranty that the plant was true to description. The plaintiff alleges that the plant is not true to description, that the plant delivered to him was not an *Odontoglossum* of the description *Tropicum de Rem-outlet* but an *Odontoglossum* of all [? Ed.] but altogether an inferior plant, and not worth more than 25 or 25 of the most, whereas the plant, had it been according to the description, would have been of great value.

Now the question really turns on the plant as delivered to the plaintiff. It seems to be admitted that the plant produced is not an *Odontoglossum* (? Ed.), but a plant of an inferior character. The question is whether the plant produced in Court to-day is the plant that was delivered by the defendants to the plaintiff. The defendants say it is not, and the plaintiff says it is. That is the main question for me to determine.

Having regard to the evidence given on behalf of the plaintiff, I think that it is not the evidence given on behalf of the plaintiff is sufficient, if not displaced by the evidence given on behalf of the defendants, to prove the plaintiff's case. The plaintiff speaks of the plant arriving Mr. Rutherford was called and he said he saw the plants arrive. They all had labels, he produces the labels which were upon the plants when they arrived, and he saw the plants with the Bambouillet labels on them at the Orchard house. He says that the pot in which the plant now is, is the same pot as that in which it came. It is a pot of Belgian make, and the plant has never been removed from that pot. Mr. Rutherford and his gardeners keep a register. The plant was entered in the register, and the number which it entered but it was described, and the number of bulbs, and it had six bulbs, and it was entered in the register with the number of bulbs with the label on "*Odontoglossum Triomphe de Bambouillet*." Mr. Rutherford paid £20 for it, and therefore it was carefully watched, and it did not flower until January, 1900. Then beyond all doubt it turned out that the blossom was not true, that it did not answer the warranty. Mr. Lupton, Mr. Rutherford's gardener, was called. He said he met the plants at the station, took them to Mr. Rutherford's place, "Rendwood," sent word to Mr. Rutherford that the plants had arrived, and unpacked them in his presence. The particular plant in question was put into the house where the *Odontoglossum* were kept, and he put on it a label, and made the entry in the book, and put a label on the pot. Now, according to that evidence it is clear that they have watched that plant ever since, and it has never been transplanted. Now if that evidence is true, undoubtedly the plaintiff has proved his case that he received from the defendants a plant which does not answer the description given in the warranty. Now is that displaced by the evidence of the defendants? The defendants call Mr. Hamont, who is, I understand, the superintendent of Horticulture to the defendant Company. He says that he has a register of a very large business, and have a very large number of *Orchids*, and send out a good many thousands in the course of a year or season. The defendant's witness says he took the particular plant from a house where only *Odontoglossum* were kept and he put a label on it, and the wooden label was withdrawn when the other label was put on. Then he said—and this was important—that when the plant was sent off he had four bulbs and a growth. That seems to go to show that the plant which had four bulbs and a growth was not the same plant which had six bulbs when it arrived at the plaintiff's house. Therefore, in some way or another there was a mistake, and if the plant which the defendants brought, they sent off as a *Bambouillet* was a plant which arrived at the plaintiff's house with six bulbs on. As I have said, the defendant keeps a register, and the evidence on their part depends entirely on the memory of Mr. Hamont, or almost entirely upon his memory. It appears that his attention was not called to the matter until a long time afterwards, and he may well be mistaken. It seems to me that I ought to find in favour of the plaintiff upon this part of the case, that the plant produced in Court was the plant sent to him as the *Triomphe de Bambouillet*; and as it is admitted that the plant is not a plant which answers the description, the warranty has not been complied with.

I may mention another circumstance with reference to that which I have just mentioned before. The plant that was sent away, in the ordinary course, have flowered in the following spring. This plant did not flower for two and a half seasons or more, and therefore it is not likely to be the same plant. It is suggested by the defendants that it was not properly cultivated, and that the want of cultivation would affect the flowering. I do not think that is open to the defendants, because it was raised that earlier in the case, and then abandoned it.

Now the only question remaining is, the question of damages. I have a considerable body of evidence of witnesses produced on behalf of the plaintiff who say that this plant, if it answered the description, would be of the value of £60 guineas. Mr. Cowan gives evidence to that effect, Mr. Low gives evidence to that effect, and Mr. De Bary, who has given evidence to that effect. They are all gentlemen of experience who speak very positively as to the value of a plant of this description. On the other hand, the evidence of the witness for the defendants, Mr. Seluster, is that the value of an orchid of this description would not be more than £20. Then there is the evidence of Mr. Cannon, who is the defendant's solicitor, but who says he is also a large orchid grower, and he says he would not give £20 for the orchid. There is a great conflict of testimony. I must deal with it in the best way I can, and when I find on the one hand the witnesses for the

plaintiff saying that the plant is worth £150, and the witnesses on the other side deprecating that value, I am inclined to assess the value of that orchid at £120. I think there is no doubt at all about the principle upon which I should assess the damages in a case of this kind of breach of warranty. It is the difference between the value of the article as it is, and the value it would have been if it had answered the description. In my opinion if it had answered the description it would have been worth £120. The present value of the plant I understand to be not more than £5 or £6. Putting it the highest, £6. That leaves the amount of £114, at which I assess the damages.

There will be judgment for the plaintiff for £114.

Mr. HORTON: And the costs, my Lord?

Mr. JUSTICE BARRY: Yes, and the costs.

In reference to this matter we have received a letter from *L'Horticulteur Colonial*, of which the following is a translation:—

"The judge has given his decision. It seems to us that common sense has also a word to say, and that this question concerns a large number of your readers. We sold four years ago to the plaintiff some fine varieties of orchids, among them the one which formed the subject of the recent judgment. The daily journals have recorded the facts that one of them was taken back by us and the money returned, and that another having flowered, was returned by the purchaser because it was worth the money; and that as to the *Triomphe de Bambouillet* it was not worth more than £8. When the purchaser returned to us the first orchid, we refused to establish without comment. When he sent us a flower of *Triomphe de Bambouillet*, this was so unlike what it had been with us, and with the French nurserymen from whom we purchased it, that we were made to recognise it, and refused to take back. The plaintiff threatened us with a lawsuit.

We allowed him to carry out his threat not only that we might defend our rights, but because there was an interesting legal point to establish. We sold four years ago a rare variety for £50. The plant was in good condition, as are all those which we grow at Moortbeck. All our visitors know the good order which is there maintained. We are certain that we supplied the true variety; but an abnormal circumstance occurred which ought to have influenced the judge and the three expert witnesses. The plant has only flowered on one occasion, and we have seen the description of the purchaser's orchid-house, and this gentleman asserts that the plant is still at the present time in the same materials and in the same pot. How could it flower well in such circumstances?

"Our counsel suggested to the purchaser that he should deposit the plant in the hands of a good cultivator, who would period it and give it in this manner it could be ascertained if the bad flower of last year was due to degeneration. We are inclined to believe in this degeneration, because elsewhere properly cultivated, our varieties have always improved, as the following instances show:—

"We sold to Mr. W., also after an inspection of the illustration in the *Lindens*, three celebrated varieties of *Orchids*, *Lindens*, and *Moortbeck*, which were very high priced—*Lindens*, *Lindens*, and *Moortbeck*. Since then they have been so much admired at the meetings and exhibitions in England that it was clear that their beauty was not exaggerated in the *Lindens*. Let Mr. W. tell us if the varieties *And Charles* and *Kegeljan*, which we sold him when in flower, have not degenerated under cultivation, or whether they have not become more beautiful.

"We sold also to Mlle. B. R. three years ago, after an inspection of a plate in the *Lindens*, the *Odontoglossum Fairy Queen*. When it first flowered, Mlle. B. R. was dissatisfied, when it flowered a second time in spring, the plant was superb, and obtained a First-class Certificate at Manchester.

"Last year we exhibited at the Temple Show *Odontoglossum crispum* and *Odontoglossum*, and obtained an Award of Merit. We sold it to Mr. L., who cultivates orchids only. He showed it in his last spring in London, and obtained a First-class Certificate. Are these facts conclusive?"

"This is not the only point in which the judgment is extraordinary. It is so, especially by reason of the fact that the plaintiff called three experts to testify that if the variety had been in conformity with the plate in the *Lindens*, it would have been worth not less than £150. The three witnesses were unanimous on this point, and have thus confirmed what we allege on every page of our catalogue, that we sell 50 per cent. cheaper than other establishments.

"In condemning us to reimburse the plant at a higher price than we sold it for, the judgment has created a dangerous precedent alike for amateurs and for nurserymen. In the face of such a judgment the seller might on his side demand from the purchaser the difference (enhanced value) when the variety improves under his care. Thus, if the *Odontoglossum crispum* (Cochet) above mentioned was worth £20 when we sold it, the purchaser's suits admit that it is worth double that amount now.

"What would be the verdict of the same judge if such a case came before him and if we demanded to-day the difference between the value of the plant at £150?"

"We should always be consistent. If the price can be altered when the value is lessened, it might also be altered when the value is increased. This would be common sense. *Revoire, Sir, ex, L'Horticulteur Colonial*.

Obituary.

WILLIAM SCOTT.—There was laid to rest on Saturday, 6th inst., one who for many years was an interesting figure in the North of Scotland. Born in Peterhead in 1822, Mr. Scott during his long life played many parts, and in the horticultural world he was well known as an ardent cultivator of Ferns, competing most successfully for many years at the principal Scottish horticultural shows. He was also a naturalist and botanist of no mean ability, and was at one time a valued correspondent of Mr. Harrison Weir, the well-known artist and naturalist. Mr. Scott knew intimately the flora and fungi of Buchan, and also the beetles and moths of that district, and where to find them. A poet, too, of no mean order, Mr. Scott finds a niche in *Edwards' Minor Scottish Poets*. For several years past he had resided at Stoneywood, about five miles distant from Aberdeen. His social qualities endeared him to many; he was a bright and keen conversationalist, brimful of his native, pawky humour; and he was equally esteemed for his sympathetic, kindly, and genial disposition, which was one of the prominent traits in his character. He is survived by a widow and one son and two daughters. The son is a gardener in New Zealand.

SOCIETIES.

ROYAL HORTICULTURAL, CHISWICK.

JULY 5.—On this date a meeting of the Fruit and Vegetable Committee was held to examine *Minicoper Peas* and *Lettuces*. Mr. G. Bannard was in the Chair; and also present were Mr. W. Marshall, Messrs. W. Farr, H. Esling, S. Mortimer, W. Bates, W. Pope, A. Ward, G. Wythes, J. Willford, and A. Dean.

Mr. G. WYTHES presented two fruits of a new green fleshed Melon "*Victoria*," raised from *Syon House X Sutton's Epicure*, of good size, and well netted. They were of such delicious flavour, that an Award of Merit was unanimously given.

Some seventy-five stocks of mid-season and late Peas were then seen, dwarf and tall, and all finely grown and cropped. Of these, one, *Sutton's Prize-winner*, 3 feet, a splendid long-podded, and good-cropping wrinkled Marrow, received the honour of a First-class Certificate.

Awards of Merit were made to *Dwarf Telephone*, 2 feet high, heavy crop; *Dandy's Stratagem*, late, 3 feet, excellent variety; *Sharpe's Queen*, 3 feet, one of the best old late Peas; *Proflig Marrow*, 3 feet, a splendid cropper; *The Sherwood*, 2 feet, a capital cropper, and good successor to *Chelsea Gem*; *Sutton's Perfect Gem*, 2½ feet, great cropper; *Defiance*, 2½ feet, heavy crop; *Centenary*, 3 feet, very fine podder; and the well-known *Duke of Albany*, which had not previously received any award. Previous awards to that grand Pea, *Alderman*; to *Mansfield Show*, and *Glory of Devon*, were confirmed. The *old Omega* was here in capital condition, as also was the much older and heavy-cropping *Prince of Wales*. An Award of Merit was also given to a purple-podded, stump-rooted or *Narrow Trump*, long and oval-shaped, certainly earlier, finer, and sweeter than is the white *Jersey Navet*. Similar awards were given to *Green Cos Lettuce*, *Junabo* and *New Yorker*, both first-rate forms; sweet, crisp, hearting *linety*, and standing well; also to *Curbed Cabbage Lettuce Duke of Cornwall*, and a high commendation to *Cos Lettuce Herbigier*. The Committee, desirous of marking their sense of the general excellence of the Pea trial, and the high cultivation shown in connection with it, took the unusual course of passing a resolution of special commendation to Mr. S. T. WRIGHT and his staff for the admirable work shown. A suggestion made that the gathering of the Committees at Chiswick on Tuesday next, should be taken advantage of, to obtain from them an unofficial expression of their views with respect to the provision of a proper trial-garden for the Society, was heartily endorsed, and it is hoped will be generally agreed to.

THE WEATHER IN WEST HERTS.

A VERY warm week. On four days the highest temperature in shade exceeded 75, and on the hottest of these days rose to 82, making this the highest shade reading as yet recorded here during the present summer. The nights remained warm until the 8th, but during the last two nights the exposed thermometer has fallen respectively to within 7° and 8° of the freezing-point. At 2 feet deep the ground is at the present time 1° warmer, and at 1 foot deep 6° warmer than is reasonable. About one-tenth of an inch of rain fell on the 3rd, but since then no rain at all has fallen, and for more than a month no rain water whatever has come through the bare soil percolation gauge. The record of bright sunshine during the week proved unusually good, averaging seven hours a day. The winds were very light, and the air, on the whole, exceptionally dry.

JUNE.

Taken as whole, this was a month of about average temperature. The days were, as a rule, unusually warm, while the night readings, on the other hand, proved as unseasonably cold. As regards temperature, the most marked feature was a week of continuously cold weather in the middle of the month, on the last night of which the exposed thermometer showed 3° of frost, making this the coldest night experienced here in June for six years. Rain fell on only ten days, the total measurement being less than half an inch, which is less than half the June average, and equivalent to a watering (as a rule, about 2 gallons) on each square yard of surface in this district. No rain-water at all came through the percolation gauge on which short grass was growing, and no measurable quantity through the bare soil gauge after the first week. The sun shone on an average seven and three-quarter hours a day, which is about one and a half hours a day in excess of the mean for the month. The strength of the wind was, as a rule, about reasonable, on the 23rd, however, a strong westerly wind was blowing, the mean velocity in the most windy hour reaching 17 miles. The amount of moisture in the air was exceptionally small; indeed, in only two previous Junes during the last fifty years has the atmosphere been as unusually dry. *E. M. Eckhardt, July 5, 1901.*

ADDENDA.—HANLEY FLOWER SHOW.—We are informed by MESSRS. R. Handland & Son, Lough Finsay, co. Cork, that they were awarded a Gold Medal for Begonias at the Hanley flower show, of which award our reporter failed to make mention. The firm received a similar award for exhibits at the show of the Royal Horticultural Society of Ireland (Dublin), last Tuesday. Of course, we do not undertake to mention all exhibits.

ASPARAGUS WITH BEETLES.—S. A. C. This pretty insect is known as the Asparagus-beetle (*Crioceris asparagi*), and was figured and described in *Gardeners' Chronicle*, January 8, 1870, p. 11. Be careful to burn the Asparagus growths when you cut them down, as the stems will contain myriads of eggs. Some of the growths affected worst, should be removed at once. Syringing the Asparagus at the present time with hot water, which will make the beetles fall, then scatter soot or unslaked lime over them whilst upon the soil.

ASTERS.—S. & S. We can find no evidence of beetle or fly. Probably the injury is due to the Aster-worm (*Elychtricus parvulus*), figured and described in *Gardeners' Chronicle*, August 11, 1897, p. 97.

CORRECTION.—In our report of the National Rose show last week, the name of W. Upton, Esq., was printed as 1st prize winner in the amateur's class for pine-blossoms P.'s or N.'s (distinction). It should have read A. Mum, Esq., Teaplewood, Hedgeley, Slough, who also won the premier honour for six blossoms of one variety in the same section, 1st, for growers of fewer than 200 plants.

CUCUMBER STEM DECAYED.—W. G. The plant has succumbed to a malady common to the Cucumber and the Melon, and it is usually set up by excessive wetness of the soil round about the stem, and by constantly pouring water against the latter. In order to avert it the bed of soil should be in the form of a

mound when the plants are set out, and the soil that is added afterwards should be sharply sloped away from this part. When canker is first noticed, apply charcoal-powder to the spot.

CUCUMBER-LEAVES SPOTTED.—R. P., *Worthing*. The angular dry leaf-spots are indicative of the downy mildew, and this fungus was recognised after keeping the specimens moist for some time. This is not easily checked after first appearance, although Bordeaux Mixture has given good results in early stages. Water laying on the foliage, or want of ventilation, would favour the disease.

DISEASED PEACHES.—H. W. The stone is split, and the kernel is in a state of decay. The causes which lead to the splitting of the stones of Peaches, &c., are not known with certainty. It is usually supposed to be due to the absorption of excess of water by the roots, following on a very dry state of the soil. This in some instances may cause the bursting of the stone, admitting moisture, and causing decay of the immature seed, and thus upsetting the whole economy of the fruit, arresting its growth to a certain extent, and usually bringing about a fissure in the flesh round about the stalk. Some varieties of Peaches, and some kinds of stocks, may be predisposed to the malady; and when that is the case, it is the better policy to replace these trees by others than to waste time in attempts to cure it. Again, splitting may be due to the imperfect setting of the flower, which seems a probable cause, not all the fruits on a tree being similarly affected. There may be malformations in, or imperfections of, the organs of some of the flowers, which hinder complete fertilisation of a kind met with in the flowers of some varieties of the Grape-Vine. As a means of arriving at a more correct knowledge of the causes the flowers of varieties liable to have split stones might be artificially pollinated with other pollen than their own.

FIGS.—G. H. We do not think proximity to the gasometer has caused the fruits to fall. The first crop of Figs is frequently a source of anxiety to the gardener, and very little provocation is needed to cause some of the fruits to fall. The best means to prevent them doing so, is to so attend to the details of affording water, heat, and fresh air, that the plants will suffer no check. Another means of preventing them is that of stopping the shoots when they have made six inches or so of growth. You might try this in respect to some of the shoots, and note the result.

INSECT.—*J. Mochar*, *Sirex gigas* (great sawfly).

IRIS DISEASED.—C. W., *Dod*. The fungus *Helminthosporium* found on specimens last year could not be recognised. The numerous black bodies embedded in discoloured parts are sclerotia of a *Botrytis* fungus, the active spore-bearing stage of which is abundant on the specimen. There is no good method of treating this fungus directly. It generally indicates dampness, either in air or soil. A heavy soil with poor drainage causes a similar disease to Tulip, Narcissus, and other bulbs. Lime added to the soil should act beneficially, if it is not already present, but any means to open out the soil should be helpful. Of course, I do not know what the soil is like; (the above remark is only suggested by specimens, W. G.)

MELON AND OTHER LEAVES.—C. C. W., *M*. Sun scorching. The CUCURBITACEAE leaves have been punctured by green-fly, bacteria come afterwards. *Chrysanthemum*; the leaves have suffered from some errors in cultivation, such as lack of air, brought on by over-crowding, lack of water, or excess of it at the root.

MELON-LEAVES.—H. D. K. The leaves are scalded; perhaps they have been syringed while the sun was shining.

NAMES OF PLANTS.—*Correspondents not answered in this issue are requested to be so good as to*

consult the following number. T. B. D. A form of *Delphinium ajacis*, common Larkspur.—*Empire*. *Lilium monadelphum Szovitzianum* (syn. *L. colchicum*).—A. H., *Loughboro*. We cannot undertake to name varieties of Roses or other florists' flowers.—G. F., *Northampton*. 1, *Pteris cretica*; 2, *Pteris tremula*; 3, *Adiantum hispidulum*; 4, *Pteris cretica albo-lineata*; 5, *Pteris longifolia*.—R. R. The *Odontoglossum Vuytstekeanum* is the true plant going under that name in gardens; the variety of *O. crispum* very distinct, and one of the other *Odontoglossums* has a crest much like *O. Andersonianum*. The other, with a more spiny crest, seems near to *O. x Adriane*.—C. K. B. 1, *Silene Armeria*; 2, peloriate variety of *Linaris vulgaris*; 3, *Hydrangea quercifolia*.—D. K. L. 1, *Corydalis lutea*; 2, *Linum usitatissimum*; 3, *Oenothera Lamarckiana*; 4, *Colonia grandiflora*; 5, *Lychnis chalcidonica*; 6, *Veronica spicata*.—G. R. W. 2, *Oenothera Youngii*; 3, *Stenactis speciosa*; 4, *Crocus*; 5, *Polemonium ceruleum*; 6, *Agrostemma coronaria*; 7, *Morina longifolia*; 8, *Campanula trachelium*; 9, *Helianum autumnale*; 10, *Lychnis viscaria*, double. Another time do not send more than six, and pack and label them more carefully. Try and think what the specimens will be like when they reach us, and when they will perhaps have to wait a long time before we can look at them.—*Leavis*. Both varieties of that form of *Cattleya labiata* known as C. Warneri.—H. J. H. *Oncidium crispum*—a very fine variety.—W. K., *Preston*. 1, *Hippophae rhamnoides* (*Sea Buckthorn*); 2, *Elymus arenarius* (*Sand grass*); 3, *Olearia Bastii*; 4, *Glaucium luteum* (*Horn Poppy*).—*Herbaricus*. 1, *Agrostemma coronaria*; 2, *Stenactis speciosa*; 3, *Helianum autumnale*; 4, *Lysimachia thersiflora*; 5, *Silphium*; 6, a very fine *Potentilla*, not known to us.—S. W. *Azara microphylla*.—*Cambrian*. 1, *Solanum Dulcamara*; 2, *Pyrola secunda*; 3, *Rhinanthus crista-galli*; 4, *Pinguicula vulgaris*.—*Taurus*. Specimens insufficient: 1, *Eugenia*? send in flower; 2, cannot be named from specimens sent; 3, *Diplopappus*; 4, *Podocarpus* sp.; 5, *Syringa Josikae*, probably, send in better condition; 6, *Bupleurum fruticosum*; 7, *Calcicola violacea*; 8, *Spirea opulifolia*.—W. H. B. *Ruscus androgynus*.

PEA.—M. J. W. The spots on the leaves are apparently the result of the sun shining through drops of water, such as dew. The Beans are affected with a fungus *Fredo*.

PELAGONIMUS.—C. T. There is no trace of either fungus or insect work. Are not the black patches caused by contact with some fertilizer?

PRIMROSE LEAVES.—P. R. C. We see neither fungus nor insect. Is it from drip, or have you been using some insecticide carelessly?

TAX ON GLASSHOUSES.—*Bristol Jack*. See p. 416 in our issue for June 22 of the present year.

TRUFFLES.—*Berks*. The specimens sent are true Truffles.

VINE LEAVES FLABBY, &c.—*Constant Reader*. The flabbiness of the leaves is due to the presence of too much moisture in the house at times, and to lack of sufficient ventilation. Air should be admitted, and the moisture removed from the leaves before six in the morning.

VINEWITH DISCOLOURED LEAVES.—G. W., *Reader*. The fungus is not the *Cladosporium*; it is the mildew, which has often been referred to in these pages.

WHITE-FLOWERED STOCK.—A. E. T. A fine and beautiful variety of the Intermediate Stock. Good for beds and borders, or for growing in pots for greenhouse or window decoration.

LILIES AND THEIR CULTURE.

(Continued from p. 21)

THE TIGRINUM GROUP.—Lilies of the Tigrinum group succeed under conditions favourable to *L. speciosum* and its varieties. Tiger Lilies are very telling in the mass, particularly the late-flowering variety *L. Fortunei*, and its form *giganteum*; this latter, a plant with spikes of from thirty to fifty flowers, each of a "mixed" ground colour of yellow, orange, and red, heavily spotted with chocolate. It is distinct whilst in growth in its markedly woolly stems. This variety likes a strong loam and generous treatment when growing; well grown specimens attain a height of 6 feet. *L. tigrinum splendens*, the earliest of the Tiger Lilies to flower, and a splendid forcing variety, has by far the finest flowers of all; the colour is of a brilliant orange tint, spotted on the inside of the long, elegantly-recurved petals with purple-red or black. These and the old double Tiger Lily, one of the few Lilies that are really double and handsome withal, comprise a group which may be planted in any well-tilled soil with a certainty of success. Once acclimatised and fully established they will take care of themselves; and if it is desirable to increase them at any time, scores of small blackish bulbils will be found in the axils of the leaves. If these are encouraged

to develop fully by removing the inflorescence, and are planted when ripe enough in a light, sandy soil, they will grow away freely, and develop into flowering bulbs in the fourth year, reaching their maximum size in the sixth and seventh. The flowers of the old Tiger Lily have been described as dull and uninteresting; such cannot be said of its garden varieties. For instance, a group of *L. tigrinum splendens*, seen at their best at the close of a warm day, produces an effect such as could not be obtained from any other Lily outside the auratum group; whilst Fortune's giant Tiger Lily, with its erect spike of forty or more handsomely-spotted flowers, and long, bright, yellow and red-tinted buds, and grey pubescence below, is really a noble Lily when well grown. *Lilium Leichthni*, a slender growing Lily of the Tigrinum type, with buff-yellow flowers, spotted with orange, and *L. Maximowiczii*, a similar plant, with orange-coloured flowers, spotted a darker tint, grow well with the Tiger Lilies. Neither are generally cultivated, possibly because their flowers are less showy than many others.

MARTAGON AND CANDIDUM TYPES.

These Lilies are distinct from the preceding ones in one important feature, which bears on their cultivation, viz., they have no stem-roots, or but few, and, as a general rule, they do not flower well the first year after planting. Should they tend to produce a big inflorescence, it is advisable to remove it till root-action is stronger. They should all be planted as early in the autumn as is possible, even before the leaves die down, for these will help the bulbs to re-establish themselves before winter sets in. In removal, every piece of root should be preserved intact, and the bulbs planted in their new quarters forthwith. Orders or new stock should be placed by September at the latest, if even a partial success is wanted the first season. If for various reasons they are obtained later in the year, it is advisable to stratify them in damp sand, and to place them in a temperate-house, in order that they may make roots an inch or so long before they are planted out; a very light compost should be placed beneath the bulbs to encourage further root-action. *Lilium candidum*, *L. excelsum*, and *L. Hansonii*, do not require to be stratified before planting out, their root-action being much quicker than that of others. This group of Lilies is generally adapted for planting in the herbaceous border, for, once established, they do not require any particular treatment; a well-cultivated soil is best for them, planting the bulbs fully 5 inches deep, not forgetting the usual envelope of sand—an important measure in the planting of all Lily bulbs. If the subsoil is light, poor and dry, it should be removed, and a good dressing of turfy loam, old cow-manure, sand, and vegetable refuse placed 4 or 5 inches below the bulbs, deep cultivation being as essential to these Lilies as surface cultivation is to stem-rooting kinds. A light, porous soil is best above and around the bulbs, but a stiffer, more or less retentive soil is best below them, for it is here that the roots will feed, and at a time when droughts may be expected. Surface mulchings, or manure applied in any form at the surface does more harm than good. In watering these Lilies the surface soil should be loosened with a digging-fork, in order that moisture may quickly pass to the subsoil—having regard to the fact that the feeding extremities of the roots are some 9 inches below the surface.

Those Lilies which grow well in a sunny position are the old purplish "Turk's Cap," *L. Martagon*, *L. M. dalmaticum*, a handsome stronger-growing form, with richer purple flowers on stems 5 feet high, and its black-purple coloured form *Cantani*, *Lilium monadelphum*, a charming free-flowering Lily, with twelve to twenty yellow reflexed flowers, the filaments of which are united in the lower third; and its variety *Szovitzianum*, with larger, citron-yellow, less reflexed flowers, which open a week or ten days later, and have free filaments and crimson anthers, are two Lilies which should be represented in every garden. Their handsome spikes of bell-shaped flowers, produced in early June, are of a pleasing appearance on the plant; but their heavy, somewhat sickening colour, detracts from their value as cut flowers. *L. pyrenaicum*, a kindred plant, dwarf and sturdy-growing, with six or eight greenish-yellow, spotted flowers surmounting a stem densely clothed with a multitude of ample leaves, is another sun-loving species. Its habit is quite pyramidal and distinct. *L. carniflorum*, *L. chalcidonicum*, and *L. pomponium*, are all sun-loving "Turk's Cap" Lilies, with graceful, nodding flowers of some fiery tint of red, scarlet, or crimson. They are among the most charming and showy of Lilies, and are worth every effort that can be made to establish them. *Lilium Dalmaticum* (*Martagon dalmaticum* *Hansoni*) is a hybrid, producing a dozen or more flowers of the deepest maroon colour imaginable; the inside of the flower is slightly marked with yellow. *L. Marhan* (*Martagon* or *Martagon album* *Hansoni*) is a similar plant, with larger flowers, orange-yellow and star-like, densely and minutely spotted with rose-red on both surfaces. *Lilium Martagon album* requires a shady place; not that it minds sunshine, but its leaves are liable to be scorched. It also likes a cooler rooting medium than most Martagons. It is a difficult plant to establish outside, for some inscrutable reason; on the other hand, it establishes itself in pots plunged in a cold frame much quicker than other Martagons, hence I would recommend that this plan be adopted, turning the plants out into the open ground when root-growth has well advanced. It is a very pretty Lily, and one of the most popular of the Martagon group. *L. Hansonii* is a particularly good "doer," and one I can recommend strongly for general planting. It grows fully 1 to 5 feet high, and produces two to four stems from each strong bulb, and five to ten flowers on each stem. The flowers are of a rich shade of orange-yellow, and are spotted chocolate. The petals are very stout, being nearly as thick as they are broad, by reason of the projecting keels on the backs of the segments. The buds have a massive chubby appearance, and the spikes are somewhat crowded with flowers. The plant loses in this latter respect the grace of the true Martagons, but the individual flowers of *L. Hansonii* last three times as long as those of *L. Martagon*. When given a good soil, it will make both kinds of roots, and grow with great vigour; it requires shade in the middle of the day, as the flowers are very liable to scorch. *L. candidum* (the *Madonna Lily*) and *L. testaceum* (*excelsum*), the finest hybrid Lily yet raised, practically close the list of border Lilies which have no stem-roots of importance. *L. candidum* is difficult to obtain free from disease, the difficulty being aggravated by the wholesale importation of cheap French bulbs, which, when they do flower, produce miserable spikes of disease-stricken flowers—mere ghosts of what *L. candidum* ought to produce. Moreover, it is almost impossible to establish these French bulbs, and their continued importation merely serves as a source of contagion to home-grown established plants. Home-grown bulbs, when free from disease, are far better

material to plant, and they only cost a trifle more than French bulbs. This disease, despite rigorous measures in weeding out affected plants, is on the increase; and unless some concerted measures are adopted, *L. candidum* is likely to follow in the steps of *L. Harrisii*—a plant that is to all intents and purposes "dead" to cultivation. The clever Japanese speedily filled the place of *L. Harrisii* with *L. longiflorum giganteum*, so that it was not missed to a great extent. A healthy substitute for the cottager's glistening white *candidum* would be more difficult to obtain.

Lilium testaceum, an excellent border Lily, is somewhat particular as to its situation, for if planted in a sunny position it loses many of its lower leaves before the flowers expand, and the plant is thus robbed of much of its beauty. It likes a cool shrubbery, with a very light canopy of foliage overhead, best of all. There its early growth is protected from severe frosts, and its stems are guarded from injury by violent winds. Planted in the open it has rather a lanky appearance, and the flowers pass away quickly; but when grouped among the ornamental foliage with which so many old gardens abound, its handsome, reflexing, apricot-tinted flowers, with their brick-red anthers, are seen to the best advantage. Their pleasing odour, most noticeable at evening, is an additional merit. The plant forces well and at nearly all seasons, but it requires careful watering in pots. Existing colonies of this Lily should be cherished with great care, as it is becoming very scarce. Like *L. candidum*, it much resents disturbance once established. *G. B. Mullett.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

LILIUM OCCIDENTALE.

WE are unable to refer to the published description of this Lily, but owing to the kindness of Messrs. R. Wallace & Co, we are in a position to quote the following particulars from a letter of Mr. Purdy:—

Eureka Lily (Purdy).—A graceful Lily, in bulb and foliage much like *L. maritimum*; bulb rhizomatous, one stalk to a bulb only; flowers few to many, pendulous or horizontal; the lower part of the segments curving into a constricted tube, from which the upper two-thirds at first spread broadly, then the outer three become closely revolute, while the inner third remain spreading (all of the flowers reaching me did this, and my information is that this is the rule). They are brown, spotted in the throat; and the spreading segments are dark crimson, as in *L. maritimum*. Growing in rich, moist lands and around peaty bogs. A much larger and showier Lily than *L. maritimum*, but with its peculiar colouring; the form of flower is very distinct.

ORCHID NOTES AND GLEANINGS.

ORCHIDS FROM LLANDUDNO.

FROM Joseph Broom, Esq., Sunny Hill, Llandudno (gr., Mr. Axtell), comes an interesting lot of flowers, as usual bearing evidence of the pure air of the district in which they are grown. Specially attractive are an elegant spray of *Oncidium pulchellum* bearing over twenty beautiful bluish-white flowers, and an equally fine example of the carmine-crimson *Broughtonia sanguinea*, both natives of Jamaica, and both needing very

careful culture. *Lycaste Deppii* is represented by two distinct forms, the one having white petals, and the other having them densely spotted with crimson. *Odontoglossum* are represented by a fine *O. crispum*, with heavily spotted sepals and lip; *O. tripudians*, *O. Andersonianum*, and the form of *O. gloriosum* known as *albidum*, but which is often purchased (as it was in this case) as *O. nevium majus*. The *Cathayas* are a very large and richly coloured *C. Warneri*, a summer-flowering *C. labiata*; a very distinct *C. Mendeli*, with white sepals and petals and yellow disc, and purple front lobe to the lip; and a very handsome *C. Warszewiczii*, in which the purple

grown as any hardy border flower about which no doubt exists in people's minds.

It is, however, sometimes true that what gives no trouble in one garden will fall in another, and some references in the charming articles of Rev. D. R. Williamson may carry the impression that the Martagon Lily is troublesome to cultivate in the south-west of Scotland, although I feel certain that your contributor does not intend his remarks to bear such a broad interpretation. I have a good many opportunities of seeing the various forms of *Lilium Martagon* throughout a great portion of the south-west, particularly within a radius of about 30 miles round Dumfries, and

FIG. 15.—LILIUM RUBELLUM AS GROWN IN JAPAN. (SEE P. 15.)

front lobe of the lip is much enlarged, and the yellow blotches usually seen on each side of the tube much reduced. The flower measures 9 inches across the petals. Also included are good *Cypripedium bellatulum*, *C. Masterianum*, *C. Madame Barbey* (consim. Lawrenceanum), and a curious pale yellow *Anguloa*.

MARTAGON LILIES IN SOUTH-WEST SCOTLAND.

THE Lily Conference will serve a good purpose even if it only give an impetus to the cultivation of this exquisite and noble flower. There seems an impression abroad that it is difficult to cultivate, and that all the species require careful treatment, while the fact remains that many of the Lilies are as easily

my observation convinces me that it is a district in which all the forms almost invariably do well with a minimum of care. [We have known it and its white variety do well in a smoke-begrimed garden in eastern-most London, Ed.]

All the recognised garden and other forms of *L. Martagon* recorded in Dr. Wallace's *Notes on Lilies*, with the exception of *L. M. cattanæ*, which I have not met with under that name, if distinct from *L. M. dahmaticum*, are to be found in one or more gardens, and all are doing well. It is almost impossible to come across anyone who has experienced constant failure with any of them. Instances of bulbs being lost the first year are not uncommon, but that is a frequent experience with all Lilies almost everywhere.

The ordinary coloured forms of *L. Martagon* are very vigorous in some gardens, and in several, notably in that of Mrs. Maxwell-Witham, of Kirkeconnell, the old double variety is very plentiful. In this garden it has grown from a time beyond the recollection of the present owner. The white *Martagon* is also fairly plentiful in the district; but one meets

graceful in its form of spike, while the other keeps dwarfer, and gives a large proportion of fasciated stems, some of which are positively ugly, so great is the width of the flattened stem, and so unattractive the way in which the flowers are produced.

I should be glad to hear what other Lily admirers have to say upon the question of two

THE QUINCES AS ORNAMENTAL PLANTS.

AN interesting memoir of the Quinces, by Dr. Alfred Bargerstein, appears in the June number of the *Illustrirte Garten Zeitung*. The list of species and varieties given includes the common Quince, *Cydonia vulgaris* and its varieties, the Portuguese *C. lusitanica*, the Pear-Quince, *C. oblonga*; the Apple form, *C. maliformis*; the pyramidal Quince, the variegated variety, *C. marmorata*, with white and yellow leaves; the Japan Quince, *C. japonica*, introduced as a decorative plant from Japan by Sir J. Banks in 1796, and now found to the number of twenty-five to thirty varieties in gardens; the alpine Quince, *C. Maulei*, introduced in 1871, and originally described and figured in the *Gardeners' Chronicle*, Dec. 12, 1871, i., p. 710; *C. Sargentii*, also Japanese, and named by Lemoine in honour of the celebrated American Dendrologist, Prof. Sargent; and lastly, the Chinese Quince, *C. sinensis*, which indicates close relationship with other species of the genus, as, for example, in the form and outline of the leaves, and the anatomical formation of the wood; it is near to *C. japonica*, and in the backward-inclined, woolly-felted tips of the calyx, the number of the stamens, and in the free base of the style, it is related to *C. vulgaris*, and in heterostemony, it recalls *C. Maulei*.

Dr. Bargerstein believes that by careful culture, judicious selection, and artificial crossing, it is certain that new and beautiful decorative forms could be obtained; and it was with this intention that he penned the little article from which the above extracts were taken.

THE ROSARY.

SOME GOOD ROSES.

VARIETIES of Roses have so much increased during the last few years, that the nurseryman's list is apt to perplex the ordinary cultivator, and make it difficult for him to find a suitable selection. Several admirable new varieties, as well as others of less merit, have been added to our list of Roses. The tendency in the novelties is towards light colours. I believe that if the same amount of interest were bestowed on old as on new varieties, and they were tended to with an equal amount of care, gardeners would discover they were much finer than many of the newer varieties. Some of the most beautiful among new Roses are Bessie Brown, a very large creamy-white flower, of good substance, and strongly fragrant; Mildred Grant, a blush tinted flower; Mrs. Edward Mawley, a carmine shaded with salmon, a perfect flower; R. B. Cater, bright magenta, a very fine flower, of good shape and large size; Shandon, a flower of deep carmine, with a fine form, and bush of a good habit of growth; Killarney, which changes from flesh colour to white, has exquisite buds, and the bush is a continuous bloomer and robust; White Maman Cochet, a beautiful flower, a white sport from Maman Cochet; Tom Wood, is another very fine Rose of cerise tint, a solidly built flower; Cléo, of flesh colour, is very large and well formed; Cleopatra, is a fine Rose, of a pale pink hue; Souvenir de S. A. Prince, is one of the finest of Roses, pure white; Souvenir d'un Ami, is a salmon-pink Rose, of good form; Sunset resembles Madame Falcot, and is a lovely flower in the bud.

Mrs. John Laing, of a light pink hue, is a very large flower, and the plant an abundant bloomer; Mrs. W. J. Grant is a flower of a rich pink tint, a lovely very large Rose;

FIG. 16.—*LILIUM PARDALINUM* VAR. *CALIFORNICUM*, SOMETIMES CALLED VAR. *OCIDENTALIS*.

with far more plants of the form which so frequently produces fasciated flowers than of the more graceful variety which retains the elegant habit of the greater number of the *Martagon* Lilies. Some may question one's distinction between these white plants, but from a good deal of careful observation, and from enquiry from others who have grown the white *Martagon*, one finds that these two remain distinct in several gardens, the one never giving fasciated stems, and being more

forms of the white *Martagon*. I recently saw a row consisting of about one hundred plants, all of the fasciated type, and giving some extremely pronounced examples. In the same garden there were clumps of the other form, which had never shown this feature. *L. Martagon dalmaticum* also does well in the few gardens into which it has found its way, but it increases but slowly; it is a handsome variety, with its tall, strong stem and dark-coloured flowers. *S. Arnott, Carsehorn*, by *Dunfries, N.B.*

Marjorie, of salmon-pink, is a fine free bloomer. Marie Van Iloutte, yellow, changing to white, is a charming variety; Margaret Dickson is a white flower, having a pale flesh-coloured centre, is of a very large size; Bridesmaid is said to be an improvement on Catherine Mermet, but it retains colour longer than that variety.

Kaiserin Augusta Victoria, cream, is a distinct Rose, with the perfection of shape; Francisca Kruger has flowers of a copper tint, shaded with yellow, a fine Rose; Grand Duchess Victoria Melita, is creamy white, with light gold centre, a free bloomer in the summer, and again in the autumn. His Majesty has flowers of flattish form.

The above-named Roses were seen last year in great perfection, and there are several besides which I may mention that will remain unheated for a long time, viz., Alfred Colomb, A. K. Williams, Anna Olivier, Boule de Neige, Chess-hunt Hybrid, Captain Christy, Comtesse de Nadaillan, General Jacqueminot, La France, Ulrich Brunner, Baroness Rothschild, Duke of Edinburgh, Viscountess Folkestone, Marquis Litta, Caroline Testout, to say nothing of Marsechal Niel and Niphetos, which are two unique varieties for in or outdoor culture. Here we are seldom without flowers of Niphetos.

I favour the planting of Roses in the early autumn or in March, early or late, accordingly as the weather is favourable or otherwise. There is much advantage derived by planting Roses whilst the ground retains some amount of warmth, as is the case in the autumn. Land for Roses should be deeply dug or trenched, some good manure being incorporated during the digging. Shallow planting is to be preferred, taking care to make the plants secure against wind-rocking by staking them.

Ten Roses should be afforded a warm position, especially the more delicate varieties, and if they can be artificially shaded from hot sunshine when in flower, so much the better, as this very much prolongs the season, and also the delicate colours.

All persons interested in and intending to buy Roses should visit some Rose shows or nurseries where Roses are a speciality. My advice to those who do not know much about Roses is to go to a trustworthy nurseryman, explain their requirements, and allow him to make a selection. It may cost a few shillings more money, but it is better than attending sales and buying promiscuous lots, which may include what they have already got. W. A. Cook.

SOME WALL ROSES, AND OTHERS.

At the meeting at the Drill Hall on June 18, I showed two Roses, with the object of ascertaining their names, as I had not got them. Mr. Paul, of Messrs. Paul & Son, kindly gave me the name of one of them, viz., Reine-Marie Henriette. This is an admirable wall Rose. I have never seen it at any of the Rose shows. Mr. Paul, in his catalogue calls its colour "deep carmine;" while Mr. George Prince calls it "cherry-carmine," and very "sweet scented."

The colour of the one I possess, when the buds are opening, is of a beautiful and pure carmine, which I do not think any cherry ever possessed. As to scent, I have not discovered any in its flowers, and Mr. Paul does not mention any scent. Probably no two persons smell identically, or give the same name to the different colours they see. This Rose produces long shoots, fitting it for training on a wall, with long flower-stems, with never more than two buds, and generally only one. On the whole, it is a very satisfactory Rose, both for wall and cutting.

The other Rose I showed, Mr. Paul appeared to have some hesitation in naming. He thought it might be "Paul Perras," which I could not find in any catalogue; but in posting him two other Roses, the names of which I had not got, I included a third, to which he had previously given the name of "Paul Perras," for further consideration. He very kindly replied, "We take it (Paul Perras) to be H. E. Charles Lawson.

Whatever its name may be, it is a very fine wall Rose, with plentiful and beautiful foliage and abundant inflorescence. I first saw it in Seone, near Perth; and there it was called the "Old Cabbage Rose." It covered the whole face of a cottage, and was most effective with its hundreds of flowers. I never saw it anywhere else, and never met with it in any exhibition. I obtained some pieces of it, and am now the possessor of several specimens of it. It thrives as well here as in Scotland, and presumably it would flourish at all intermediate places. Its flowers are 3 inches across, of a deep rose colour, and very full, and scented. The first buds (owing, I suppose, to vigour) have a blemish in a green heart, which later on disappears. One of its main features is, that it is covered with foliage and flowers from top to bottom, while others become leggy and bare below, and furnished only at the top.

A good trellis Rose now in flower is Bouquet d'Or; it is like a second edition of Gloire de Dijon, but its whole colour is more of a buff-yellow, and without that charming mixture of pale pink and apricot of the Gloire. This Gloire de Dijon is said to be one of our finest and best varieties; but, curiously enough, mine do not answer to this description. I have five—one on south, two on west, and two on east walls; and in June, the "Rose mouth," I rarely ever get a decent bloom out of any of them. Four flower profusely in June, but the large majority of blossoms before they open turn brown and fall off. Mr. George Prince calls it "the hardiest of all the Teas, will grow in any position—a grand old Rose!"

One of the two on an east wall is a curious anomaly. I had it under glass, and it got covered with mildew, and it never flowered. I took it out and planted it on an east wall. This spring it made a show of vigour, and gave a number of young shoots, but soon the whole plant became again covered with mildew, and no blossom appeared. I have a suspicion that the Gloire de Dijon does not much like the sun of the south of England. Of two which are in partial shade, I got some fine blooms last autumn. I shall give it a trial on a north wall.

Then at the meeting of June 2 I took up three other good Roses, with the object of getting someone to tell me their names. One is of a shell-pink when it first opens, and turns paler the next day. It is of the flat-surfaced variety, and has the scent of the Otto Rose. At the meeting one gentleman said he was sure it was a form of the "York and Lancaster Rose." Another shook his head when I told him so. A third said it was related to the "Centifolia;" and four different persons asked me for cuttings of this Rose-tree. Evidently the scent and its colour took their fancy, as it originally did mine when I first saw it as a bush with hundreds of flowers on a lady friend's lawn at Seone.

The *Encyclopædia Britannica* says that the Otto Rose is *Rosa Damascena*, and my Rose is much like the Otto Rose I had seen in Lucknow, only the latter was more strongly scented. Messrs. Paul & Son give the Otto Rose in their catalogue under the name of "Kakalik." This is no doubt a misprint for

Kazanlik of Bulgaria. They call it "Provence Rose," but not improbably it got the latter name from being largely grown in Provence for perfumery.

Anyhow, the Rose of the meeting is a very decorative one. Its effect is very beautiful, especially after sundown. As I have twenty-five pillars of it, the place looks like numerous constellations. The effect is enhanced by the colour turning paler the day after the flowers open. Moreover, it is never touched by frost, not bothered by fly, and thrives under the rudest cultivation both in the north and south of Britain.

The second Rose of the last meeting is a good climber, probably of the Polyantha section, for I counted as many as eight buds on one stalk. It has fine foliage; its flowers are 2½ inches across, of a deep rose colour, turning purplish as its prime passes. Some one wrote on the card I put to it, "De la Griferia;" but this name is not in any catalogue I have. [It is used as a stock for other Roses, &c.]

The third is a very interesting and exquisitely tinted Rose. It is flat, and about 3 inches across when fully developed. It has a pure white border, and a beautiful shell-pink centre, which colour does not fade even when the Rose is cut and placed in water. It somewhat resembles the colour of Psyche, but the pink centre of the latter fades. This is, I think, a great merit. The plant is almost thornless, only a thorn here and there. It is not a climber, but makes a good pillar 3 feet high.

These beautiful ancient and hardy Roses are being swept out of existence by modern rivals, which are often tender, and often difficult to grow in perfection. Would it not be a good thing if some wealthy person were to devote a couple of acres to a sort of archaeological museum of Roses which are now rarely seen, and found only here and there in cottages and old gardens? Many of them are very beautiful, and worth preserving from extinction. E. Bonavia, M.D., Worthing, July 1, 1901.

THE GROVE, STANMORE.

SHUTTERED by the noble trees and shady dells which summer and winter give such beauty and variety of scene in Mrs. Brightwell's garden, the many tender plants which it is her delight to acclimatise, or to use to beautify the garden, are favourably situated, and few of them turn out entire failures. The chief floral display lately was furnished by Rhododendrons and other shrubs, by Peonies, Iris, Roses, and others; but it is not to such plants that the visitor to The Grove has his attention called by Mr. J. W. Odell, the gardener there, who is most interested in uncommon species, on which he can exercise his knowledge of botany and of vegetable physiology, which has been a special study with him for many years.

One interesting bed has Iris hevigata, and a collection of hardy terrestrial Orchids, among which *Cypripedium spectabile* and *Orchis foliosa* have each had many spikes. At present in bloom are several forms of *Orchis latifolia*, *Listera ovata*, *Gymnadenia conopsea*, *Habenaria bifolia*, and some other species. On the rockery near by, among fine patches of many alpine, are two of *Linnaea borealis*, the Norwegian and the Canadian forms, the latter having the larger and rose-tinted flowers. Among all the showy Peonies, *P. albiflora*, a large single white with bright yellow centre, is a prominent object; *Orananche speciosa* is starting well as a parasite on a Broad Bean plant placed for it to grow upon, and other

species of *Orobanche* are thriving; the *Aquilegias* are very beautiful and in great variety; the *Tangier Pea*, and *Lord Anson's Blue Pea* as it is called, are in great beauty; the sweet-smelling *Martynia fragrans*, with its *Gesneria*-like flowers, are now not common in gardens, but are here very effective; *Nemesia strumosa* of various tints make beautiful undergrowth to a bed of *China Roses*; varieties of *Schizanthus* are going to be very showy, and *Heuchera sanguinea*, *Primula japonica*, *Galax aphylla*, the *Rock Roses*, especially the double red; the varieties of *Gum Cistus*, *Campanula*,

house, and partly in a cold frame. *Disa grandiflora* and *D. racemosa* have bloomed well; the pretty little white and lilac *Disa sagittalis* has bloomed annually for many years. Several of the *Satyriums* are about to flower; *S. carneum*, *S. coriifolium*, and others, and the white and fragrant *S. acuminatum* has been in bloom for several weeks, and is still good, a 2-foot spike rising above its singular fleshy, prostrate leaves. *Utricularia montana* is about to flower, and patches of the blue *Pinguicula grandiflora* in flower, and of *Drosera rotundifolia* represent interesting British plants.

JAPAN LILIES.

I beg to enclose a photograph showing five spikes of *Lilium rubellum* (fig. 15, p. 12), which were cut on May 15 from plants growing here in my Lily farm. The bulbs of these Lilies were only the remainder or refuse of our last year's exports, and I was surprised to get lovely flowers from such shrivelled, unsaleable bulbs. *Lilium rubellum* grows in the northern part of the Island of Xippon, from where come all the *rubellum* bulbs which are exported. Needless to say, the climate there

FIG. 17.—LILIAM BAKERIANUM — LOWE.

(see Royal Horticultural Society's "Lily Conference Report," p. 61)

Saxifraga, &c., all give fine displays of flowers. Among the hardy *Primulas*, *P. farinosa* is well in bloom.

In one of the plant-houses is a batch of *Disa tripetaloides*, a charming species, each plant having five or six elegant sprays of bluish-white flowers, one form being unspotted, and the other densely spotted with rose colour. This species, here so beautiful, is often considered a small-flowered kind not worth growing, but evidently the quality of its flowers depends on the grower. As seen here they make a charming display. Mr. Odell is very successful with Cape terrestrial *Oreohids*, growing them partly in a light cool-

Overhead in one house, *Aristolochia ornithocephala* and *A. trilobata* have many of their singular flowers; and among other plants remarked were the singular-looking *Ceropegia d-bilis*, recently illustrated in the *Gardeners' Chronicle*; *C. Woodii*, the purple typical form of *Swainsonia coronillaefolia*, and its commoner white variety; *Lotus Jacobaeus* with blackish flowers, and a number of interesting things not usually seen in gardens, together with some of the showy species of *Oreohids*, among which some very large specimens of *Dendrobium Dalhousienum* have each had a profusion of their large, showy flowers.

is much cooler than here in Yokohama, and therefore these Lilies are particularly well adapted for our home climate.

Mr. Peter Barr, the famous *Narcissus* cultivator of London, who, during his stay in Japan made a special study of Lilies, in a letter to me says: "When in New York, 1898, I saw *The Garden* plate of this Lily. I thought it a form of *Lilium Kramerii*, but since seeing *Lilium rubellum* flowering in Japan, I consider it a good species, and am sure it will be extensively cultivated when better known and its culture understood. I cannot conceive of anything more beautiful than a 5-inch pot with three plants of this lovely Lily in flower in the

month of April, or early in May. It is one of the earliest Lilies, flowering a month earlier than *Lilium Kramerii*. It grows about 1 foot high, compact and elegant, the colour of the flower is more or less that of *Lilium Kramerii*, but the height is about one-third, and the leaves are shorter and paler green. . . . I feel therefore no hesitation in recommending that *Lilium rubellum* in pots should be grown in poor, stony, sandy loam, with at least 2 inches of drainage, and very judiciously watered from the time of potting. The soil must be kept moist, but never wet, and success will be sure to follow. Out of doors I would recommend a northern or eastern aspect, and failing this, plant under deciduous bushes where the roots in winter will keep the bulbs comparatively dry, and shade the plants from the hot sunshine in April and May.

"I think you should caution your readers against exposing the bulb to a dry atmosphere, the scales are thin and soon shrivel, therefore if they cannot be potted-up or planted out at once, they should be buried in dry soil or placed out of doors in a northern aspect, where they will take no injury from the weather, and the bulb kept plump." *Alfred Unger (L. Boehmer & Co.), Yokohama, Japan.* [*Lilium rubellum* was originally figured in our columns in 1898, Ed.]

MR. PETER BARR, V.M.H.

(VICTORIAN GOLD MEDALLIST IN HORTICULTURE, LONDON.)

THESE are travellers and travellers, there are visitors and visitors. Of one class it may be said they come and go, and are remembered no more, nor do they remember much besides the names of the hotels at which they had put up their quarters. There are, however, travellers who travel and visitors who visit, and wherever they go they see something, they learn something, and they teach others to see. They take away treasures of knowledge, and they leave behind pleasant memories of their sojourn, however short it may be. To the latter class Mr. Peter Barr may undoubtedly belong; but, "who is Peter Barr, anyway?" some readers will ask with or without the inebriant Americanism, and they shall be answered.

Mr. Peter Barr is a genial, sprightly Scotchman, who wears a Tam O'Shanter cap and looks like a man of fifty, but tells you he is seventy-five years old. He is as active and alert as a youngster, and as full of information as a sage. He is as ready with anecdotes as an Arabian, and as fond of a joke as one could well be who owns to having been born near Glasgow. By the way, he explains that the common idea that a Scotchman cannot see a joke is quite wrong, and merely applies to the joke of an Englishman. In writing an account of an interview with him, an American florist's paper quoted from the "Street Minister" to the effect that "it will be to be hoped he has been given the tear of God, for of a truth the fear of man has been withheld from him." If one may judge the honesty of his opinions by the candour of his criticisms, the American interviewer was about right.

Mr. Barr was brought up as a fruiterer and seedsman in Glasgow, and eventually became the head of a seed and bulb business in London in 1861. About two years later he commenced to work on bulbs, and became an enthusiastic gardener, devoting his attention especially to hardy garden plants, Lilies, Scillas, Hellebores, and other favorites. He did much to make Lilies popular, but his name has been more prominent in connection with *Daffodils* than in connection with anything else, and he is known throughout the bulb world as the "Daffodil King." He explains the origin of that designation, of which he is as proud as a modest Scotchman can be of a deserved honour, in this way. When he was in the full bloom of his work with the *Daffodils*, Dr. Masters, the editor of the *Gardener's Chronicle*, visited his nursery to obtain twelve of the very best *Daffodils* for description. Mr. Barr took his knife and said: "Well, you must select them, for I really do not know which are the very best. I have over 500 species and varieties, and several millions of bulbs." They started round, and the doctor selected this one and that until the labels were exhausted. Then the assistant had to get a box and a new supply of labels, and when Dr. Masters had to leave he caught his team he had a box full of the "very best," and had been about half way round. In next issue, instead of a description of a few of the best *Daffodils*, there appeared an account of Mr. Peter Barr and his work under the heading of "The Daffodil King."

Three years since Mr. Barr handed over his London seed, bulb, and plant business to his sons, and has

spent the time in travel in Japan, America, the South Seas, New Zealand, and the Eastern States of Australia. Previous to that he had travelled all over Europe collecting wild Narcissus and Peonies, and had devoted special attention to Spain and Portugal, where he was rewarded by discovering some beautiful species of Narcissus.

Mr. Barr is a traveller with many interests and unflagging energy. He has been in Adelaide nearly a month, and every day has been occupied giving and receiving information. *The Garden and Field, Adelaide.*

OSMASTON MANOR, ASHBOURNE.

THE seat of Sir Peter Walker, Bart., is a place which may well claim the attention of all lovers of natural and artistic beauty, as both nature and art here combine to make the place what it is. The massive grandeur of the building, picturesque situation, and fine surroundings, cannot fail to impress all visitors. In the writer's opinion there is no other gentleman's residence in the fine county of Derby, taking into consideration all its features of interest, which can claim an equality, of course leaving out Chatsworth, The Palace of the Peak.

At the recent reopening of the gardens, all who entered were at once impressed with the beauty of the scene which opened out before their vision. On gaining the front of the mansion, a magnificent stretch of scenery opens out before the eye. In the distance are two fine stretches of water, abounding in fish and aquatic birds of various kinds. On the other side of these lakes are woods, covering from 130 to 140 acres, the trees of which approach close to the verge of the water. Beneath these trees and forming an extensive undergrowth, are thousands of magnificent clumps of *Rhododendrons* and *Azaleas*, which in early summer furnish a gorgeous mass of colour.

At the Osmaston entrance to the park is a fine avenue of Lime-trees; and dotted about the park are clumps of ornamental trees, among which the double pink and new scarlet and white-flowered *Thorn* figure prominently. The scarlet Chestnut, *Aria Theophrasti*, several pretty varieties of *Ilex*, some splendid groups of Copper Beech, *Castanea vesca*, Turkey Oaks, and many others; these all add features of interest to the landscape. There are also some fine specimen Conifers which claim notice. Amongst them I noticed some fine trees of *Abies nobilis*, *Sequoia gigantea*, *Abies Nordmanniana*, and some grand specimen *Deodars*. On entering the ornamental grounds, we find that great alterations and improvements have been effected. As you pass in there is a border of scarlet-flowered *Rhododendrons* which has a pleasing effect. Then the judicious planting of ornamental foliage and other plants, such as the *Laburnum*, *Cornus variegata*, *Thuja aurea*, some fine varieties of Japanese Maples, the white Persian Lilies, *Deutzia*, &c., are prominent and striking features. The new Rose-garden, planted with new and approved varieties of Roses, exhibits the plants in the best of health. From the front of the mansion the scene presents many fine features. On the terraces are planted choice *Rhododendrons*, *Azaleas*, &c., in fine variety. In the park, below the terraces, is to be found the noted herd of wapiti, elk, and red deer, and on one of the opposite hills Japanese deer may be seen, these animals really appearing to be acclimatised in their new home.

The rock garden is a pretty and very naturally constructed feature of the place, as is also the greenhouse fernery, built of tufa. A border was remarked which is also dotted with Japanese Maples and early-flowering *Rhododendrons*, having Lilies in the background, and *Myosotis* forming the edging.

The large conservatory contains fine plants of Palms, Orange-trees, Yuccas, Tree Ferns, and others; and climbing plants are profusely made use of. At a little distance from the conservatory, on the front wall of the mansion, is found one of the largest *Rosa Banksiae* in the county.

The place is well found in vineries and other forcing-houses, pits for Melons, Cucumbers, for plants, &c., and all the usual appointments of a country gentleman's well-ordered establishment. Mr. Barmey is the gardener. A. W. G.

CALIFORNIAN LILIES AND THEIR HABITATS.

THE native haunts of the wild Lilies of California are, with one exception, confined to the mountain regions of the State, that exception being the seaside-dwelling *L. maritimum*, which occurs in swampy soils only along the coast-hills. Unlike some other of our Californian Liliaceous genera, these plants are never met with in the rich alluvial bottom-lands of large and fertile valleys.

Topographically, the State of California may be described as consisting of a great central valley, about 400 miles long, and from 40 to 60 miles wide, surrounded by high mountain chains; that on the east, the Sierra Nevada, being the highest; those on the west, the Coast Ranges, being lower, and often cut up into subsidiary ranges, separated by comparatively small longitudinal valleys. The region south of the southern end of the Great Central Valley, and separated from it by a western continuation of the Sierra Nevada, known as the Tehachapi Mountains, is climatically and phylogenetically distinct from the rest of California, and is generally distinguished under the name of Southern California. The flora of this region has pronouncedly distinctive features, xerophytic plants occupying a prominent place in the vegetation, which evidently forms a part of the same flora which covers a large part of adjacent Mexico and Arizona, and extends eastward through New Mexico to Western Texas.

On account of the large area of the State of California (about 750 miles long, and 200 miles wide, covering in all some 158,000 square miles), and its peculiarly varied topography, the writer has not yet enjoyed the privilege of visiting all of the Lilies in their native haunts; he has therefore been obliged to draw freely from the observations and records of others.

Only one species of *Lilium* is found to occur over the whole of the State from north to south, and east to west, and that one does not occur in the great valley regions. The remaining eight or nine species are peculiarly restricted in their distribution; two are strictly confined to the coast range region of middle and northern California, and may be called maritime species; three are confined to the Sierra Nevada of middle and northern California; two are strictly southern, belonging to the flora of southern California, Arizona, and Mexico; and one, though apparently most abundant in southern California, is also found in the foot-hill region of the northern Sierra Nevada.

MARITIME SPECIES.

1. *L. maritimum*, Kellogg ("Coast Lily").— Apparently restricted to the immediate vicinity of the ocean, on the coast bluffs from San Mateo co., near San Francisco, to Humboldt co., and said to be seldom found further than 2 miles from the ocean. Its habitat is peat bogs or moist sandy soils, often in company with *Lomaria spicata*. It flowers from May

to August. The height varies usually from 1 to 3 feet, but it is occasionally only 2 to 4 inches, and sometimes as much as 5 feet; the flowers are usually one to five, occasionally ten to fifteen, of a deep blood-red spotted with purple, yellow, and more decidedly spotted below the anthers with cinnamon-coloured pollen.

2. *L. rubescens*, S. Watson ("Redwood Lily").—Restricted to the narrow strip of coniferous mountains for about 200 miles north of San Francisco, where it is found on wooded slopes or high, dry, and scarcely accessible

the summit as many as twenty-five flowers; these are at first pure white, dotted with purple, but soon take on a metallic lustre, and begin to turn to a delicate pink, which gradually deepens into a ruby-purple. Carl Purdy mentions having seen a specimen 9 feet high, bearing thirty-six flowers.

SIERRAN SPECIES.

3. *L. Washingtonianum*, Kell. ("Washington Lily," "Shasta Lily").—Restricted to the Sierra Nevada Mountains and Mount Shasta, from about 3,000 to 6,000 ft. altitude, in loose

time, where the streams, fed by the snow lying in shadowy mountain fastnesses, gush through emerald meadows, starred with millions of Daisies, and bordered by luxuriant tangles of Larkspurs, Columbines, Monks-hoods, Lupines, and a thousand other charming plants—a veritable flower-lover's paradise. Here, from the thickets, standing with their roots in the rich, loamy soil of the brookside, gleam the small orange-blossoms of the little Alpine Lily—little only in flower, for the slender stems often rise to a height of 6 feet, producing several whorls of rich green leaves.

FIG. 18.—LILUM PHILLYENSE: FLOWERS WHITE.

mountain ridges, among brush, or beneath the Live-Oak (*Quercus agrifolia*) or Redwood (*Sequoia sempervirens*). Of this species Miss Parsons writes in *Wild Flowers of California*:—"This is the most charming of all our Californian Lilies, even surpassing in loveliness the beautiful Washington Lily; and it is said to be the most fragrant of any in the world. It resembles the more familiar *L. Washingtonianum*, but its flowers are fuller in form, with wider petals and shorter tube, and it has a smaller bulb. It sends up a noble shaft, sometimes 7 feet high, with many scattered whorls of undulate leaves, and often bears at

soil on rather dry ridges, or lightly shaded hills in open coniferous woods. The stems are about 4 feet high; the flowers sweet-scented, at first pure white or sparingly and finely dotted, becoming purplish in age; flowering, July.

4. *L. parvum*, Kell. ("Little Alpine Lily"). This has almost the same range as *L. Washingtonianum*, but at higher altitudes in the mountains (1,000 to 8,000 ft.), and in moister situations. "Passing from the parched and dusty plains of our central valleys in July and August," writes Miss Parsons, "we are transported . . . into a heavenly region of spring-

These Lilies are but an inch or an inch and a half long, with their perianth-segments yellow or orange below and deeper orange-vermillion above, their tips only being rolled backward."

In his charming book, *The Mountains of California*, John Muir describes the habitat of the alpine Lily as follows:—"Speaking of the great coniferous forests of the Sierra Nevada he says, "It is in these woods the great granite domes rise that are so striking and characteristic a feature of the Sierra; and here too we find the best of the garden meadows. They lie level on the tops of the dividing ridges, or sloping on the sides of

them, embedded in the magnificent forest. Some of these meadows are in great part occupied by *Veratrum album*, which here grows rank and tall, with boat-shaped leaves 13 inches long and 12 inches wide, ribbed like those of a *Cypripedium*. Columbine grows on the drier margins, with tall Larkspurs and Lupines waist-deep in grasses and sedges; several species of *Castilleja* also make a bright show in beds of blue and white Violets and Daisies. But the glory of these forest-meadows is a Lily—*L. parvum*. The flowers are orange coloured and quite small, the smallest I ever saw of the true Lilies; but it is showy nevertheless, for it is 7 to 8 feet high, and waves magnificent racemes of ten to twenty flowers or more over one's head, while it stands out in the open ground with just enough of grass and other plants about it to make a fringe for its feet, and show it off to best advantage.

"A dry spot a little way back from the margin of a Silver Fir Lily garden makes a glorious camp-ground, especially where the slope is toward the east, and opens a view of the distant peaks along the summit of the range. The tall Lilies are brought forward in all their glory by the light of your blazing camp-fire, relieved against the outer darkness, and the nearest of the trees with their whorled branches tower above you like larger Lilies, and the sky seen through the garden opening seems one vast meadow of white Lily stars."

Lilium parvum appears to be the Sierra counterpart of *L. maritimum* of the coast; it flowers in June and July. A variety *luteum* was described by Carl Purdy in *Erythra*, v., 105 (1897).

L. columbianum, Hansen, has a more northerly range than either of the two last named, being of frequent occurrence in the States of Washington and Oregon, and extending southward into the middle Sierra Nevada of California. It flowers in August.

SPECIES OCCURRING IN BOTH THE COAST RANGES AND SIERRA NEVADA.

The most abundant and widely distributed species in California is (*Lilium pardalinum* (see fig. 16, p. 43), the "Californian Tiger Lily," Kellogg, which, unlike the other species referred to, is common alike in the coast-range mountains and in the Sierra Nevada. It is found along shaded streams, the bulbs being often deep-seated among rocks and debris brought down by the streamlets. It occurs from about sea-level up to 4,000 feet altitude, and flowers in July and August.

The variety *L. angustifolium*, S. Watson, is characterised by its very narrow leaves, and though not commonly met with, appears to have a wider range than the more typical form, occurring from Southern California to Oregon.

L. occidentale, Purdy, *Erythra*, v., 103, 1897, is a little-known species. (See p. 42.)

SOUTHERN CALIFORNIAN SPECIES.

L. Humboldtii, Roetz and Leichtlin.—The complete range of this species is not yet recorded, but from the data at hand it appears to be one of those southern plants which occasionally find their way north along the dry foothills of the Sierra Nevada, in what has been called the upper Sonoran zone; it has been recorded as occurring in dry open localities of the foothills, from 2,500 to 4,000 feet altitude, as far north as Butte co. It flowers in July.

L. Parryi, S. Watson ("Parry's Lily," "Lemon Lily") (see fig. 19, p. 57), appears to be more strictly Sonoran in its distribution, apparently being restricted in California to

the San Bernardino and San Jacinto Mountains, and extending eastward to Fort Huachuca in Arizona. This beautiful Lily is of a clear yellow colour, sometimes dotted with deeper yellow or with small purple-black spots, and has very fragrant flowers. Unlike *L. Humboldtii*, it luxuriates in moist, rich humus, along shaded stream bottoms, in cool cañons, or in marshes, and is said never to occur on dry hillsides, nor even on meadow bottoms; it is found at higher altitudes than *L. Humboldtii* (6000 to 8000 feet), and flowers in July and August.

L. Clevelandii, Greene, is a little-known species, apparently recorded only from one locality, viz., Laguna, San Diego co.

EXTRA CALIFORNIAN SPECIES.

Of the conditions under which the following extra-Californian species occur, the writer is unable to speak; they are merely enumerated here for the convenience of some lovers of Lilies who may wish to make a collection of all our forms from western North America.

11. *L. Purshii*, Wagh (L. Bakeri), Purdy, *Erythra*, v., 101, 1897), is recorded from Washington State and British Columbia.

12. *L. Bolanderi*, S. Watson, a little-known species, was described from material collected in the coast range, Mts. of Oregon.

13. *L. montanum*, A. Nelson, *Bull. Iowa Bot. Club*, xxxi., 6 (1899), is described from Willow Creek, Wyoming. *Jos. Bartl Bary, Assistant Botanist, University of California Agricultural Experiment Station, Berkeley, California, U.S.A.*

The Week's Work.

THE ORCHID HOUSES.

By H. J. CHAPMAN, Gardener to R. J. MEASURES, Esq., Cambridge Lodge, Flitton Road, Cambridge.

Temperatures and Ventilation.—The almost tropical heat that has prevailed has its beneficial as well as its harmful effects upon Orchids. It is favourable to Dendrobiums, provided enough humidity is maintained by damping the floors, staging, &c., and frequently syringing the plants. It is a difficult matter to meet the requirements of all species of plants growing together in a house, and to guard against a check being given by the fluctuations of the temperature. A low degree of warmth will but very few exceptions has ruled by night, and much care has been called for in maintaining the desired amount of humidity by day; and, on the other hand, to prevent injury from an excess of it by night, I have only been able to afford the proper conditions by applying a little more fire heat at night. This averts any drop in the temperature, when the plants are wet at the roots and the air is loaded with humidity, a fertile cause of a black spot. Let any deciduous Dendrobium once commence to "spot," and it will generally be found that little progress is hereafter made by such plants, which generally finish up their growths almost directly in an unsatisfactory manner; and growths thus checked often produce new growths at the base of the last one made, which usually appear when the days are getting shorter. Owing to the lack of light at that season, such growths generally mature badly; and when the flowering season arrives they yield but few flowers, and the succeeding growth suffers to a corresponding extent.

Cattleyas.—*Cattleya Warscewiczii* (gigas), C. Downiana aurea, and C. Gaskelliana, derive benefit from a period of bright warm weather whilst making growth, and I would recommend that the plants of these species be placed under brighter and warmer condition from the time growth begins; and I find that our plants are much benefited by being placed at the warmer part of the Cattleya-house. Under this regimen flowers are produced earlier in the season, and it becomes necessary to remove

them to a cooler house as soon as flowering is over, in order to prevent a second growth.

Cypripediums.—For these plants a mild moist season is more beneficial than one that is bright, dry, and hot. There are, however, a few exceptions to the rule, viz., C. Rothschildianum, C. Stonei, C. levigatum, C. Lowii, and the hybrids that have been derived from these. East Indian Orchids, viz., *Vandas*, *Aerides*, and *Phalenopsis*, succeed under most external conditions of the weather.

The cool division.—The difficulty has been hitherto in keeping the houses cool enough; but where the houses are situated on the north side of a wall, the difficulty is much less than is the case with houses having more sunlight. Houses not shaded by a wall should have the glass white-washed, in addition to using the ordinary blinds, and if mats be placed on the roof during the hottest parts of the day the inside temperature will be lessened.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bleton, East Endleigh, Devonshire.

Mushrooms.—Collect fresh horse-droppings and short litter for making beds towards the end of the present month. Only the dung of horses fed largely on Oats is of any use. I prefer to add two wheelbarrowfuls of soil to six of litter and dung when making up the bed. At this season beds may be made in any outbuilding or shed, and not necessarily in the Mushroom-house; also out-of-doors beneath trees, &c.

Pol Herbs.—Those dried herbs which are most in request during the winter should now be gathered, made into small bunches, and hung up in an airy shed or seed-room. Even when not required for winter use, the beds of Spearmint, Peppermint, Marjoram, and Sorrel, are the better for being cut over at about this date, new growth soon pushing up and becoming fit for use. The flowers of Camomile should be plucked as soon as they expand, and be placed in the shade thinly to dry before being stored in bags. Other herbs are the better for not being allowed to form flowers before they are gathered for drying.

Autumn-sown Onions.—Bend down the tops of the bulbs, and in about a fortnight afterwards remove and dry them before storing. The vacant land may be planted with Coleworts at 12 inches asunder, and unless it be very hard, no digging will be necessary.

Tanbuds.—Plants growing in pots or boxes will require close attention in affording water, two or three times a day being not too often during hot, sunny weather. Plants on which there are fruit may be assisted with manure-water. All side-growths, and any foliage that overshadows the fruit should be removed. If space can be found for a top-dressing of loam with a little bone-meal, it will be of great benefit. The outdoor plants are doing well this season; we have gathered several good fruits already. As soon as from four to six trusses of flowers have formed, nip out the leading point, and generally treat the plants in the manner directed for those under glass. Repeat seedlings raised last month.

Barbecole and Savoy Cabbage should be planted by the end of the month, affording them water until they are established.

Celery.—The earliest plants are ready for a slight earthing-up, but previous to doing this, thoroughly saturate the soil in the trenches one day previously, and remove lateral growths and suckers, with a few of the bottom leaves, and afford a dressing of lime and soot to the soil. In earthing-up a double row, one man should draw up the foliage of the plants close together, whilst two men, one on either side, puts the soil round the plants with the hands or a trowel, the soil being made fine; on no account should the soil be placed higher than the heart-leaves. The successional crop should be planted within the next ten days, or the produce will be poor. All unmoiled Celery should be afforded water twice a week, excepting when much rain falls. Moulded-up Celery may not require water

oftener than once a week, but it depends on the nature of the soil how often water must be applied; the lighter, the more water.

THE HARDY FRUIT GARDEN.

By C. HEEREN.

Summer Pruning.—The summer pruning of the Pear should now receive attention, earlier pruning not being advisable in view of a probable second growth being made; but after this date any danger of this kind will be small. During the late warm weather, growth has been rapid and strong in general, as with many kinds of Pears the crop of fruit is a light one. With a view of not inflicting a severe check on the trees which the removal of much growth causes, the pruning may be carried out in two or more operations, a good plan being to take the upper half of the trees first, where the strongest growth is usually found, and in a week or ten days later the lower portions. Cut, or rather by pressing the shoot with the thumb against the pruning-knife, sever the shoot with a sharp twist at about the fourth leaf from the base. The exceptions are leading shoots, which should be left at full length. Should moist, warm weather in the months of August and September cause a second growth in the pruned shoots, it will occur in the upper buds, while the basal two of the four may be trusted to remain dormant. Cordons should be similarly treated, the leading growths being secured in an upright or oblique direction, as the case may be, before it gets damaged by the wind. The leading shoots of fruit-trees growing on walls and fences should also be secured with shreds or bast, in order to secure symmetry in the tree, and prevent loss by wind.

Apricot, Peach, and Nectarine. The leading shoots should be made safe with nails and shreds, or bast ties, and the lateral ones by means of straight lengths of Privet, Willow, &c., thrust behind the older shoots. The shoots should be laid in so as to allow of the full development of the leaves. In very hot weather the sun is liable to scorch the fruits when close training is carried out; therefore it will be advisable only to secure the shoots from breaking by a temporary fastening, and allow the points to droop, which will afford sufficient shade to the fruits without spoiling their colour. The final thinning, where necessary, of late varieties should now be done. During hot, dry weather the trees should be syringed once a day, either in the early morning hours, or after 5 o'clock p.m. To do this will keep the trees free of red-spider and aphides. If the pests are now present on any of the trees, in addition to syringing with clear water, make use of the quassia decoction; but do not make use of this on any trees on which there are fruits that are colouring, which therefore cannot be well and often syringed with clear water after the quassia has been employed.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HUSLEY PARK, Esq.,
Prestwood Hall, Longhoughton.

Brick Pits and Cold Frames.—The plants occupying these structures, chiefly those which will flower in the winter, will need attention in various directions. Cyclamens, as the foliage develops will want more space to develop it, and until the end of August a cold frame will suit them. Afford the plants a daily syringing, applying the water to the lower sides of the leaves, give more air than hitherto, and slightly shade the plants in bright weather. Great care should be taken not to let the plants get dry at the root at this season, or they will fall to throw up their flowers well later on. Winter-flowering zonal Pelargoniums must be stood thinly in the frames, and all the trusses of bloom should be removed as fast as they appear. When the pots fill with roots afford weak manure-water once a week, and stand the plants in an exposed sunny spot. Plants of *Campanula pyramidalis* may be shifted into 32-sized pots, which to some may appear a large shift for a plant in a small 60,

but with good management it may be safely given, and obviates repotting, and is a saving of labour. Afford the newly-potted *Campanulas* during sunshine shade for a few days, and afterwards stand them in an open position. Surplus seedlings may be planted in firm, rich soil, where they should remain till the spring. They will give a succession of flowers to the plants earlier potted.

Primula stellata and P. sinensis.—The former and the double-flowered *Primula* are now ready for repotting, this time into the flowering pots; but do not let them get pot-bound first, or they will bloom prematurely. A suitable size of pot is a large 48, and the potting-soil should consist of loam one half, leaf-soil one half, with powdered charcoal and sand to give porosity. Let the balls go sufficiently deep to prevent rocking without using pegs, and put the plants in a frame turned towards the north; keep the frame rather close for a few days, then afford air more freely, and on fine nights for a period of two months remove the lights from the frames. Put off the remaining stock of seedlings of *P. sinensis*, place them in a cold frame, and generally treat them like the larger plants, syringing them late in the afternoon if the air is hot and dry, being careful not to afford an excess of water—this remark applies to all species of *Primula*. Prick off seedlings, affording them genial conditions, and a temperature at night not higher, if this be practicable, than 55° to 60°, and keep the frames moist by damping down the bed of coal-ashes and the sides of the frames.

Begonia Gloire de Lorraine.—This plant should forthwith be potted in 48's, the size in which they will flower. In potting, employ turfy-loam in a rough state, half leaf-mould, a quarter spent hops, with a little charcoal and sand. Make the soil firm, and to each plant put a small stake, to which the main growths should be fastened. A pit or frame having a temperature of 55° to 60° at nights, and 70° to 75° during the day, will suit this plant. Keep the frame close for a few days after repotting; syringe lightly several times a day, and shade whenever the sun is bright. Remove every flower as it appears, and encourage growth until about a month before they are wanted. Do not crowd the plants together, but keep them by themselves, and allow each ample space. Keep a sharp outlook for yellow thrips, and vapourise the plants occasionally as a preventive to aphids.

THE FLOWER GARDEN.

By T. H. STANT, Gardener to Lord Baltimore,
Potters Park, Exeter.

Funkias.—These plants are useful for forming edgings to large beds, and as clumps in the pleasure-grounds and in the wild garden; and the best species is *F. Sieboldi*, which is in flower at the present time. Its striking large foliage and creamy-like flowers, borne on spikes well above the foliage, make it a conspicuous plant when planted in masses. In some situations it should be mixed with other plants of an evergreen character, as when its leaves ripen off in the autumn the soil is exposed to an undesirable extent. The larger growing species are very effective for planting where they can be viewed from a distance, as their bold appearance makes them more noticeable than would be the case with smaller-leaved plants. Some of the smaller growing Funkias are useful and effective as edgings for large beds, especially the variegated kinds, such as *F. lanceolata*, *alba marginata*, *undulata variegata*, and *undivitata*; there is also a variegated variety of *Sieboldi*. Species which flower late in the year are *F. ovata* and *F. grandiflora*. All the species are easily increased by division in the autumn or late winter, and they thrive in any fairly good garden soil, but attain their largest dimensions in a deep, fairly moist soil, and they will grow satisfactorily in moderately shady places.

Glabriolus are showing for flower, and should be made secure to new upright stakes, the flower-shaft being easily broken off. It pos-

sible, afford them liquid-manure at this stage, as by so doing the spikes are greatly improved in strength, and the flowers in size.

Specimen Plants.—Hollies, Sweet Bays, Thuas, &c., may be pruned into shape, rampant shoots and rival leaders being shortened with the knife. It may in some cases be prudent to secure a leader to a thin stake fastened to the stem, so as to prevent the birds from snapping it off. Plants growing in tubs will require water frequently, and a light mulch of spent Mushroom-bed dung, which will save much labour in applying water, and at the same time afford a safe kind of nutrient.

Summer Bedding.—The recent rains have benefited the plants exceedingly, but they will have caused the soil to cake, hence the hoe should be got to work wherever possible. Beds in which are plants that require to be pegged down to the soil should have the surface loosened first. Pinch the shoots of *Pyrethrum*, *Alternanthera*, *Coleus*, and other plants of low growth, whether planted in carpet-beds or as edging. *Königia maritima variegata* is a plant that should not be pinched, as each shoot produces flowers, and pinching would remove the terminal flower-heads. Regulate and peg down the shoots of Ivy-leaved *Pelargonium* frequently, so as to get the beds covered quickly.

FRUITS UNDER GLASS.

By MALCOLM M. STAYE, Gardener to SIR CHAS. TASSER, The Glen, Inverlathie, Peebleshire.

Vines in Pots for Early Forcing.—Vines being required for fruiting next year should have completed their growth by this date, especially those for fruiting early, which should have no more water than will prevent the foliage from becoming limp, and should be exposed to the fullest sunlight. Red-spider will probably appear on the leaves, and these must be syringed occasionally in order to cleanse them, if being of importance that the leaves remain in a healthy state to the last. After the Vines have become brown and firm, stand them against a south wall, to which make them secure.

The earliest-fruiting Vines should now be afforded a dry atmosphere to ripen the wood, but artificial heat will not be necessary, sufficient heat being obtainable by regulating the ventilators according to the state of the weather. Avoid a close atmosphere, especially by night, as this would have the effect of causing laterals to push, and keep the laterals and all late growths checked, and compel complete rest by keeping the vinery cool and dry. A drier condition of the border at this season is likewise desirable, although the soil should not become parched, which however is not likely to happen if a mulch has been afforded.

Muscat Vines with Ripening Fruit.—These will need fire-heat to insure a temperature of 70° to 75° by night, and 85° to 90° by day, with air in abundance. The air in the house should be kept drier, as under no other conditions will the fruit acquire that rich golden tint that accompanies fine flavour. The Muscat Vine requires abundance of water at the root, and so far as my experience goes, more than any other kind of Vine. I know of gardens in which Muscat Grapes are grown of the finest quality and quality, that have the borders flooded with water almost every week when the fruit is swelling, and during the early part of the finishing stage; indeed, they can hardly be overdone with water at the roots after the leaves have reached their full size until the Grapes are well advanced towards ripening, provided the border has thoroughly good drainage. Attend, therefore, to affording water to inside and outside borders in dry weather. Much aerial moisture in the vinery is injurious to Muscat Grapes when ripening, causing them to spoil; and it is very necessary to apply a gentle artificial heat and a small amount of air constantly, to prevent moisture settling on the bunches. After the final application of water, afford a layer of a few inches in thickness of dry bracken or Out-straw.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the PAPER, and as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 23:—(Dulham, North, and Newmarket-Tyne Botanical and Horticultural Society's Show (two days).

WEDNESDAY, JULY 24:—Boston (Lincs), Horticultural Show. Messrs Johnson's Cullinary and Sweet Pea Show (two days). Southern Counties Carnation Society's Exhibition at Southampton.

THURSDAY, JULY 25:—National Sweet Pea Society's Exhibition at Royal Aquarium, Westminster.

SALES.

FRIDAY NEXT—Imported and Established Orchids, and Palm Seeds, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick—63.4.

ACTUAL TEMPERATURES.

LONDON.—July 17 (P.M.): Max. 81; Min. 60.
July 18—Fine, hot
PROVINCES.—July 17 (P.M.): Max. 81, Home Counties; Min. 61, N. Wales.

Lilies and the Conference.

At the present time the species of Lily, properly so-called, exclusive of varieties, and cultivated in British gardens, amount to about fifty, and there are several more awaiting introduction. LANSBETS (1753) knew but seven. All are interesting, and most of them beautiful. There are but few which the fastidious cultivator would care to eliminate. Some of them are easily grown—some are difficult. Some are recognisable with facility; of others, the determination is puzzling. Now that cultivators, like Barlank, have begun to hybridise them, the puzzle will become still greater.

In addition to the hybrids known in Europe, which are few in number, the great Californian hybridiser announces in his catalogue for 1901, that he has ten thousand hybrid Lilies produced on his grounds! It is really consoling to know that only the best of these are now being selected, for under the name Barlanki \times various forms have been introduced. One of the very finest hybrids, L. \times Parkmanni, figured on p. 52, is, we fear, no longer in existence.

The great impulse to the cultivation of Lilies was given by Mr. ELWES, whose sumptuous monograph published in 1880, is a model of what such a publication should be. Mr. ELWES is a gardener, and an observant traveller, as well as a botanist. He has recognised the immense importance of studying the living plant in all the phases of its existence, as well as in all the details of its structure, and of observing the "evolution" which takes place when the plants are brought under cultivation. There

are some, indeed there are many, plants that cannot be satisfactorily studied in herbaria. Imperfect skeletons or mummies are not enough. The whole life history requires to be known, especially for purposes of cultivation; and this is especially true of bulbous plants, and of Lilies in particular. Urged by considerations like these, and aided by the counsels of BAKER, DURANTIE, and other specialists, Mr. ELWES set to himself the task of cultivating all the species he could obtain, of describing them, and of getting them figured by the skilled pencil of the late W. H. FITCH.

What has been done since by himself and others was detailed at the Lily Conference held on Tuesday last, at Chiswick.

Apart from the fine collection of Lilies shown by MESSRS. WALLACE, of Colchester, at Chiswick, on the 16th instant, the exhibition was not so particularly remarkable. MESSRS. VEITCH & SONS and BARR & SONS showed Lilies proper, and Water-lilies which are, of course, not Lilies at all. MESSRS. WARE, AMOS PERRY, and others showed herbaceous plants in variety. But the chief interest centred in the luncheon given by the President and Council, the only opportunity which occurs in the year for the Council to meet officially and thank those committees who throughout the year, in season and out of season, give their services without fee or reward. Sir TREVOR LAWRENCE appropriately expressed the thanks of the Council, and Mr. A. DEAN tactfully responded for the committees. This function over, the tents were cleared for the meeting of the Conference, which was presided over most fittingly by Mr. ELWES. Our report will show that the proceedings were of a very interesting and valuable character.

Mr. BAKER gave a summary of the botany of the genus since the publication of Mr. ELWES' Monograph. Dr. HENRY, the intrepid explorer and indefatigable botanist, gave a most valuable account of the Lilies of China, and the conditions under which they grow. He was followed by Mr. YELD, who contributed a paper on the cultivation of Lilies in the open, which, like that of Mr. WALLACE on pot Lilies and their culture under glass, will be of the greatest value to cultivators. Captain SAVILLE REID followed with a similar paper, which growers will study with interest; and Mr. MASSEE, in somewhat too satiric vein, considering the occasion, amused his audience by discoursing on the diseases of Lilies and the best methods of prevention.

We have always looked on these conferences as the direct outcome of the Botanical Congress held in London in connection with the memorable exhibition of 1868, from which also the Scientific Committee may be looked on as a direct derivative.

Be this as it may, these conferences, of which there have now been many, decidedly constitute the greatest claim which the Society will have on the gratitude and admiration of posterity. Chiswick trials will be relatively valueless in years to come, Temple shows, Drill Hall meetings, and other exhibitions are of service for a very short period only, and must be constantly superseded by others; but the conferences and their record in the *Journal* of the Society, constitute a permanent body of information practical, scientific, and historical, the like of which it would be impossible to find elsewhere.

AN AMATEUR'S SUCCESSSES.—Mr. OSMOND G. ORPEN, West Bergholt, Colchester, Secretary of the Colchester Rose and Horticultural Society, and well known as an exhibitor of Roses at the National Rose Society's and other shows, informs us that his record in six shows this season amounts to thirty-one prizes, composed of twenty-three 1sts, six 2nds, and two 3rds. At Woodbridge Mr. ORPEN won 1st prizes in four of the leading classes for amateurs, and one 2nd prize.

DON MIGUEL COLMEIRO, founder of the Botanical Garden at Seville, and later Director of the Botanical Garden Madrid, and Professor in the university of that city, who was also the author of several works on the flora of Spain, died on June 21st of the present year, aged eighty-six years. In former years the Professor occasionally contributed to this journal.

THE "TEMPLE" ROSE SHOW.—We are glad to hear that the financial report is satisfactory, and that the guarantors are not likely to be called on for any contribution.

THE REPLANTING OF BULBS.—Col. WHEATLEY writes: My remarks on this subject were incorrectly reported in your issue of June 22. What I actually said was as follows:—

"A large number of new bulbs are purchased every year, the quantity required may be imagined when I tell you that to fill some of our beds 4,000 Tulips are required, and from 2,000 to 3,000 Hyacinths. In the case of the beds in Park Lane new bulbs entirely are necessary. New and old cannot be mixed, as the latter come into flower so much earlier than the former, and the result is that the cost of our bulbs in Park Lane alone is usually between £200 and £400 each season.

"I may here mention that we have always to take out our bulbs before they have properly ripened and died down in order to get in our first summer crop, and consequently we lose a large number that might otherwise be saved. Every care, however, is taken to preserve them. They are arranged in shallow trays in a dark, well-ventilated shed, and in the case of Tulips they are covered with ashes to check evaporation during the summer. These old bulbs are used principally next season for herbaceous borders, &c."

It should be understood, as regards the annual cost of new bulbs in Park Lane, "between £200 and £400," that the principal portion is for Hyacinths, which, as Sir WILLIAM DYER admits, cannot be grown at Kew. M. J. Wheatley.

GEORGE NICHOLSON.—The news of the retirement of this gentleman from the Curatorship of the Royal Botanic Gardens, Kew, on the score of impaired health, will be received with more than ordinary concern. His wide and accurate botanical knowledge, his skill as a gardener command universal respect, whilst his qualities as a man and a colleague have long since won for him the affectionate regard of all who have come in contact with him. That such a man should be leaving Kew, for such a reason, is truly distressing. Some means will, we hope, be adopted of testifying the admiration felt in the horticultural world, for one whose long career at Kew has been one of sympathy and well doing.

THE LATE EXHIBITION AT BOSTON, U.S.A.—Prof. SARGENT writes, concerning the show which inaugurated the newly-erected hall:—"There were some novel and to me interesting features in this exhibition. The chief of these was the voluntary sinking of all individuality on the part of the exhibitors, that is, they put their plants in my hands, and allowed me to arrange them with reference to the best general effect, without any reference to ownership, which in no way has appeared in the exhibition. All the Orchids from a dozen owners were massed together in a way to produce the best possible effect, and the same is true of other exhibits. The new halls worked well as to light, ventilation, and temperature; and the scheme of a dirt floor in the large hall, into which teams

LILIAM GIGANTEUM — HEIGHT ELEVEN FEET; FLOWERS WHITE.

LILIUM - PARKMANNI—A HYBRID BETWEEN *L. auratum* AND
L. speciosum; FLOWERS CRIMSON ON A WHITE GROUND.

LILIU NEILGHERRENSE: FLOWERS CREAMY-YELLOW.

LILUM JAPONICUM VAR. ALEXANDRE: FLOWERS WHITE.

with the plants are driven directly from the street, is an admirable one, and permits the exhibition of much larger plants, and a more natural arrangement than has been possible before in this country. This idea I borrowed, of course, from Ghent. The high and well ventilated hall with electric fans is a great improvement on a tent, which generally becomes unbearable in the middle of the day from our hot sun, and in which plants do not last so long as they do in this new hall."

HARVARD UNIVERSITY.—Here is an announcement which will give the greatest pleasure to those on this side of the Atlantic who have had the opportunity of appreciating the work of Professor SARGENT. At the "Commencement" held on July 1, President ELLIOT conferred the degree of Doctor of LAWSON various men of eminence, including "CHARLES SPRAGUE SARGENT, first Director of the Arnold Arboretum, that precious living treasure which the last quarter of the nineteenth century has provided for later centuries; author of the monumental *Silva of North America*. And in the name of this society of scholars, I declare that they are entitled to the rights and privileges pertaining to their several degrees, and that their names are to be forever borne on its roll of honorary members."

SODA AND POTASH.—Experiments made at the New York Agricultural Station show that a deficiency of available potash greatly depressed the growth of the plant even in the presence of an abundant supply of soda salts. A lack of soda in the presence of potash sufficient for the plant's needs seemed to have no deleterious effect whatever upon growth.

ROSA MACRANTHA is supposed by some to be a hybrid between *R. canina* and *R. gallica*, but its real nature is a matter of controversy.

NEW GARDEN PLANTS OF 1900.—Appendix III. of the *Keen Bulletin for 1901* contains a list of the novelties introduced into British gardens during the year 1900. The plant figured in our columns as *Cryptostemma luscianicum* is referred to as *C. calendulaceum*. This list is very serviceable for reference. No authors' names are given, and this omission is, under the circumstances, not to be regretted, as the names given in the horticultural periodicals are the names under which the plants have been shown at various exhibitions, or have been offered in commercial catalogues. In only a few cases have the names been given or verified by competent authority in association with an adequate description. It is a great pity that provisional names intended for garden use only should be written in Latin in imitation of botanical names.

THE EASTER LILY.—The Lily commonly grown as *L. Harrisii* has no right to a specific name, it being merely a variety of the Japanese *L. longiflorum*. According to an article by Professor BAILEY, this variety was introduced from Bermuda to Philadelphia about the year 1875. A woman returning from Bermuda brought two flowering-bulbs to a Philadelphia florist, who recognised their value, propagated them till he had got a stock, which he sold to Mr. W. K. HARRIS, who distributed the plants in 1882 as *Lilium Harrisii*. Had he called it the HARRIS Lily, no mischief would have been done, but the application of a Latin name is incorrect and misleading. How or when this Lily was introduced into Bermuda, we do not know.

FLOWERS IN SEASON.—We have received from Mr. EBENEZER POTTER, Camden Nurseries, Cranbrook, Kent, a considerable number of seedling varieties of Delphinium. They are

numbered but unnamed, and it would serve no useful purpose therefore to refer to particular numbers, suffice it we say that there are single and double varieties, and much variation in colour, including shades of blue, purple, and mauve, white being occasionally united with one of the colours already named. They are good bold spikes, and the flowers are of commendable size.

MEETING OF THE GHENT CHAMBRE SYNDICALE.—At a meeting on July 8 of the *Chambre Syndicale des Horticulteurs Belges* and of the *Société Royale d'Agriculture et de Botanique* of Ghent, the following awards were made:—

Certificates of Merit.—For cut flowers of *Iris Kämpferi*, from M. E. BEMINGHUIS (*à l'unanimité*); for *Pteris Wayrini* *hyb. Pteris cretica* - *P. umbrosa*, from M. ARTH. VAN DEN HEEDER; for *Draecena* "Père Charon," from M. L. DRAFS-DOM, of Laeken, Brussels; for a cut flower of *Gardenia Bonfiglioli*, from the last-named exhibitor; for *Gloxinia Mme. Fierens*, from M. E. FIERENS; for a *Gesneriad*, from M. L. DE SMET-DUVAIVIER; for *Conopteris Brazziana*, from the French Congo, from MM. DURIEZ FRÈRES; and for *Hemanthus mirabilis* and *H. fascinator* (*par acclamation*), from M. L. LINDEN.

Certificates for Flowering were awarded for a set of *Hemanthus*, from M. L. LINDEN (*par acclamation*); and for a set of flowering *Gloxinias*, from M. E. FIERENS (*par acclamation et avec félicitations du Jury*).

Honourable Mention for flowering was allotted to a set of flowering *Gloxinias*, from Count J. DE HEMPELIXE; and Honourable Mention for the Variety for *Kentia Forsteriana* var. *pendula*, from M. Ed. PUYSAERT VAN GEERT.

In the second section of the meeting *Certificates of Merit* were accorded for *Laelia grandis tenobrosa*, from M. E. PRAET; for *Cattleya Mendeli* var. *Mme. Edg. Wartel* (*à l'unanimité*); and for *C. Mendeli* var., from M. M. VERDONCK; for *C. Mossie*, and three specimens of *C. Mendeli*; for *Laelio-Cattleya Valvassori* nat. *hyb. C. labiata* Warneri *Laelia purpurata*; for *C. labiata* Warneri, *C. Gaskelliana*, *C. Mossie* var., *C. Mossie* (*à l'unanimité*); and for *C. Mossie* again; all these from the Marquis DE WAVERIN.

A *Botanical Certificate* was awarded to M. M. VERDONCK, for an Orchid imported from Madagascar; and Honourable Mention for Flowering to M. L. DE SMET-DUVAIVIER, for *Cymbidium tigrinum*.

THE CEYLON GOVERNMENT ENTOMOLOGIST.—The Barclay Medal of the Royal Asiatic Society of Bengal has been awarded to Mr. E. E. GREEN, Government Entomologist, Ceylon, in recognition of his work on the insects of Ceylon and India.

YORKSHIRE NATURALISTS' UNION.—The 159th meeting will be held at Wetherby, for the investigation of the Wharfe, from Collingham Bridge to Flint Mill, Stockeld Park, Linton, &c., on Saturday, July 20, 1901 (Monday being found extremely inconvenient, the date is altered). Through return tickets at pleasure party rates will be issued at all stations on the G.C., G.N., H. & B., L. & Y., L. & N.W., Midland, and N.E. Railways, which have booking arrangements for Wetherby, Collingham Bridge, or Thorp Arch, to members and Associates showing their signed card of membership at North-Eastern Stations, or (at other companies' stations) surrendering the certificate noted below. Tickets taken on Friday or Saturday, July 19 or 20, will be available for return any day up to Monday, July 22. Where through bookings are not in operation, members may book to most con-

venient junction, and re-book to destination; the reduced fares being available for each stage of the journey. The railway booking clerks will only grant those reduced fares to members and Associates producing a special certificate signed by the Secretary of the Union (except at stations on the North-Eastern line, where production of card of membership is sufficient). Members and Associates wishing for this certificate must apply to Mr. HAWKESWORTH, Goodman Street, Ilmsley, Leeds, for it at least two days before the date of the excursion, and must enclose a stamped directed envelope and their current card of membership of the Union, which latter will be returned with the certificate. In case of no through booking, members must apply for an additional certificate. Permission is kindly granted by Col. Sir ROBERT GUNTER, Bt., M.P., for his Wetherby estate; Mr. GEORGE FABER, for the Ainsty estate; Mr. ROBERT J. FOSTER, for Stockeld Park; and Mr. T. B. MATTHEWS, for the grounds and woods of Thorp Arch Hall. Permission is granted with the express condition of there being no disturbance of game, nor pulling up roots of ferns or rare plants. The X. E. Ry. Co. have also given permission for the geologists to examine the sections at the Wetherby New Station works, at their own personal risk. A detailed account of this excursion will be published in the *Naturalist* as soon as possible. Mr. F. ARNOLD LEES, Meanwood Lodge, Leeds, who will write it, will be glad to receive, not only the official reports of sections, but any other information, which should reach him within a week.

SOMETHING LIKE A STRAWBERRY!—A fruit weighing half a pound all but three-quarters of an ounce is what the boys call a "whacker," which it is, in more senses than one. Yet we read in the *Daily Mail* of July 2 that a fruit of this weight was gathered by Mr. VERE JONES, of Parkfield, Lowestoft, Norfolk, this season. A fruit of Keen's Seedling, of which we possess a record, weighed 1½ oz., and was 7½ inches in circumference. Query: What would be the size of that half-a-pound fruit?

SCIENCE AND INDUSTRY.—"I am convinced," said Mr. CHAMBERLAIN, at the University of Birmingham the other day, "that unless we overcome the innate conservatism of our people in regard to the application of the highest science to the commonest industries and manufactures in our land, we shall certainly fall very far behind in the race." This is a statement which those who are conversant with what is being done in Germany, and the United States especially, will thoroughly endorse. "A University," says Mr. CHAMBERLAIN, "should be a place where knowledge is taught, tested, increased, and applied." A great deal of the teaching could be done in schools, but the increase should be the special work of the University, and its application that of technical schools and practical establishments.

EMIGRATION.—The circular last issued by the Emigrants' Information Office, 31, Broadway, Westminster, S.W., states that this is the best season of the year for emigration to Canada. There is a good demand for competent farm-labourers in nearly all parts, except British Columbia. There is a good demand for coal and other miners, more especially in British Columbia and Cape Breton, Nova Scotia. There is a fair demand for general labourers, and for certain mechanics, such as carpenters, blacksmiths, and iron and steel workers, but not at St. John, New Brunswick; or at Winnipeg, Manitoba. There is a good demand for female servants everywhere, both on farms and in towns. Owing to

drought and scarcity of employment, emigrants, other than female servants, are not recommended to go to Queensland at present, unless they receive nominated passages, or take a little money with them. Work at the mines and on farms and stations has been seriously injured by want of water. Plentiful rains, however, have recently fallen in parts of the colony, so that prospects may be expected to improve a little. In Western Australia, at Farrabdale, there is a steady demand for sawmill hands and fellers. In many parts of the south-west, as at Toodyay, Perth, Katanning, and Pinjarra, there is a scarcity of farm hands, and of general labourers such as fencers and axemen. There is a good demand for female servants everywhere. In Tasmania the supply of labour is generally speaking equal to the demand. In New Zealand competent general labourers are always able to obtain employment; at Timaru "there is a keen demand for ploughmen and farm hands, who seem very scarce;" and at New Plymouth "boys or men to go milking cannot be got at any price."

OAKBROOK, SHEFFIELD, enjoys the distinction of possessing seven memorial trees planted by Royalty. In 1875, when King EDWARD and Queen ALEXANDRA visited Sheffield as Prince and Princess of WALES, to open a park for the use of the people, the donor of that first park, the late Mr. MARK FIRTH, resided at Oakbrook, and to commemorate the event of their R.H.'s visit to the town and to Mr. MARK FIRTH's residence in particular, four golden-leaved Irish Yews were planted upon the lawn on August 18. The trees planted by the Prince have made much the better use of their time, but this may not be due so much to a more proper method of planting as to the choice of a more suitable position, a circumstance with which probably neither the Prince or Princess had anything to do. Prince LEOPOLD on October 22, 1879, planted two Oaks upon the same lawn, and these are succeeding well, as they should, seeing that they were planted at the most suitable season of the year for such an operation. On August 7, 1879, the Crown Prince of SWEDEN planted a Golden Queen Holly. MARK FIRTH is now only a name for grateful remembrance in the town, and Oakbrook is the residence of Mr. W. S. LAYCOCK, one of Sheffield's foremost industrial men, who naturally places very great value upon the Royal trees that have come into his possession. When we visited the place on a recent occasion there were many signs that Mr. LAYCOCK intends to make Oakbrook as attractive as possible, by developing several features the natural conditions of the place render possible. Then will the present gardener, Mr. P. MASSEY, have a better chance to perfect his Peaches. Though Oakbrook is a considerable distance out of the town, and adjoins the late Sir JOHN BROWN'S residence, Endcliffe Hall, the excellent system of electric tramways, of which Sheffield is justly proud, is just being extended beyond both places.

VITALITY OF SEEDS.—Sir W. T. THURSELTON-DYER and Professor DEWAR have shown us that the vitality of protoplasm is not impaired by the almost inconceivably low temperature of liquid hydrogen. Dr. HENRY DIXON, of Trinity College, Dublin, has recently been experimenting in the opposite direction, and in *Nature* for July II he narrates the results of some experiments that he made with dried seeds, from which he concludes that in every case they can resist surprisingly high temperatures. For instance, in Medicago, 10 per cent. of the seeds germinated after an exposure of one hour to 110° C., and then to another hour to 121° C. The effect

of exposure to high temperature is, however, noticeable by the marked retardation of germination, and by the extremely slow growth afterwards. Seeds that resist, as many do, the action of poisonous vapours owe their immunity, not to the quiescence or power of resistance of the protoplasm, but to the imperviousness of the seed-coat, for if this be punctured before the seeds are exposed to poisonous vapours or liquids, then the pernicious effect of the poisons is rendered evident, as the seeds do not germinate.

ROYAL PURVEYERS.—Mr. CHARLES TURNER of the Royal Nurseries, Slough, has been appointed by royal warrant Nurseryman to His Majesty the KING.

—Her Majesty Queen ALEXANDRA has been graciously pleased to appoint T. JANSOCH, of Dersingham, near Sandringham, Florist to Her Majesty.

—Messrs. WILLIAM WOOD & SON, Ltd., have been appointed by royal warrant horticultural specialists to His Majesty the KING.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—At the Bath Rose Show, on July 11, a stall was provided for the sale of spare Roses and other flowers, which were kindly given by the exhibitors and others for the benefit of the Gardeners' Royal Benevolent Institution, in connection with the Bristol and Bath auxiliary branch. The sale and collection realised the sum of £11.

ABIES BRACTEATA.—This beautiful and extraordinary species, by some called *A. venusta*, was supposed to be confined to a limited area in the Santa Lucia Mountains, California. We now learn from Mr. BERT DAVY, that he has discovered five new stations for the tree, by which its northerly range is increased by some 250 miles. This tree is somewhat spring tender in this country, but we owe to the courtesy of Mr. COLEMAN some fruiting specimens from Eastnor Castle, Herefordshire, one of which was figured in our columns in 1889, vol. v., p. 211.

FRUIT PROSPECTS IN SPAIN.—We are informed that the prospects of the Orange crop in Spain are of the "record" order; also that the Grape yield is expected to be a large one.

ROOTING OF LILIUM GIGANTEUM.—Mr. MALLETT writes us:—"I am sending you an interesting root of *Lilium giganteum* (fig. 21, p. 61), showing that this Lily is stem-rooting to a marked extent, and illustrating how the enormous stems support themselves when the bulb has gone. You will notice the basal roots which supported the plant before it flowered, some of which have perished with the bulb, and that those proceeding from the flowering stem have pierced the bulb scales in all directions, and destroyed them. A few offsets will be noticed around the basal disc, which will survive the old bulb, and live on its dead tissues for a year or two. I have never seen a more thorough annihilation of a bulb by its own flowering axis in any plant I have examined hitherto; not only has the stem exhausted the bulb, it is also feeding on its dead tissues. I have removed a number of the old scales because they were quite rotten, and unfit for the post."

PUBLICATIONS RECEIVED.—*Journal of the Board of Agriculture* (Messrs. Loughton & Co., 1, Essex Street, Strand), June. Contents: Gooseberry Mildew, Handling of British Wool for Market, by J. W. Turner; Canker Fungus, Feeding Experiments with Sheep, Insecticides, Manuring Swedes and Potatoes, Pasteurisation of Milk and Cream, Cold Storage and Transport in Canada, Agricultural and Miscellaneous Notes, &c.—*West Indian Bulletin*. Contents: Agricultural Conference, 1901 (continued).

Legislation to Control Bush Fires, by H. A. A. Nicholls; Treatment of Soils in Orchard Cultivation in the Tropics, by the Hon. Francis Watts; Rubber-planting in the West Indies, by J. H. Hart; Pine-apple Cultivation in Antigua, by the Hon. Francis Watts; Marine Resources of the British West Indies, by T. E. Duerden; Cultivation of Onions at Antigua, by W. N. Sands; and Artificial Drying of Cacao, by G. W. Smith.

HOME CORRESPONDENCE.

PEA EXONIAN.—I was pleased to see A. H.'s remarks on this fine Pea, p. 35. I have grown it every year since it was sent out by R. Veitch & Sons, of Exeter. It does well in the west, and has this season been good at Droppore. As the haulm is not very robust, I had it best to sow the seed about the end of the month of March. Those who have not as yet grown Exonian, would do well to try it next season. C. Page, *Droppore Gardens, Maidenhead.*

GREENHOUSE HEATING.—Mr. Alfred Chandler (p. 12), while being of opinion that petrolumised in a small boiler would answer where "there was not a large house or a number of houses to be heated, fears that it would be useless to nurserymen and others, who have coke furnaces heating some thousands of feet of 4-inch hot-water pipes." In reply, they seem to say that it was the "coke furnaces heating thousands of feet of 4-inch pipes," which I had in my mind's eye at the time I penned my note on the above-mentioned subject. Taking it as a fact that a cycloid of given dimensions filled with petroleum, and placed inside a small boiler, will effectually heat the water contained therein, together with that in a given number of feet of 4-inch hot-water pipes attached. Thereto, the question of heating by the same means the water in a coke furnace, say a horizontal tubular boiler, 9 feet 6 inches long, with from 2,000 to 1,000 feet of 4-inch hot-water pipes connected therewith, simply resolves itself into a sum of "simple proportion"; the heating capacity of a petroleum stove or cylinder being governed by size and the number of burners provided therein. For my own part, I do not see any difficulty likely to arise in the way of heating glasshouses by means of petroleum employed as described by me in the *Gardeners' Chronicle* for June 15 last, p. 391. It would be interesting to hear what mechanical engineers may have to say on the subject. In future, petroleum will probably be more generally used to supply the motive power than is thought of now. At present cars and carriages on both pleasure and business bent are driven by it, as also are the Great Eastern Railway Company's express trains from Harwich to Liverpool Street, and *vice versa*. In conclusion, I beg to thank Mr. Chandler for the remarks with which he concludes his note *re* patent rights, which however I was not altogether unmindful of when I penned the words "I reserve to myself all rights." &c. H. W. Ward, *Linc House, Rayleigh, July 6, 1901.*

LILY POND AT BERKSWELL, COVENTRY.—Having given an account in the *Gardeners' Chronicle* of September 1, 1900, p. 172, of the first year's flowering of my Lilies, I now give the result of their second year's flowering, and I am pleased to say they have grown and flowered quite to my own and to everyone else's satisfaction who have so far had the pleasure of seeing them, which is proof sufficient that they enjoy and delight in the silty porous clay in which they were planted, the leaves of some of the stronger-growing plants occupying a space in the pond of fully 5 feet in diameter, so that the native aquatic which spontaneously grow up in the pond are now, I hope, in a fair way of being overgrown and eventually altogether expelled. *Nymphaea Gladstoni*, which did not flower last year, has amply made up for this year, by sending up magnificent white blooms four and five at

a time, larger flowers, and of apparently with more substance in the petals than those of *N. albida*, although the latter runs it close in its habit of free-flowering. *N. odorata exquisita*, which did not flower last year, is still a weak plant, and flowers sparingly, sending up not more than two flowers at a time. The flowers are of good size, neat, and of a slightly pinkish-

Some of the plants send their blooms well up above the water-level, whilst others seem to prefer to rest upon it; but of this I am not prepared to give any decided opinion, as my pond, notwithstanding much puddling, has a leak somewhere, and the plants are in rather low-water sometimes. When planting, one of the mounds happened to be made a little higher

average day's list of their flowering:—*N. albida*, two plants, eight flowers; *N. rosea*, one plant, five flowers; *N. Gladstonei*, two flowers; *N. Dr. Paunce's Seedling*, two flowers; *N. Robinsoni*, three flowers; *N. Marliacea ignea*, two flowers; *N. chromatella*, four flowers; *N. Laydekeri liliacea*, two flowers; *N. flammea*, two flowers; *N. sulphurea*, two

FIG. 19.—LILIUM PARRISI; FLOWERS YELLOW. (SEE P. 18.)

white, but not of a very fascinating colour; its name implies perfume, but of this I discover very little. Dr. Paunce's seedling is a very strong-growing plant, having dark green leaves,* and sends up fine bold flowers of a pinkish tint, which stand well out of the water. This *Nymphaea* is a favourite in my pond, although it does not appear to send up its flowers so freely as *N. albida* or *N. rosea*.

* It is the *Gladstonei* whose leaves are tinted with brown.

than the others, on this a plant of *N. chromatella* was placed; when the water happened to get low, its crown was almost above water. To ensure its safety, I took a strong crooked fork having a long handle to it; this implement was fixed well under the plant, which was dragged with sundry strong pulls into deeper water. The roots had strong hold, and many were broken, but the plant, after a short season of sulking, is now growing and flowering freely. Subjoined is about an

flowers; *N. exquisita odorata*, one flower. These flowers are always at their best during the hottest part of the day. W. Miller, *Borksweil*, July 11.

TWO LONDON DINNER-TABLE DECORATIONS.

Having been enabled recently to inspect two table decorations carried out by Mr. Bacon, gr. to W. W. Astor, Esq., Cliveden, at his town house, at Carlton House Terrace, a few notes thereon may be acceptable to some

of the readers of this journal. The tables were laid for about fifty persons, and were consequently of considerable length, and required a large quantity of material. In these decorations Mr. Bacon uses, as far as is possible, one flower, and these of one colour, those at the time of my visits being Malmaison Carnations on the first occasion, and on the second Crimson Rambler Roses. For the purpose of effectively decorating the table on these occasions, Mr. Bacon has made a series of wire shapes of various designs, and these are very lightly dressed with greenery, and the selected flower. Some of these shapes represent baskets when dressed, others epergnes, hoops with three feet on which to stand, &c. They are fitted with very small egg-cup-shaped receptacles at convenient points, and these are filled with damp clay, into which the flowers when wired are stuck. Smilax is used to cover the framework of the shapes, and it is kept in position by a few ties here and there. Much of this work, and the wiring of the flowers, is carried out on the previous day, and the flowers preserved fresh in water. The Malmaison (pink) Carnation formed a pleasing and effective display, over a thousand blooms being used, including a couple of shapes dressed with the variety Miss Jolliffe. Fifteen of these shapes were used, besides some low glass vases on either side the whole length of table, and a few well-grown *Draecenas* stood between the shapes in the centre. Besides the trails of Smilax, the shapes are also lightly dressed with sprays of Asparagus Sprengeri, and the flowers thinly introduced afterwards. Beautiful as the Malmaison Carnations were, for effect they were far behind the Crimson Rambler, the colour of which when lit up by electric-lamps was vivid and effective. Besides the Rose foliage, spikes of *Eulalia japonica variegata* were tastefully introduced. These shapes are of Mr. Bacon's designing, and are very useful where lightness in the work and an unobstructed view across the table are sought for. *Rambler*.

STRAWBERRY VEITCH'S PERFECTION.—Having grown this Strawberry for three seasons in different aspects in the gardens here, I have formed a very high opinion of it. Strange to say, the first plants I had of it did not prove a success. In July, 1899, I had a number of runners layered into 4-inch pots, and from these plants, which were planted in the end of August of that year, we had last year one of the finest crops of dessert fruit we have had for years. I had runners taken from these plants in 1900, and planted in August, which have produced a magnificent crop of fine fruits this season, and are now, July 1, a sight worth seeing. I consider it a grand Strawberry for a second early, or mid-season variety; the fruit being large, handsome, produced in quantity, and the flavour is excellent. I learn from my note-book that plants were planted on August 17. The plants which were planted in August, 1899, are producing a very heavy crop of fine fruits, which shows that it is a Strawberry that will crop heavily when either one or two years old. I may here state that after many years' experience in different soils and districts, I consider it a mistake to destroy the plants after one year's fruiting. The young plants produce fine fruit the first season after planting, but the quantity bears no comparison to that produced the second year; and I assert that in deeply cultivated, heavily manured land most varieties of Strawberries may be retained with advantage for three years. On thin, light soils the case is different; but then the Strawberry being so much esteemed as a fruit for dessert and other uses that it is well worth extra attention, and where thin soils have to be dealt with, I know of nothing better than a thick coating of good farmyard-mannure well incorporated with the soil during the winter previous to planting for getting such soils into a condition to grow Strawberries upon them. My practice is to plant a bed annually, and to destroy one annually, so that we have always abundance of fine fruit to meet all requirements. I have observed during recent very

trying summers that autumn mulching is very much preferable to mulching in the spring, especially on light soils such as we have here resting on gravel. *David Kemp, Stoke Park Gardens, Slough.*

STRAWBERRIES AT LAMPPOST.—This year has been the best season for many years for Strawberries in this district, and the soil at Lampost being a retentive loam, the plants withstand drought well. Fruit-picking was begun on Sunday, July 9, the variety being Laxton's No. 1. The fruit of this variety is not so good looking as some others, Royal Sovereign, besides being one of the first to ripen, is a great acquisition. The variety Laxton's No. 1 fruited on young plants on a warm border, and side by side with Royal Sovereign, the latter being also young plants, layered in pots last year, and planted as soon as ready. This is the second year that I have grown Laxton's No. 1, and it is the earliest I have, but is of very little use the second year, and it is not advisable to grow a large quantity of it. One thing in its favour, however, is that it is good for preserving, for the colour and quality of the preserve cannot be excelled. The next variety to fruit was Royal Sovereign, on young plants as above mentioned; the fruits from those plants were of large, good shape, and fine flavour, but for preserving, it is inferior. I have several lines running across the garden of varieties of two-year-old plants, Royal Sovereign amongst them, which have borne a very heavy crop of fruit; also Laxton's Monarch, which has this year proved to be a superior fruit, having size, weight, flavour, and firmness. I am much pleased with Monarch this year, and intend to give Royal Sovereign and Monarch a fair trial in order to see which is the better variety. Sir Joseph Paxton is later than either, and I have just started picking the fruit, and I may just mention to relate about it shortly. The varieties Mentmore and Leader have heavy crops; Loxford Hall Seedling and Latest-of-All are just ripening. *H. Kempshall, Lampost, July 10.*

LILIU M GIGANTEUM.—Growing in a deep peaty bed, amongst Rhododendrons, Azaleas, and Kalmias, in the Royal Park at Greenwich, may just now be seen in all its glory an unusually large and well-developed specimen of the king of Lilies. It is fully 9 feet high, bears twenty-one flowers, and has a stem circumference of fully 11 inches. Rarely in these Isles has a larger specimen of this Himalayan Lily been recorded. The situation is certainly peculiarly suited for the growth of this plant, it being low-lying and protected on all sides by full-grown trees. *A. D. W.*

LILIU M CANDIDUM.—No doubt the fungoid disease which attacks this popular Lily will be much discussed during the Lily Conference of the present week. [See Mr. Masse's paper, p. 63, *Et.*] I have had just recently in diverse parts of Surrey ample evidence that the disease has not by any means exterminated this Lily. One of the finest clumps seen in one cottage garden, on the leafage of which there was not a trace of fungus, had fifteen strong stems in full bloom, and the bulbs were so crowded, that the central ones were forced quite out from the soil, and were fully exposed. It is commonly assumed that such exposure of the bulbs checks the progress of the fungus. But then I found in many other gardens this Lily in luxuriant leafage and bloom, the bulbs of which were quite buried. For that reason, it does not do to construct an hypothesis in relation to the fungus from two or three cases only. It seems odd that whilst in literally myriads of gardens white Lilies should thrive so well without any treatment of a remedial kind being applied, in others no remedy, however strongly recommended, seems to be effectual in combating the fungus. We may say almost the same thing with reference to the Hollyhock, as now and then in cottage gardens quite a charming show is made. But Lilies should be much more amenable, when in the resting stage, to remedial treatment than are Hollyhocks. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 2.—*Present.*—Dr. M. T. Masters, F.R.S., in the Chair; Messrs. Odell, Chapman, Saunders, Holmes, Bowles, Drury, and Worsdell, Drs. Müller, Cooke, and Rendle; Prof. Boulger, Rev. W. Wilks, and Rev. G. Henslow, Hon. Sec.

Orchids, Malformed.—Dr. MASTERS reported on the flowers sent to the last meeting. He found the Cattleya to be dimorphic, and the odontoglossum to have five perfect stamens, the other parts being variously twisted and deformed.

Harthouge, abnormal form.—Mr. DRYEY exhibited a plant with the fronds variously modified, being sub-lanceolate, emarginate, sub-pinnate in places, and much crested. It was a seedling of doubtful origin; but a similar plant had been found wild many years ago.

Aristobolchia trilobata.—Mr. ODELL showed flowering shoots of this species, remarkable for the form of the flower, in that the calyx closely resembled a pitcher of Nepenthes, having a lid provided with three long, pendulous streamers.

Christinus alpinus, pods proliferous.—He also showed specimens of this, not uncommon monstrosity in certain *Christine*. The pods were swollen at one place, within which was a double flower having several crumpled yellow petals and abortive stamens in the place of an ovule.

Silene and Anthyllis.—Mr. HOLMES found that the specimens sent to the last meeting proved to be *S. hirsuta*, and a variety of *A. vulneraria*.

Campanula, fasciated.—Mr. HOLMES exhibited a large terminal flower of the common Canterbury Bell. It consisted of a "multifid" flower of numerous parts; also a flower of Paris quadrifolia, with six leaves to the whorl, but having the usual 4-merous perianth.

Plymouth Strawberry.—Mr. HOLMES also brought specimens of the "Plymouth Strawberry," which he has had growing for ten years. It is remarkable for having a foliaceous flower, the petals and stamens being represented by numerous small leaves, as in the Green Rose and Alpine Strawberry; while each carpel on the receptacle consists of a three-pointed leaf, or rather petiole, rolled up upon itself. There is no trace of an ovule within it.

Beech with pubescent-veined leaves.—He also showed specimens of this peculiarity, apparently due to some insect attack. Mr. SAUNDERS undertook to examine it.

Proliferous Causes of Cryptomeria.—Mr. WORSDELL brought specimens of this monstrosity; which Dr. MASTERS observed was not an uncommon production in that tree.

Lily funguses.—Dr. RENDLE showed stems badly attacked by a fungus. Dr. M. C. COOKE reports as follows upon it:—

"It may be reasonably assumed that the Lilies exhibited were suffering from the attack of the "Lily disease," so called by Marshall Ward in his memoir (in the *Annals of Botany*, vol. ii., p. 39, pl. xxii. to xxiv., 1899). This is stated to be due to a white mould, of the genus Botrytis. Most of the specics being only a conidial stage of a trumpet-shaped fleshy fungus called a Peziza in past times, but now dignified by the name of Sclerotinia, because the cups are developed from a hard sclerotium, which is the hibernating mycelium of the mould. In the present instance I am not aware that the sclerotium has been observed, and certainly not the Peziza; hence it would be rather premature to give the supposed Peziza a name, before its existence has been demonstrated. Moreover, Marshall Ward has not given a specific name to his Botrytis, although he has described it with its clusters of egg-shaped conidia. Berkeley described, in 1851, a species of white mould, growing upon Lilies, which he called *Ovalaria elliptica* from its elliptical conidia (*Gardener's Chronicle*, Sept. 10, 1851, fig. 66). This nevertheless is a species of Botrytis, since called Botrytis elliptica, and probably is Marshall Ward's species. Long previous to the above, Corall figured and described a white mould, with ovate conidia, in glomerules, which was found growing on immature fruits of Lilies, in Bohemia; afterwards cited in other parts of Europe. This mould he called *Polyactis cana*, but during the recent revision of all species of fungi, by Saccardo, it has been called Botrytis canescens. Whether it is different from Botrytis elliptica I cannot say. Another species of Botrytis has been found in Britain and Holland, on leaves, stems, and flowers of cultivated Tulips. It is

called *Botrytis parasitica* *Cavara* *App. Bot. Ven.*, 10, tab. vi., figs. 1 to 4. This is probably different from the *Botrytis* on Lilies, although it is not improbable that it might develop upon Lilies if it came in contact with them. Having in view the conference which is shortly to take place, it may be interesting to allude to all the fungoid diseases of Lilies which have come under my notice; and, in this connection, it is satisfactory to learn that the number of pests is below the average of plants so largely cultivated. No other parasitic mould has been recorded, and only recently, one species of *Mucor* which attacks Lily bulbs raised in Japan for exportation to Europe. This species is *Rhizopus means*, described by Yassoe (*Kio Bulletin*, 1897, p. 57,

To these must be added the brands with two-celled teleutospores, although I am not aware that *Puccinia lilacearum*, notwithstanding its name, has been found to attack Lilies, although it is known in Britain on *Gagea* and *Ornithogalum*. Two other species, *Puccinia Tulipæ* and *Puccinia lilaceosa*, attack Tulips, so that, on the whole, the Lilies are favoured by almost immunity from these forms of fungoid pests.

The last group or section of parasites to which I need allude are the leaf-spots caused by incomplete fungi, called the *Spheropteridæ*. Here, again, the British cultivator may congratulate himself, since *Phyllosticta bilirica*, on the leaves of *Lilium candidum*, has not extended beyond Italy, and *Phyllosticta lili*, on *Lilium*

Hybrid Pisson Flower.—Dr. J. H. Wilson, St. Andrews, sent specimens of a hybrid between *P. alba* and *P. Constance Elliott*.

Taberna.—*Diseased*. Some specimens were received from Mr. C. MAYERS, Hockley, Essex, upon which Dr. Cooke reports as follows: "In the decayed crown of the corn I find no mycelium, or evidence that the decay was caused in the first instance by fungi, but plenty of insects were present." Dr. MAYERS has observed that such decay was usually at the base, not at the apex, of the corn, as in the pre-cut instance.

Catantopus Disease.—Mr. G. Rinkens, of Exton Park, sent some plants which were in a failing condition. Dr. COOKE examined them, and reports as follows: "The Carnations evidently suffered in the first instance from worms at the roots, afterwards, when the foliage was fading, they became attacked by the Carnation mould (*Heterosporium catantopum*) figured in *Gard. Chron.*, August 21, 1886, fig. 500. It is doubtful whether these particular black moulds will attack healthy and vigorous plants; but when they are weak, sickly, or injured, they then become a ready prey."

Apple-stems attacked by Caterpillars.—Specimens were sent by Mr. W. CAMM, of the Abbey gardens, Bath, Sussex, upon which Mr. SAUNDERS reports as follows:

"The Apple stems from Mr. Camm are, I should say, undoubtedly bored by the caterpillars of the 'Wood Leopard Moth' (*Zenozera aspidi*). The entrance to the gallery may be easily found by examining the tree, and it moisture is seen to be exuding from any part mixed with sawdust like particles of wood, there the hole will be found, a sharp pointed wire should then be passed in as far as possible, so as to stab the caterpillar. If this cannot be accomplished, the entrance should be somewhat enlarged, and some tow or cotton wool steeped in tar or paraffin oil should be pushed in as far as possible so as to stifle the insect. When no more can be got in, the entrance should be closed tightly with well kneaded clay or wax. If a large grey and white moth with delicately spotted wings is found on the trees, it should be killed, as it is probably the parent insect."

Palms flowered.—Mr. A. Doto, 36, Albyn Road, Dulwich, sent a portion of the male inflorescence of *Chamærops Fortunei*. The plant is described as being some 4 feet high to the top of the crown. Another plant has flowered at Christchurch this season, and a third elsewhere. Lastly, a fourth has flowered after an interval of twenty-seven years. This summer has therefore appeared to be particularly favourable to the flowering of Palms in the open.

Plants from I. de Minor.—Miss WILMOT sent specimens of a white-flowered Larkspur, and a golden yellow Centaurea, both of which appear to be new to science, and at present unnamed.

Lucubræ, nitida.—Plants were received from Mr. A. H. SMYTH which failed to produce their flower spikes. The stems were remarkable for the large size, and flat form of the leaves, the leaves on the lower part being small and with serrated margins. This feature appeared to show that the plants had grown in too moist a locality, the vegetative growth being abnormally stimulated, and so possibly a frost had arrested the flower spikes.

COMMITTEES AT CHISWICK

JULY 16, 17. On Tuesday last the Royal Horticultural Society's Committee, met in the big vinery at Chiswick gardens, and a Conference on Lilies was held in a tent on the lawn. H. J. Elwes, Esq., F.R.S., in the Chair, at which a number of papers were read by Dr. Henry, the great "Chinese traveller," Mr. J. G. Baker, Mr. Yeld, and other gentlemen. The company was for the season disappointingly scanty, and the display of Lilies smaller than had been hoped for, the best and fullest collections coming from Messrs. WATSON & CO., Colchester, and Messrs. J. VEITCH & SONS, Chelsea. Other floral items of most interest were Sweet Peas, and numerous hardy herbaceous perennials in their variety. Orchids were few, and fruit was not abundant.

Orchid Committee.

JULY 16, 17. *Present*.—Harry J. Veitch, Esq., in the Chair, and Messrs. JAS. O'BRIEN (Hon. Sec.), H. T. PILL, Dr. B. Crawshaw, W. B. Young, A. Haslop, L. Hill, W. Thompson, H. J. Chapman, and T. W. Bond.

Messrs. HUGH LOW & CO., Birch Hill Park, showed a small group in which were *Lælia* × *Bombacina* × *Devania*, with rather small flowers, in form like *L. tenebrosa*, in colour bright rose-purple with maroon tinge to the lip, *Cypripedium* × *Lawrenceana* Charlesworthii, having a strong resemblance to *C. Charlesworthii* in form, but with rose-purple lines and tinge

FIG. 20.—LILIAM WASHINGTONIANUM VAR. PURPUREUM. (SEE P. 48.)

with plate), and attacks the bulbs which soon become rotten, and exhibit clusters of tiny filaments with black heads, like miniature pans. These heads enclose minute conidia, whilst resting spores or zygospores are produced within the tissues of the decayed bulbs, and thus perpetuate the species after a period of rest. The section of fungoid parasites which include the smuts, rusts, and brands is represented, although there is no such such as smuts, Erythronium or Ornithogalum. The cluster cups of the Lily of the Valley (*Lilium convallaria*), has occurred on *Lilium condensæ*, and another cluster cup (*Eskidium*) occurs on *Martagon* Lilies in Siberia. Of the brands with simple teleutospores consisting of a single cell, the most common is *Eromyces Erythronii* on *Lilium candidum*, in Europe; and another, less common, probably unknown in Europe, is *Eromyces lili*, described as a pest of Lilies in the United States.

superbum, is at present confined to Canada. There is an allied parasite, with some technical differences, called *Cylindrosporium meconopium*, found on leaves of the *Martagon* Lily, but at present confined to Switzerland. Altogether, this report should give courage to the English cultivator of Lilies, inasmuch as the "Lily disease" so called, associated with *Botrytis*, is the only one which need cause anxiety."

Mr. WILKS observed that the best remedy was to place the diseased Lily bulbs in a bag of sulphur in some hot place in a greenhouse, then to replace them in the ground, but not too deeply.

A unanimous vote of thanks was given to Dr. Cooke for his report on the fungus sent to the last meeting, as well as on the present occasion.

Lily Hybrids. Mr. BOWLES exhibited blossoms of *L. Dahlmanni*, the result of *L. dalmaticum* × *Hansonii*, to show the difference in colouring.

in the upper sepal. C. x Frau Ida Brandt (to grande x Youngiana, C. x Goweri magnificum Schofield's variety, a very large and finely coloured form, C. x Kinsballiana, Low's variety, and two fine varieties of Cattleya Gaskelliana)

REGINALD YOUNG, Esq., Linnet Lane, Sefton Park, Liverpool (gr. Mr. Poynter, sent Cypripedium Tautziaum Youngii (barbatum grandiflorum x niveum), differing from the original in being larger and more uniformly purple tinted)

SIR FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr. Mr. W. H. Young, showed flowers of the natural hybrid Cattleya x Whitei (Schellieriana x labiata), Flowers large, bright, dark rose-coloured, with purplish-rose front to the lip)

E. ROBERTS, Esq., Park Lodge, Eltham (gr. Mr. Carr), showed a finely grown plant of Anguloa Ruckeri, with six flowers of excellent quality; yellow uniformly spotted with pale red-brown

Awards.

FIRST CLASS CERTIFICATE.

Ochthoglossum varicatum Thompsonianum, from W. THOMPSON, Esq., Walton Grange, Stone, Staffordshire (gr. Mr. W. Stevens). A remarkable and gigantic form of this pretty Mexican species. The inflorescence was very stout, over 20 inches in length, and bearing eight large and finely-formed flowers, far superior at all points to any previously seen. Flowers 3 inches wide across the petals, and $\frac{3}{4}$ diagonally across the sepals; petals $1\frac{1}{2}$ inch wide; lip $1\frac{1}{2}$ inch wide; sepals salmon-brown, margined with yellow; petals and lip pale yellow, blotched with brown.

AWARD OF MERIT

Ochthoglossum x Crossoglossum, from DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables).—A very fine and distinct hybrid, well intermediate between the parents. The cross was made July 7, 1891, O. Hallii being the seed-bearer, the other parent O. Harryanum, and the plant flowered July 12 this year. The form of the flower is nearest to O. Harryanum, but the colouring and spiny erect and apiculate wings to the column are strongly indicative of O. Hallii. The ground colour of the sepals and petals is of the palest greenish-yellow, with a nearly white area at the bases. The sepals are very heavily blotched with chocolate-brown, and the petals similarly but less profusely marked. Lip large and concave at the base, as in O. Harryanum, and with a bristly erect dotted with brown. The basal half is cream-white, spotted with purplish-brown; the front unspotted, lined inward at the sides, and apiculate.

Cypripedium x Kinsballiana, Low's var., from Messrs. Hiron Low & Co. The plant was illustrated but not described in the *Gardener's Chronicle*, June 29, 1896, p. 891. It is a garden-raised specimen, raised between C. Rothschildianum and C. Dayanaum. That shown by Messrs. Low was an imported natural hybrid. The present variety is the largest and best, and the most nearly approaching C. Rothschildianum in form and colour. Upper and lower sepals large, cream-white, heavily striped with purple-brown; petals long and extended, whitish, spotted with purple-brown; lip tinged with reddish brown.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. R. Wilson Kerr, W. J. James, R. Dean, S. A. de Graat, E. H. Jenkins, W. P. Thomson, W. Bain, J. Jennings, C. R. Fielder, Chas. E. Pearson, C. Dixon, C. E. Shea, Chas. T. Druecy, Geo. Paul, H. Turner, R. C. Notcutt, O. Thomas, Jas. Walker, George Gordon, J. Fraser, and J. F. McLeod.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, showed extensively Lilies in variety (fifty-seven species and varieties) admirably grown, and many growing in pots, and others were set stems merely. The groups sent in circle in form, was placed at the head of the central mass of exhibits. The *pièces de résistance* consisted of L. Browni len-antium, L. auratum var. Witter, a delicately coloured variety, white, with a yellow band on each petal, L. auratum, with evenly distributed purple spots, and the usual yellow band; L. rubro-vittatum, of which there were several examples, the central band on the petals being of a reddish-purple tint, and half an inch in width, and the spotting as in the type; L. Browni was shown as a cut flower, massive looking blooms, white on the inside and dull purple outside; L. superbum, an orange and yellow coloured flower, with purple spotting, and a Turk's cap as regards form. Some of the flowers of this species shown presented brighter tints than others. L. Thunbergiana var. Orange Queen, an exactly posed flower, 6 inches in

width and orange coloured, with a few diffused spots over the surface; L. T. var. atro-purpurea, a flower of a dull crimson tint, having narrow petals; and a flower not more than 4 inches in diameter; L. T. bicolor, with a flower of orange scarlet colour; L. T. E. L. Joerg, similar, but the petals tipped with crimson; L. Humboldtii, an orange-coloured Turk's cap, and set off by bold spotting; a plant very free to flower; L. Grayii, a small drooping flower of orange-scarlet, which does not open widely; L. concolor, brilliant scarlet; and L. c. var. luteum, a plant of small growth, flowers erect, both apparently delicate, but really of easy cultivation; L. parvulum var. californica, a very brilliant scarlet and orange-coloured "Turk's Cap," with petals which completely reflex; L. longiflorum foliis albomarginalis, the leaf variegation being in the form of longitudinal lines of a creamy white; L. L. giganteum, with much larger flowers, of purest white. Of the handsome L. excelsum (testaceum), several well-bloomed plants, and also cut stems loaded with flowers, were shown. The colour is that of a pleasing shade, and it is a plant of easy culture in most soils and situations; L. Hansonii, an orange-coloured, and odoriferous flower, which in the present season is about a month too late; L. croceum, so-called; L. ligurium splendens, an orange-scarlet flower; L. candidum, the painter's Lily, a plant which in some soils succeeds like a weed, and in others will not grow for any length of time; L. chalcidonicum maculatum, L. speciosum album, and L. rubrum, both well known species for market-garden work and in pots and borders; L. Henryi, a magnificent, tall-growing species, with large flowers, 5 inches in diameter, lightly disposed on long petioles; the stems of the plants exhibited were 7 to 8 feet in total height. The Colchester firm showed likewise the lovely *Mariposa Lilies* (*Glaucidium*) in variety, *Hemerocallis luteola*, a late-blooming species, of a pure yellow tint (Gold Medal).

Messrs. J. YETCH & SONS, Ltd., Royal Exotic Nurseries, Chelsea, staged in formal manner cut blooms of a large number of species of Liliaceae. The back line consisted of L. longiflorum, the next toward the front, L. Hansonii, L. excelsum, L. Purple Maritagon, L. excelsum in duplicate examples; the third row L. elegans sanguinea, L. mabeliana fulgidum, which differs from the type in its more fervid tint; L. elegans fulgens, L. croceum, L. candidum, L. Browni, and L. umbellatum var. imperatoriae. Other species, some scarce, were L. Washingtonianum, white, faintly spotted; L. superbum, L. canadense flavum, with small flowers of an orange tint, having recurving tips to the petals; L. concolor, L. croceum, L. chalcidonicum Heidehrii, a brilliant crimson "Turk's cap"; L. canadense rubrum, L. dilatatum, with deep purple flowers, covered with densely set bars; L. venustum macranthum, L. canadense flavum, &c. — A most interesting because comprehensive collection (Silver-gilt Flora Medal).

Messrs. YETCH & SONS showed *Buddleia varietalis*, a plant having long racemes of pale blue flowers of a small size, but showy withal.

Mr. HENRY JONES showed a few nice blooms of *Lilium Browni*, *L. parvulum*, L. elegans, and others, merely describing them as having been grown outdoors in Surrey.

Capt. REID, Yalding, Kent, showed *Lilium Browni*, L. *Segovitzianum*, observed in no other collection at the meeting; L. x Burbanki, and L. candidum.

SIR TREVOR LAWRENCE, Bart., Burford, Dorset, showed *L. Parryi*, a seedling from L. Martagon album (see fig. 16), Burbanki (Award of Merit), and L. Humboldtii *Blumenavianum* magnifica, an orange-coloured "Turk's Cap," with crimson spotting over the entire surface of the petals.

G. S. PATEY, Esq., Newton Abbot, showed *Lilium chalcidonicum*, common Martagon, and Martagon album; L. candidum, L. dilatatum, L. croceum, L. Burbanki x L. excelsum, and L. candidum var. floristratum, a white flower mainly, with blue-coloured stripes towards the tips of the petals.

Messrs. BAIRD & SONS, 12 and 13, King Street, Covent Garden, London, showed well a number of hardy perennial plants as cut flowers, including excellent Phloxes, Water Lilies, Dolphiniums, and Penstemons. Their Lilies included several of the more common species, besides L. canadense rubrum, L. parvulum Michauxii, L. p. pavillorum, and L. Browni (Banksian Medal).

Mr. JOHN RUSSELL, Richmond Nurseries, Richmond, set up a group of foliage plants, including *Caladium Russellii*, a big-leaved variety, pale pink, mottled ground, green veins; C. Gauremii, C. Sir Julian Goldsmith, C. Oppheii, C. Exquilita, &c.; *Aloucaia* (Sander-

ana, A. gandavensis, A. aryzana, and A. montifontanensis, very striking; and numerous Crotons. Altogether a very showy group (Flora Medal).

Messrs. THOS. WADE, Ltd., Hale Farm Nurseries, Feltham, exhibited a mixed group of plants and cut flowers of hardy herbaceous perennials, including a few species of Lilies, such as L. parvulum, L. Humboldtii, L. Browni, L. chalcidonicum, L. odorum, L. longiflorum, and L. Henryi. The group was rich in shrubby Phloxes, Iris Kempferi, Gaillardias, Campanulas, Aktenverias, Delphiniums, Camas, Chrysanthemums, succulents in variety, Water Lilies, Statice. Special mention may be made of *Campanula mirabilis*, with a drooping habit of growth, and palest of blue flowers (figured in the *Gardener's Chronicle*, 1898, vol. xxiv., p. 23); *Ornithogalum luteum*, leafless plants, having spikes of pure white blossoms ins. in length, on slender stalks 2 feet high; *Ajuga reptans*, with crumpled moss-green foliage, as large as a florum, the habit of growth dense and lowly; *Lithrum roseum superbum*, *Chrysanthemum W. Henshaw*, a flower having white rays and a yellow disc; *Acanthus longifolius*, *Semper-vivum Dufouieri*, having yellow flowers; *Ericeron glaucus*, pale violet rays and yellow disc; *Penstemon heterophyllus*, with bright blue-coloured flowers; *Delphinium chinense*, deep blue flowers; and D. album; *Stellaria media* rosea, *Heuchera Zabolina*, pale pink (Banksian Medal).

W. PROWSE & SONS, Sutton Court Nursery, Chiswick, exhibited an extensive collection of Japanese Maples as examples, rising in height $1\frac{1}{2}$ feet to 6 feet. This group was enhanced by the insertion of Lilies in bloom in variety. *Aver sanguineum* is a remarkably dark coloured variety, new to us, the prevailing tint a chart purple and rosy-red, making it an effective plant. It is, so far as we know, quite the darkest of the ornamental-leaved section of Japanese Maples (Banksian Medal).

Messrs. J. YETCH & SONS, LTD., showed small plants in 8's. of *Nerium roseo-pinnatifidum*, flowers rather larger than is usually the case with *Nerium Oleander*. They likewise had a good exhibit in a shady nook on the lawn, of a number of *Nymphæas* in pans filled with water, the plants being in most cases well in flower. The species consisted of *N. fulva*, *N. Marliacea alba*, *N. M. chromatella*, *sanguinea*, *ignea*, *carnea*, and *flammea*. *N. seignouretii*, *N. Aurora*, *N. pygmaea helveta*, *N. Robinsonii*, *N. Ellisiana*, *N. tuberosa*, *N. Laydenkeri fulgens*, *N. L. purpurata*, *N. L. lilacea* (Silver-gilt Flora Medal).

Mr. ED. LADBLOW, of the Roker Nursery, Sunderland, showed a white sport from *Pelargonium Madame Thibaut*, used by an late bloomer.

PERRY WAKEBER, Esq., Fawkham, Kent, made an excellent display of Sweet Peas, the beauty of a blossom being greatly enhanced by a light green groundwork of crumpled muslin on which the flower glasses were placed, and against which flowers of almost every tint showed to perfection. We do not suppose that this sort of setting admits of improvement. All the best varieties were shown, and a selection must be made, we would, among blues, name *Begonia*, deep purple; *Captain of the Blues*, Navy Blue, C. E. Wilkins, and Duke of Westminster. Of pinks, *coccinea*, Lady Mary Currie, Countess of Powis, Triumph, Lord Kenyon, George Gordon, Chancellor, and Oriental. Other fine varieties were *Salopian*, Oriental, Aureole, Prince of Wales, Mars, and Firefly (Silver-gilt Flora Medal).

Mr. J. DOTY-LAS, Elderside, Great Bookham, showed Carnations and Peonies, including many very choice and pretty novelties; besides those that received an Award of Merit. *Seymour Corcoran* is a primrose yellow flower, with regular, smooth edged, cupped petal, a circular bloom with unspilt calyx. *Ensign* is similar in every point, but is white; the grass being of moderate strength in each case.

Mr. G. YELD, Clifton Cottage, York, showed *Hemerocallis Pioneer* x H. *Thunbergi*, and H. *disticha*, single flowered species of a bright orange tint.

SIR TREVOR LAWRENCE, Bart., showed *Spiraea callosa pinnica*, of a deeper tint than the type; also *Hebe-streitia comosa*, having an inflorescence similar to the New Zealand *Veronica*—a South African species.

Awards of Merit.

Arctostaphylos grandis.—Flowers nearly 3 inches across; florets white, shaded with heliotrope on the outside, with yellow ring around the disc, which is of deep heliotrope colour. Shown by Mr. A. W. WADE, Riverside Nursery, Colchester.

Campanula lactiflora varietalis.—Some exceedingly strong flowering growths of this were shown by Mr. AMOS PERRY. The colour of the flowers is like that of Lavender, with nearly white centre.

Candy-stalk "Rose Cardinal."—This variety was grown in Chiswick Gardens from seeds supplied by Messrs. Watkins & Simpson, Tavistock Street, Strand. It has a very good habit of growth, and branches considerably. The colour is rich rosy-carmine.

Carrotion Ensign.—A very fine white border variety of large size, with exceedingly good petals, minutely fringed at the margins. The calyxes are not so good as they might be. Shown by Mr. DOUGLAS.

Carrotion Segonaire Capricorn.—A first-class border variety of buff-yellow colour. Shown by Mr. DOUGLAS.

Lilium x Babolnki.—Flowers of this variable Lily were shown by Sir TREVOR LAWRENCE, G. S. PERRY, Esq., Newton Abbot, Mr. AMOS PERLEY, and Messrs. WALLACE & Co. From the appearance of these flowers it would seem obvious that the name Babolnki has been given to hybrids of different parentage, or from unselected varieties from the same stock-pond. Mr. Perry's flowers were not strikingly good, but resembled a poor form of *L. pardalimum*, except that the growth was stronger and bore more flowers upon very long pedicels. Those from Sir Trevor Lawrence were quite

From the Horticultural College, Swanley, Kent, were shown some large Melon fruits of several varieties. Cultural commendation.

H. P. STICKS, Esq., Givans, Leatherhead, Surrey (grt. Mr. W. Peters), exhibited fruits of Strawberry Givans' Late Profile, which was recommended an Award of Merit at the last meeting of the Committees at the Drill Hall.

A collection of fruit given within two miles of Charing Cross, was of exceptional interest at Chiswick, because it showed that very fine results are possible of attainment, even so close to the heart of the Metropolitan. There were six Melon fruits in several varieties, not of large size, but capably finished; Tomatoes Golden Jubilee, Sunbeam, and Perfection; fifteen dishes of Gooseberries, two dishes of Red Currants, one dish of Plums, obtained from a post-tree, which has ripened the fruits in its open; about twenty good fruits of Diamond Peach, and a dish of Superlative Raspberry Silver Knight in Medal.

LORD LANGRISH, K. The Herds, Monmouth (grt. Mr. T. Coombs), exhibited a collection of eighteen excellent

Melon Victoria, from a cross between *Syon House* & *Stilton's Epicure*. It was recommended an Award of Merit at Chiswick, see p. 36 of our last issue.

Eloagnus edulis in fruit was shown by T. T. STANSON, Esq., Aldermanston, Reading. The reddish fruits were exceedingly acid.

MESSRS. R. VERNON & SONS, Exeter, exhibited pots of *Psoralea* of Devon, a good plant crop wrinkled *Mazoe* growing about 4 feet high. It was recommended an Award of Merit by the Royal Horticultural Society on July 11, 1900.

MR. ALFRED WILKINSON, The Gardens, Bucklebury Place, Woodlinton, Berks., exhibited a fruit called Melon Best-of-All, a green-fleshed variety, and Melon Royal Favourite, with white flesh.

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, exhibited fruits and foliage of Strawberry The Khedive, a deep red coloured fruit, with prominent seeds and good flavour; the result of a cross between Lord Sunfield and British Queen.

AWARD OF MERIT.

Staphylea trifolia *Algaridii*, exhibited by Mr. ALFRED WILKINSON, Mandley Road, North Walsham. There were no fruits for inspection after the Committee had risen.

The Lily Conference.

This most important feature of the day's proceedings proved to be very interesting. Mr. H. J. ELVES presided, and amongst those present were Mr. J. G. BAKER, F. B. S., Dr. Henry, Geo. Masson, Capt. Scoble Reid, G. Yeld, R. Wallace, F. W. Moore of Glenview (Dulwich), and George Nicholson.

In opening the proceedings, Mr. Elves said that when he was abroad, and it was uncertain whether or not he would be able to be present at that function, he had been allotted the task of writing a paper upon the new Lilies if it had been introduced or discovered since he published his book upon these plants. Mr. Baker, however, had written such a paper, and he had the greatest pleasure in calling upon that gentleman to address the audience in his stead.

MR. BAKER ON NEWLY INTRODUCED LILIES.

Mr. Baker said that the publication of the excellent monograph of Lilies, written by the President of that Conference, constituted an era in the history of the genus. Nothing of the same character had been done since the publication of that work. In the paper from which he was about to read extracts, therefore, he had mentioned the Lilies that have been discovered since, and that those names had not been included in Mr. Elves' book. He proposed to give a description of the characteristics of each, and some information as to their native habitats. Instead of reading the detailed descriptions of them in full, however, he hoped that his paper would be thought sufficiently interesting to be printed in the *Gardeners' Chronicle*, with a report of the proceedings of that Conference.

The two countries that have contributed new Lilies during the last twenty years or so were Upper Burma, from which an excellent collection, including those new Lilies, had been brought home by Sir H. G. Gilchrist and Mr. Boxall, and Central and Western China, which was undoubtedly exceedingly rich in Lilies. Fortunately, Dr. Henry, who had been so successful in introducing Lilies and other species of plants from that region, was present that afternoon. His collection included 3,700 numbers, but amongst these, of course, were many duplicates of species and varieties collected from different localities or habitats or in different stages of growth. Some Lilies had also been collected in Western India by the French, Italian, and German missionaries.

Mr. Baker enumerated the new species in the order familiar to botanists, commencing with the sub-genus *Candidulum*, of which the old species, *cochinchinense*, *claytonii*, and *granatum* (Himalaya), were well known. During the past twenty years this group has been enriched by two new species, The late M. Franchet, of the Jardins des Plantes, Paris, described two new species, one of these is *L. mirabile*, which resembles *granatum* and *cochinchinense* in its general habit and characteristics, it grows strong and high, and bears as many as fifteen flowers upon a stem, having broad ovate cordate leaves. A curious feature of this Lily is that contrary to other species which have centripetal inflorescence, this one is centrifugal, consequently the uppermost flowers are the first to expand. The other new one was *L. Gleditsii*, from the island of Szechuan, which differs from *L. cochinchinense* in several respects, one difference being that the valves of the capsules possess but one nerve.

Passing to sub-genus *L. Edmonium*, which includes *capitatum*, *Brownii*, and *longifolium*, Messrs. Low & Co. had introduced a Lily under the name of *L. Wallichii* among sulphurium. This was discovered by F. WALLICH

FIG. 21.—BULB OF LILIUM GIANTIUM. (SEE P. 56.)

distinct, being larger in size and more attractive in colour. While some flowers in the show seem to be the result of a cross between *L. pardalimum* and *L. Washingtonense*, those of Sir Trevor Lawrence suggested *L. Parryi* and *L. pardalimum*. At present purchasers of this Lily should buy the plants whilst in flower, that they may get the type they wish, as the confusion will be great, especially as each type shown can claim to have received an Award.

Lilium concolor Cochitum. Much like *concolor*, except that the flowers are yellow instead of red. The variety shown on Tuesday had minute spotting. Height about 15 inches. From Messrs. WALLACE & Co.

Fruit and Vegetable Committee.

Present: A. Bean, Rev. W. Wilks, and Messrs. F. Q. Lane, George Wythes, G. F. Miles, S. Mortimer, W. Pope, Jas. H. Vitch, George Kell, E. Beckett, W. E. Tyte, Thomas Coomber, Jno. Escham, J. Willard, H. Balderson, Jas. Smith, Geo. Woodward, Henry E-Rings, W. Pompat, J. Bates, C. Herbin, and W. R. Divers.

Mr. A. Pettigrew, gr. to the Marquis of Bute, Cardiff Castle, exhibited four large fruits of Melon Royale, a white-fleshed variety with yellow exterior, netted white. It was awarded an Award of Merit by the Royal Horticultural Society last year, and is of very good flavour.

lent Pine apples. The fruits, though not of extraordinary size, were of commendable average, and excellent quality and finish. Silver Knight in Medal.

MESSRS. GEO. BISHOP & Co., Royal Nurseries, Maidstone, exhibited a few fruiting branches of varieties of Cherries, to show how far ahead the crop has been in Kent this season. The varieties were Black Eagle, Flenish Red, Old Black Heart, Kent Bigarreau, and Waterloo Heart.

Four fine Pine apples were shown by Baron NATHANIEL DE ROTHSCHILD, Bohle Warte, Vienna (grt. Mr. Roberts). Three of these fruits were Queens, and the other Black-african, which is very little grown in this country. The fruit of this sort is found in (silver Bankian Medal).

MESSRS. W. RAY & Co., Mount Pleasant Nurseries, Teynham, Kent, exhibited a very good collection of Cherries, the fruits being of good size. The large new variety Noble was represented. There were about seventeen varieties shown, including Frogmore Bigarreau, Black Eagle, Black Tartarian, Waterloo, Bigarreau Napoleon. Fruiting spray-illustrated the exceptionally good crops the trees have yielded (silver Bankian Medal).

Mr. Geo. Wythes, gr. to the Duke of Northumberland, Sand, *Syon House*, Brentford, exhibited three fruits of

the Shan States of Upper Burma in 1891, and was nearly allied to, but distinct from, *L. Walliciana* of the Himalayas. It has yellow not white flowers, and the plants produce bulbs in the axils of the leaves. *L. primum* is not so abundant as the last-named plant. It was figured in the *Botanical Magazine*, and differs from *L. Scellbergense*, in having shorter and more expanded flowers. Sir H. Collett collected the plant in 1888 in the Shan States.

L. Bakerianum (fig. 17, p. 15) was originally collected by Sir H. Collett, and was figured in the *Journal of the Linnean Society*. Another Lily was known as *L. Lowii*, both of them having been collected first in Upper Burma. Since, however, they have been discovered in larger quantities in China, and have become better known, it is thought that they will prove to be insufficiently distinct to rank as separate species, and *L. Bakerianum*, having the claim of priority, would have to stand for both, and the name *Lowii* abandoned.

L. rubellum (see fig. 15, p. 12) is a very pretty species, with widely expanding flowers about 3 inches long, and quite unspotted. It was received at Kew in 1898 from Messrs. Bunting, of Chelmsford. It is allied to *L. japonicum*, but has smaller, pink flowers.

L. japonicum var. *Alexandrae* (see p. 34) was introduced from Japan by Messrs. J. Veitch & Sons and Messrs. Wallace, and was exhibited in 1893. It has pure white flowers, grows very tall, and has a habit similar to that of *L. japonicum*.

L. leucanthum was discovered by Dr. Henry near a gorge where the great river of Central China breaks through and forms a beautiful ravine. It is near to *L. Brownii*, but has white flowers, and produces axillary bulbs. *L. forsanum* is only a variety of *L. longiflorum*.

In the *Gardeners' Chronicle* of 1891 there were five varieties of *L. Brownii* described. One of these, *Chlostrae*, is only slightly brown on the outside, and has a green star, which is noticeable inside and outside the flower. *L. odorum* or *colchesterense* may prove to be distinct from *Brownii*. *L. myrianthum*, from W. China, is near to *L. longiflorum*, but differs in possessing narrow segments, and in other details.

The sub genus IV. (*Soliflori*) had been enriched by a new variety of *L. elegans*, known as *Batemannii*; it has large, clear, apricot-yellow coloured flowers, quite free from spots, and was collected in Japan. Future experience with the plant may prove it to be a hybrid.

Passing to the *Archelion* section, much praise was given to *Lilium Henryi*, a magnificent garden Lily, and satisfaction was expressed that its name commemorated Dr. Henry's labours. Combining some of the characteristics of *L. speciosum* and *L. auratum*, the plants grow to a feet high, and flower rather late in the season. The flowers are very distinct, and are bright red or orange in colour. It is one of the very best and distinct acquisitions during the period under consideration. Collected in China, in 1888, the plant appears to adapt itself perfectly to the British climate.

L. Lilium auratum, &c., two noteworthy varieties had been introduced, namely, *tricolor* and *platyphyllum*. The variety *tricolor* differed from the type in being more robust, having broader leaves, more veins, no spotting in flowers, but copious papillae. *Platyphyllum*, from Central China, is very large in size, and richly spotted with brown.

L. oxypetalum, which has been introduced since the publication of Mr. Elwes' Monograph, has been transferred to the *Fritillaria* genus.

L. Delavayi is near to *Fritillaria*, and was found in Yunnan by Father Delavay. It has erect flowers, which expand widely, in colour wine-red, and spotted.

L. yunnanense is a very distinct species, collected by several persons, has a widely expanded perianth, some 1½ to 2 inches wide, and is of reddish colour.

Turning to the *Martagon* group, Mr. Baker went on to say that the majority of the new Lilies for the past 20 years belonged to this group. *L. Heldreichii* (Greece, 1850) is allied to *L. carnioleum*, has bright red flowers, distinct, 2 inches long, and like all of the *Martagon* group, the petals reflex.

L. ochraceum, from Yunnan, is near to *L. monadelphum Szovitsianum*, but would prove to be distinct. It has yellow flowers. *L. Jankei* is near *L. pyrenaicum*.

Several other species, including *sutchense*, *Wallacei*, *Duchartrei*, *papilliferum*, *L. Fargesii* (nearly allied to *L. tenuifolium*), were mentioned before Mr. Baker referred briefly to—

NEW AMERICAN SPECIES.

Regret was expressed that Carl Purdy, who knew more about American Lilies than anyone else, was not present. *L. nitidum*, with bright yellow flowers, was introduced by Mr. Bull in 1880. *L. Grayi* was collected in Virginia and in North Carolina, and has reddish-orange coloured flowers, with spots. *L. occidentale* of Purdy is near to *L. parvum*.

Summing up, Mr. Baker said at present it appeared

there were thirty-five distinct species and varieties of Lilies that were not included in the Monograph. Many of them are not at present in cultivation, and though some of the West China *Martagon* species may prove to be synonyms, most of the Lilies mentioned would probably be found to be true and distinct. The two best of the acquisitions were *L. Henryi* and *L. rubellum*.

The CHAIRMAN said that all had listened with very great pleasure to Mr. Baker's paper. Mr. Baker, by publishing his excellent "Synopsis of Lilies" in the *Gardeners' Chronicle* in 1871, had enabled the Chairman to write his monograph upon that foundation. It was not sufficiently recognised by horticulturists how deeply they were indebted to botanists; and there were some botanists who failed to appreciate that the opposite was also true. In the work of describing new plants, especially Monocotyledons, as Lilies, Irises, Orchids, &c., it was very necessary for the botanist to have before him living specimens. In preparing his monograph, Mr. Elwes had made it a point to exhaust every possible means to obtain fresh specimens, and of the fifty-two known species then supposed to be distinct, he had forty-eight in a living state. Of the new Lilies Mr. Baker had described, there had been introduced to cultivation only seven or eight; and Mr. Baker had shown that much work still remained to be done. Mr. Elwes believed that in W. China and Thibet there was a vast amount of horticultural novelties awaiting collection. Messrs. Jas. Veitch & Sons had there at the present time a capable man (Mr. Wilson), and great results were expected. After enumerating some of the difficulties and dangers that collectors had to face, Mr. Elwes declared that the difficulty in cultivating many Lilies in this country arose from circumstances of climate, rather than of soil. Without wishing to dishearten any cultivator of Lilies, he could but admit that unless one's garden enjoyed an exceptional situation, success in respect of many of the species would be very difficult of attainment. Since removing to his present residence, he (Mr. Elwes) had been unable to cultivate any Lilies perfectly.

DR. HENRY ON CHINESE LILIES.

Dr. Henry, who, as already mentioned, is thoroughly acquainted with the habits of native plants in Western China, said that when in that country he was seeking plants of all description, and therefore did not pay special attention to Lilies. Most of the new Lilies of China collected by French missionaries were collected at great elevations on the mountains, which were richer in species than the district examined by Dr. Henry. Alluding to the fact of Mr. Wilson collecting in the neighbourhood of Y Chang for Messrs. Veitch, Dr. Henry said that there was ample work for a hundred collectors in the mountain district of W. China and in Thibet, where in every valley there was a different flora. Y Chang was 1,000 miles inland, but at an elevation of only 50 feet above the sea level, so that the Yantze Kiang River afterwards flowed 1,000 miles through a vast alluvial plain, falling only 50 feet before it reached the sea. The mountains, on the other hand, attained a height of from 2,000 to 25,000 feet, and presented thousands of mountain elevations and puts continuous with the Himalayas. The summer temperature of Y Chang is as much as 70° Fahr. in the shade, and in winter fell to 20°. In the depths of some of the gorges, *L. Brownii* was common, and showed a large amount of variation. *L. tigrinum* Dr. Henry only saw in a cultivated state near Y Chang. *L. Henryi* occurs only in two localities near Y Chang, growing on grassy slopes up to 2,000 feet elevation, either on conglomerate or limestone soil. Unlike *L. Brownii* it always grew in exposed situations in a considerable degree of cold. In the inland mountains at a height of 6,000 to 10,000 feet, grew a small Lily, *L. tenuifolium*, or perhaps *L. Fargesii*. *L. gigantium* occurs in the depths of high mountain forests, and never on exposed grassy slopes. The flowers vary in colour, but are generally nearly white. *L. leucanthum* occurs in the province of Yunnan at an elevation of 1,000 feet. In the same district *L. nepalense* has been collected recently by Mr. Wilson at an elevation of 1,000 feet.

MR. YELD ON LILIES IN A TOWN GARDEN.

In this paper Mr. Yeld gave details of his experience in the culture of Lilies in a town garden in York. His garden possesses all the usual characteristics of an ordinary northern site, except that it is provided with effective shelter from the winds. *L. Martagon* varieties succeed well, and do not object to shade even under pear-trees. *L. Hansoni* does well, but commences to grow early in spring, and is liable to be injured by frosts. *L. testaceum*, *chalcodoniun*, *Humboldti*, *canadense*, and *Washingtonianum*, do fairly well. There is one

clump of *L. chalcodoniun* in a neighbouring garden that has been in the same position for twenty years, and still thrives. Amongst many other Lilies alluded to, *L. colchicum* was mentioned as the finest of all, and though it was ten or eleven years before flowering, the subsequent result fully compensated for that delay. Referring to the cultivation of Lilies generally, Mr. Yeld said that under general circumstances better results followed the planting of bulbs amongst tree roots than in ground by themselves, but this year the rainfall had been so inefficient that those in such a position had fared worst.

MR. WALLACE ON THE CULTURE OF LILIES IN POTS.

Mr. Wallace's paper contained an enumeration of those species that are most valuable for cultivation under glass, whether for forcing to flower in May or June, or to be encouraged gradually to cool houses, a method by which such fine Lilies as *L. speciosum* and *auratum* can also be grown to their very best condition. In such houses also, the Lilies may be planted in clumps, in tubs, or in similar large receptacles, or they may be planted out amidst species of greenhouse ornamental foliage plants, as in the new wing of the temperate-house at Kew. A good example of growing *L. auratum* in the manner described above was figured in the *Gard. Chron.*, February 15, 1873, p. 215. The specimen bore 225 buds. Among the Lilies recommended for May flowering were *L. Thunbergianum*, and *L. umbellatum*. Of the former, such varieties were mentioned as *atro-sanguinea*, Prince of Orange, and Orange Queen; and of the latter, *erecta*, Cloth of Gold, &c. *L. tenuifolium* was of great use, but required to be started into growth over a little bottom heat. After mentioning *L. excelsum*, *L. Hansoni*, and *L. Dalhousii*, Mr. Wallace said that the new *L. rubellum* was a perfect pot plant, and that growers of this Lily must not be discouraged if the plants appear very weakly when pushing through the soil; it is a common circumstance. *L. Henryi* must be started earlier to get it into flower at the same season. It is suitable for the purpose, but grows very tall. When the flower-buds show colour, remove the plants to a little shade, and the colour will then develop more perfectly. *L. giganteum* must not be afforded much heat, especially if moisture be lacking. If placed in a cool vinery, where they will progress gradually, a good result will follow. *L. odorum* [= *japonicum* colchesterense, see supplemental illustration in the present issue], if grown in much warmth, has no external colour on the flowers, but it will develop colour if the plants are removed whilst in the bud to a cool frame, and slowly graded. *L. Brownii* should be treated quite similarly, and will bloom early in June. *L. longiflorum* was mentioned as the one Lily most suitable for greenhouse culture. If very early flowers are needed, the variety *Harrisii* must be used; but for all other purposes the Japanese bulbs will give best results. *L. Martagon* and some others of the same type, need to be established in pots for a year before forcing them. The variety *album* might be used with the type, but all the *Martagon* Lilies, though very suitable for culture under glass, were not the best adapted for early forcing.

Mr. Wallace proceeded to speak of the advantages to be obtained from the cultivation of Lilies in unheated glass-houses for blooming in the summer months. *L. auratum* and *speciosum*, *parlatianum*, *tigrinum*, *chalcodoniun*, are all suitable for this purpose. As a preparation for flowering Lilies in May, thorough good bulbs should be potted up in early autumn, and placed in cold frames, from which they can be removed to heat in batches as required. The general conditions governing success in the matter of Lily culture in pots were as follows:—Keep them cool at the roots, afford requisite shade, and plenty of ventilation, taking care at the same time to avoid cold draughts; frequently syringe the plants, and damp the exposed surfaces in the house, as walls, &c.; afford each plant sufficient room, using over-sized pots rather than any that are in the slightest degree too small. Put the bulb in centre of the pot. A good soil for Lilies is one of 2 parts friable loam and 1 of leaf-soil. Species that produce basal roots require soil of a stiffer nature. Fumigate the plants with a safe vapour, as often as is necessary to keep them quite clean. Weak liquid cow-manure will be beneficial to the flowers, and lime and soft water is useful to keep the leaves in good condition.

The CHAIRMAN said a few words in recommendation of the greenhouse system of culture, and referring to the manner in which they are flowering in the temperate-house, Kew, said that if a house was devoted to Lilies, he thought the result would be acceptable to anyone. He (Mr. Elwes) emphasised the importance of having other plants mixed with their Lilies out-of-doors or in temperate-house borders. Out-of-doors, such vegetation

prevented the soil getting water-logged in winter, or dried up in summer.

MR. E. H. JENKINS also spoke strongly in favour of the practice, and referred to some successful results he had at Sycleham Hill with L. giganteum and other species. He recommended that bulbs of L. longiorum should be planted 8 to 12 inches deep, and that plenty of sand be used about them. Mr. Jenkins had been pleased to hear from Mr. Yeld a reference to the culture of bulbs from seeds, and the new species, L. Henryi, yielded seeds freely, so that the system could be easily tried in that case. L. pardalinum and others of the peat-loving section required strong shade, and it was recommended they should be planted 3 inches deep, and deluged with water and manure. Mr. Jenkins declared that we had been too timid in the use of manure for Lilies, and said that L. giganteum, and some other species, would consume it greedily.

CAPTAIN SAVILE REID ON LILY DISEASE, &c.

Captain SAVILE REID read only a very few extracts from his paper. Speaking of the white Mollusca Lily (L. candidum) disease, Capt. Reid said that six years ago, when removing to his present residence in Kent, he found the garden well stocked with L. candidum along the grass border. Afterwards he found that a disease attacked them, and caused the leaves to wither from bottom to top. Upon reading a letter in the Horticultural Press upon the subject, Capt. Reid dug up the whole of his 450 bulbs in the autumn, dried and cleaned them a little on the floor of ainery, and shook them up in bags containing sulphur, about four or six in a bag. They were out of the ground not more than forty-eight hours, except several bulbs which were forgotten, and here was an unexplainable incident. The bulbs that were forgotten, and remained in a bag of sulphur for a month or six weeks, were finally planted in an odd corner of the garden, and they grew and flourished better than those which were returned to the ground immediately. The others, however, did sufficiently well to prove that the sulphur had destroyed the fungus-past. Two years after the sulphur treatment, there were fifteen flowers on some of the spikes.

Capt. REID had found that L. monadelphum exotissimum succeeded best when planted in a position where the morning sun will find it, as a south-westerly position. A curious incident was related about the little L. Perryi. Capt. REID, with several other gentlemen, bought some bulbs of L. Perryi from Capt. Purdy. They had six each, and all of them proceeded to imitate the natural conditions in which they supposed this "Flag Lily" to grow. But Capt. Reid's water-pipe, which he supposed would deliver water and keep the situation damp, got stopped, and the land opened in conjunction with excessive drainage he had provided to carry away some of the water thus artificially brought. However, it appears that Capt. Reid's bulbs flourished, and those belonging to his friends did not. He had thirty-five flowers upon one spike, and one year had fifty flowers from his six bulbs. This year they had only seven flowers, but it is evident the bulbs are breaking up into sets.

The CHAIRMAN said that he had visited the site in South Carolina where L. Perryi had been discovered, and thought it was practicable there to divide the species as a bog Lily, it was unsuitable to English and Riviera, inasmuch as from March until October there fell next to no rain in that district. He, Mr. Elwes, did not think that all the Lilies were truly perennial. Some of them were only three years from seedlings before they flowered, and this circumstance, together with the fact of so many species as L. Tomingtonii dying after producing seed, seemed to prove them not to be long-lived perennials.

For twenty-five years Mr. Elwes had grown L. concolor, and all the time the plants had grown well yet have never flowered. He cannot flower the species, nor has he yet succeeded in killing it should it flower and perfect seed. Mr. Elwes believed the plants would die. Cultivators were advised to sow seeds of Lilies as soon as they ripen. Most of them will then commence to grow in the following spring, but those of L. candidum will commence to grow during the same year as soon as the same time as the other plants produce their autumnal leaves.

MR. MASSEE ON THE DISEASES OF LILIES.

Mr. Geo. Massee, of the Horticultural Royal Gardens, Kew, said that in all there were forty or fifty species of things that delight to feed upon Lilies, and declared in the midst of a company of Lily admirers, that many of the fungi were very much more beautiful than the

Lilies. The erubescens present must have been somewhat relieved, however, when Mr. Massee proceeded to state that one fungus only was of much importance in this country. This mildew Botrytis sp. was first described by Professor Marshall Ward, and Mr. Massee supposed that everyone was familiar with it now. The fungus can exist perfectly without the Lily, meeting with all that is absolutely necessary to its life in the humus of the soil itself; but after remaining in the soil perhaps for many years, and a Lily bulb was put near to it, the fungus found that the food it required was provided in a much more concentrated form, and Mr. Massee said that the fungus having some degree of discrimination, proceeded to feed in the best layer. The remedies recommended were purely those of prevention. When the fungus has got onto the tissues of the Lily plant, it could not be killed and the Lily saved. A method of protection recommended was that of planting the bulbs with a few inches of sand surrounding it, and the sand might be mixed with a little sulphur. The growing tip or the fungus on entering the sand would find no food, and would be unable to proceed further towards the bulb. Then Mr. Massee described the effect of Kautt-Strassburg Fertiliser, which he said would kill the mycelium of any fungus known to gardeners, were therefore recommended to remove the surface soil from their Lily beds every year, and top-dress with fish-bait soil, which should be mixed a little of this fertiliser. The second fungus, a sort of red Fraxinus cythronia, was present on most Lilium species, but it had not attacked Lilies very generally in this country, and the third species, was discovered in Japan, which had got hold of some of our bulbs during the passage from Japan to Europe.

We have some sympathy with the feeling that expressed Mr. Massee to the need some action of the proposed cultivators. He declared that many know the common remedies of good night doses, but most of these were possibly objected to through their very simplicity. Our experience shows that there does not lack foundation for his last statement.

After Mr. Massee's talk in a word with the gardeners, the Chairman moved a Vote of Thanks to the Council of the Royal Horticultural Society for providing the means for holding the Conference, and after well-deserved thanks had been accorded to Mr. Elwes as President, the company separated.

The literature of the Conference which has been published in *the Gardeners' Chronicle* will be another valuable contribution to the work. We so much information upon many subjects from time to time been gathered.

BIRMINGHAM AND DISTRICT AMATEUR GARDENERS'.

A LATTER was held at a private meeting at the Birmingham and District Amateur Gardeners' Association by Mr. H. T. MANN, Secretary, at Abbots Bromley, and there was a splendid attendance of members and friends.

Mr. Martin closed for his subject "Hardy and Open-house Climbing Plants," and the information he gave about the habits and peculiarities of each variety was most interesting, and could not help but be of benefit to those amateurs who are endeavoring to grow some of these truly beautiful plants, many of them, it is feared, under rather adverse circumstances.

The lecturer gave a list of those plants in both sections most likely to be chosen of all the amateurs at a large town, and strongly recommended everyone, before planting, to properly prepare the border or bed, and of attention to this point was the cause of many failures.

At the conclusion of the paper, a hearty vote of thanks was rendered to Mr. Martin for his very able paper.

ABERDEEN ROYAL HORTICULTURAL.

Not a little success of feeling has been engendered in horticultural circles in Aberdeen towards the action of the Aberdeen Town Council towards this society in the matter of granting it the use of the Duffell Public Park for its annual show next month. Some time ago the directors of the society applied for and were granted the use of garden's college grounds for their show, but it was afterwards discovered that the permission thus given did not, in former years, include the use of rooms in the Art Gallery, which sit on the grounds. Under these circumstances the directors asked of the Council the use of the Duffell Park for three days. This was refused unless the society understood that part of the park required. To have done this would have cost £100 and besides, the

society would not have had the advantage of the use of the park as a whole. The Council contend that they have no right to restrict the public use of the park, and that it would be perfectly legitimate for any payer to prevent himself at the gates and demand admittance without payment. This is all very true, but in the past, when the use has been granted, that rate payer has never yet presented himself. The society is a purely educational, and not a money-making concern. Indeed its finances have been on the wrong side for many years. Two years ago it experienced a never-to-be-forgotten catastrophe, when a hurricane levelled the show with the ground. The Society was only saved a serious loss by their having been no collection, hence no prizes had to be paid. Nevertheless, the effort was apparent on the show of last year, which resulted in a loss which the esteemed Chairman of the Society, Mr. William Pyper, of Hillhead, most generously made good. Under all these circumstances, the Society are not to be blamed if they looked for more generous treatment at the hands of the Council than has been meted out to them at this time.

LEEDS PAXTON.

July 19. The members of the above Society had their annual excursion conjointly with the Harrogate Gardeners' society on the above date, when a visit was made to the nurseries of Messrs. CURRY & SON, Altham. The party, numbering about one hundred persons, arrived at Manchester at 9 A.M., from whence they were driven to Altham by Messrs. CURRY. The branch nurseries at Altham were first visited, which contain fruit and forest trees, hedge and covert plants, conifers, shrubs, &c. From Altham, the party were driven to the Cemetery Nurseries, where there are more fine conifers, and to the Stamford Nurseries at Bowdon. Here we have some fine containing Ferns, Fuchsias, Aspidistra, some fine Impatiens, and some specimens of that lovely plant, *Fuchsia macrostemon*. Outside were noted some rare shrubs, conifers, and other choice species. Luncheon was provided at the Altham Hotel. Altham, being the chair being taken by one of the representatives of the firm, in the unavoidable absence of Mr. CURRY.

After the visitors and hosts had tasted the Royal Garden, which, amongst other things, some fine specimen Hollies were noted.

Despite the intensely hot sun, the contents of the numerous glasshouses were inspected, much admiration being expressed at the Crotons, Roses, Camellias, Arums, and Figs. There are also collections of stove, greenhouse and indoor plants generally. One set of doors were noticed open, and the house was now by itself and the visitors regretted that time would not permit them to visit the "Camellian" grounds, where such subjects as Rhododendrons, Prives, and Poplars, are grown in large numbers.

After taking tea at the Lincoln Hotel, and allowing the claim of the inevitable camera, the party returned to the city, and subsequently left Manchester for Leeds at 2.15 P.M., after spending a profitable and enjoyable day.

FRUIT, AVRAAGE WHOLESALE PRICES.

Table listing prices for various fruits like Apples, Apricots, Bananas, Currants, Figs, Grapes, etc. Columns include item name and price per unit.

THE WEATHER IN WEST HERTS.

The present spell of warm weather has now lasted nearly a month, but the highest temperatures of this period were registered during the past week...

VEGETABLES—AVERAGE WHOLESALE PRICES.

Table listing prices for various vegetables like Artichokes, Beans, Broccoli, Carrots, Cabbages, etc. Columns include item name and price per unit.

ANSWERS TO CORRESPONDENTS.

APPLE-TREES NEWLY PLANTED FAILING TO GROW OR BLOOM; A. H. O.K. We can only suggest the drying of the roots in the period between the digging up the trees at the nursery...

REMARKS.—Some Mediterranean Peas from Madeira in boxes have come to hand, and fetch 2s. Plums and Gages, etc., in boxes the first sold from 8d. to 9d.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period July 1 to July 18, 1901.

Table with columns for Day, Direction of Wind, Temperature of Air (Day, Night), Rainfall, and Temperature of Soil (at various depths).

IRON TANK; W. B. If you have reasons to suppose that the water is injurious to the Orchids, you might give two or three coats of hot lime-wash.

LIME LEAF; A. H. The Nail Gall, caused by a fly or mite.

FIG. 22.—THE POPLAR GALL. The galls are produced by an aphid (see fig. 22).

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to contribute the following number.—J. B. S., Caterham, Catalpa siringifolia, W. S. 1, Rhus typhina, 2, Colutea arborescens; 3, Lonicera Ledebourii; 4, Berberis buxifolia; 5, Spiraea Fortunei; 6, Berberis vulgaris; 7, Spiraea opulifolia, D. B., Leyland, 1, Phloxis antiochia; 2, Hedysarum multijugum; 3, Spiraea emeacens; 4, Sophora microphylla; 5, Sophora tetrapetala; 6, Quercus glabra.—GRASSES: T. C., 3, Festuca ovina; 1 and 2, not recognised; send when in flower.—J. W. L., Ltd., Oxidium hastatum, sometimes called Oxidium stelligerum, and Odontoglossum hastatum.—T. F. B., Dendrobium chrysanthum.—J. H., Leicester, Cattleya Warneri and Brassia verucosa.—P. L. H., Bifrenaria racemosa.—A. W., Schomburgkia Thomsoniana; see report of the Royal Horticultural Society's meeting, in the Gardeners' Chronicle, July 6, p. 15.—P. F., Galium verum.—Hughes, 1, Potentilla flabida var.; 2, Liatris spicata; 3, Lysimachia clethroides; 4, Dieentra eximia; 5, Helianthus multiflorus, double fl.; 6, Tradescantia virginica.—J. B., Adiantum canescens grandiceps and Polypodium aureum.—W. D., Tunc, 1, Adiantum formosum; 2, Pteris Wimsettii; 3, Adiantum capillus-veneris; 4, Adiantum concinnum; 5, Adiantum concinnum latum; 6, Selaginella Willdenovii.—A. D., Brentwood, Salvia leucantha.—Bob, 1, Phifesia buxifolia; 2, Ceanothus azureus; 3, Thalictrum majus; 4, Galega officinalis; 5, Spiraea callosa; 6, Sidalcea malviflora.—A. E. L., 1, Veronica Andersonii; 2, Dieentra eximia; 3, Centranthus ruber; 1, Spiraea; 5, Rhododendron hirsutum; 6, Astrantia major.—F. W. C., Lychnis chalcedonica and Galega officinalis, var. alba.—W. T., 1, Magnolia cordifolia; 2, Castanea vesca (Sweet Chestnut).—W. M. B., 1, Taxodium distichum; 2 and 3 not recognisable; 2 looks like a leaf of one of the deciduous Magnolias.—G. B., Galium verum.—Mrs. A. P. C., Ficus repens, also called stipularis. When growing against a wall it has small leaves, and does not produce fruit. When grown as a standard, the leaves after in form and fruit is produced.—J. McG., 1, Iaula Helenium; 2, Alstromeria pelegrina; 3, Malva moschata; 4, Catnanche corollata; 5, Helianthemum; 6, Campanula pusilla alba.—F. S., Birkenhead, Olearia macrodonta.

PAYMENT IN LIEF OF SERVICE; H. H. If what you say is correct, the would-be employer is not entitled to a halfpenny.

POTATOS; J. D. I. The tubers have most likely been induced to make fresh growth by the liquid manure applied.

ROSE-BUDS NOT EXPANDING; S. D. Very dry weather checks growth as much as does cold at times. The Roses have probably suffered from both causes in your case.

TOMATO PLANT; Elmwood. We can see neither fungus nor insect. Have the leaves been wetted while the sun was shining.

VINE-LEAF; Brownell. Materials insufficient for the purpose. Send better and more leaves as well as shoots, and state where grown, and how.

VIOLETS IN FRAMES; Alpha. A mixture of loam, run through a half-inch meshed sieve, and finely sifted, well-decayed leaf-mould in about equal proportions. Failing the leaf-mould, employ well-rotted stable dung, or disused hot-bed materials, and peat tolerably free from sand, in about equal proportions. We are unable to decipher the whole of your second query; please repeat in legible handwriting.

THE WOODS OF SURREY AND SUSSEX.

IF the regeneration and re-stocking of woods be necessary anywhere in England, it is in these two counties. The Surrey and Sussex woods are typical examples of the underwood system, and so far as timber crops are concerned, are probably the least valuable in Great Britain at the present time. I have lately seen many woods in the above counties, and have been struck by the excessive quantity of underwood everywhere, and the thin-sprinklings of timber amongst it, consisting mostly of Oak, and some Ash. On nearly every estate it is the same, and the problem of re-stocking the woods in these counties is likely to be a difficult one. The underwood is worthless, or next to it, as it cannot be got rid of, even to pay expenses, and if it were removed the timber trees left would not constitute a quarter of a crop, and they

could not be removed without denuding the landscape.

In the north of England and in Scotland there are plenty of woods consisting wholly of timber trees more or less thick on the ground; but south of London, and far to the west, it is almost everywhere standards over coppice, and the standards are far apart, from 10 to 20 yards in many instances. The Surrey Oak, too, is small for its age, the trees containing about as much top-wood as trunk, or more. In a mature wood of Oak, where the underwood had been cut for generations, the trees were not worth more than £2 each, valued at the highest price per foot. On the good land of Surrey and Sussex, in a favourable climate, one might expect to see fine Oaks if anywhere, but as a rule they are small. The trees are not dying, but they are stunted to a degree not general elsewhere. The branches have numerous ramifications, and the annual growths are very short, denoting slow growth. Wherever the Oaks have been grown with underwood they are short-stemmed. They have kept a clean trunk to the height of the underwood, having been drawn up to that height by the latter, but above that they have spread out into broad tops of the roughest description. In some woods between Horsham and Brighton, what are called wood surveyors, had been at work valuing standing Oaks, and I found that nearly the whole of their valuation lay in the trunks of the trees, very few of which exceeded 15 feet in height, all the rest being top, worth next to nothing.

The periodical cutting of the underwood appears to have had a bad and retarding effect upon the timber trees, which have been subjected to alternate periods of shelter and exposure. The rule everywhere appears to be to sweep away the whole of the underwood at periods ranging from seven to twenty years, and I can conceive of nothing more naked-looking and exposed than an Oak-wood quite cleared of its underwood, nor of any practice more likely to injure the timber trees. After the underwood has reached a certain height, it affords just the kind of protection to the trunks of the trees and soil that they need, and what continental foresters aim at by density of canopy; but when the underwood is cleared away, the effects of exposure to drought in summer and cold in winter must be disastrous, and may be compared to the exposure of a plant brought out of a hothouse without being "hardened off" to the open air. I am much mistaken if this system of sweeps and chills is not the cause of the slow growth in the Oak-woods of Surrey and Sussex, and their peculiarly stunted tops.

The difficulty now with these woods, consisting of standards over coppice is to determine what to do with them, as in most cases that I have seen they are in a worse plight than woods that are undercropped but not encumbered with worthless underwood. The latter the owner has but to regulate, clean, and plant up to the full crop condition; but in the case of the former the underwood is in the way, and cannot be got rid of without much trouble and expense, while the standards are already too few on the ground to constitute a crop, and replanting in a dense jungle of coppice is impracticable.

All that can be done in such a case is to convert the underwood into timber trees

by thinning and regulating on the plantation principle, but that can only be done where the underwood consists of the right species, such as Ash, Sycamore, Elm, or Oak, or any other species that will grow into trees. Fortunately indeed, by comparison, are those owners whose underwood consists of these species, for on some estates there are hundreds of acres of underwood that consists chiefly of Alder, Hazel, witley-wood, saughs, and the like, that cannot be converted in the way suggested, and the owner has no alternative but to clear completely and sow or replant.

But even where the underwood does consist of timber-tree species, care and judgment are required in thinning and regulating. I find it is a very common opinion in the south that "stools never produce trees," and there is a good deal of truth in the saying. Still, the fact is well known that second and even third crops are often got from old stools of such species as Oak and Ash, for example, although it is also true that trees from old stools are often hollow at the bottom. The decay from the old stool seems sometimes to extend to the base of young trees that spring from it, although the trees may be healthy at the top. I have often seen mature Oaks from old stools, not one of which was quite sound at the base. In underwoods, however, much depends upon the age of the stools. I would not like to say how old some underwoods are that I have seen, but acres upon acres are to be found on many estates where the stumps are from 3 to 4 feet high, and which, it can be seen, have been cut over at periods of from fifteen to twenty years for generations. Such stools or stumps, I can well believe, never produce trees. So rotten are some of them, that the foot can be shovelled through them; the living branches just spring from any portions that are alive. This is underwood in the last stage, and the only trees that may be originated from such stools are those that push strong from the base of the stool close to the soil. These are always the strongest, and produce independent roots of their own. I have seen nice Ash and other poles that have grown up by chance in such cases, containing from 6 to 10 cubic feet of timber, but shoots produced higher up on old stools are worthless and short-lived.

In underwood culture there has been much bad work, as in other matters connected with forestry. Careless cutting, and the leaving of long snags annually, have produced tall, weak stools; but in some parts where close cutting has been the rule, the stools hardly stand above the ground level. These produce the strongest underwood and the best trees, as all the growths are produced from close to the soil.

To clear worthless underwood crops completely off the ground preparatory to replanting is expensive work, as it means stubbing up the old stools. That would be the best plan, however, as it would thoroughly clear the ground and leave it fit for planting, and few soils are in better condition for sowing or planting with timber trees than such as have been long cropped by coppice, as the surface of the ground consists of a deep rich layer of vegetable mould, and is often quite free from any kind of vegetation likely to interfere with young forest trees. In old coppice the

stools are often so rotten that they would not be difficult to knock over level with the ground, and if these with their tops were burnt, the ground would soon be cleared for planting; while the future growths from old weak stumps could be kept down easily till the young trees grew up. So unsalable is the underwood on some estates that owners would burn it as it stands, if they dared, in order to clear the ground. In cases where the crop has not been cut for a good while, Alder and Birch have attained to the dimensions of pit-prop—such clean samples of the kind as I ever saw, and for these, in the south-west of England, a very considerable market has been found in the Somerset and W.-H. coal-pits, 20s. to 22s. being got per ton at the pits. It is the practice there to sell the timber by weight on the weigh-bridge, and when it is cut and sent off green a ton goes into little bulk, the wood being heavy. In Yorkshire a ton is taken as equal to 40 cubic feet, wet or dry. *J. Simpson.*

NEW OR NOTEWORTHY PLANTS.

BEGONIA FORGETIANA.*

This is a pretty species, similar to *B. undulata*, figured in the *Botanical Magazine*, plate 2723, but decidedly of a more ornamental character. It is a native of the province of Rio Janeiro, Brazil, where it was discovered by Mr. L. Forget, who was travelling for Messrs. Sander of St. Albans, and sent it home in 1898. The original plant is lush in habit, having about a dozen stems, the tallest nearly 2 feet high, and more or less branched. It is almost glabrous throughout, and somewhat fleshy, and the internodes are shorter than the leaves, and at first completely enveloped by the membranous stipules. Leaves fleshy, in two rows, obliquely lanceolate, the largest between 6 and 7 inches long and 2 inches broad, semi-cordate at the base, tapering to the top, margin wavy and curled, with a few very small teeth, glabrous on both surfaces, except a few bristles along the midrib on the under surface, glaucous above. Flowers pink and white, about an inch in diameter, borne in axillary clusters, equalling or overtopping the leaves; male and female usually intermixed. The flower-buds are at first enveloped by large, pale, membranous bracts, similar to the stipules.

In a genus so rich in beautiful species it is difficult to appraise the ornamental value of any given one, but *B. Forgetiana*, although not one of the showiest, is very pretty, even when not in flower. It is of elegant habit, and the glossy green leaves, and large sheathing stipules, render it decidedly attractive. *W. Botting Hemley.*

* *Begonia Forgetiana*, Henstley, sp. n.—Suffrutex vel herba subcarnosa, lere omnino glabra, a basi ramosa, creberr. bipedalis, ramis rectis rubescentibus, internodiis annatis foliis brevioribus primario stipulis membranaceis simplicibus vagantibus, vestitis. Folia carnosa, disticha, subpetiol. brevissim. petiolata, leviter oblique lanceolata, in ramulis florigeris usque ad 7 ped. longa et 1½–2 ped. lata, basi semiobcordata, apice acuminate sed vix acuta, margine undulata vel primario em-pato-undulata et remote denticulata, nervis glaberrima, supra glauca, subtus scens costam perspicua. Pedicelli axillares, rubri, folia squantes vel superantes, pauciflori, monomeri vel multicaules, pedicellis creberr. semipetiolariis. Bractee spatul. acce, bracteolae stipulis simillime, flores omnino vestite, cito decidue. Flores roseo-albi, creberr. 1 ped. diametro. Perianthium segmenta 4 cum supero in fl. fem. 3, exteriora late ovata, interiora minor, angustiora, in fl. masculo 4, linearia. Stamina circa 20, filamentis brevissimis. Capsula trilobulari, imbricatis lobata, placentis integris, stylis 3, lobis lobatis. *W. B. H.*

SOBRALIA RUCKERI.

OUR illustration represents a flower of a very fine and richly coloured *Sobralia*, shown by Sir Trevor Lawrence, Bart. (gr., Mr. W. H. White), under the above name at the meeting of the Royal Horticultural Society, May 7 last, when it was accorded an Award of Merit. It is much dwarfer than *Sobralia macrantha*, and bears smaller but better-formed and more richly coloured flowers than those of that species, the substance of the flowers also being finer. The species is rendered somewhat difficult to decide by the name erroneously appearing to other species in some botanical works, notably in the case of the plant figured in *Venit. Oech.*, l. t. 42, which has been referred to *S. rosea*.

The name appears in the catalogue of the fine collection of G. W. Schiller, of Hamburg, 1857, and it was in Mr. Rucker's collection; but how these plants would compare with the species here illustrated (fig. 23) it is not possible to say.

In any case, the plant in Sir Trevor Lawrence's collection is a very fine and distinct flower, differing from any of the large number of species in whose company it is now growing. The sepals and petals are pale rose-purple; lip white at the base, and with a conspicuous dark yellow plate running up the centre; front of the lip dark rose-purple.

LILIES AND THEIR CULTURE.

(Continued from p. 12.)

THE ELEGANS AND UMBELLATUM TYPES.—These are very hardy plants, of dwarf stature, producing erect, cup-shaped flowers, either solitary, or in umbels of several, coloured some shade of yellow or red, or both. Their bulbs are below the average size, and are generally compound, i.e., they have several crowns each, and produce a corresponding number of flower-stems. They like a warm situation and a well-tilled soil, especially around and above the bulbs, for these plants produce stem roots which can be encouraged to form perfect masses, thus adding to the strength of the flower-stems, and helping to preserve the bulbs from undue stress. As pot plants they are very useful, and the plants flower without fail under ordinary treatment the same season in which they are planted; they force well early in the year. They may be grown in a small pot, planting as many bulbs in each pot as will cover the surface of the soil in the case of the elegans group, and three bulbs to a 6-inch pot in the case of umbellatum. The elegans group make excellent pot-plants for table decoration, or for the decoration of apartments generally; their flowers are of a rich colour, they last a week in good condition, and their odour is not so pronounced as in many forms—in some cases it is entirely absent. As border plants they are invaluable for grouping in the foreground of taller plants; they are also effectively planted in beds in association with a few ornamental grasses, or some such light-foliaged plants, which would help to break up the flat sheet of colour. These Lilies should be planted in a light soil as soon as procurable, but in heavy, wet soils planting had better be deferred till spring. The bulbs should be planted 4 inches deep and 4 inches apart; their stems will then cover the ground and keep it moist, so that the stem-roots may be encouraged. Lilies of the umbellatum group should be planted 6 or 8 inches apart, these growing to twice the size of *L. elegans*, and their inflorescences are also much more branched.

Lilium elegans embraces some twenty garden forms, all showing distinctive characters both in growth, leaf, and flower. I have only space here to mention the best of them; Prince of Orange is a dwarf, early-flowering plant, a foot high, each stem bearing three or four flowers of a rich orange colour, spotted in the lower half with linear crimson spots. The anthers contain coffee-coloured pollen, and the stigmas are tinted a similar colour; it makes a capital bedder. *Alutaceum* opens its flowers a week later; they span 6 inches across, are of elegant shape, and are coloured orange-red, shading to a rich apricot at the apices of the petals, and a rich yellow at the middle, the basal half being covered with linear crimson spots, these being smallest near the claw. The outside of the flower is flushed a silvery-orange. Both this and Prince of Orange have large, glabrous buds. Van Houttei is a taller plant, with rich sanguineous-red flowers, the outside being feathered and flecked buff or pale crimson; the filaments and styles are crimson-tinted, and the lower half of each petal is markedly ridged, the ridges terminating in a few black-crimson spots on raised processes resembling hairs; the buds are green and glabrescent. *Atro-sanguineum* has darker flowers than Van Houttei, heavily spotted on the inside the lower two-thirds of their depth, the apical third alone being free from spots; a very rich-coloured, popular variety.

Marmoratum aureum has two or three-flowered stems 1½ ft. high. The buds and young growth are covered with a woolly tomentum, which is retained on the stem, leaves, and on the outside of the flower till they ultimately wither. The flowers are very full, of an orange-yellow tint, occasionally flushed with red; the whole flower is heavily spotted blood-red, save for the extreme tips of the petals. The middle of the flower is markedly ridged, the ridges aggregating into a median process at the base of each petal, entirely covered with a multitude of whitish hairs; it is one of the best of the elegans group.

Semi-plenum is a rare form, two or three-flowered, the bud and young stem being covered with loose tomentum. The flower resembles Van Houttei in colour, shape, and spotting, but the filaments are shortened, and have lateral appendages, which form a mass of red petaloid growths in the centre of the flower. The upper half of these petaloid filaments and the anthers (which do not contain pollen) are coloured white or pale rose, giving the flower a bright yet singular appearance.

Orange Queen is a grand new form, with large flowers of a rich orange tint, shading to apricot at the margins of the petals. The petals are very stout and broad, spoon-shaped, with emarginate apices, which give the flower a full, rounded appearance. The anthers are unusually large, and contain coffee-coloured pollen.

Alice Wilson is a similar plant, with flowers of a clear lemon-yellow colour, shading to a soft apricot as the flower ages. These two forms represent the cream of the elegans group.

Lilies of the UMBELLATUM group are rather better known, few gardens being without a few representatives. The three best reds are incomparable, a very free-flowering plant, with splendid flowers of glowing red; grandiflorum, a similar plant, with orange and red flowers of larger size; and erectum, a form in which the flowers are red, flushed with yellow in the basal half. Of good yellows, Cloth of Gold is best, it bears grand flowers of old gold colour,

six or seven on each spike: *Tottenhamense* is another good yellow-flowered form, the flowers being slightly spotted red; *Aurantiacum* has orange-yellow flowers, shading to red as the flower ages. These three yellow forms are supposed hybrids between *elegans*, a good species, and *umbellatum* forms—these latter, a race of Lilies of garden origin, probably derived from *L. bulbiferum* or *L. davuricum*, or both. *Lilium croceum*, a well-known border plant,

which I suppose they must belong, as they are listed as varieties of *L. elegans* in the Kew hand-lists. Both plants attain a height of from 2 to 4 feet, and bear several flowers on each stem. These flowers are about midway between the *elegans* and *Martagon* types in shape, in that the petals are more reflexed than in *L. elegans*, but not to the extent of the turbinate flowers of *L. Martagon*. *Lilium Batemanie* has lovely, rich apricot

A MIDLAND GARDEN.

I HAVE been measuring the height of some of my taller trees by their shadows, and find that the figures given previously (*Gardeners' Chronicle*, November 24, 1900) were too small. They were only estimates by the eye. The Lombardy Poplar is 65 feet instead of 50 feet, and the Tulip-tree is 32 feet instead of 25 feet. The measurement by shadow is easily accom-

FIG. 23.—SOBRALIA RUCKERI. (SEE P. 60.)

with large spikes of orange coloured, heavily spotted flowers; and *L. bulbiferum*, a smaller-growing plant, with rich orange and scarlet flowers produced early in June, practically complete the list of early-flowering types which thrive together.

Two other fine Lilies, which, though known long ago, are not nearly so much grown as their beauty would warrant, are *Lilium Batemanie* and *L. Wallacei*. Both are late flowering plants, requiring a rather moist soil in a sheltered spot, as they are likely to dry out when planted with the *elegans* group, to

coloured flowers; those of *L. Wallacei* are coloured orange-red, and are copiously spotted with purple. They are excellent bedding plants, and are useful for planting in the front of *L. auratum* and other tall-growing Lilies. They do not force well, being more or less moisture-loving, and resenting heat; nor are they likely to be wanted as forced plants, for many dozens of Lilies flower naturally in advance of these. Their affinity with *Lilium elegans* will not be very apparent to cultivators of these plants. *G. B. Mallott.*

(To be continued.)

plished whenever the shadow is clearly defined on a flat surface. Take a stick of measured length, say 3 feet, set it upright, and measure its shadow. Suppose the shadow is 1 foot; then measure the shadow of the tree. If it is 80 feet, a simple rule-of-three sum will show that the tree is 60 feet high.

Some persons imagine that the garden Bluebell is the same as the wild one, only altered a little by cultivation. This is not so. They are distinct species. The wild form, with which all our midland woods are painted blue in the month of May, has the flower-spikes

drooping at the tip, the perianth segments strongly recurved, and the leaves rarely more than $\frac{1}{2}$ inch wide. This woodland beauty has never held the same scientific name for more than a generation or two. It has been tossed about by the botanists like a shuttlecock between *Agraphis*, *Hyacinthus*, and *Scilla*, and has at last found rest, it is to be hoped, as *Scilla festalis*. The garden form, of which the flower-spikes are always upright, not drooping, and the leaves wider, is *Scilla hispanica*, a native of Spain. I have both forms growing together, and some that look like hybrids, having intermediate characters. Also a single plant of a very fine pure white form, with leaves $1\frac{1}{2}$ inch wide, and very large flower-spikes.

Bulbous-rooted plants supply many of our most beautiful spring flowers, but they are troublesome things in the garden. Most of the smaller bulbs are best left undisturbed in the ground for several years, but after the flowers are over the leaves remain for a long time, and have a very untidy appearance, just when you want to plant out the summer things and clean up the beds. To cut them off injures the bulb. To tie them into bunches is not much improvement. I know of no means of getting over the difficulty. I have planted out the *Pelargoniums*, &c., disregarding the bulbs as much as possible, and as soon as the leaves are yellow they will be pulled off. One of the most untidy of them all is the Star of Bethlehem, *Ornithogalum umbellatum*. It is pretty, but it only opens while the sun shines, and it has a terrible number of leaves.

The rhyme of the Oak and the Ash has many forms, here is one of them:—

“If the Oak is in leaf before the Ash,
You'll maybe get nought but a bit of a splash;

If the Ash is in leaf before the Oak,
Look out, my lads, for a jolly good soak.”

This last spring the Oaks in this district were clothed with their yellow-green foliage long before the Ash woke up at all. We ought therefore to expect a dry season. But I have very little faith in that dictum. My belief is that the Oak is always before the Ash. I have taken notice of the point for many years, and though I have made no records I do not remember ever to have seen the Ash in leaf first. The Ash is about the latest of the woodland trees to put out its leaves, and the first to drop them in the autumn. Rural wisdom is not always to be trusted. I was once told by an intelligent old countryman that Elm-trees were never struck by lightning, but I have seen several with the bark ripped down from top to bottom, evidently by lightning.

I have not yet arrived at any conclusions with respect to the twist sometimes observable in tree-trunks. More observations are wanted on this subject. A friend who has lately been staying in the New Forest tells me that he could find no such twisted trunks there, which is a remarkable fact if correct. In the grounds at Frogmore, there is a good example of it in the trunk of an evergreen Oak opposite the “Queen's Tea Room.” I lately visited the park at Rothley Temple in this county, and observed four distinct cases of twist, viz., a Wych Elm, a Turkish Oak, and a Sycamore, all from left to right; and a common Oak, from right to left. The tree which shows it most frequently is the Horse-Chestnut, and always from left to right.

Not a single caterpillar of any kind has appeared on my Gooseberry-bushes this year. All the leaves are sound and healthy, and the crop is a heavy one. I have counted fifteen large berries on an 8-inch spray.

The entire absence of grub is remarkable.

If there are no grubs this year, where are next year's flies to come from? The saw-fly is not extinct. I have seen its caterpillars in a garden 2 miles distant. Probably the chrysalids under my trees did not develop into flies this year, but, remaining in the ground, will develop next season, when I shall see enough of them.

I do not know whether the brown-leaved *Prunus Pissardi* has ever ripened its fruit in this country. Its rather recent introduction has hardly given time for much experience of its capabilities, and as it comes from the warmer climate of Persia, it would not be safe to prophesy. I have just found under the tree on my lawn a fully formed but unripe fruit, of a deep red colour all over, about the size of a boy's marble, only oval instead of globular. I cannot see any more such on the tree, but this exactly corresponds to the descriptions of the fruit of *P. Pissardi*. That it should be dropped in an unripe state seems to indicate that it would not ripen.

We have a fine crop of Strawberries this year, but as soon as they began to ripen they disappeared mysteriously; and for the first week we were not able to gather any for our own use, the blackbirds and thrushes had them all. To these sweet songsters we do not mind paying a fair price for their music, but it is possible to pay too dearly even for a blackbird's whistle, and as these depredators will not content themselves with a share, we have had to shut them out altogether by netting the bed all over. But this involves the trouble of lifting of the net whenever you want a Strawberry. It is a good plan to fix a stout stake in the middle of the bed and fasten the centre of the net to this. The edges can then be pulled tight in all directions. Good strong netting may be bought for about a penny a square yard. For the protection of seeds I have found the following “scare” effective, and I shall try it next year for the Strawberries:—

Get two stakes about 4 feet long, and stick them into the ground at about 6 inches apart, and sloping at about 15°. From one of these hang by the neck a glass bottle of any sort, and from the other a good sized piece of broken window glass; every breeze makes these two clink together, and the sound frightens away the birds. *F. T. Mott, F.R.G.S., Birstal Hill, Leicester.*

(To be continued.)

STRAWBERRIES IN 1901 AT MAIDSTONE.

THE blossoming season was a very favourable one. In this district we had a fine rain in the first week of May, which gave the plants a good start. We began to pick from our open fields on June 15, being much later than usual; but the season generally has been nearly a month later than ordinary years for all crops. As regards Strawberries, this is unfortunate for our Kent growers, as they prefer to clear the yield before the Cherries ripen. The earliest to gather was Royal Sovereign, *Vicomtesse Hericart du Thury* being a few days later; but the former had a more sheltered position.

As far as garden varieties are concerned, the crop has been very satisfactory. Here and there a variety has not turned out so well as usual; but as we grow for the plants, and only fruit a portion of the two years' stools, it may be that those which failed were weakened by the strain thrown upon them in producing a heavy crop of runners. This was noticeable in British Queen, a variety for which there is always a strong demand.

The most remarkable feature in this year's culture has been the wonderful way the plants have stood the long drought and excessive heat; entirely because the land was deeply moved, and heavily manured for the new plantations. Late sorts have been exceptionally fine, because in mid-June we opened a trench with the spade between the rows, about 6 inches deep, by inserting the spade and working it to and fro, so as to form a V-shaped aperture, and in this we poured a liberal supply of liquid manure, raking down afterwards. Our beds being very wide between the rows, the liquid did not taint the straw round the plants. This enabled those treated to feel their rootlets at a critical dry period, and we commend this idea to growers, not that it is novel, but because it is more honoured in the breach than in the practice. As we write (July 15), the following are giving us fine fruit daily:—Waterloo (the black Strawberry); Laxton's Latest - of - All, immense berries, of the best flavour ever tasted in this sort; Elton Pine, Eleanor, Filbert Pine, enormous crop, rich flavour; Frogmore Late Pine, large fruit, of exquisite flavour; Newton Seedling, large supply for preserving; and Queen of Denmark, an enormous crop of highly flavoured, small berries.

Of the new autumnal kinds, *St. Antoine de Padoue* has produced fine globular fruit; but the best flavoured is *La Constante d'Antonne*, an improved *St. Joseph*. These three, with *Oregon*, are now blossoming again, and promise a fine yield up to the November frosts.

The July crop on the Alpines has been unusually good. Among the older kinds, *President* holds its own as one of the most reliable, and has been grand in flavour. *Vicomtesse H. de Thury* is as fine as ever, and its distinct, rich flavour is always appreciated, while for jam it is perhaps the best. *Stirling Castle* for all practical purposes is the same variety.

Dr. Hogg maintains its place as the richest-flavoured, and the next best is *Countess*; *British Queen* follows, and for flavour also *Queen of Denmark*.

The most noticeable has been the pink-fruited *Louis Gauthier*, justly admired by all visitors. The crop has been enormous; the whitish-pink fruit laid in handsome clusters all round the foliage, some berries being almost circular, and up to 2½ oz. in weight. The flavour is rich and refreshing, but the fruit is soft, and as such is only suitable for home use. It also fruits again in the autumn.

Sir Joseph Paxton has been very prolific, and having both autumn and spring-planted beds, the picking has lasted over a long period, the spring bed being ten days later in use than the other—a hint that growers might like to know; we refer to two-years' beds, as we do not keep any older than this.

The older varieties have kept their good characters; and among the newest ones we consider *Trafalgar* the most promising. We must have greater experience before we venture an opinion on other varieties. We might mention that *Edouard Lefort* is certainly an improvement on *La Grosse Suerce* for the earliest forcings.

In conversation with a London salesman, we learn that the market Strawberry crop has been an abundant one, but prices have ruled low, because the fruit has not reached buyers in first rate condition. There seems to be a tendency, possibly stimulated by the competition of the railways above London, to favour the consignments to distant places, to the prejudice of the bulk intended for London consumption. It is allowed to stand in the trucks at the collecting stations while the “foreign trucks” are despatched, often

for three or four hours in the broiling sun; this, added to the jolting to the station, takes the freshness off the fruit. Why do not the railways paint these fruit-trucks white (and also the meat-vans, this would be some advantage.

The fruit, generally, has been smaller than usual, but after the rain on the 18th of June, it was distinctly better, but naturally rather soft for travel. We hear the early crops near Southampton have been very large, 40,000 gallons leaving Swanwick station in one day. *George Empson & Co.*

TREES AND SHRUBS.

VIBURNUM OPULIS.

THIS truly beautiful deciduous shrub, a native of Britain and North America, is not grown nearly so much as it should be. To find it, and to enjoy it, we have to go out into the woods, the highways, and the byways, where it grows and luxuriates—often unscathed—in a wild state; the run being generally on

plant does not go out of flower so very quickly, as whilst some flowers are going off, others are coming on. There are two bushes of it in my grounds; one is 10 feet by 10 feet, but to form this, I should mention there appears to be more than one root-stock.

These plants, as regards root-feed, have to take pot-luck with some large Holly-bushes, which formerly formed part of a quickset-hedge. When the latter was grubbed up, the Hollies were left, and from under these, on the sunny side, the *Viburnums* grew and flourished.

FIG. 21.—LILIUM GRAYI: FLOWERS REDDISH-CRIMSON.

LILIUM GRAYI (S. WATSON).

THIS is one of the newer Lilies shown by Messrs. Wallace at Chiswick on the occasion of the Lily Conference. It is evidently closely allied to *L. canadense*, but the flowers are more funnel-shaped, and the segments less recurved; the colour, too, which is probably variable, is more crimson than in *L. canadense*. Our illustration (fig. 21) is from a sketch taken at Chiswick for us by Mr. W. G. Smith. The plant is a native of the Alleghany Mountains of North Carolina, where it was originally discovered by Dr. Asa Gray in 1810, and found again by him in company with Prof. Sargent in 1879. It is quite hardy. For fuller botanical details we may refer to the *Botanical Magazine*, t. 7231.

V. sterile and *V. plicatum*, which, owing no doubt, to their large, globular blooms, are on that account more popular.

Let anyone give *V. Opulus* a fair trial on a well-prepared bed of, say, 10 feet diameter to begin with, of ordinarily brown loam; and the sooner to have the bed well furnished with plant and bloom, place thereon five plants, which in two or three years, less or more, will grow into one at least of the glories of the glade around. The scent is simply delicious—so much so, that neither the *V. sterile* or *V. plicatum* can, so far as sweet perfume goes, come near it. A handful of sprays in a bowl before me not only scents the room, but also permeates the whole house. The

Besides the above, I had almost omitted to mention the beautifully red, translucent berries and tinted leaves which are left to adorn the plant during the autumnal months, which have their naturally fading glories, in contradistinction to the revivifying glories of the spring. *W. Miller, Beckenwell.*

MAGNOLIA MACROPHYLLA.

MESSRS. J. Veitch & Sons have sent us a flower of this noble tree. The leaves measure about 15 inches by 8 inches in width, with a leaf-stalk of 3 inches. In form the leaf-blade is oblanceolate, with two rounded lobes at the base, and with an acute apex. The upper surface is green, the lower face

lancous. The flowers are 6 to 8 inches across, petals leathery, creamy-white, with a deep purple blotch at the base. *M. macrophylla* occurs about the base of the Southern Alleghany Mountains from N. Carolina to Florida, inhabiting, according to Sargent, sheltered valleys in deep rich soil, protected from wind by forests of swamp Chestnut, Oaks, Gums, Hickories, and Dogwoods. It generally grows in isolated groups of a few individuals. It is by no means so generally cultivated as its merits demand. *M. T. M.*

CARPENTERIA CALIFORNICA PLENA.

I have found an almost fully double flower on my big bush of this most beautiful shrub. It was the only flower left, all the others which this year were rather sparingly produced, having fallen some time ago. It was also the only flower on the end of the shoot, though they are usually produced in threes. I shall be glad to hear if any of your shrub-loving readers have ever noticed a double flower on this shrub.

DIMORPHANTHUS MANDSHURICUS ALBO-MARGINATUS.

This is quite one of the most evenly variegated and handsomest new hardy shrubs I have seen for some time. It originated from a sport of dimorphism occurring a few years ago in the garden of a Frenchman named Gonchault, and was at once propagated by grafting it on the roots of the ordinary green-leaved variety, which is, I believe, the largest leaved of our deciduous shrubs. It was distributed last year by M. Léon Chenault of Orleans, who exhibited a fine specimen of it at the Paris International Exhibition, where it was much admired, and was awarded the first prize as the best new hardy shrub of the year. My plant has now ten fine leaves, which are from 2 feet 6 inches to 2 feet 9 inches long by 2 feet across. They will doubtless attain a larger size when the plant is fully established, as the leaves of the type form often reach 3 feet. *W. E. Gumbleton.*

NOTES FROM THE CAUCASUS.

(Continued from p. 3.)

NURSERIES.—One of the principal of the few nurseries in the Caucasus is that which belongs to Mr. Nojev, in Alaskan. This nurseryman, besides other specialities such as cool Palms, which thrive in the open ground, has started bulb-growing, and had already (at the time of my visit in 1898) a large field of old and young bulbs of Tulips, Hyacinths, &c. Considering the great masses of bulbs which every year are imported into Russia, it is really a good plan for the Russians to try to grow their own bulbs, when they have within their own boundaries a climate suitable for the purpose. It is important to find out places fit for such cultivation without entailing large expense. If the land is too low it is often too moist, and causes the bulbs to rot. If, again, the ground is too heavy, sand will have to be carted on to it, which is very expensive, especially if the land is situated at a distance from the sea.

To give an idea of other parts of South Russia, I will just say a few words about the climate in Charkow. When this is compared with that of the above-mentioned part of the Caucasus, a great difference is found. Although this town is at about the same latitude as Paris, we usually get the first frost in the middle of September, but severer frosts seldom set in before the end of October. In winter the temperature often sinks 15° to

20° Réaumur. Occasionally in some years it may fall to 25°, or even more. In March the weather gets milder, and in April the real spring begins. This is very short, and the warm weather often sets in all at once.

I have known years when one week had north wind, and from 10° to 15° R. of cold, deep frozen ground, and much snow; the next week a south wind, and 15° to 20° R., with bright, warm sunshine, which in a few days melted the snow, thawed the ground, and everything turned green in no time. Such a climate makes much difference to the work in a garden, when everything must be done at once after the ground has laid frozen all the long winter. Different, for instance, from England, where it is often possible to work in the garden nearly all the winter, and although, as I mentioned before, this part of Russia lies further south than Paris, yet most of the best foliage and ornamental trees cannot stand the climate. The reasons for this are principally three, viz., drought, cold, and sudden changes. Summers with little rain or humidity in the air, scorching sun, and strong, dry winds across the large and bare plains, dry the ground up to a great depth, fostering many insects, such as greenfly and others; then comes the winter with severe cold, often before any snow has fallen, and the ground is frozen to a great depth, and the trees have their stems and branches withered.

Sudden changes injure many plants severely, and we often in February and March have hard frosts in the night, and in the day a very clear dark blue sky with bright sun. It may be from 10° to 15° or 20° R. before the sun rises, but only a few hours after, the thermometer, if hung in the sun, may register from 10° to 15° or more above freezing. This causes the bark of the trees to crack in all directions, from the ground right up and along the branches to the crowns. In this way many different trees are spoiled or killed; for instance, choice varieties of Ulmus, Acer, Tilia, Esulus Hippocastanum, and others, not to mention the tender and finer sorts of fruit-trees, especially Pears, on which the bloom-buds turn black wholesale as soon as the severe winter comes, and even the young branches turn black and are killed. Populus and Salix are trees much used for planting in the streets for shelter. Evergreen Conifers, such as Thuja, Cyprresses, and others, suffer much in spring from the sun, frost, and drying winds. Choice varieties of bluish-grey Picea, such as *P. Paryana* or *P. pungens*, Engelmanni, concolor, and *Abies anabilis*, grow very well, especially if given plenty of water in summer. *A. K. Andersson.*

PENICUICK.

This fine Middlethian estate came into the possession of the Clerks some 250 years ago, the present representative of the family and owner of the property being Sir Geo. D. Clerk, Bart. It is extensively wooded, the river Esk making its noisy way through the grounds or down deep glens, the steep, sloping banks of which are clothed with thinly planted trees, which again in some portions, mainly near the house, spring from an undergrowth of Rhododendrons, great masses of these coming within range of the vision from many points of vantage. Much of the older wood is Beech, than which in early May there is no tree with foliage quite so tenderly green, nor so lace-like as in its half-expanded state it shimmers in the sunlight or dances at the passing of the slightest breeze. The Silver Fir is another of the original trees; these, with the Beeches, are also not far distant from the house. Many handsome

specimens lie recumbent, laid low by a fierce gale of the past winter. It was sad to see these otherwise fine trees affected with rot, though their age cannot extend beyond 150 to 170 years at most.

The house, which unfortunately was gutted by fire at a recent date, is delightfully seated on a nearly level lawn, with the easiest slope to the east, while to the west the ground slopes rapidly downwards, forming a vast natural amphitheatre lying in a hollow, with the Esk winding in a curve in the distance; and nearer the spectator a lake of some extent cuddling the base of the half-hidden slope. Down here, also, the old gardens are situated, the river flowing close past them. At one time these were somewhat famous, and Loudon mentions the glass erections, early in last century, as being extensive. The walls are low, and arranged with an absence of mathematical precision that appeals to the present-day observer as remarkable. One of the most noted gardeners connected with this old garden is Mr. Henry Eckford, of Sweet Pea fame, who some fifty years ago served his apprenticeship here to the calling he has since done so much to adorn and to advance.

Mr. Buchanan, who manages this large estate, reminded me, when walking round the policies, of another famous Scotsman who has still a visible connection with Penicuick, in the form of an obelisk erected to his memory by the third baronet. This was Allan Ramsay, of Edinburgh, periwig-maker, bookseller, dramatist, and poet, the forerunner of Ferguson and of Burns, and whose characteristic Scottish dialect still appeals to a numerous body of readers. Ramsay and Sir John Clerk, the second baronet, himself a poet and a man of most liberal views, were fast friends, and not unnaturally the "fam'd and celebrated Allan" spent much of his leisure time at Penicuick. Ramsay was in some things in advance of his day, and objected to herbs and roots being exposed for sale on the streets "on stalls unclean." He seems, also, to have dreamt of the North Loch being improved and the grounds in its vicinity adorned with flowers and trees. He, too, incidentally mentions Apricots and Peaches as having been cultivated in his day on walls, but not Grapes.

Returning to the more immediate subject of these notes, an enclosed American garden, near another lake of large extent, bears evidence of the dampness of the climate, many of the deciduous plants being covered with moss. Here are some large and healthy bushes of *Andromeda floribunda*, not so very long ago admitted to greenhouses as too tender to exist out-of-doors in Scotland. The plants flower here profusely, but the racemes are naturally much smaller than one sees them growing in England. Here, too, are some large specimens of Himalayan Rhododendrons, raised some fifty years ago from seeds sent from India by Lord Dalhousie. Spring frosts are inimical to the development of the flowers, otherwise the high position and cold climate do not affect the plants injuriously.

New gardens were formed about thirty years ago, and are situated near the house, but on a slightly higher level. The ground is naturally cold, and vegetation in spring is late. The appointments of the garden are all of a high-class order, the fruit-walls being constructed of bricks of a special manufacture, and built hollow, to ensure dryness and warmth. It is disappointing, therefore, to find south walls devoted to the culture of Plums, and culinary Apples established on others. Possibly the old gardeners, who laid out their gardens in sheltered, low-lying positions near streams, were wiser in their generation than we some-

PLANT NOTES.

SCOLOPENDRIUM VULGARE DAVIESII.

The lovers of Ferns may be pleased to hear that another discovery of a variety of *Scolopendrium vulgare*, with toothed margins, and with lines on each side of the frond from the base to the point of the frond. Some of the fronds are multipidennium, &c., and as far as it is are unrecognised in the *Scolopendrium* class. I wish to claim its name through your columns,

together by Prof. Sargent to inaugurate the building. The numerous photographs sent us all give the impression of a vault-like structure, but we are assured that ventilation and light are well cared for. The cost of the building was 285,000 dollars, to which has to be added the cost of the land, 225,000 dollars. The main exhibition hall is 122 feet x 50 feet, and 15 feet in height. If the Boston Society can do this with a membership of a thousand fellows, we ought to be able to do at least six times as well.

times are, who condemn their views as unsound.

In the glasshouses Mr. Angus, who controls the garden, has a lot of very fine Mignonette in full flower; and in another structure, and very appropriately, a quantity of Eckford's Sweet Peas flowering in pots. In one of the fruit-houses trial is being made of Strawberries planted out in borders instead of in pots for early fruiting.

Mr. Angus speaks very highly of the good points of an American-cultivator employed in

FIG. 25.—A PORTION OF THE ORCHID EXHIBIT IN THE NEW HORTICULTURAL HALL, BOSTON, U.S.A.

the kitchen garden quarters, as a hoe mainly. For efficiency combined with rapidity of action it appears to occupy the same position with regard to the Dutch-hoe that the lawn-mower does to the scythe.

I shall just add, that one of the nicest pergolas is in course of construction as a covered way to the entrance of the building which at present is doing duty as a dwelling instead of the ruined house. Roses apparently are being largely depended on to furnish clothing to it, and alongside one of its flanks a little garden of Roses has been arranged. B.

Scolopendrium vulgare marginatum, were found in the county of Green, D. Myrdlin Davies, *Bryoniae*, July 16, 1901.

**THE HORTICULTURAL HALL,
BOSTON, U.S.A.**

We have on several occasions lately, alluded to the spacious hall erected in Boston for the Horticultural Society of Massachusetts. We have done so with the view of stimulating our fellow countrymen to follow the example set by our transatlantic brethren. We have also referred to the magnificent exhibition got

TOMATOS FOR WINTER USE.

With abundance of fruit at the present time, it may seem out of place to call attention to future supplies. Still, the gardener is obliged to take time by the forelock, and to begin to prepare in July or early in August. In the earlier stages, winter Tomato plants cost but little labour to grow them, a cold frame sufficing for their needs, and after being potted or planted out, no forcing is necessary till November and December, and then only sufficient heat is needed to develop the fruit.

The chief point is to obtain a heavy set of fruit early in October. My practice is to sow

in July, and repot the plants till they reach 8-inch pots—the final potting. The plants are accommodated and fruited in low-roofed pits, of which the sashes are left open at night, indeed, are entirely removed in fine weather to get a sturdy growth, no warmth being applied till the date named. I prefer pots to planting out, the growth being more compact, and the set better. As a potting soil, good turfy loam and some bone-meal are employed, and this is rammed into the pots, ample space being accorded for holding water. Larger pots than 8 inches may be used, but much will depend upon the growth of the variety. Smooth, handsome Tomatoes of the Perfection type are not the best for winter-fruiting, as they do not set freely, the ribbed kinds being better; moreover, the flavour of the ribbed fruit is equal to the other.

I used to grow Conqueror for winter fruiting—a good-flavoured, prolific variety; also Frogmore Selected, which is a good setter, and of middle size and shapely. Sown now, this variety will give a full crop at Christmas. During last winter I gave Sutton's Winter Beauty a trial, and was satisfied that it is a good grower at that season, and a heavy bearer, and the fruits of good size and flavour. It is the best late-setting variety that I know of; and it is equally adapted for early spring, as is likewise Early Beauty. *G. Wythes.*

The Week's Work.

THE KITCHEN GARDEN.

By H. J. MAYNE, Gardener to the Hon. MARK ROLLE, Bicton, East Budleigh, Devonshire.

Potatoes.—The earlier varieties should now be lifted, the good shapely tubers selected as sets, and stored in a cool, fairly light place; and those for consumption placed thinly in a dark root-store or cellar. If the tubers of these early varieties are left in the soil and much rain fall, they would sprout, and in consequence be greatly impaired in quality. After clearing away the rubbish, apply a light dressing of quick-lime or of soot to the land, and dig it one spit deep.

Turnips.—Potato-land is very suitable for Turnips, and a good breadth may now be sown, after trampling the ground to give it firmness, and raking it to an even surface. Sow in shallow drills drawn at 15 inches apart, which moisten a few hours before sowing. Having sown the seed, rake the land to cover it in, roll lightly or trample it again, and finish off with another raking. Thin the advancing successions after affording water in order to soften the earth.

Spinach.—A sowing may now be made without there being so much fear that it will run to seed, the ground being prepared for this vegetable as for Turnips.

Applying Water to Crops.—On light soils, Peas, Beans, Lettuce, Celery, Turnips, Cauliflower, and Broccoli, all need much water if vegetables of good quality are expected; and if to these applications of water, liquid-manure in a weak state can be added, the results will be still better. Where mulching is practised, the litter should be pulled aside before water is applied, and be replaced afterwards, or a little fresh soil may be pulled over the watered ground so as to conserve the moisture.

Globe Artichokes.—As soon as all the heads are cut, remove the stalks close down to the ground-level, and apply plenty of water, and a mulching of rich dung.

Work in General.—Clear off exhausted crops of all kinds, and prepare the ground for planting and sowing. Gather Beans and Vegetable-Marrows, and keep the hoe plied among the various crops wherever possible. Sowings may be made weekly of Radish and Mustard and of Cresses in variety on a north border.

THE ORCHID HOUSES.

By H. J. CHAYMAN, Gardener to R. I. MEASTERS, Esq., Cambridge Lodge, Flodden Road, Camberwell.

Repotting.—The repotting season, excepting for a few species of Orchids, may be considered closed, and no plant should be disturbed unless there is an absolute necessity so to do, and I would advise that in all cases repotting be deferred till the beginning of September. The chief work meanwhile will consist in cleansing the plants.

Cleansing the plants.—The leaves of *Cattleya labiata autumnalis* are expanding, and the flower-sheaths pushing up. It will generally be found that after this plant has been imported about two seasons, it becomes infested by a small white scale insect, commonly found on the young developing growth inside the leaves, even before these expand. It is desirable that these pests should be removed without delay. This operation requires care, as the leaves when young are easily scratched, and thus permanently disfigured. If the scale be not removed quickly, they give a spotted and unsightly appearance to the leaves, and the creatures increase so rapidly that other plants in the house quickly become infested. A weak mixture of soft soap and rain-water is a good solvent and safe means of removal. It should be applied with a sponge.

Cymbidiums, if grown with the *Cattleyas*, or in a dry, airy house, should be kept under observation, red-spider soon infesting them in warm, dry weather. If any traces of this acrid be noticed on the leaves, the latter should be sponged, and their undersides often syringed. This is best done early in the day, and when outside conditions are favourable. The pseudo-bulbs are equally liable to be infested by scale, which are found on the inside of the old leaf bracts. *Masdevallia Chimera*, and those of that section, whose new leaves are now appearing, are likewise liable to be attacked by red-spider in hot weather, and it is well to stand the plants on the floor of a house and syringe them once daily for several weeks, and afford air by the lower ventilators, shading the plants heavily during the brightest hours.

Seedlings.—The raising of seedlings has required much more attention this year than usual. The cold drying winds prevalent in the spring, having delayed germination for a long period of time, and the weather of late has been so warm and dry, that it was a difficult matter to keep the surface of the seed-pans in a desirably moist condition; and when the seeds have at length germinated, they have not made rapid progress. This, of course, is my experience here, situated as I am with dry brick walls closely surrounding me. I have never had Orchid-seed to germinate more freely than this year, but the progress of the seedlings has been very slow. The seedlings of *Dendrobium* are the only ones which have grown a pace. Seedlings older than one year have made good progress, and in many cases the plants will require to be repotted soon. The plants which have become well rooted, must not be allowed to remain in a dry state for any length of time; and the cultivator should examine his plants twice daily in very warm bright weather. Guard against any excess of moisture at the roots during dull weather.

THE HARDY FRUIT GARDEN.

By G. HEIGER.

Cleansing the Strawberry Quarter.—The drought has almost brought the Strawberry season to an end, and the fruiting of all early and mid-season varieties is finished. The plants should now have the dead and exhausted foliage removed, together with the runners which have formed, if these be not required for increasing the stock of any variety. Remove also the mulching materials, then slightly hoe the alleys, and afford a light top-dressing of spent Mushroom-bed or hot-bed materials, afterwards applying water copiously. Any beds

older than three years, unless there are good reasons for retaining them, should be cleared away, and the ground utilised for some other crop. Where plants that have been forced are planted out, they should not be left to carry fruit for a longer period than two years. Not much being gained by summer digging land in times of drought, but rather injury is done by dissipating what little moisture is found in the soil, it will be found quite suitable without digging or manuring for Broccoli, Kale, Savoys, &c. Falling heavy rain to soften the soil, it may be necessary to use a crow-bar in making holes for the plants. The plants necessary for forming new Strawberry quarters should be layered forthwith into 3-inch pots, if it has not been performed previously. It is always advisable to plant one or two new quarters annually, as from these younger plants the earliest and best fruit is obtained. These rooted runners should be ready to plant before the middle of August, if fruit be expected next year. The Hautbois Strawberry, whose peculiar flavour is much liked by some persons, should also be planted at an early date on a partially shaded border, at 18 by 12 inches apart. The runners must be taken from a bed that contains a mixture of male and female plants, the species being more truly dioecious than other garden Strawberries. *Ed.*

Fruit Protection.—The birds are more troublesome this year than usual, and Gooseberries and Currants will have to be protected by fish-netting, or very thin canvas. The latter affords a slight shade to the fruit, very welcome in this sunny time. Before the nets are put over the bushes, the longer shoots should be shortened to half their length. Where Gooseberry and Currant-bushes grow together in a square, it is an advantage to have the plantation permanently covered with wire-netting.

Insects.—American blight is much in evidence this hot year. In a Middlesex garden I noticed recently some old Apple-trees, the main stems of which were whitened over with this pest, and nothing apparently was being done, or any notice taken of it. A strong lather made with Gishurst's Compound Soap, applied with a stiff painter's brush, or a little methylated spirits carefully applied in the same way, will destroy all the aphides with which it comes in contact; but to eradicate this pest where very abundant on the trees, winter dressings are required, and these should be very thorough. Green and black aphids are destroyed by the quassa mixture, or the XL-All insecticide; but the former cannot be used where fruits are ripening, it being intensely bitter. Red-spider on Peach and other fruits may be kept in check by frequently syringing the trees with clear water with some force.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HUSSEY PACKER, Esq., Prestwold Hall, Loughborough.

Palms and Cycads.—Any of these, whether repotted lately or not, which are in full growth should be copiously syringed night and morning, and have weak manure-water or clarified soot-water frequently applied at the root. At this season, artificial heat is not needed by these plants, and it will suffice if the plants are syringed and the house closed about 4 o'clock, after a good dumping down of the floors, &c. It is an advantage when some of the inmates of the Palm-house proper can be placed, during their season of growth, in other glass-houses, as this will usually admit of affording those that remain and those that are placed elsewhere more space in which to develop their new leaves. Palms being liable to infestation by scale insects, should at this season receive a thorough cleansing with an insecticide, applied with a rather hard brush to the stems and ribs of the leaves, and with a soft rag to the tender parts of the leaves. A Palm is never thoroughly cleansed at one operation, but it should receive two or three

before being arranged in its proper place for the winter. The remedy for scale will be found in one of my former Calendars.

Ferns.—At this dry season, Ferns growing in baskets should be dipped in vessels of water twice a week. As the potted Ferns increase in size, let them be afforded plenty of space, so that their fronds may become firm and properly matured, as unless this be done, the dry air of the apartments in which they may have to stand will greatly injure the fronds. Now that growth is more or less complete, manure-water may be afforded at the rate of one of manure to twelve of water. The fronds of most species should now be approaching the mature stage, and these alone will remain in good condition in the winter; late-formed fronds, on the contrary, suffer from damp during the winter.

Camellias and Smilax.—Where these plants are grown on the walls of forcing-houses, the foliage must be kept in a clean condition by the use of the syringe, and the shoots regulated, thinned, and fastened in neatly. Smilax should be afforded a top-dressing of soil and manure, and the growths prevented from running into tangled masses.

Winter-flowering Stove Plants.—*Thyracanthus rutilans*, *Aphelandra aurantiaca* *Roezlii*, *Clerodendron fallax*, and *Eranthemum Andersonianum* may now be placed in the pots in which they will bloom, viz., 4 to 6-inch pots for the first two, and 8-inch ones for the others. The compost used should consist of mellow turfy loam, rotten stable-manure and leaf-mould, a small quantity of steamed bone-meal, and silver sand. The plants may be kept close for a week in an ordinary frame, being afforded shade in the brighter parts of the day, syringing them, and closing the frame from 3.30 to 4 P.M. When quite re-established, more air should be afforded, and the frame kept moist by wetting the coal-ash floor occasionally.

Propagation.—*Acalypha musaica*, *A. hispida*, and *Abutilon Sawitzii* may have the tops taken from plants that have become shabby, inserting these singly in small pots, and placing in a frame or pit having a bottom-heat of 75 to 80°, and in which moist conditions are maintained. In about a month enough roots will have been made to warrant a shift into larger pots.

THE FLOWER GARDEN.

By T. H. STADE, Gardener to Lord Portman, Portman Park, Exeter.

Evergreen Hedges.—Those consisting of Holly, Laurel, Thuas, Sweet Bay, *Juniperus virginiana*, *Phillyrea*, &c., should now receive their annual pruning, using the knife in the case of those with large leaves, especial care being taken to preserve a level face on the visible side. Depressions can be made up by leaving the shoots of greater length than elsewhere. As a rule for general observance, the plants of which a hedge consists should be cut in harder at the top than at the bottom.

Deciduous Hedges may be trimmed with the hedging-shears, and those consisting of *Rosess* or Sweet Briar should be trimmed more than once during the season. A China Rose hedge should have frequent attention, and after a large number of blooms have been cut or have faded, is a suitable time to regulate the growth and shape, as by carrying out the operation at various times a hedge does not present so stiff or shorn appearance, as is the case when closely trimmed at one time with a pair of shears.

Border Carnations.—The layering of the plants should not be delayed after the chief flush of bloom is past. Some gardeners have reserve plants in the vegetable or the reserve garden from which they take layers in preference to obtaining them from plants in the flower-garden or dressed border; and it is a good plan where it can be carried out. Before commencing to layer, scrape away the soil

around the plant in order to make space for some new compost, consisting of fine, sifted, sandy soil, sea-sand being used if readily obtainable. The lower leaves for a space of three knots should be removed without tearing the skin of the shoot, then with a sharp knife cut half way through the shoot just below a joint, and make an upward slit so as to form a tongue; and having made a shallow bed around the plant, gently bend down the layer into this, and fix it with a wooden hook or a layering pin of iron, the slit being kept open whilst doing this. The layer being fixed should be mounded up with the prepared soil, and so on with all the other layers round a plant. Apply water to settle the soil, and afford water daily in hot, and less often in dull weather. In a month or six weeks the layers will be sufficiently rooted to warrant removal. When a layer is prepared, the tips of the "grass" should be cut off.

Pinks.—These may be propagated by pipings inserted in light, sandy soil, placing a hand-light over them until rooted; but they root more quickly when layered and treated like Carnations.

The Budding of Rose-stocks.—The present is a good time to begin the budding of dwarf and standard Rose-stocks, the operation being carried on for the greater part of the month of August. If the bark will not run readily, deluge the soil after slightly loosening it with a digging-fork or a crowbar, and wait for a few days for the sap to rise. Dog Rose-stocks for standards should have had three of the stronger shoots selected in June, and the other removed or considerably shortened. Stout dormant buds from the base of strong young shoots of half-ripened wood should be taken of the varieties of which it is desired to increase the stock, and care taken when stripping the rind from the woody portion not to pull out the heart of the buds. The buds should be inserted in a T-shaped slit made with the young shoot of the Dog Rose-stock close down in the fork, and should be earthed with bound in with worsted or fine raffia. In the case of dwarf stocks of the Seedling Briar and Manetti, the buds are inserted low down below the ground level, and the soil is brought up and slightly above the inserted bud. All buds inserted should be examined in a fortnight after the operation, and tight ligatures loosened and re-fastened.

Standard and Dwarf Roses.—After the first flush of bloom is passed slightly shorten the longer shoots, remove all weak and blind, that is, flowerless shoots, but do not denude the plants of too many shoots, or harm will be done instead of good.

Anemone coronaria.—Seed may now be sown on rich soil in a sunny position where the plants can remain to flower. Before sowing, mix the seed which is woody with some damp silver sand by rubbing it between the palms; sow in quite shallow drills or broadcast, and cover with half an inch of soil. The seed may be sown in pans or in boxes, and the seedlings transplanted, but the former method is preferable.

Hints on Routine.—Mow lawns, cut grass-edgings, roll walks after rain, and maintain neatness and good order in every part of the garden and pleasure-grounds.

FRUITS UNDER GLASS.

By MALCOLM McINTYRE, Gardener to Sir CHAS. TESSANT, The Glen, Inverhouston, Peeblesshire.

Seedling.—This season it has been a common occurrence for the foliage to scald, and the berries also, to a greater extent than usual. This mishap generally prevails in vinerias in which the rods are too near to the roof, and the ventilation is inadequate; but it occurs also from neglect to give air early in the day and afford a gentle heat in the hot-water pipes, and thereby obtain a more buoyant atmosphere. Scalding of the fruit has been assigned to a variety of causes, but there can

be no doubt that it is brought about by the same conditions which cause the foliage to scorch; and it can be arrested by paying timely attention to the ventilation and temperature of the vinery. Air should be admitted rather freely, especially in the early hours, and a small amount at night, together with genial warmth in the heating apparatus, maintaining a temperature of 70°. It is a very prevalent malady with Lady Downes' Seedling, and in lesser degree with the Muscat of Alexandria—and the Black Hamburgh will also get scalded, especially when the bunches are exposed to powerful sunshine after a period of still, cold weather. It always occurs at the end of the stoning period, i.e., about three weeks before the berries change colour. In modern vinerias, having large panes of glass, a slight degree of shading is called for at this period, and during the early stages of ripening. For Muscats, a double thickness of herring-net drawn over the roof is of great service in breaking the rays of the sun from mid-June to the latter part of July or beginning of August, according to the time at which the Grapes finish stoning. Some Vines in vinerias glazed with large panes of glass are the better for a slight amount of shade during the hotter months.

Peaches and Nectarines.—Early varieties that were started during December, as for example, Alexander, Early Beatrice, and Waterloo, or even later ones, as Hale's Early, Dr. Hogg, Royal George, and Stirling Castle, from which the fruits have been gathered, may now be pruned to the extent of removing from them the shoots which have borne fruits, and any others that are obviously not needed. A greater degree of light and air will thus be admitted to the trees generally. If the roof-lights are removable it is better to take them away, but if this cannot be done, to throw them open as widely as possible. Keep the trees perfectly free from insects, using insecticides for this purpose if necessary. Afford water to the roots as often as is required, and to weakly trees afford weak manure-water. A mulch may be applied in order to keep the border moist. Syringe the trees once or twice a day.

Succession Houses.—The fruits on trees which were started early in February will now be ripening, and as soon as these have been gathered, prune the trees as described above and syringe them daily. Stop all laterals back to one joint, or allow an extension if the buds are in an advanced state, and prevent premature ripening of the foliage by encouraging continued root action. When the buds are well formed and the wood well matured, admit all the air possible by day and night. If scale be found on any of the trees, and these are cleared of fruit, they may be dressed with petroleum emulsion and water, stirring the liquid well when using it. Keep the border moist, and afford manure-water to trees that show signs of weakness, or which have carried a heavy crop of fruit.

Late Houses.—If it is needful to accelerate the ripening of the fruits, ventilate the house freely up to 10 o'clock in the day, then reduce the ventilation gradually so that at 4 P.M. the temperature may be 80° or 85° when closing the house. Syringe the trees well at this time, and allow the temperature to rise to 90°. About 6 o'clock admit a little air, so that some of the moisture in the house may escape, and the temperature gradually cool down. Tie in the shoots as occasion requires, and retain no more of them than are necessary. Keep laterals stopped back to one leaf, but allow a little growth to encourage circulation of the sap. If gross shoots push laterals from their leaf-buds, cut them back to where the buds remain undeveloped; or if likely to disarrange the balance of the tree, or the distribution of the sap, cut them off altogether. Draw away the leaves from before the fruits, and raise these up to the light as much as possible. Peaches are not much prized unless coloured. The flavour of Peaches is generally good in proportion to the amount of colour they possess.

EDITORIAL NOTICES.

ADVERTISEMENT should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—As well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents. The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 30.—Royal Horticultural Society's Committees, Meeting at Westminister.

WEDNESDAY, JULY 31.—Midland Carnation and Peetree Societies' Exhibition, in the Botanic Gardens, Edgburgh, Birmingham (2 days).

SALES.

FRIDAY NEXT.—Imported and Established Orchids; Orchids in flower and bud, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick 63.2

ACTUAL TEMPERATURES:—

LONDON.—July 24 (6 P.M.): Max 70° Min. 58°.
July 25.—Dull, some rain, thunder storms.
PROVINCES.—July 24 (6 P.M.): Max 67, Home Counties; Min. 57, Shetland.

In the twelfth annual report of the Missouri Botanical Garden, Mr. H. C. HENRICH has published a very complete and elaborate account of the garden Beans cultivated as esculents. This was founded upon the comparative examination of all the varieties procured from leading American and European seedsmen, and cultivated in the Missouri Botanical Garden at St. Louis. The varieties are classed under five genera, *Phaseolus*, *Vicia*, *Bolichos*, *Vigna*, *Glycine*, of which the three last are not much grown in this country. Three species of *Phaseolus* are recognised, viz., *P. lunatus*, *P. vulgaris*, and *P. multiflorus*. *P. lunatus* is a native of Brazil, while the other two have not yet been found wild. *P. lunatus* furnishes the Lima-beans, but is not much grown in this country. Under *P. vulgaris*, the Haricot-bean, more than 130 varieties are enumerated and described, mostly of interest to American growers; but many, such as the Mont d'Or, Sion House, Long Negro, Kentucky Wonder, Veitch's Climbing, are well known on this side of the Atlantic.

Of *P. multiflorus*, the Scarlet Runner Bean, only seven varieties are enumerated, viz., Black Runner, White Runner, Mammoth, Chelsea, Scarlet Runner, Best-of-All, and Painted Lady. It appears that these are comparatively little grown in the States, where the Lima Beans are preferred.

The Broad Beans, of which some fourteen are enumerated, are all varieties of *Vicia faba*. It was cultivated by the ancient Egyptians, as appears from the discoveries of FLEINHENS PERRIE and others. It is not considered to have been a native of Egypt. WITTMACK found the seeds among those

collected at Troy by VIKETOW. Whence then did it come? Some say from the southern shores of the Caspian. HOOKER, in the *Floca of British India*, i., 179, suggests that *Vicia narbonensis*, a Mediterranean and oriental species, was the source whence the cultivated bean was derived. The native country of the Haricot and of the Runner Beans is likewise not known with certainty, but such evidence as we have points in no uncertain manner to tropical South America. Curiously enough, ALPHONSE DE CANDOLLE, in his *Origin of Cultivated Plants*, makes no mention of *P. multiflorus*.

NARCISSUS KING ALFRED.—This magnificent variety, a photograph of which forms the subject of our Supplement this week, was produced by Mr. P. J. KENDALL, of Newton Poppleford, near Ottery St. Mary, Devon. It was awarded a First-class Certificate by the Royal Horticultural Society in March, 1899, and has also been awarded First-class Certificates this spring by both the Midland Daffodil and the Cornwall Daffodil Societies. The flowers are of a very deep rich yellow, and of remarkable substance. It is one of the largest varieties in existence, and is a very strong grower. Unfortunately, the initial letters of Mr. KENDALL's Christian name are incorrectly given in our illustration.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on Tuesday, July 30, in the Drill Hall, Buckingham Gate, Westminster, at a lecture on "Some of the Plants Exhibited" will be given by the Rev. Professor G. HENSLOW, M.A., V.M.H.

OUR ROSE AND LILY NUMBERS.—Whilst we are regularly and properly reminded of blunders and shortcomings, from which no journal can be entirely free, it is unusual for us to receive letters of thanks and congratulation on our endeavours to please our clients. On this occasion our efforts seem to have been crowned with unmeted success, and we have to acknowledge with great gratification the numerous appreciative letters we have received.

"RHODES'S STEAMSHIP GUIDE."—Edited by THOMAS RHODES (London; GEO. PHILIP & SON, 32, Fleet Street; Liverpool; PHILIP, SON & NEPHEW, 15-51, South Castle Street). A fascinating book for the armchair traveller, and a useful guide for the intending globe-trotter. It has alphabetically arranged lists of ocean services, ships, and ports; with information under each heading. The present (1901-2) edition is naturally fuller than previous issues, and the low price brings it within the reach of all classes.

ROYAL APPOINTMENT.—We learn that a Royal Warrant has been granted to Messrs. WEBB & SOXS, of Wordsley, Stourbridge, appointing them seedsmen to His Majesty the KING.

ROYAL NURSERYMEN.—Messrs. IRISH LOW & CO., Bush Hill Park Nursery, Enfield, inform us that they have received Special Appointment of Nurserymen to His Majesty the KING.

THE LOUGHBOROUGH GARDENERS' ASSOCIATION journeyed to Alton Towers on the 10th inst., and inspected the many features of interest in those beautiful gardens. Mr. GILMAN, Lord SHREWSBURY's head gardener, showed the company of seventy-three persons everything that was to be seen, and upon returning home, after a most enjoyable day, the visitors felt much indebted to that gentleman for the trouble taken to make the event a memorable one.

EUCHARIS GRANDIFLORA.—Notwithstanding the ravages of the bulb mite, this invaluable stove-flowering species is still cultivated with unqualified success in some gardens. We have recently received a photograph from Mr. PAGE, Silwood Park Gardens, Ascot, of a plant bearing sixty flower-spikes, and about 300 flowers. What a wealth of pure white blossoms from a single pot of bulbs! The plants appear to be in the best health, and have large, strong leaves. We only refrain from publishing the photograph for the reason that we have already illustrated many other instances of success with this plant.

THE DEVON AND EXETER GARDENERS SOCIETY, whose members had their annual outing this year to Cardiff, enjoyed their visit perfectly. The party of nearly one hundred persons journeyed from Exeter on the 17th inst., and were invited to visit the annual exhibition of the Cardiff and County Horticultural Society then being held in the Sophia Gardens. By permission of the Marquis of BUTE's agent, an inspection was made of the interior of Cardiff Castle, many of the rooms in which were built and furnished in oriental magnificence by the late marquis. Mr. A. PETERGREN conducted the party through the gardens and pleasure grounds, where many a hint was obtained in the successful cultivation of fruits and vegetables. Mr. A. HOPE, secretary, and his committee, were much gratified that the arrangements worked so smoothly.

XANTHOCHYMUS PICTORIUS.—Under this name we have received from Mr. GUTTERIDGE, Curator of the Liverpool Botanic Gardens, handsome golden-yellow fruits (see illustration fig. 26, p. 76, in our present issue), which are evidently allied to those of the plant yielding Gangee. Mr. GUTTERIDGE tells us that the plant fruits freely every year, and that young plants are freely obtained from seed.

CASSELL'S DICTIONARY OF GARDENING is nicely got up, and the cultural details are very serviceable for reference. The illustrations, are useful, but require some indication as to the actual size of the flowers, thus, at p. 72, *Aristolochia triacaudata* is shown as if larger than the gigantic *Aristolochia gigas* var. *Sturtevantii*.

PLANT-BREEDING.—An International Conference on Plant-breeding is, as we have previously announced, likely to be held in New York, U.S.A., some time during the year 1902. The preliminary steps for the event are being made by the Horticultural Society of New York, and persons in any way interested should communicate with the Secretary, LEONARD BARROX, whose address is 136, Liberty Street, New York City, N.Y. The Hybridisation Conference which was held in London two years ago was attended by several horticulturists from America, whose presence was highly appreciated, and the suggestion was made at that time to confine the work across the water. British representatives may be sure that they will receive a hearty welcome.

GARDENING FOR BOYS.—A contemporary informs us that "good gardeners are deplorably rare." Well, this is bad news, but the panacea is produced in the fact that the London County Council has offered to London boys an opportunity of getting a thorough training in this branch of industry. The Council's Technical Education Board offers scholarships to boys who are leaving public elementary schools, so that they may go through a thorough course of training at the School of Practical Gardening, now established by the

Royal Botanic Society in Regent's Park! The pupils who left the school last summer have obtained good situations. The gardening profession will now rejoice and be exceeding glad.

APPLES AND PEACHES IN THE UNITED STATES.—According to the latest information we learn that the average condition of the Apple-crop, on the whole, favourable, though in some of the larger producing States the condition is somewhat below the ten-year average. Of the Peach crop, we are told, that present prospects are highly favourable. In every important Peach-growing State the crop is considerably above the average—except in California.

YORKSHIRE NATURALISTS' UNION.—The 160th meeting will be held at Masham, for the investigation of Colsterdale, Birk Gill, Armagill, and the district adjacent to the confluence of the Burn with the Yore, on Saturday and Monday, August 3 and 5, 1901. Permission has been kindly granted by Lord MASHAM to visit Swinton Park and his estate; also by Mr. THOS. AITON, for the Tanfield Lodge estate. Members must take great care not to disturb the game, and in accordance with the policy of the Union, they must not take the roots of Ferns or rare plants. Being so near Aug. 12, the permission does not extend to the moors, and members are requested to confine their attention to the low grounds. The tract of country appointed for examination is Colsterdale, the valley of the river Burn, with its two main feeders, Birk Gill and Armagill, the full length of the stream being about 10 miles. It seems to be an absolutely uninvestigated and therefore virgin soil for the Union, which has never before in its history appointed a district for an excursion about which so little is known. "On the south of the river [Yore] we have an undulating moorland gritstone country, sloping suddenly towards the east, and penetrated by a dale, the stream [the river Burn] of which runs from west to east, and has numerous branches. It is about 10 miles in length, and the dale is called Colsterdale. The town of Masham stands upon the banks of its stream, not far from the point where it joins the Yore, the latter being here 250 feet above the sea-level, and the top of the ridge which separates Colsterdale from Covedale being upwards of 1500 feet above it." Mr. WM. CARTER, senr., writes that the flora of the district is fairly extensive, but of course in August the wealth of flowers is overpast. The following are the most notable plants that occur:—*Epipactis latifolia*, *E. palustris*, *Orehis ustulata*, *O. pyramidalis*, *Gymnadenia conopsea*, *Ophrys muscivora*, *O. apifera*, *Nesofia spiralis*, *Listera nidus-avis*, *Paris quadrifida*, *Primula farinosa*, *Parnassia palustris*, *Trollius europæus*, *Drosera rotundifolia* (*D. anglica* used to occur, but is probably now extinct), *Actæa spicata*, *Leopard's Bane*, *Wintergreen*, *Oak Fern*, *Beech Fern*, and *Moonwort*. Information as to routes and programme of meeting may be obtained from the Hon. Secretaries, W. D. ROBERTS, 259, Hyde Park Road, Leeds; and E. HAWKSWORTH, Goodman Street, Hunslet, Leeds.

PUBLICATIONS RECEIVED.—From the Western New York Horticultural Society, *Proceedings of the Fortysixth Annual Meeting, Rochester, N.Y.*, January.—From the Department of Agriculture, Central Experimental Farm, Ottawa, Canada, *Appl. Culture and Lists of Apples suitable for Ontario and Quebec, with description of Varieties*, by W. T. MACDON (Bulletin No. 37, April, 1901).—From the Ontario Department of Agriculture, Toronto, *22nd Annual Report of the Fruit Experiment*

Stations of Ontario. Fruit-growing has become of great importance in Ontario, and the Secretary of the Department has begun the work of illustrating and describing the fruits, and invites notes of criticism from pomologists generally.—*Thirty-second Annual Report of the Fruit Growers' Association of Ontario, 1900*. Published by the Ontario Department of Agriculture, Toronto. Much attention has been devoted to means for checking the spread of the San José scale, and there are also here Notes on New Fruits, Experiments in Fruit-growing, Canadian Fruits at Paris Exposition and in British Markets, &c.—*Transactions of the Massachusetts Horticultural Society for 1900, Part II*. Contains the reports of meetings and of committees.

PLANT PORTRAITS.

- AZALEA INDICA MADAME MORFVN. Double flowers, white, with deep rose-colored centre, some of the petals spotted. It is said to have originated as a sport from *A. Imperatrice des Indes*. *Revue de l'Horticulture Belge, June*.
- BEGONIA CALEDONIA. *Revue de l'Horticulture Belge, June*.
- CLANTHUS DAMPFIELD. *Le Jardin, July 15*.
- CYBELLA PLUMBIA. *Garden, July 6*.
- CYRTOFACHYS RENDY VAE DEVAVERIANA. *Revue de l'Horticulture Belge, July*. A low growing, palm with pinnate foliage, the pinnæ linear, the petioles and rachis of a rich crimson colour. Native of Malaya. The plant obtained as a seedling raised by M. DE SMET DEVAVER.
- PEAR NATIVELY PLANT. First exhibited in 1854, characterised by beauty, excellence, late ripening, and productiveness. *Bulletin of Arboriculture, June*.

NOTICES OF BOOKS.

BRITISH TREES, WITH ILLUSTRATIONS. By the Hon. Stanhope Tollenache, (Sampson Low, Marston & Co., St. Dunstan's House, London.)

The chief attraction of this book consists in the illustrations, which are from photographs of trees upon the same scale of magnitude, and taken with the same camera. Forest-trees indigenous, or such as have been naturalised to Great Britain, are alone dealt with, and their portraits certainly form a fine book of beauty. The modern custom of illustrating natural history books with actual reproductions of the subjects is a great improvement upon the often idealised representations and sketches formerly used. So we have here this portrait-gallery of forest favourites, and to each likeness is appended a simple description of the characteristics of the species, with as much information as to its habits, uses, &c., as the average amateur is likely to need. The book is not encumbered with scientific details, though the names and plain statements are accurately given, and it is pleasant to miss the historical traditions and half-verified folklore which, given in patronising language, too often spoil a "popular" book. Mr. Tollenache's handsome volume is well suited for reference when the names of trees are under discussion, though it must be noted that the illustrations show only the growth and form of typical examples of growing trees; but no details of foliage or flowers are appended to assist in the determination of cut specimens. The book has no scientific pretension, but nevertheless a few errors may be pointed out. It is a mistake to say, as at p. 40, that the Occidental Plane is the one generally planted in England. The reverse is, of course, true, "*Betulus*" should be *Betula*. The term "British" is made to include many trees cultivated in Britain; but that only adds to the attractiveness of the volume. The representations of the Coniferous trees are specially good.

THE SUBURBAN GARDEN AND WHAT TO GROW IN IT. By F. M. WELLS. (London: Sampson Low, Marston & Co., St. Dunstan's House.)

This book has one distinct recommendation; it is written from experience, not compiled from books and catalogues. It is what it claims to be, a simply-written treatise on suburban gardens, with advice concerning their laying-out and planting. The author, like every other intelligent plant-lover, is much averse to the ordinary square or oblong garden-patch, with four paths and four borders outlining a small lawn. Objection is also made to the too exclusive use of commoner plants, and to the universality with which these varieties are employed. But there is this excuse for such want of enterprise; that the tenant of the ordinary suburban house is rarely a resident therein for many years, and is naturally disinclined to incur the expense of remaking his landlord's garden, and stocking the same with choice and rare plants.

Still, the counsel given in the book is all good for those who have means to abide by it, and time to await the results of their labours. There is a description of the author's half-acre patch, and of the pains taken with it. Wisely indeed does the writer say that "it is worth a good deal to realise one's limitations, and to abide by them," not striving for more beauties than space permits, for forest trees in limited areas and for a display of many styles where there is room for but one.

In the few pages before us, the quantity and quality of the cultural instructions are naturally small, so that the general advice is more original than are the details; the chatty part being acceptable, in spite of the unfortunate introduction of "my lady." These side allusions to anonymous persons have become a weariness in modern garden literature. We prefer practical hints, such as the following: "There is another point that should never be lost sight of in these very small gardens. The owner of each one should aim at striking a distinctive note. He should introduce some one feature or plant that shall raise it above the monotonous sameness of these suburban strips of gardens." Quite so; one fine shrub or climber; one well-filled bed can be made the first step towards improvement, and the substitution of rare for common sorts of other plants may or may not be gradually made afterwards.

"TEIGNMOUTH: ITS PAST HISTORY AND PRESENT INTERESTS." By BEATRICE F. CRESSWELL. Illustrated by GORDON HOME (London: The St. Bride's Press, Ltd., 21, Bride Lane, Fleet Street, E.C.4). This is No. 15 of a familiar series of guide books that, as the prospectus truly says, "treats of a charming Devonshire sea-side resort and its equally charming surroundings." An interesting literary association links Teignmouth with MACKWORTH PRAED and KEATS, the latter having issued *Endymion* while lodging in this town. This handbook contains a 1-inch Ordnance Survey map of Teignmouth and its surroundings. A chapter on driving and cycling in the neighbourhood, and some notes on the natural history of Teignmouth, complete a very handy little volume. The Natural History Notes are rather scanty; but this must be forgiven in a book that makes no claim to being comprehensive or scientific.

"WHAT IS A KINDERGARTEN?"—By GEO. HANSEN (D. P. ELDER and MORGAN SHEPARD, San Francisco). Each of us has his or her idea concerning the proper training of children; and Mr. HANSEN has put his theory into words,

In trying to answer his own question, he "feels it his duty to build upon and build out FROBEL'S lines with the aid of his professionalism." The kindergarten, then, is an actual recreation-ground, planted and laid out according to the requirements of the children. "The teacher shall not attempt to explain any of the habits of those plants with which I insist the child should be surrounded. . . . Remember, every child in your charge is an Edison, every tot a Columbus; and the idealising disposition of all of them sees a Garden of Eden in a vacant lot. I insist upon more association of plants and children." Mr. HANSEN is indeed very positive. He gives schemes, with illustrative plates, for laying out gardens of various sizes and shapes, and is quite certain which plants should be cultivated and which excluded. It is all meant for the best: for the good of the children, and the author has quite a right to his own ideas, and to express them if he wishes to do so. Those specially interested in the education of children by a system, will like to read the instructions here given, and may glean hints even if they cannot agree with the entire scheme. There is, at least, no doubt on the one main point; that association with plants and with Nature generally cannot but be beneficial to the little ones as well as to those of larger growth.

"WORKMEN'S COMPENSATION ACT."—Mr. W. A. WILLIS, of the Inner Temple, has published through BITTERWORTH & Co., the full text of the *Workmen's Compensation Acts, 1897 and 1900*, together with notes on those Acts, as well as on the Employer's Liability Act of 1880. This edition, the seventh, contains notes on the Act of 1900, which extends the principal Act to "employment in agriculture, affecting thereby not only farmers and market gardeners, but a large number of persons who up to the present have not regarded themselves as engaged in agriculture." The expression "agriculture includes horticulture, forestry, and the use of land for any purpose of husbandry, inclusive of the keeping of live-stock, poultry, or bees, and the growth of fruit and vegetables." A copious classified index is appended.

MESSRS. LEE & NIGHTINGALE, 15, North John Street, Liverpool, have also published a *Handy Guide to the Workmen's Compensation Act*. This pamphlet contains explanatory notes for the use of farmers and others, and should be useful in elucidating the verbal technicalities of the Act. Mr. JOHN GRIFFITHS, solicitor, says in the introduction, that:—"Briefly, the purport of this Act is to give to every farm-labourer and others included in the Act, compensation at the rate of half his weekly earnings, so long as he is incapacitated by an accident befalling him during his employment. In case the accident causes the man's death, it provides that his dependants shall receive compensation on the scale of three years' earnings, if the deceased has been so long with his employer, or £150 at the least. This compensation is to be paid whether or not the accident has been caused by negligence, unless it can be shown that it was directly due to the serious and wilful misconduct of the injured man." This is the gist of the subject in a nutshell; the details are not less carefully dealt with. The pamphlet is obtainable from Messrs. LEE & NIGHTINGALE, 15, North John Street, Liverpool.

"FLORA CAENSIS."—*FLORA OF TROPICAL AFRICA*.—Botanists will learn with great satisfaction of the publication recently of another instalment of each of these important works. The fifth volume of the Cape Flora

opens with an account of the Acanthaceae, by Mr. C. B. CLARKE, an order which is largely represented; Selaginaceae, treated of by Mr. ROEPE, is also a large order; Verbenaceae, enumerated by Mr. H. W. PEARSON, includes likewise a large number of species. The *Flora of Tropical Africa* is now in its eighth volume. The most important orders monographed in the present part are the Commelinaceae, by Mr. C. B. CLARKE; the Palmaeaceae, by Mr. C. H. WRIGHT; the Aroidaceae, by Mr. N. E. BROWN, as well as some smaller groups.

We are grateful to miss long speeches from would-be "characters" with wonderful names, and to find the whole book, though naturally limited in scope, practical in design. Garden books by ladies have multiplied greatly lately, and we recommend every ardent amateur to write one. It is not necessary to publish it in an over-crowded market, but friends would like to interchange their diaries and ideas while these are yet in manuscript. Not that the *Garden in the Suburbs* is unworthy of publication, but that it has had many

FIG. 26.—FRUITS OF XANTHOCHYMUS PICTORIUS: YELLOW.

(see note on p. 71)

"A GARDEN IN THE SUBURBS," by Mrs. LESLIE WILLIAMS, with illustrations. (JOHN LANE, The Bodley Head, London, and New York.) Here is another gardening book from a lady's pen, and it is gratifying to read that it is the "outcome of some happy years of garden work," not a mere product of armchair theorising. Suburban gardens certainly deserve the attention now bestowed upon them by writers, for they suffer from the drawbacks of both town and country plots. There is the inevitable "dear pussy" (the writer's term), often a heavy soil and much smoke, yet plenty of bird and insect enemies to be defeated. Mrs. WILLIAMS gives pretty illustrations of well managed nooks and corners, and a plan of a small plot showing what can be done with it. The chapters are, some of them, named after the months of the year, and the friendly hints incorporated will help many an amateur, whom more formal information might dismay.

forerunners. We commend it to suburban gardeners, to lighten the dullness of heavy treatises and of catalogues with mere epitomes of routine work.

"FLOWERS AND FERNS IN THEIR HAUNTS."—By MABEL OSGOOD WRIGHT. With illustrations from photographs by the author and J. HORACE McFARLAND (New York; The Macmillan Co. London: MACMILLAN & Co.). This is essentially a "pretty" book, sent out by an enthusiastic lady whose acquaintanceship is chiefly with the country on the further side of the Atlantic. She sagely, but without much originality, considers that wild flowers are never so perfectly charming as when in their natural habitat. "The flower in its haunt is a part of the landscape, a tint on Nature's palette not to be heedlessly removed." But she knows little of the botanist, confusing him with the mere collector; hints that his

NURSERY NOTES.

MESSRS. J. LAING & SONS.

Forest Hill, Catford, and the southern slopes of Norwood Hill remain in spite of the busy builder, comparatively rural, and the resident nurserymen, unlike their *confères* nearer London's centre, have not considered that the time has come when they must go further afield. Fogs are thick at times, and the "blacks" are not unknown, but the sulphurous fumes of London smoke are diluted with Surrey air as to be comparatively innocuous. Indoors plants, such as *Streptocarpus*, *Gloxinias*, *Begonias*, *Orchids*, and general nursery stock in the houses and grounds were looking clean and vigorous on the occasion of a visit of inspection made on the invitation of Mr. H. Laing a fortnight ago. It is well to be accurate as regards the date, for the reason that the tuberous-rooted *Begonias*, for which it is almost needless to remark that the firm of Laing & Sons has been celebrated for almost a generation, would not, as we were informed, be really at their best for a week or ten days. Nevertheless, the show of bloom would have satisfied anyone less critical than the present head of the firm; and although there were great numbers of expanded blooms, there were many more buds coming on.

Some so-called "frilled" *Begonias*, some white forms having the fragrance of the *Violet* or *Maréchal Niel* Rose, were remarked. Double-flowered, named collectively *Duplex*, in very brilliant colours, are becoming common, not purposely worked for by the cross-breeder, but individuals which have appeared fortuitously among the seedlings raised at this nursery, and now being turned to good use. They have just enough doubling of petals, or to speak more correctly, petaloid forms of stigmas, in the blooms to impart solidity without destroying the characteristics of the *Begonia*, and making it look like a *Carnation* or a *Camellia*. Some of these "*Duplex*" have frilled edging, similar to the *Carnation* at present *en vogue* in the United States of America, which certainly adds to their attractions.

The pose of all the *Begonia* flowers to-day is much better than formerly, and they look you in the face without the support of a concealed stick—a decided gain from the decorative gardener's point of view, but not so for basket-work, for which drooping *Begonias* are most suited, and of which there is no lack. One of the large span-houses was filled with plants in pots of double-flowered varieties, of which extremely fine ones were noted in *Queen Alexandra*, a very big cerise-coloured flower; in *Lord Roberts*, *White Swan*, and *Duke of Fife*. Out-of-doors beds of the useful red-coloured *Begonia Bavaria* were noted—a dwarf form of the *floribunda* type.

The *Streptocarpus* have been very fine, the blossoms large and prettily marked. Efforts are being made to secure other and brighter tints in blue and purple, of which as yet there is a dearth; and by cross-breeding from varieties showing moderate leafage, a neater form of leaf is being sought for. Of this last, at the present day, there is no evidence. In some few instances a doubling of the flowers was remarked, an alteration which scarcely looks like an improvement, although it is sure to come. The plants are now being fertilised, and the main flora is over for 1901.

Gloxinias occupied houses to themselves—an excellent strain, with pendent leaves and clear, distinct colours. *Caladiums* have been a speciality here for many years, and we entered a house filled with these plants, with a

FIG. 27.—*ODONTOGLOSSUM CRAWSHAYANUM*.

Shown by Mr. H. Crawshay, Esq., of Rosefield, Sevenoaks, at the meeting held at Chiswick on Tuesday and Wednesday, July 16 and 17, when it received an Award of Merit (See Report, p. 99, in previous issue.)

chief glory amid lovely scenery is the adding of some treasure to his vasculum; but the same lady whose opinions are as above quoted has dedicated her book to a pony, and treats us to the usual feminine digressions concerning *Floxyer Hat* and *Time o' Year*. These nick-named characters are no doubt useful in making a little book into a large one, but in gardening and country matters generally we have long ago heard all they have to say. So

that *Flowers and Ferns* is not to be taken too seriously. It is pleasant enough reading, when the authoress keeps to her subject, for it must be a bad book indeed on such a topic that cannot be made interesting. The illustrations (on nicely toned paper) are delightful, again not specially original or striking, but a series of really pretty pictures, which we have pleasure in turning over. To non-scientific readers the book will be specially acceptable.

FIG. 28.—*ODONTOGLOSSUM MACULATUM THOMPSONIANUM*.

Shown by W. Thompson, Esq., of Wallon Grange, Stone, at the meeting held at Chiswick on Tuesday and Wednesday, July 16 and 17 last, when it received a First-class Certificate (See Report, p. 99, in previous issue.)

line bit of *Gloriosa superba*, well flowered, growing on a trellis erected over the entrance. We may specify C. Alexander III., which is the finest dark crimson, in leaf, form, and habit a fit companion to the well known C. argyrites; C. Lord Rosebery, C. ornatum, C. illustris, a pale tinted leaf, with red veins; Lord Derby, Golden Queen, Madame Coquetin, Rose Laing, and John Laing.

In another house numerous large and small examples were observed of the creamy-white variegated *Cordylina australis* variegata. The firm engages rather extensively in the cultivation of Vines for fruiting as pot-plants, and likewise for permanent planting. The stock, consisting of every popular variety, was remarkable for the strength and moderate length of the rods, and the closeness of the nodes. The Vines for fruiting in pots have already finished their growth, and are being very gradually ripened off. Out-of-doors Carnations, Picotees, and Pinks occupy a great deal of space, but the plants were not generally in good bloom, and seemed to need a fortnight more time to perfect them, so that it must suffice if we indicate them.

THE TREE NURSERY.

In this department, not having visited the nursery since 1897, we noted very considerable additions, ornamental (picture trees and shrubs) as well as common species and varieties, fruit trees, and fruit bushes, being found in greater quantity than heretofore, and in a thrifty state. Of rarities of Conifers, we may mention *Picea pungens* Kosteri, a variety with yellow variegation, and *Picea alba* var. *aurea*. *Acer californicum* [?] *aureum* is a satisfactory variety, with telling foliage; as are likewise *Cerasus Mahaleb* variegata, *Catalpa bignonioides* var. *purpurea*, the colour being especially good in the young leaf; *Crataegus Oxycantha* variegata, *Cornus brachypoda* *aureo-variegata*, *Robinia aurea*, *R. angustifolia* elegans, very pretty leafage, and *R. inermis* variegata, *Praxinus nove-anglie*, *Pyrus salicifolia*, a weeping *Morus nigra* in fruit, *Caragana arborea pendula*, quite a handsome variety of a very stiff-habited species; *Ulmus minor*, misnamed, probably a form of the Japanese *U. parvifolia*; *U. umbraculifera*, *Populus trichocarpa*, new. The fruit-trees and bushes have made, notwithstanding the dry weather, excellent growth in this heavy land; and most varieties of Apples, Plums, and Pears on Quince stocks, were abundantly fruited. Every popular variety of Apple is grown on the dwarfing and the free stock, and even young trees on the latter were noted that were heavily laden with fruit. Dwarf-trained Peaches, Nectarines, and stone fruit generally make thrifty, but not too vigorous growth, and the trainers were busily engaged in "tying them out."

Roses.

Of these considerable breadths were remarked, and on enquiry, Mr. Laing told us that he grew about 10,000 dwarf, and 14,000 standard Roses annually. The dwarfs were in full bloom, and so good were they that in selecting a winning forty-eight, one would not have found it needful to search very far.

We remarked a *Clematis paniculata* with the general appearance of *C. flammula*, and with the same grateful aroma, but which is in flower at this season.

Two thousand Chrysanthemums, inclusive of the newest varieties, are being grown in pots, strong, stocky plants, full of promise. A collection of fifty species and varieties of Ivy is well worthy of inspection; as, indeed, is the entire collection of plants grown for sale.

MESSRS. J. VEITCH & SONS' SHOW OF CARNATIONS AND PICOTEES.

The hot weather has not been favourable to these beautiful flowers anywhere in the south, the colours paling and the flowers withering almost before they are fully open. The late rains will, however, have done much to restore freshness in the blooms, and prolong the season of flowering.

The usual quadrangle between the glass-houses was devoted to the plants, and here we found the long, rectangular beds filled with the choicest varieties, and the sun-heat at mid-day in that walled-in space at about 120° Fahr. We were enabled to inspect the following novelties of 1900 and the present year, viz., *Alecinus*, a flower having a lemon-yellow ground colour, marked heavily with purple; *Bertie*, a pinkish-white flower, heavily marked with crimson, and the plant vigorous; *Etarre*, a flower of a soft apricot-yellow tint, very free and vigorous; *Lady Jane Grey*, said to be the best lavender-coloured Carnation, the flowers large, and of capital form; *Mrs. Prinsep*, a large yellow self of good form—a variety good for planting in the border.

Among recent introductions, we may name *Banner*, a full-sized brilliant scarlet flower, which received an Award of Merit from the Royal Horticultural Society; *Comet*, a plant of dwarf habit of growth, maroon-crimson, with smooth petals; *George Maquay*, a very useful hardy border Carnation, pure white flowers of perfect shape, and circular petals; *Isinglass*, scarlet, of much brilliancy—received an Award of Merit from the Royal Horticultural Society; *Rizzio*, a large, full, bright yellow self; and *Sweetbriar*, a pale scarlet-coloured variety, of beautiful shape.

Among yellow-ground Picotees of recent date, we may mention *Caracei*, with a bright rose edge; *Daniel Defoe*, with a rose-red edge; *Edna May*, bright yellow, with a broad pink edge; and *Falkland*, with a bright rose edge, and perfect calyx, the plant of vigorous growth. *Hendigo*, *Joe Willitt*, *Ketton Rose*, *Mephisto*, *Mrs. F. Watt*, and numerous old favourite varieties, were noted.

HOME CORRESPONDENCE.

SOME HERESIES.—A few days ago in Godalming I passed through a vineery 40 feet long which was erected by Boulton & Paul. The place had changed hands, and the present occupier having no regard for indoor gardening, had allowed hot-water pipes and boiler to get out of order. Consequently, the Vines had received no fire-heat for three years. The vineery is a mixed one, containing Black Hamburgh, Lady Downes Seedling, and Muscats. The Muscats and Lady Downes had set equal to many I have seen where fire-heat is used. They were what might be termed a good set, and the Vines were healthy. When the Vines were in bloom, the temperature had for many nights fallen to 45°. The ventilating apparatus at the top of the vineery was out of repair, and so was always open. This seems to suggest that a high temperature is not always required for Muscats when in bloom. In the same garden a Royal George Peach of bush form was growing at the foot of an east wall; its head rises above the top of the wall, and it has received no pruning, and is in no way protected. This tree had several dozen of fruit on it, and was quite clear of green-fly, curl, or any of the maladies to which Peach-trees are subject. This tends to show that the town garden is favourable to the growth of the open standard Peach-tree, as well as many tender and choice flowering shrubs. I have seen a plant of *Choisya ternata* planted out on the open lawn full of blooms with no

protection whatever. When planted in the country in a warm, sheltered spot, I have seen this plant cut by frosts. W.

MILDEW ON VINES.—I noticed in a recent number of the *Gardeners' Chronicle* a correspondent, "W. M.," is in difficulties with mildew on his Vines. For two or three years I had mildew very badly in a vineery here, and I tried all I could to check and prevent it, but to no purpose. At last it occurred to me that perhaps there may be something lurking above the Vines on the roof-glass that may cause it. The following winter, and each winter since, I have had the inside roof-glass wiped over with clean water only, and am glad to say that I have not seen a trace of mildew in the house since doing so. If "W. M.," could only sponge his glass over now it may check the pest. S. Williams, *Holnet Hall, Market Drayton.*

THE BOLTING OF CABBAGES.—I am much interested in the correspondence that has appeared in these pages on this subject. While I admit that some varieties are more apt to bolt than others, and that it may be caused by sowing at too early a date, these are, in my opinion, not the only causes. My practice is to plant autumn-sown Cabbage on the ground occupied by the spring-sown Onion crop, the ground not being dug for the Cabbages, but merely hoed, and the rubbish and weeds raked off. Then drills are drawn 3 inches deep, and at suitable distances the Cabbages are planted in the drills. The hoeing that the land receives during the autumn fills in the drills, and growth is steady. Early in the month of February, according to the weather, the land is lightly top-dressed with nitrate of soda and basic slag or superphosphate of lime, and the ground dug with a fork, and three weeks later another sprinkling of nitrate of soda is applied; if necessary, the ground being stirred once a week with the hoe. It is my opinion that bolting is more frequently caused by a too rapid growth during the autumn and mid-winter, owing to the land being manured and dug previous to planting. *T. H. Shade.*

SWEET PEAS.—Plants that were turned out from pots have been flowering here grandly. In order to prolong the blooming of such plants they should be well mulched with rotten manure, and if this material be objectionable, grass mowings may be used in the fresh state. Afford the plants occasionally some artificial manure-water, such as guano, using about a handful to a 4 gallon water-pot, or Clay's Fertiliser at about the same strength; soot and cow-manure liquid is very beneficial. Gather the flowers as fast as they begin to open, and never allow them to remain long on the plants unless an effect is wanted in the position where they are planted. Syringe the plants with the garden-engine underneath the foliage. Successional sowings will need attention in the matters of staking, weeding, and affording water. If gathered in the bud, and placed in a cool structure, Sweet Peas may be retarded a little; or they may be hastened by gathering them whilst in the bud, and placing them in a warm structure—buds will open beautifully in one night and have good colour. *W. A. Cook.*

FRUIT PROSPECTS IN IRELAND.—The crops of Strawberries are heavy, though the fruit is much smaller than last year's. Cherries are fairly good, and of the commoner varieties they are very good. Apples are an uneven crop, a good crop in some districts, and bare of fruit in others. Out-of-doors Peaches and Pears are similar. *A. O'N.*

SKIN IRRITATION FROM STEMS AND LEAVES OF BRYONIA DIOICA.—The following case has come under my observation: Several plants of *Bryonia dioica*, the upper parts of which a lady wished to remove, were growing round trees in a garden here. She pulled away the stems and leaves with her hands one afternoon last week; the work only occupied a few minutes. In the evening both her hands were covered inside and out with innumerable red

FLORISTS' FLOWERS.

THE YELLOW-GROUND PICOTEE.

A good deal has been written about the Yellow-ground Picotee, its antecedents, and its present position in the world of florists. I can remember it fifty years ago, but more particularly about the year 1858, and I think it is quite safe to say that no good yellow-ground Picotee had been cultivated in England until that date. The coloured plates in the books published by Mr. Thomas Hogg of Paddington, Paxton's *Horticultural Magazine*, and the *Flori-cultural Cabinet*, are not to be trusted—the yellow colours are laid on too deeply; but even if this were not the case, they had not the properties desiderated in the florist's type of a yellow-ground Picotee. My friend, Mr. Simonite, can well remember the fine yellow-ground Picotees exhibited by Mr. Richard Smith, of Witney, Oxfordshire, in 1858. Mr. Smith exhibited his flowers in that year, and they came very nearly to the florist's standard reached in the white-ground varieties; he was able to send out. A variety named Consolation was the best, and second to it was Dr. Horner. There were a number of others, but their names are of no importance, as they have all gone out of cultivation. There was some correspondence in the *Gossip of the Garden* on the production of these flowers, but except for the statement that Mr. Smith had been working up the yellow-ground Picotee for ten years, and wisely destroyed his inferior varieties until he was able to shine forth in such fine varieties as unexpected Dr. Horner and Consolation, Dr. Horner had written about the development of the yellow ground Picotee, and Mr. Smith was in a fair way of verifying his predictions. It is on record that his work was greatly hindered by the loss of most of his finest seedlings by wireworm. He planted his seedlings in beds 18 feet in length by 12 feet in breadth, and from two such beds he trapped by means of carrots about 300 wireworms. Doubtless while this trapping was going on, the Carnations were rapidly disappearing. It would surely be better in such circumstances to take the plants away from the wireworms rather than by the much slower process of getting the pests away from the plants. Experience is worth more than a great deal of theory on this question. I have trapped the wireworms with carrots buried in the ground, but they attacked the Carnations quite as freely as they buried their slender bodies in the carrots. Now in the case of valuable plants, it is much better rather than lose them, to dig up and pot them or plant out if it were possible on ground where there are no wireworms. The fine varieties raised by Mr. Richard Smith as above are not in existence. If they had been taken in hand by someone when Smith was unable to carry on the work, we might by this time have been in the possession of yellow ground Picotees of as high quality as the white ground, and as varied in the colour margin.

No yellow-ground Picotee known to me has served its purpose in life so well as Prince of Orange (Perkins). Maybe the raiser was indebted to the Witney varieties to seed from. I do not know the year it was sent out, but I had it in cultivation about the year 1867-8; and it was a singular co-incidence that the late Mr. John Standish, of Ascot, should introduce about that time another very fine yellow-ground Picotee under the name of Ascot Yellow. But this variety, although it was very fine in quality, and won the First-class Certificate of the Royal Horticultural Society, had a very poor constitution, and it soon died out;

whereas Prince of Orange had been grown for over thirty years. This variety is the original parent of all the yellow ground Picotees now in existence. The late Charles Turner, of Slough, was the first to raise seedlings from it. He had a very fine lot for decorative purposes; but one at least of them, *Xe Plus Ultra*, was free in growth, and was a nearer approach to the florist's standard than Prince of Orange. From this *Xe Plus Ultra* I raised a fine lot of seedlings from this variety by cross-fertilisation. These again were a great advance on the set raised by Mr. Turner, and a second batch of seedlings produced such standard varieties as Mrs. Robert Sydenham, Countess of Jersey, Mrs. Douglas; and one which the fanciers thought superior to any of them was named Remembrance. This variety was a true yellow-ground Picotee, with a narrow margin of deep red or scarlet, without any markings of any kind on the petals. The nearest to this variety in quality is Mrs. Robert Sydenham. This is also a very good representative of the broad-margined variety; it is of a pleasing rose or pink tint, but the yellow colour was not so deep or decided as in the variety Remembrance.

In recent years, Mr. Martin R. Smith has been most successful in raising fine varieties of the yellow-ground Picotee. The Hayes seedlings are distinguished in the first place by a vigorous constitution, and a great variety of colour-margin. Of those in general cultivation, *Empress Eugénie* is a good representative of the narrow margined varieties, although there are many others, such as *Ouida*, *Caravel*, *H. Falkland*, *Heleodorns*, *Lady St. Oswald*, and *Lawzan*; these are the best of the quite new varieties. Of older ones *Borderer*, *Day Dream*, *Hyacin*, *Ladas*, *Mr. Vigol*, *Moliveau*, *Professor*, and *Wanderer*. Many prefer the varieties with broad margins. The best of the newer ones are *Daniel Dofon*, *Edna May*, and *Lady Bristol*. The older ones are *Countess of Jersey*, *Dorvish*, *Heather Bell*, *Mrs. Douglas*, *Mrs. Tremayne*, *Miss Alice Mills*, *Miss Violet*, *Stanley Wrightson*, and *Mrs. Drandiell*. The above is a list of the best of the yellow-ground Picotees. Their culture does not differ in other respects from that of other Carnations, and, with a few exceptions, they may all be treated as ordinary border Carnations.

Many persons scout the idea of growing border Carnations in flower-pots. They reason thus: the Carnation is a hardy garden plant, and should be treated as such; and if it requires greenhouse culture, it cannot be truly described as a border Carnation. This is arguing on wrong premises. Yellow-ground Picotees, and certain choice border Carnations, are not grown in pots because they will not grow in the open border, but because the quality of the flowers is much better from pot plants, and if placed in a greenhouse and shaded from hot sunshine, they retain their beauty much longer. Moreover, if some plants are retarded, and others put in a house with some warmth, they give a succession of bloom; and surely it is more profitable to fill a house full of Carnations than it is one of scarlet Pelargoniums and such-like flowers—but in this matter allowance must be made for individual fancies. I know many gardens where the best greenhouses and the best attention is given to Carnations. On the other hand, I saw some of the choicest border Carnations growing splendidly and flowering beautifully in a famous garden in Sussex in August last. Most of them were planted out; but some of them were growing in vases in the open garden, these latter being allowed to hang over the sides of the vases, and in that way they bore beautiful flowers.

spots as if from the stings of nettles; by night all her fingers had swollen, and the spots had turned to convex, confluent blisters, with an irritation that nothing at hand would allay, and which caused a hopelessly sleepless night. After three days the skin of both hands peeled away. *W. G. S. Dunstable.*

RAINFALL FOR SIX MONTHS FROM JAN. 1 TO JUNE 30.—The following is a register of the rain that has fallen at Rumwood, Langley, Maidstone, in six months:—

January	0.8 inches.
February	1.1 "
March	2.5 "
April	2.16 "
May	1.42 "
June	0.75 "
Total	8.97 "

The heaviest fall in twenty-four hours was 0.56 of an inch. Rain fell on seventy-one days. The rainfall here seems to get less during the spring months, and consequently it is becoming a serious matter with us. We live on a plateau with a valley on either side, which seems to get the rain more frequently than we do at the top. *W. J. Gould, jr., Langley, Maidstone.*

KAINIT.—Mr. Massoe, at the Lily Conference, describing the effect of kainit, called it Strassburg Fertiliser, and you have it so in your report; but it ought to be Stassfurt, and not Strassburg. *Hugo Müller, Crosby Hill, Canterbury.*

AFTER THE RAIN.—We have at last had some heavy thunder-showers after a long spell of dry weather, which made itself severely felt on the pastures, reducing the feed of cattle so much that many farmers were obliged to open their gates and let their stock pass into the meadows which were reserved for hay. This will, of course, cause hay to be scarce, which will tend materially to raise the price thereof during the ensuing winter and spring. This state of things may probably be modified by the import of hay from Canada and other grass-growing countries, which will no doubt be advised of the situation in this country. Oats, Wheat, and Barley, are all short in the straw; the rain may help to fill the ears, but it has come too late to add any appreciable length to the straw. Great breadths of Turnips and Mangolds are a failure, but there are instances where the land has been in extra good cultural condition. There is still, with these timely rains, fair hope for good crops. Potatoes will yet respond in renewed vigour with change of weather. Yesterday I saw a large field which for good cultivation and signs of health and vigour could not be beaten even in the palmiest days of Scottish Potato-growing. These are on the farm of a Mr. Postlethwaite, a west Cumberland man, which is perhaps the neatest, cleanest, and best cultivated farm in Warwickshire. Beans are in flower, but they, too, are short in the haulm; and black aphid has appeared among them, but the rain, let us hope, may stop the spread of this pest. Garden crops were showing signs of the drought, but being more in hand than field crops, have not taken much harm. Applications of water in the evening, together with mulches of short stable-litter and some crumbs of soil drawn over that, saved crops of Cabbages, Cauliflowers, Peas, and Beans, from harm. In gardens that are well looked after, and especially if the soil is retentive, the drought has not done much harm. Speaking personally, my Strawberries, which are growing on a strong, friable loam, are excellent. I use stable-manure, which costs me, delivered at the railway station close by, 1s. per ton. This consists of wood-sawdust, which not only enriches, but has also the effect of making strong hand work freely, allows rain to pass down, engendering a general moisture, which is not so obtainable by the use of artificial manures, and not being grown in "fungophobia," I do not dread any evil consequences from its use. This manure is largely used by farmers in this neighbourhood. *W. Miller, Berkswell, Warwickshire.*

I never use artificial manure of any kind for Carnations. Good loam three parts, one part decayed manure, some mortar rubbish or pounded oyster-shells being used instead of sand to keep the material open.

The size of flower-pots is not of very great importance; but overpotting in this, as in most other things, is to be avoided. Cleanliness, abundance of light and air, are the requisites for success. *Jas. Douglas.*

BORDER CARNATIONS.

There is to be seen in bloom, a fine and interesting set of border Carnations at Chiswick. Possibly the collection may include some varieties to which the term border may be thought objectionable, as they may be of the florists' section. But at least at Chiswick they all come into the same category, being there subjected to out-of-door conditions only. The plants generally seem to have wintered well, the district having during the dull months been singularly free from fogs. It is too much to hope that this indicates permanent improvement. The Carnation collection includes many seedlings, forms always full of interest because no one knows before flowers open what qualities they may exhibit. There are also some named varieties. When this collection is gone over by the Floral Committee, it is to be hoped that under no circumstances will any variety with split calyxes obtain an award, unless they possess very great fragrance as a compensation for this imperfection. It is universally admitted that Carnations of all descriptions now have little perfume. The breeding has been rather in the direction of form, size, and colour, and whilst pod splitting has been freely tolerated, the absence of perfume has been ignored. We badly need a race of free-growing border Carnations that bloom freely, are not specially amenable to fungoid attacks, and have rich scent. We have in new and old, an endless succession of what may be described as house, pot, or show forms of Carnations—practically, we have enough of them. The Chiswick trial should do something to show what varieties are to be very specially recommended for planting in borders. I am not sure whether the Council of the Royal Horticultural Society would not do well to invite for next autumn planting pairs of strong layers of any variety, which they find to be in constitution, free blooming, good habit, and sweet perfume, a good, hardy border variety. There may be in gardens about the country numerous good ones of that nature, and which it would be most interesting to have tested at Chiswick. In some places, Carnations planted out on a carpet of *Violas* are used as bedders. These are seldom a success. Carnations need supports, and netting can keep the sticks from being seen. The body of bloom produced at any one time is not such as to give a good effect; the flowering season, also, is far from being early or prolonged. Carnations never look better than when planted in small clumps of some half-dozen plants, in mixed borders and on good soil; also if not too close together, and there is ample room for layering them in the autumn, one-half the rooted layers being removed for planting elsewhere, the rest being left and top-dressed with old pot-soil, to bloom the following year, then a very fine body of bloom results. The transplanted layers should be allowed to make similar second-season clumps, the old ones being lifted and cleared out, other new plants taking their places. That is the way to keep up a fine show of Carnations in our garden borders; but to have strong plants for removal, layering should be done early. This season, for instance, there seems to be no reason why that work should not be completed by the end of July. A. D.

VEGETABLES.

I MAKE it a practice to grow several varieties of early Peas every year. So far I have found none to equal Sutton's Early Giant. Sown at the same time as William the First, it is fit for consumption at about the same date. The variety has much larger pods, and the Peas are of fine quality. The haulm grows to the height of 1 ft., and the plant is a heavy cropper. Sown on February 26, pods were gathered on June 1. I have sent a few pods for your inspection, *Wm. Duffryn, Elmstree Gardens, Telbury.* [Very fine, well-filled pods. Ed.]

PEA SECTION'S SATISFACTION.

This variety of Pea has done remarkably well here this season; the pods have filled well, and the quality when cooked is good. So far the haulm is free from mildew, and notwithstanding the drought the plants are cropping excellently.

CALLIFLOWER SUTTON'S FAVORITE.

I have grown this variety by the side of several others, and am more than satisfied with the way it has turned in. The curds are solid, white, and of excellent quality. It is of moderately dwarf habit, and can be planted somewhat thickly in the rows. It forms a capital succession to the dwarf Erfurt type, coming fit for use before the *Walteren*. To grow good Calliflowers, especially in dry seasons and on light soils, the land must be broken up to a good depth, and there should be plenty of manure worked in several inches beneath the surface. Plants put out on deeply worked land need little care and attention compared with those growing on shallow cultivated soils. Within the last two years I have had the greater part of the kitchen-garden here trenched, and we are being well rewarded for the labour by the fine produce obtained. *H. M., Wrotham Park.*

Obituary.

MISS ORMEROD.—The death on the 19th inst., at St. Albans, of Miss Eleanor Ormerod removes from among us one who rendered great service by making the knowledge of the men of science available for practical purposes. Indeed, her life was for many years devoted to the interests of agriculturists. She was the youngest daughter of George Ormerod, D.C.L., F.R.S., of Sedbury Park, Gloucestershire, the well-known author of the *History of Cheshire*. Three-and-thirty years ago she gained the Silver Flora Medal of the Royal Horticultural Society for specimens, drawings, and models illustrative of insect depredations. In conjunction with the late Andrew Murray, she formed the collections of economic entomology now in the Bethnal Green Museum. She was the first lady Fellow of the Meteorological Society, and edited a mass of important documents relating to weather and plants. Her *Manual of Injurious Insects, and Methods of Prevention and Remedy for their Attack on Food Crops* enhanced her reputation; but she will be, perhaps, best known by her *Annual Reports and Observations on Injurious Farm Insects*, which she first began to issue a quarter of a century ago. She acted for many years as Consulting Entomologist to the Royal Agricultural Society, and was lately Additional Examiner in Agricultural Entomology at Edinburgh University; and rather more than two years ago the Société Nationale d'Acclimatation de France awarded her the large silver medal bearing the portrait of Godfrey Saint Hilaire. The University of Edinburgh conferred on her the degree of LL.D.; and the Royal Horticultural Society comparatively recently awarded her a Victoria Medal of Honour. For some years past Miss Ormerod had been an invalid, and for upwards of a month had been seriously ill.

SOCIETIES.

NATIONAL ROSE SOCIETY, Northern Exhibition, Ulverston.

JULY 17.—Owing to cool, dull weather up to noon, the Roses in all classes were presented in magnificent condition. Hybrid Perpetuals were grand in the winning stands, of immense size and high colour. Teas and garden Roses were also exceptionally good. It was, without a doubt, the finest Rose show of the season in regard to the quality of the blooms. The arrangements were well carried out by the local committee, and the meeting of rosarians was an extremely pleasant one.

JUBILEE TROPHY.

In the *Jubilee Trophy* class for thirty-six distinct, Messrs. A. DICKSON & SONS, Newtownards, were 1st, with one of the finest stands ever staged for this trophy. The quality of the flowers was exceptionally good. *Horace Vernet*, Her Majesty, Etienne Lede, Mrs. W. J. Grant, Star of Waltham, Reynolds Hole, Prince Arthur, Bessie Brown, Madame Crapelet, Dupuy Jamain, and Souvenir d'Elise, being the most remarkable. Messrs. HARKNESS were 2nd, showing grand flowers of Her Majesty, Madame Etienne Verdier, Comte de Rainbault, Helen Keller, Reynolds Hole, and Mrs. W. J. Grant; 3rd, Messrs. PERKINS, of Coventry.

Fordygrill distinct.—1st, A. DICKSON & SONS, a fine stand, 2nd, Messrs. HARKNESS; 3rd, B. R. CANT & SONS.

Twenty-four trebles.—1st, A. DICKSON & SONS, having Bessie Brown, very fine; Duchess of Portland, fine; Horace Vernet, Mildred Grant, Mrs. John Laing, and Ulster, very good; 2nd, B. R. CANT & SONS.

For thirty-six distinct.—1st, G. PRICE & SONS, Oxford; 2nd, J. BURRELL & CO., Cambridge.

For eighteen Teas distinct.—Messrs. PRICE were 1st, with a fine stand containing *Maman Cochet*, awarded the Silver Medal for the best Tea in the nurserymen's section. Other excellent flowers were *Souvenir d'un Ami*, *Marchal Niel*, *Princess of Wales*, *Bridesmaid*, *Golden Gate*, and *The Bride*; 2nd, A. DICKSON; 3rd, Messrs. CROLL, Dundee.

Twelve Teas.—1st, Mr. J. BURRELL; 2nd, Mr. J. MATTOCK; 3rd, Messrs. HARKNESS.

For twelve new Roses.—Messrs. DICKSON were 1st, showing good examples of *Mildred Grant*, *Mamie*, Mrs. Mackreth, Ulster, and Robert Scott—a fine stand; 2nd, Messrs. PERKINS. For twelve blooms of any white or yellow Rose, the three winning stands all contained Bessie Brown; 1st, Messrs. DICKSON; 2nd, Messrs. PRICE; 3rd, Messrs. PERKINS.

For twelve of any Parker Light Rose.—1st, HUGH DICKSON & SONS, Belfast, having Her Majesty; 2nd, Mr. D. CROLL, with Mrs. W. J. Grant; 3rd, A. DICKSON, with *Mildred Grant*.

For twelve of any Orleans Rose.—Messrs. PERKINS were 1st, with a grand box of *Horace Vernet*, for one of which was awarded the Silver Medal for the best hybrid perpetual in the trade section, a flower of great size and exquisite finish; 2nd, HUGH DICKSON, with Capt. Hayward; 3rd, B. R. CANT, with A. K. Williams.

GARDEN ROSES.

There was a very fine display of garden Roses, which attracted a great crowd throughout the afternoon before both the open and the amateur exhibits. In the open division Mr. J. MATTOCK was placed 1st, for a grand exhibit of eighteen bunches, especially noticeable being *metrantha*, *Lucida plena*, *Perle d'Or*, *Cecile Brunner*, and *Souvenir de Catherine Guillot*. Messrs. FAY & SOX were close 2nd, with grass an *Teplitz*, *Marquis de Salisbury*, W. A. Richardson, *Madame E. Resal*, and *Lady Battersea*, as the best; 3rd, H. V. MACHIN.

AMATEURS.

In the *Amateur Division*, the *Jubilee Challenge Trophy* for twelve distinct, which was very close, and grand hybrid perpetuals were staged in the winning stands. Mr. E. B. LINDSELL was placed 1st, showing excellent flowers, both in form and colour, his best being Her Majesty, *Horace Vernet*, *Duc d'Orleans*, *Fisher Holmes*, *Bessie Brown*, and *Maman Cochet*; 2nd, Mr. F. W. TATTERSALL of Moulcombe. His box contained some grand blooms, two of which won the Silver Medals for the best H.P. and H.T. in this division, viz., *Captain Hayward* and *Bessie Brown*; equal 3rds were awarded to the Rev. J. H. PEMBERTON and Mr. BOYES.

For thirty-six distinct.—1st, Mr. E. B. LINDSELL; 2nd, Mr. H. V. MACHIN; 3rd, J. H. PEMBERTON.

For eight trebles.—1st, Mr. E. B. LINDSELL; 2nd, Mr. F. W. TATTERSALL; 3rd, Rev. J. H. PEMBERTON; 4th, Mr. H. V. MACHIN.

For nine blooms of one variety, except Teas.—1st, F. W. TATTERSALL, with A. K. Williams; 2nd, H. V. MACHIN, with Her Majesty; 3rd, Rev. J. H. PEMBERTON, with A. K. Williams.

For growers of fewer than twenty.—Mr. FOLLY HOBBS, of Worcester, was 1st in all three classes. For growers of fewer than 1000, Mr. MATHON WHITE, of Leicester, occupied the premier position.

colour: Lemon Queen, white; Prince Edward of York, rose-standard, purple veins; Lady Skelmersdale, pink, with white wings; Chancellor, veined rose-salmon; Senator, A striped Pea, purple and white; Little Dorrit, delatetero-seed, with white wings; Miss Willmott, rose-scarlet; Lottie Eckford, very light purple and white; Royal Rose; and Aurora, a striped Pea, light red and white. The exhibit already noticed was shown on the level table in pitcher bottles, but the 2nd prize collection from Mr. ROBERT BOLTON, Warton, Garforth, and the 3rd prize exhibit from Messrs. JONES & SONS, Shrewsbury, was staged in glass bottles, on shelves covered in white cloth; 1st, Mr. Thos. Leitch, gr. to H. WELCH-THORNTON, Esq., Beaupre Park, Basingstoke.

There were three collections of twenty-four bunches in as many varieties, and Mr. F. J. Clark, gr. to MARK ROUTH, Esq., West Hill, Leicester, won 1st prize with some very fine flowers, arranged loosely in vases, and relieved with sprays of Gypsophila, &c.; 2nd, Messrs. JONES & SONS, Shrewsbury; 3rd, The South Metropolitan District Schools, Sutton.

Messrs. JONES & SONS, Bobin Hill Nursery, Shrewsbury, won 1st prize for the best dozen varieties, showing Gorgeous, Hon. Mrs. E. Kenyon, 2nd, Mr. Bolton, Prince of Wales, 3rd, Miss Elizabeth, Duchess of Sutherland, Miss Emily Eckford, Little Dorrit, and Mrs. Eckford, Mr. W. SIMPSON came 2nd, and Mr. DAVID M. ROSE, Elm Villa, Woking, Surrey, 3rd.

The best exhibitor of six varieties was Mr. F. J. CLARK, who staged the varieties Lady Mary Currie, Emily Henderson, Salsopian, Countess of Radnor, Navy Blue, and Prince of Wales. 2nd, Mr. ROBERT BOLTON, 3rd, bunches of three varieties, were best from Mr. SLAS-COLE, the Gardens, Althorp Park, Northampton, and his varieties were Gantz, Miss Willmott, and the Hon. Mrs. E. Kenyon.

TWO VARIETIES TO COLOR

The best white varieties were Sadie Burpee and Blanche Burpee, shown by the Rev. L. KNIGHTS SMITH, Brightstone, Isle of Wight.

Of scarlet or crimson varieties, coccinea and Sunproof, from the Rev. KNIGHTS SMITH, were best.

Yellow or buff varieties that won 1st prize were Hon. Mrs. E. Kenyon and Lady M. Ormesley Gore, from the same exhibitor as the winner in the two preceding classes.

The best pink varieties were Countess of Lathom and Prima Donna, also from Rev. KNIGHTS SMITH.

Rose-coloured flowers adjudged best were from Messrs. JONES & SONS, Shrewsbury, and were Mrs. Dugdale and Prince Edward of York. The best mauve varieties were Countess of Radnor and Duke of Westminster, and the best blue varieties, Navy Blue and Bobin-Panoré, all from Messrs. JONES & SONS.

Of striped varieties those awarded 1st prize were Princess of Wales and America, shown by Mr. R. H. JEFFERY, Southampton.

LAVENDER LATIOLIUS.

MR. R. CHAMBERLAIN, Chessingham Park Gardens, Reading, won a 1st prize for two bunches of the Everlasting Pea, showing flowers of rose, pink, white, and crimson colour, which were very pretty.

THE FLORAL DECORATIONS.

were shown numerously, and for such uses the Sweet Pea is one of the best. In the two classes for decorated dinner tables, showing the use of Sweet Pea foliage in one case, and of added relief in the other, there were displayed as many as nineteen tables. First prizes were won by Miss MARY ANSTEY, 1, Knight Hill Road, W. Norwood, who exhibited in the class where Sweet Pea foliage was the only relief permitted; and by Messrs. E. S. COLE & SONS, Bath.

Messrs. JONES & SONS had the best epergne and wreath; and Miss E. B. COLE the best bouquet.

Mr. Thos. Bolton, gr. to B. WEGGILLIN, Esq., Cosme End, Kingston, had the prettiest buttonhole bouquets.

NON-COMPETITIVE EXHIBITS.

HOBBIES, LTD., Dereham, made a very large exhibit of Sweet Pea, staged and graded. Palms, Ferns, &c., also a large quantity of sprays of Turner's crimson Rambler Rose and other cut roses. Numerous racemose tenuifolia in berry in pots, the berries of scarlet colour, considerably less in size than a Sweet Pea seed, &c. (Gold Medal).

Messrs. HARRISON & SONS, Leicester (silver-gilt Medal); Messrs. H. CANNELL & SONS, Swenley (Gold Medal); Messrs. H. BARRIE & Co., Rothsay, N. E. (Gold Medal); Mr. H. ECKFORD, Wrentham, Shropshire (Gold Medal); Mr. L. BROWN, Brentwood, Essex (Silver Medal); Messrs. HUNTS & SON, Hounslow (Silver-gilt Medal); Mr. WILLIAMS, Ealing (Silver Medal); Mr. ROBE. SYDENHAM, Tenby Street, Birmingham (Silver-gilt Medal); and Mr. E. W. KING, Coggeshall, Essex (Silver Medal), exhibited collections of Sweet Pea flowers.

Messrs. T. CAMPBELL & Co., Reading Wells Nurseries, Kent, exhibited a plant 18-in. tall, of Retinospora Odontocrippis, with golden-cedrel color foliage.

Messrs. JOHN PECK & SONS, Rempell Park Nurseries, Norwood Road, London, S. E., exhibited a collection of hardy flowers, including Sweet Peas.

Mr. H. J. JONES, Kyevoed Nurseries, Lewisham, exhibited Sweet Peas, excellent plants of Humea elegans, the new Canna, Miss Kate Gray, Campanulas, &c. (Gold Medal).

BULBSHIES: H. M. M. The inflorescence is of full size in September, and may then be removed from the plants.

CORRECTION.—MR. A. PERRY'S EXHIBIT AT CHISWICK: We regret through inadvertence to have omitted to make mention in our report of the fact of Mr. A. Perry, Winchmore Hill, N., having shown Lilies and hardy plants at the Lily Conference, for which he was awarded a Silver-gilt Banksian Medal.

CUCUMBERS GOING OFF SUDDENLY: W. E. So far as we can judge by the scraps of roots sent, the loss of the plants is due to eelworms infesting the roots. The insects forwarded in the box are such as prey on decaying vegetation; and eelworms are of microscopic size, and not visible with the naked eye.

ELM (WEEPING) AND IVY: Nil Desperandum. The Ivy will undoubtedly kill the Elm, and it is a matter for your own decision which you prefer to keep. If the Elm is a symmetrical specimen in perfect health, we should keep it intact, and remove the Ivy entirely.

ETCALYPTIS: B. According to the experience of Mr. Ewbank, Mr. Gaultlett, and others, the most hardy species is E. resinifera.

FUMIGATING PEACH-TREES WITH TOBACCO-PAPER: W. B. The application of smoke was too strong for the plants, hence the damaged foliage. The paper was of good quality, but you used too much of it. At this stage XL-All would have been a safer means of killing aphids, or simply syringing with soapy water.

GALEGA OFFICINALIS: W. B. H. The bicolor variety of this species is by no means new, but is well known in gardens. The grass you have sent is Bromus sterilis.

GRAPES: Constant Reader. The fruit sent is affected by a fungus, Gloeosporium beticola, the "spot" fungus. Remove every affected fruit and destroy it immediately by burning, besides taking care that when cut out of the bunches with the scissors, the berries fall into a tin box or can, and are not allowed to fall on the soil or staging, as in the ripe state of the fungus the spores readily spread all about. Theinery should be well cleaned and painted in the winter if it need it, and the walls lime-washed to a depth of 2 or 4 inches below the ground level, flowers-of-sulphur being mixed with the wash; the soil should be skimmed off 2 to 4 inches in depth. The fungus was figured and described in our issue for December 6, 1890, p. 657.—J. T. The shanking of Grapes may be due to loss of roots, the result of an unwholesome state of the border, to overcropping, or to great loss of foliage in thinning the shoots at one operation.

GREENHOUSE HEATING: Erratum. In the ninth line from the top the words "they seem" should be "I beg;" and nine lines lower down should read "attached thereto," and not attached with a full stop, as printed.

NAMES OF PLANTS: Correspondents not insured in this issue are requested to be so good as to consult the following number.—C. J. P. A myrtaceous shrub. Send when in flower. It is not native.—J. T. S. A species of Statice. Send leaf.—W. G. Paulownia imperialis and Butcher's Broom, Ruscus aculeatus.—T. H. H. Colutea arborescens, the Bladder Scima, Spiraea Lindleyana, Spartium junceum, Spiraea confusa. Specimens were good, but no labels were attached.—J. M. E. L. Melilotus officinalis, and Artemisia vulgaris.—Froggitt, 1. Cypripedium tonsum; 2. Epidendrum alatum; 3. Odontoglossum crispum; 4. Cypripedium barbatum.—P. E. Cattleya Harrisiana,

of a very pretty and uncommon variety, if the white middles of the segments prove constant.—W. H. O. Cypripedium Boxalli.—N. F. P. 1, Corydalis lutea; 2, Coronilla glauca.—A. B. 1, Omphalodes luteifolia; 2, Genista sagittalis.—R. V. & Sons. Phacelia tanacetifolia.

PEAS DISEASED: J. F. S. A similar case to that referred to in December last (p. 405). The fungus which causes downy mildew (Erysiphe) is present. Flowers-of-sulphur dusted on, or Bordeaux Mixture, will check, if applied early. Some varieties, especially late ones, are more liable to attack. Lime added to the soil should benefit.

PINK-COLOURED AND WHITE CARNATIONS: W. J. Godfrey. The blooms sent were those of very pretty, well formed border varieties deliciously fragrant.

PLUM-FRUIT PUNCTURED AND GUMMING: T. W. O. The injury is caused by the larvae of Grapholitha funebrana. Collect all damaged fruits and burn them. You cannot destroy the perfect insect on out-of-door trees, but you might render the fruit tasteless to the female by the use of quassa-wash applied occasionally soon after the fruit is set.

"POPLAR DOGS": E. C. Alderton. The caterpillar that you mention as infesting your Poplars may be that of the Goat Moth or of the Wood Leopard Moth. The caterpillar of the Goat Moth is at the first pinkish. Can you not send specimens for identification. They can be killed by thrusting a piece of stiff wire into the galleries they make.

SEEDLING CARNATIONS: B. K. The flowers have pretty colours, and may be useful and decorative; but in point of size they would compare very unfavourably with existing varieties.

TARRAGON: C. L. Wood. The habit and leafage are rather like the true plant, but the leaves lack the unmistakably pleasant odour of Artemisia Dracunculus. The plant is probably an Artemisia, but it being without flowers, we are unable to say which species.

TOMATO DISEASED: J. McPhail. The pale coloured part of the fruit indicates the immature stage of a fungus, Dactylidium lycopersici. No cure is possible after an attack is made, but the fungus may be kept off by applications of liver-of-sulphur, sulphide of potassium, used at the rate of ½ ounce in one gallon of rain-water. Remove and burn forthwith every diseased fruit.

TOMATOS: W. Y. Case. Kindly send a few fruits for our inspection.

TOMATOS: G. Appleton. Owing to the great heat, the specimens of leaves and stems became dried up, and identification of the fungus was impossible. We would advise that all affected parts, fruits, leaves, &c., be removed with a knife and destroyed forthwith by fire, having done which syringe the plants once a week for three weeks with water, in which ½ oz. of liver-of-sulphur is dissolved per gallon.

VINE LEAVES: Brouett. The leaves now sent have warts on the under surface, which usually indicate excessive moisture from deficient ventilation.

WHITE GREB DESTRUCTIVE AMONG CARROTS, ONIONS, AND OTHER GARDEN CROPS: W. B. Probably the larvae of a weevil. Kindly send specimens.

DR. AUGUSTINE HENRY.

THE appearance of this gentleman at the Lily Conference held at Chi-wick on July 16, when he gave some valuable particulars of the conditions under which Lilies grow in central and western China, was hailed with delight by those present, most of whom had not previously had an opportunity of seeing him. We now have the pleasure of presenting our readers with a portrait, not a very successful one, we regret to say, but the best we could procure.

Dr. Henry has done so much for botany, and directly or indirectly for horticulture in the far East, that some particulars of his career will doubtless be welcome just now. Augustine Henry is an Irishman, and graduated Master of Arts in the Queen's University in 1878. He is a Licentiate of the Royal College of Physicians of Edinburgh, a Fellow of the Linnean Society, and corresponding member of the Pharmaceutical Society of London. In 1881 he entered the service of the Chinese Maritime Customs as Medical Officer and Assistant, and was stationed at Shanghai for one year. Thence he was transferred to Jehang in the province of Hupeh, on the Yangtze Kiang, about 1,000 miles from the sea, yet only about 70 feet above sea-level. Jehang is situated between 30° and 31° N. lat. and 111° and 112° E. long., almost the eastern limit, in this latitude, of the vast mountainous region of Central Asia. It was here that he began collecting and drying plants in 1885, in the first instance with the object of identifying the Chinese names of economic plants and of vegetable products with their scientific appellations. His first collection was sent to Kew in the spring of 1886, and proved so rich and interesting that he was urged to continue the exploration of a district previously unknown botanically.

In the beginning, he collected and did all the work of drying and labelling with his own hands; but official duties prevented him from doing nearly all that could be done, so he successfully attempted the training of natives to assist him. During 1885, 1886, and 1887, Henry's own collecting was limited to a radius of 10 to 15 miles of Jehang, and to altitudes not exceeding 3,000 ft. One of his most interesting discoveries during these years was *Trapella sinensis*, Oliv., a new genus of Pedaliaceae, figured in Hooker's *Icones Plantarum*, plate 1595.

In April, 1888, he started on a three months' tour in the south-west, and penetrated the province of Szechuen, but nowhere reached an altitude exceeding 6,000 feet. A solitary tree of the remarkable and highly ornamental *Davidia involucreata* was seen on this journey.

Parentetically it may be mentioned here that the summer-heat of Jehang often reaches 100° in the shade; but although it is often bitterly cold in winter, with snow, there is rarely more than 2 or 3 of frost; therefore we must not expect the trees and shrubs of this region to be hardy, except in the warmer parts of the British Islands.

Following the tour in the south-west, a second was made, after a few days' rest, to the north-west, where elevations of 8,000 to 10,000 feet were reached, and an enormous collection of plants was made, rich in new species; for example, there were no fewer than ten new species of Maple. In 1889, Dr. Henry was transferred to the tropical island of Hainan, south of Hongkong, where he remained only three months; yet he made a botanical collection consisting of about 750 numbers. He then (August, 1889) came home on leave. During this holiday he married, and returned with his wife to China in 1891; but his wife was of delicate constitution, and his brief married life was a period of trouble and anxiety.

On his return to China, Henry did not resume medical duties, but became an ordinary Assistant in the Customs; and after a short stay at Shanghai he was sent to the island of Formosa, where he remained until 1895. His collection here was estimated at 1,000 species.

The next change was in 1896 to Mengtze, Yunnan, situated in about 103° E. longitude, and just within the tropics, at an elevation of 4,500 feet, surrounded by mountains rising to between 8,000 and 9,000 feet. The flora of this region is exceedingly rich and varied, and collecting was continued with the greatest ardour.

In 1898 Henry was removed to Szemao to fill the appointment of Assistant, in charge of that port. Szemao lies to the south-west of Mengtze, in about 101° E. longitude, and is nearly as high. Further collections were made here; and in November, 1899, he returned to Mengtze in the capacity of Acting Commissioner. In December, 1900, he came home on furlough.

Having taken a large share in the classification of Dr. Henry's colossal collections of plants, the writer is able to give some interesting particulars of their composition. The aggregate of the numbers exceeds 15,800, and as there are on the average ten specimens under each number, we have the enormous total of 158,000 specimens! So much remains to be done in working out the

collections, that only a very rough approximation can be made of the total number of species they comprise; but I think I am well within the mark in estimating the number of distinct species at 5,000; the number of new species at 500; and the number of new genera at thirty. The two first numbers may prove much too low.

The exigencies of space prevent fullness of detail, but a few of the facts published in various places may be repeated here. For example, the familiar genus *Clematis*, *Rhododendron*, *Lonicera*, *Primula*, *Gentiana*, *Ly-machia*, *Pedicularis*, *Senecio*, and *Saussurea*, are represented in the flora of China, some by upwards of fifty, some by upwards of a hundred species each. Of *Rhododendrons* more than 120 species have been described, and it may be confidently asserted that no part of the Himalayas has a richer flora than the mountains of Western China. *Rubus* and *Rosa* are nowhere else represented by such a wide range of forms. The same may be said of *Jasminum* and *Lonicera*, some of which surpass any of those in cultivation. *Leycesteria sinensis* is a new species, found growing with *L. formosa* and *L. glaucophylla*, the only previously known species. *Hellecia*, the only genus of *Protocera* reaching China, offers at least half-a-dozen new species, including the very handsome *H. grandis*, figured in Hooker's *Icones Plantarum*, plate 2671. It may be mentioned in passing that many of the Chinese novelties are figured in the recent volumes of the publication named.

Of the *Cyrtandraceae* there are probably not less than fifty novelties, many of them charming little plants.

At least sixty kinds of Oak are recorded from China, including many strikingly ornamental ones. Orchids and Lilies abound, and Ferns now number some 300 species; among them a remarkable new genus called *Archangiopteris*, a connecting link between *Angiopteris* and *Danaea*.

Especially remarkable among the new genera are: *Eucommia*, Oliver (Hook., *l.c.*, *Pl.*, t. 1, 1950), belonging to the *Trochodendraceae*, a highly curious group of trees restricted to China, Japan, and Eastern India. *Toa*, Hemsl. (Hook., *l.c.*, *Pl.*, t. 2688), belonging to the *Bixaceae*, and closely allied to *Idesia*, from the same region. *Dipteronia*, Oliver (Hook., *l.c.*, *Pl.*, t. 1898), related to *Acer*, but having pinnate leaves, small flowers in large panicles, and a samaroid fruit with circular wings. *Bretschneidera*, Hemsl. (Hook., *l.c.*, *Pl.*, t. 2708, *ined.*), a highly ornamental tree, which may be described as a Horse Chestnut, with pinnate leaves and racemose flowers. *Hemsleya*, Cogniaux (Hook., *l.c.*, *Pl.*, t. 1822); a member of the *Cucurbitaceae*, having a capsular, calyprate fruit. *Emmenopteryx*, Oliver, Rubiaceae (Hook., *l.c.*, *Pl.*, t. 1823), resembling *Mussaenda* in one lobe of the calyx of the outer flowers growing out leaf-like, and becoming white. *Carolinella*, Hemsl. (Hook., *l.c.*, *Pl.*, t. 2723, *ined.*), near *Primula*, but having a calyprate capsule. *Henrya*, Hemsl. (Hook., *l.c.*, *Pl.*, t. 1971), *Asclepiadaceae*, of more botanical than horticultural interest. *Trapella*, Oliver (Hook., *l.c.*, *Pl.*, t. 1595), a singular amphibious genus of the *Pedaliaceae*. *Petrocosmen*, Oliver, a lovely genus of stemless plants belonging to the *Cyrtandraceae*, of which four species are figured (Hook., *l.c.*, *Pl.*, t. 1716; 2110; 2599, and 2600). *Hancea*, Hemsl., *Labiate* (*Journal. Linn. Soc.*, xxvi., t. 6), very distinct, and reminding

one of the Acanthaceae rather than of the family to which it actually belongs. Saruma, Oliver (*Hook. Ic. Pl.*, t. 1835), closely allied to A-sarum, but distinctly caulescent, and the flowers are furnished with petals.

Dr. Henry is now at Kew engaged in arranging his plants in sets for distribution to a few of the principal botanical establishments of the world. It is to be hoped that he will soon publish from his vast stores of knowledge of the vegetation of China, and of a number of other subjects connected with that wonderful country. That is the wish of at least one of those who enjoy the profit and pleasure of being personally acquainted with a gentleman who has accomplished so much towards the botanical exploration of China. *W. Botling Hensley.*

TREE AND PLANT LABELS.

From time to time much has been written about these, mostly as to which is the best material to use, the size, form, and general usefulness—but with all there appears always to have been a consensus of opinion that it is necessary to have a name-label of some sort, though it never has been quite decided as to which is "the best." I now intend to show what is not only the very worst, but where much loss of time, and somewhat of vexation might be at least lessened. During a prolonged life it has been my good fortune to have been a lover of arboriculture and horticulture, and in that respect to have done much in "planting," consequently have purchased both large and small quantities of trees, shrubs, and plants, besides fruit-trees. Well! it may be said, "What has all this to do with labels?" Why, this. Fifty years ago, when buying fruit-trees, they were sent out with labels that were so far lasting as to be serviceable for some months, being mostly of wood, and then also the trees were cheaper, dwarfs being 6s. to 8d., and standards 1s. each. Now the price is more, and the labels are of a most cheap and perishable kind, so much so in most cases that unless they are re-labelled when planted, the chances are this, their identity will be lost, or at least until the fruiting time. This remark also applies to plants, herbaceous and others. Some nurserymen, however, seem to think that a label ought to be in a degree durable, marking their trees with tough paper-slips and the names printed on; while others, forgetful or careless of the label requirements, use cardboard of such texture as to become mere pulp by the first shower; while others, and this more lately, use strong paper-slips, but written on with such fugitive ink that though the labels remain intact they are perfectly clear of any writing, and this often in a very few days. Among my herbaceous plants are many such at the present time, which are shown to my horticultural friends as specimens of "progress" in these enlightened days.

Now, what I am coming to is this. Why cannot the nurseryman when he is sending out his orders, label each with a permanent label, and so let the one act be that of utility and lasting use? Instead of which, as matters are, when one is planting, fresh labels have to be got and written, the travelling ones taken off, and the permanent ones substituted. This double labour should be avoided, and the customer put to as little inconvenience and trouble as possible. This I take it is the proper and business-like way of doing things, not the slipshod style now adopted, of useless labelling, beyond that of present identification. Permanent name appendages would also simplify planting, and make it at least more pleasure-

able than as now it is tedious. Why not have either wood or zinc in a form easily wired loosely on the tree, and written on either in indelible ink or with an indelible ink pencil? And so with the herbaceous plants. Why not have nice white wooden labels so written that when the new comers are garden-placed, the label can be inserted in the soil, and then so on to the next and next. True it may be argued, and this with some reason, that you know what you have ordered can prepare and write your labels beforehand, and then change the nurseryman's for yours. Yes! this could be done, doubtless, and probably is, but if you have a hundred or two they get mixed, and each has to be sought for as wanted, and thus very much valuable time is lost. Whereas if the nurseryman on sending out his trees or what not, properly puts on permanent labels, all this secondary use of time, which is lost, would be saved and the planting perfected at once. It is just as easy to tie on one kind

DR. AUGUSTINE HENRY. (See p. 85.)

of label as another, and therefore it is merely a matter of cost, which might be slightly more, yet of such a trifling sum as to render it unworthy of consideration in the face of the increased utility. I think that now the matter has been brought to the notice of the trade, they will at once see that it is "progress," that it is a step in the right direction, and—take it, *Harrison Weir, Appleton, Kent.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA WARSCWICZII "J. RICHARDSON."

A FLOWER of this richly-coloured variety, which was shown by J. Richardson, Esq., Hale Croft, Hale, Altrincham (gr.), Mr. W. Jenkins, at the meeting of the Manchester Orchid Society, on Thursday, July 18, has been kindly forwarded by that gentleman. The flower, which is a large and fine one, reminds to mind the natural hybrid *C. × Hardyana*, the rich colour of the lip being the equal of that variety. The interior of the base of the lip is of a glowing light purple,

and reddish lines on a light ground radiate towards the centre. On each side of the middle area of the lip is situate a large yellow blotch on a cream-white ground, and which distinctly indicates true *Cattleya Warscewiczii*. The large front lobe is of a ruby-purple tint, the edges of the side lobes and their exterior forming the tube, being as darkly-coloured as the front, which constitutes its chief distinguishing character.

CYPRIPEDIUM × LEEFANG-CHAMBERLAINIANUM.

A bloom of the first to appear in a number of plants raised by Mr. T. Stafford, gr. to F. Hardy, Esq., Tyntesfield, Ashton-on-Mersey, between *Cypripedium × Lecanum*, Wells' variety, and C. Chamberlainianum, has been received. The upper sepal is white, with reflexed edges, the lower third tinged with purple, and purplish lines follow the veins to within one-third of its entire length. The lower sepals are whitish, and have a few purple spots at their bases. The petals are ligulate and ciliate, 2½ inches in length, whitish tinged and veined with purple; lip whitish, with bright yellow side lobes folded under the bronzy-yellow staminode, and the pouch is ringed with light purple. Other crosses with some forms of *C. × Lecanum* and *C. Chamberlainianum*, have been obtained by several raisers.

CATTLEYA GASKELLIANA.

The beauty and usefulness of this free-growing variety of *Cattleya labiata* is well shown in the plant-houses of T. F. Blackwell, Esq., The Cedars, Harrow Weald, where many fine specimens of the plant, which have been well cultivated by his gardener, Mr. J. Dinsmore, for many years, are now in bloom. Each plant bears a number of large blooms, varying in the tint of their sepals and petals from bluish-white to bright rose colour; and the lips display much colour variation. There are arranged along with these plants *Cattleya Mendellii*, *Epidendrum vitellinum*, *Coeliodia vulcanica*, *Miltonia vexillaria*, *Odontoglossum crispum*, and other *Odontoglossums*; among which the graceful *O. aspidochilum*, Lchm., is remarkable for the profusion of its flower-spikes, a dozen or more of which spring from quite small plants. *Oncidium Kramerii*, several *Dendrobiums* and *Anturiums*, assist to make a fine display. Orchids are grown for decorative purposes at the Cedars like other stove and greenhouse plants, and the species from hot climates are arranged with *Korras*, *Gardenias*, &c., with very satisfactory results. Mr. Dinsmore grows a limited number of all the forms of *Cattleya labiata*, and as each section flowers at a different season, there are some of them in bloom at almost all seasons of the year. *C. Gaskelliana* and the autumn-flowering *C. labiata* are found to be the easiest of all to grow, and bloom profusely.

"LINDENIA."

The July number of this periodical contains coloured illustrations and descriptions of the following plants:—

LILIA LINDENIANA, Veleh, t. DC. XLII.—The *Brassica-Cattleya Lindeniana* of *British Chron.*, 1898, 1, p. 437. Flowers 4 inches across; segments binate, white; lip ovate at the base, expanding into a flat ovate-acute rosy-lilac anterior lobe.

ODONTOGLOSSUM BRYCKWANI, Hort., t. DC. XLII.—A conical cross between *O. Bellii* and *O. Hartmanni*. Flowers about 4 inches in diameter; segments binate, ligulate, undulate, primrose-yellow blotched with purplish-brown; lip oblong-acute, similarly dotted.

ONCIDIUM STELLIGERUM, var. **ENSSETI**, t. DC. XLII.—Flowers across 2½ inches across; segments lilac or lilac-yellow, with brown spots; base of lobes of lip rounded, yellow; anterior lobe ovate-acute, rosy-lilac.

ZYGOPETALUM × CLAYI, t. DC. XLII.—A hybrid between *Z. crinitum* and *Z. maculatum*, raised by Clay, and described by Reichenbach in *Gard. Chron.*, vol. p. 681. The flowers are nearly 3 inches across; the perianth segments are green, heavily barred with purplish-brown; the broad-expanded lip rich violet.

FIG. 30.—SWEET PEAS OF THE CENTURY. (SEE TEXT, P. 91.)

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP; AND "GOOD," "VERY GOOD," OR "BAD," INDICATE THE QUALITY.

NORTHAW HOUSE, POTTERS BAR.

AN interesting old residence surrounded by a fine old garden from which, across the pleasure grounds and race-house paddocks, comprising about 200 acres, fine views of the surrounding country appear through openings in the girdle of aged Oaks and Elms which encircle the estate. At one time a noted garden, it had been allowed to decline until some three years ago, when the property came into the hands of J. B. Joel, Esq. It was sadly in need of the capital which he has so liberally expended on it with such good results under the management of his gardener, Mr. J. May, who had previously been gardener at Northaw for over twenty years. Uncompromising renovation, without destroying any of the beauty which age imparts to an estate, has been the order of the day, consequently much of the old fashion of the garden has been retained; but in the matter of flowers it has been brought up-to-date with the most happy results. The garden surrounding the house, with its adjoining ornamental rockery and Palm-house, merges into the pleasure grounds, some few beds of Fuchsias, Cannas, Pelargoniums, and other showy flowers appearing near the house, on one side of which stands a gigantic *Araucaria imbricata*, which must have occupied the position for many years. The walks and shrubberies are bordered with hardy perennials, Pinks, Carnations, and other

fragrant flowers, now making a good display. In beds and borders, Zinnias, Stocks, and Asters are used with fine effect, and the manner of arranging the walled-in kitchen-garden with broad borders of dwarf Roses, Carnations, and with the showy herbaceous perennials, renders walking in that part of the garden as pleasant as in the flower-garden, as well as securing large numbers of flowers for cutting without interfering with those required for more permanent effect. One of the best features in the kitchen-garden and in other parts of the garden, is made by the pillars of *Noisette* and other trailing *Roses* which stand at the corners of the beds and in other prominent places, and which are now 8 to 10 ft. in height, and literally covered with flowers and flower buds.

THE ORCHIDS.

Some time ago it was decided to commence Orchid-culture on a moderate scale, and with that thoroughness which characterises all his transactions, Mr. Joel caused a proper Orchid-house to be arranged. This is a fine, large, span-roofed structure, fitted with a centre stage for moisture-holding ballast, and with an open staging raised above it on which to stand the plants. Similar staging runs round the house, and the greater part of its occupants are *Cattleyas* and *Laelias*, which have thriven in the most satisfactory manner under the care of Mr. May's son, who evidently takes great interest in his charge, and has thoroughly

grasped the subject of *Cattleya* and *Laelia* culture.

The middle row in the centre stage consisted of fine plants of *Laelia purpurata*, which were just over, and the very fine display now seen is chiefly composed of a large number of *Cattleya Warscewiczii* (gigas), most vigorously grown and profusely flowered, the flowers good and very large, but exhibiting singular variation in their tints, each of the different importations having some peculiarity by which its members can be recognised. The bulk of them are of the large-flowered form, with fine bright crimson-purple labellums, the disc of yellow on each side of the tube in these forms being very small, and in the form known as *saturata*, these yellow spots almost disappear. The rather lighter coloured type has the yellow patches on each side of the lip, large and clearly defined; and the lightest section has flowers of an almost uniform rose-tint, with darker marbling on the lip, the disc of which is white, with yellow patches in the centre of the lighter area. One of these forms has a singular-looking patch of white, striped with purple in front of the usual light blotches on the lip, and all forms offer features interesting to examine and compare. With them were a number of very good *Cattleya Mendeli*, *C. Mossie*, *C. Gaskelliana*, and some *Cypripediums* and other showy *Orchids*, all giving distinct proofs of the satisfactory results of selection and careful culture. The plants of *Cattleya aurea*, and some of the smaller growing kinds, are grown in baskets, &c., suspended from the roof.

The *Dendrobiums* are grown in a house partly occupied by *Cocos Weddelliana* and other decorative plants, the back wall being covered with *Passiflora racemosa* in flower.

THE FRUIT-HOUSES.

have good crops in the vineery, Melon, and other fruit-houses. In each is a good show of flowers on the numerous well-grown plants of *Gloxinias*, *Begonias*, &c.; and these houses, when not at work, are utilised for resting *Dendrobiums*, &c. In one greenhouse, the back wall of which is covered with *Pelargoniums* and *Plumbago capensis* in bloom, is a good show of tuberosus *Begonias* and other greenhouse flowers, and every part of the garden, both indoors and out, is kept by Mr. May in the neatest condition. Mr. and Mrs. Joel and their children are very fond of flowers, and good supplies have to be forthcoming at all seasons.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**.
Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE MONTH OF AUGUST.

SATURDAY,	Aug. 10	Coniston Horticultural Show.
TUESDAY,	Aug. 13	Royal Horticultural Society's Committees meet.
THURSDAY,	Aug. 15	Swansea Horticultural Society's Show. Tamorton Deane Horticultural Society's Show.
WEDNESDAY,	Aug. 21	Shropshire Horticultural Society's Exhibition at Shrewsbury (two days).
THURSDAY,	Aug. 22	Royal Horticultural Society of Perthshire's show (three days).
SATURDAY,	Aug. 24	Strathleven Horticultural Society's Show.
TUESDAY,	Aug. 27	Royal Horticultural Society's Committees meet.
WEDNESDAY,	Aug. 28	Glasgow Exhibition and Glasgow and West of Scotland Fruit Society's Show of Pot Plants and Flowers (two days). Hampden Horticultural Society's Show. Bath Floral Fete (two days).
THURSDAY,	Aug. 29	Sandy (Reds) Floral and Horticultural Exhibition.
FRIDAY,	Aug. 30	Abersford Horticultural Society's show (two days).

SALE FOR THE ENSUING WEEK.

FRIDAY NEXT. Imported and Established Orchids in large variety. Orchids in Flower and Bud, at Protheroe & Moffet's Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick—63.

ACTUAL TEMPERATURES:—

LONDON, July 31 (6 P.M.). Max. 59. Min. 50.
 LONDON, July 31 (10 P.M.). Max. 59. Min. 50.
 PROVINCES.—July 31 (6 P.M.). MAX. 75. (Home Counties; Min. 56. (Oxfordshire).

ONCE again we are indebted to our correspondents in all parts of Britain and Ireland for reports which give an accurate idea of the condition and prospects of the hardy fruit crop, and a very remarkable report it is. It would naturally be supposed that the excess or the defect would be co-related with the geographical position, local peculiarities, and meteorological conditions of the different districts. Of course, to a certain extent, this is so; but, as a glance at our tables will show, it is so to a very limited extent. Take Apples, which may generally be considered to be much below average; in Scotland the proportion is much more favourable than in England. Out of fifty-five records from the northern kingdom twenty-six, nearly half, are returned as average; whilst in England, out of one hundred and ninety records, only fifty-four are chronicled as average, as compared with eighty-eight in 1900, and ninety-seven in the year preceding.

In one fruit garden near Berkhamstead, Herts, not a bushel can be had from seven acres of standard and bush Apples. Over all these seven acres Apples may therefore be said to be practically non-existent.

Of Pears in England and Wales, we have one hundred and eighty-eight records, ninety-eight that declare an average crop, as against one hundred and four in 1900, and fifty-seven in 1899.

Out of a total record of one hundred and eighty-seven relating to Plums in England and Wales, seventy-two are reported as average, which is about the same as in 1900, and greatly in excess of 1899.

Cherries this year show ninety-three average reports out of a total number of one hundred and eighty-six in England and Wales; no fewer than seventy-seven over average, and only sixteen below it; so that this has been a good Cherry year.

Apricots have also done well, and small fruits and Strawberries very well.

Of other fruits which are not of primary commercial importance, it is not necessary to speak here. In subsequent issues we shall give a selection from the notes of our correspondents, to whom we tender, in the name of our readers, our most hearty thanks.

Finally, we can but express our regret that some statistician does not study our reports, which have now been given for many consecutive years, and elicit from them when confronted with meteorological and other data some general conclusions which could hardly fail to be of value to cultivators. The task is much too onerous for those who have to conduct a weekly journal, but it is surely not beyond the capabilities of those who have the requisite leisure and ability.

The Sweet Pea

Two hundred years or thereabouts have elapsed since the Sweet Pea was introduced into British gardens. It has been a favourite flower ever since, and the efforts that were made last year to celebrate the bi-centenary of its introduction have no doubt tended to extend its popularity. The reports of that gathering, and of the exhibitions in connection with it, have just been published in time for the present Sweet Pea season, and the first show of the National Sweet Pea Society, was reported in our last issue. Of course, the information put forth is now somewhat out of date. Still, there are many who will be glad to possess in a handy form the record of the latest development in the way of florists' flowers and special societies ("All about Sweet Peas," R. DEAN, Eding. The history of the Sweet Pea was given in our columns, July 14, 1900, p. 30, and it is treated of by Mr. DICKS in the booklet before us. Other papers relate to the classification of the varieties by Mr. W. P. WRIGHT. The varieties are now so numerous that some sort of classification has become essential, and that propounded by Mr. WRIGHT, and modified by members of the committee, is well adapted for the purpose. The labours of the raisers, especially of the veteran HENRY ECKFORD, are appropriately commemorated, and it is pleasant to read the warm tribute paid to our countryman by an enthusiastic amateur, Rev. W. T. HUGHES, from across the Atlantic.

Whilst we all applaud the efforts to "improve" the Sweet Pea in certain directions, such as general vigour, variety of colour, fragrance, substance of petal, number of flowers on the stalk, and the like, it is open to grave doubt whether the attempts to regularise the flower according to the florists' standard are in good taste. The flower of the Sweet Pea is naturally highly irregular in form; that irregularity is intimately connected with the life-history and work of the flower, and its relation to insect-visitors.

Every wave and curve of the petals, whilst it contributes essentially to the beauty of the flower, has a purpose of its own, or is the result of adaptation to circumstances or hereditary endowment. If we want to improve such a flower we should follow Nature's own indications, accentuate its peculiarities, and bring out its purposeful modifications. By flattening out the petals, smoothing their inequalities of surface, causing them to assume a more or less circular outline which is not natural to them, the flowers speedily become monotonous, and lose their delightful play of colour. Significance and interest are also squeezed out of them, and in place of the variety of form, of tint, of curve, of light and shade, we get a regular form, about as interesting and instructive as a circular piece of coloured paste-board. It is a triumph of evolutionary art, no doubt, but we should like to see evolution carried out on the lines dictated by the flower itself, rather than on those more or less artificially imposed upon it by the arbitrary fancy of the florist. The "standard" set up for one flower should not be insisted on in the case of a flower of different conformation, but each should be treated on its own merits.

All the forms that have hitherto been produced in the Sweet Pea are variations from one species, consequently the range of variation is relatively small. The "Cupid" section is the greatest deviation from the type hitherto met with, but reversions from the dwarf to the climbing form are not uncommon. Crosses between the Sweet and culinary Peas have been effected, but they have not as yet established themselves in the regard of cultivators.

Our illustration (fig. 300) shows several typical forms, mostly raised by Mr. ECKFORD, and selected by him at our request, as illustrations of his unrivalled skill and judgment, and as examples of what the Sweet Pea is like in the early years of the twentieth century.

The varieties figured on p. 87 are all named, but we may here add the colours of the several forms beginning at the upper left hand corner:—

1. MISS WILMOT—rose.
2. MRS. JOS. CHAMBERLAIN—finely streaked, full rose on a white ground.
3. BLACK KNIGHT—deep maroon.
4. SABLE BERBERE—clear white.
5. COULSEA—crimson.
6. DUCHESS OF WESTMINSTER—pale salmon.
7. MRS. E. KESBYN—pale yellow.
8. LADY GRISSEL HAMILTON—pale lavender.

GROUP OF ODONTOGLOSSUMS.—Our Supplementary Sheet represents a group of *Odontoglossum crispum*, including the handsome O. E. Mrs. R. Brooman-White, taken by their owner, R. BROOMAN-WHITE, Esq., Arddarroch, Garelloch, Dumbartonshire, a place noted for fine culture of *Odontoglossums*, and for the number of superb spotted forms which have flowered in the collection; and most of which have been shown at the Royal Horticultural Society's meetings, and received well-merited awards. Cattleyas at one time used to be the prime favourites at Arddarroch, but experience taught that the fine air of the Western Highlands was especially suitable to *Odontoglossums*, and consequently large quantities of them were acquired, and the wisdom of the selection is verified by the plants growing in the most vigorous manner, and producing a profusion of flower of fine quality and substance; the houses occupied by them being a grand sight in the flowering season.

ROYAL NURSERYMEN.—Messes, WILLIAM CUTBUSH & SON, of Highgate and Barnet, have been appointed by Royal Warrant nurserymen to His Majesty the KING.

GRAFTING THE GRAPE-VINE IN ORDER TO SECURE EARLINESS.—In the *Revue Horticole*, M. SABRON, a Vine-grower of Thomery, relates how he made a number of grafting trials with the well-known Chasselas Doré Grape, on a variety of stocks, with regard to cropping and ripening. These results were substantiated by the Fruit Committee of the French National Horticultural Society in Paris. It appears that on stocks of *Vitis riparia*, the ripening period began fourteen days earlier than on its own roots; on Frankenthal (Black Hamburg) the ripening period was normal, but the berries were larger; on *V. rupestris* du Lot, and on Arémont (Barekhardt's Prince), the ripening period began later. When worked on its own roots the period is quite normal, and the Grapes are remarkable for their fine colour and good keeping properties.

“THE ART AND CRAFT OF GARDEN MAKING.”

—The second edition of Mr. MAWSON'S elegant work on the laying-out of gardens has been issued by Mr. H. T. BATESFORD, 91, High Holborn. The book is as attractively got up as was the first edition, and the preface will be read with amusement as embodying the very diverse criticisms passed upon the first edition. The author, in face of this diversity, expresses his intention of going back to first principles. We feel inclined to take the same journey with the author, and to ask him what he means by a garden? This defined, the way will be cleared for the consideration of the art and craft of making it. At present it seems as if the garden, in Mr. MAWSON'S opinion, is to be treated principally as an appanage of the mansion. If so, it is the art and craft of the bricklayer and mason, not of the gardener, that we have to consider.

STRUCTURE OF THE SUCKERS OF WOODY PLANTS.—M. MARCEL DUBARD, in a recent issue of the *Comptes Rendus*, gives an account of the structure of the suckers of woody plants, from which we take the following extracts:—

“Most trees and shrubs have the capability of sending out suckers, which are formed, according to the species, either when the trees are in full vigour, or when its vitality is diminished, or even only after cutting down the trunk to the level of the soil. The suckers rise either from the roots (*Populus*, *Fagus*, *Corylus*, *Lyrcium*, &c.), or from dormant buds of the stock (quercus), or from the cambial zone when it has been cut (quercus), *Populus nigra*. The stems that constitute suckers, whatever their origin, being placed under peculiar conditions of nutrition, differing notably from those of normal branches, they, for instance, their more direct relation with the roots ensure them a larger supply of water. There is, usually, rapid growth results, and a more simple structure, for it is known that turgescence increases the rapidity of development, but regards, on the contrary, the differentiation of the tissues. Briefly concludes M. DE MARCEL, suckers have a tendency to assume the characteristics of herbaceous plants: shoots being marked by rapid growth, elongated internodes, developed and persistent stipules, dissociated buds, less differentiation of the tissues, especially the tissues destined for protection and support; less abundant production of fiber in comparison with the wood, poor ripening, assimilative tissue, but little developed, exception of oxalate of calcium much less, and, in the same genus, it appears that the suckers of the several species show a greater resemblance with attenuation of specific characters.”

THE JARDIN DES PLANTES AND THE FRENCH COLONIES.—In the latter years of his life the late Professor MAXIME CORNE devoted much attention to developing the resources of the French colonies, by growing in the *Jardin des Plantes* various plants of economic importance, and transmitting them to the French possessions. A pamphlet before us entitled *Le Jardin des Plantes de Paris et les Colonies*

Françaises, gives in some detail the result of the activity of the late Professor in this direction, especially in the case of the French colonies on the West Coast of Africa.

ENDLICKE HALL, SHEFFIELD, was the residence of the late Sir JOHN BROWN, and during his life its gardens were the finest and best maintained in the district. How extensive they were, and what a number of interesting plants was then cultivated, may be seen on reference to an illustrated article that was published in our pages, August 11, 1875, p. 207. Since Sir JOHN'S death, the place has been purchased by a syndicate, who have converted the residence into a sort of hall, &c., which is let for balls, receptions, dinners, and other functions. The glass-houses, of which there are upwards of a dozen, are rented by Mr. WILLIAM HARTROW, who was Curator of the Sheffield Botanical Gardens until the company was wound up; and previous to going to Sheffield was with Mr. LYCETT at the Cambridge Botanical Gardens, to which position he was sent from Kew. Mr. HARTROW commenced business as nurseryman and florist when he left the botanical gardens; and the glass-houses at Endlicke Hall afford him facilities for housing a large number of Palms and other decorative foliage plants, as well as flowering species. There are some fruit-houses, including vineries also in full bearing, and Mr. HARTROW informed us when visiting him on a recent occasion, that there is not the least difficulty in finding a sale for such produce. In addition to the sale of plants and fruits, some gardens have been laid out, and some of our readers will be glad to know that Mr. HARTROW seems likely to establish a satisfactory business.

A “STUNNING BRIDE.” One of our American exchanges has an article on the preparation of wedding bouquets. The florist, it is pointed out, “cannot be too careful or too artistic in preparing a bouquet to be carried by a stunning bride.” Is she to make use of the bouquet to stun the unfortunate bridegroom, or whom? The bride is “to carry the bouquet in both hands, and allow the arms to assume a graceful position before the body.” Intending brides please note.

“FLORE DE LA FRANCE.”—We note the appearance of Fasciolo 3, partie 2, of the first volume of the “*Flore descriptive et illustrée de la France, de la Corse et des Contrees limitrophes*,” par l'Abbé H. COSTE. The instalment before us leads from *Cytisus* to *Ombrychis* (the arrangement being according to the sequence of the Natural Orders), and includes figures 782 to 1082, and a “Table des Familles et des Genres du premier volume.” The figures are small, but characteristic outlines like those in the illustrated edition of BENTHAM'S *Handbook*.

“FIELDS, FACTORIES, AND WORKSHOPS; or Industry combined with Agriculture, and Brain Work with Manual Work.” By Prince KROPOTKIN. New edition (third thousand), illustrated and unaltered. (London: SWAN, SONNENSCHEIN & Co., Paternoster Square, E.C.) It will be remembered that this is by no means a new book, but is a fresh edition of what is, in its way, a classic. Into political economy, as here spoken of, this is not the place to enter; but it may be said that Prince KROPOTKIN is an advocate for the decentralisation of industries; in homely example, he prefers the establishment and encouragement of cottage and village industries, rather than the massing of energies into colossal establishments. The principle, applied among other things to agri-

culture, would involve the farming by small pieces of much now unprofitable land; in fact, a development of the “three acres and a cow” scheme, having for one object, a check upon town immigration, and the consequent depopulation of the country. A further issue of this plan is to lessen imports by raising, in small holdings and local undertakings, much of the produce of every description which we now obtain from the colonies and from abroad. It is held that much of our native wealth is wasting for need of proper development, and that the country could be made self-supporting in respect of many articles for which money is now paid out. For this unthriftiness, the onus rests with those careless of their responsibilities, and indifferent as to the origin of food and other stores. The small market-gardens and manufacturing industries in many continental towns are a reproach to the carelessness of British landowners.

SELBORNE PLANTS.—It may be of interest to many of our readers to see a list of the more conspicuous plants growing in the neighbourhood of Selborne, the direct descendants of those that WHITE must often have seen. Over-sensitive people need have no fear of a “rail” having been made, for the specimens are all sent as “cut flowers,” whose removal would not injure the plants; moreover, they were gathered by Mr. STANTON, who is too keen a lover of Nature to inflict wanton injury. It will be seen that the flowers are all of them from ordinary South of England plants, that many of them indicate a chalky soil, and some, like *Vaccinium oxycoccos*, denote a healthy soil. The names are not arranged in any order:

- | | |
|----------------------------------|--------------------------------|
| <i>Agrostis ovina</i> Gill. var. | <i>Vaccinium oxycoccos</i> and |
| <i>Silene alba</i> | <i>V. myrtillus</i> |
| <i>Leclitium dioica</i> | <i>Conium maculatum</i> |
| <i>L. floricolum</i> | <i>Euphrasia grandiflora</i> |
| <i>Stellaria granamea</i> | <i>Oxalis pyramidalis</i> |
| <i>S. Hololeuca</i> | <i>Habenaria lutea</i> |
| <i>Potentilla sanguisuga</i> | <i>Gymnadeniella conopsea</i> |
| <i>Linum catharticum</i> | <i>Listera ovata</i> |
| <i>Dielytra caerulea</i> | <i>Oxalis maculata</i> |
| <i>Saxifraga hypnoides</i> | <i>Manitula biflora</i> |
| <i>Plantago epithymum</i> | <i>Rhinanthus crista galli</i> |
| <i>Plantago rotundifolia</i> | <i>Digitalis purpurea</i> |
| <i>Veronica hederaefolia</i> | <i>Polygonum silvestris</i> |
| <i>V. scutellata</i> | <i>Veronica officinalis</i> |
| <i>Nepeta oleracea</i> | <i>V. Anagallis</i> |
| <i>Primula vulgaris</i> | <i>V. Chamædrys</i> |
| <i>Agrostis repens</i> | <i>V. hecabanaga</i> |
| <i>Galadialium litoreum</i> | <i>Potentilla Tormentilla</i> |
| <i>Linum album</i> | <i>P. reptans</i> |

FARM AND ORCHARD PRODUCE BY RAIL.—Once more we are indebted to the obliging traffic manager of the Great Eastern Railway

Company for statistics relating to the cheap transit of small pads of farm and orchard produce from the place of production to the house of the urban purchaser. Under date July 29 the official writes:—"The statement of the number of farm produce-boxes has now been got out, and I find the number conveyed during the past half year was 78,500; whilst for the same period in 1900, we conveyed 77,800." It will thus be seen that there has been a gain of 700 boxes.

KOLRUTERIA PANICULATA.—This fine old tree, which I believe is very little known, is now in full flower, covered with its yellow panicles, about 9 to 15 inches long. The tree measures about 35 feet in height, and about 40 feet spread of branches. W. Howard. [In the private garden at Hampton Court Palace, an almost equally fine tree is now in full bloom. Ed.]

BOARD OF AGRICULTURE.—The recent publications of the Board include leaflets on the Tent Caterpillars (the Lackey Moth and the Brown-tailed Moth), and on the aphids which infest Currant-bushes.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Secretary, Mr. G. J. INGRAM, desires us to inform our readers that the gardens and grounds at Battle Abbey, Sussex, will be re-opened to the public on Tuesdays, commencing from July 30; and by kind permission of F. G. FANWELL, Esq., and Captain FORSTER, the proceeds derived from admission on Tuesday, August 13, will be given to the above charity.

PINEAPPLES P. AGAVE SISAL.—The cultivation of the fibre-yielding Agave has become of sufficient importance in the Bahamas to be considered as worthy of a special little monograph by the Governor. True, the Pineapple is still the main horticultural product of the Bahamas group of islands—some 1,000,000 of the value of £28,000 being exported to this and other countries; but a good market is also found for Sisal fibre, which has gained a high place for itself, and is being exported in gradually and steadily increasing quantities. About 11,406 acres are now under the crop throughout the group of islands, and the output in 1900 exceeded 1½ million pounds, valued at nearly £17,000. This double string to the commercial bow is a fortunate condition of things in our West Indian possessions.

AN AUSTRALIAN SEED CATALOGUE.—A remarkable catalogue has just come to hand from Messrs. ANDERSON & Co., seed merchants, &c., 399, George Street, Sydney, of large octavo size; it is profusely illustrated with woodcuts, and contains an excellent coloured drawing of forms of *Salpiglossis grandiflora*. Catalogue-making appears to be as well understood at the Antipodes as at home. This, from Sydney, comprises some 100 pages of closely-printed matter, and contains not only elaborate descriptions of many popular subjects, but also cultural details of wide interest. One is able to gain from it a good idea of plants popular on the other side of the world. In the matter of novelties in seeds and plants it is quite up-to-date, and there are charming photographs of *Cupressus macrocarpa variegata* and *Cassia Caudolemma*, which is described as one of the best of the handy flowering shrubs, covered with lovely yellow blossoms during April and May, as the photograph of an example growing in the open shows.

OUR TRADE IN PLANTS, BULBS, &c.—The Board of Trade has recently published, in two volumes, its great Annual relating to the trade

and commerce of the country for the year 1900. Such works are not compiled and published in a hurry; and the many hundreds of pages of seemingly bewildering figures are a monument to patience, perseverance, and enterprise of a colossal character. As in past years, so to-day we give those obtainable statistics of especial interest to the reader of this journal, which we are happy to be able to supplement with figures relating to the export of nursery stock, &c. The following relates to the—

IMPORTS OF PLANTS, SHRUBS, TREES, AND FLOWER-ROOTS, ENTERED FOR VALUE ONLY.

Imports from:	1897.	1898.	1899.	1900.
Germany	42,020	43,889	47,735	36,376
Holland	213,663	221,763	213,265	246,298
Belgium	41,780	49,872	54,641	53,903
France	41,561	49,768	54,969	52,290
Japan	18,554	18,119	21,259	20,250
United States of America	18,373	15,285	15,565	15,264
Mexico	2,294	319	1,142	560
Republic of Columbia	9,008	10,428	7,541	1,589
Brazil	3,715	6,259	6,484	2,957
Other foreign countries	4,947	4,110	3,974	3,493
Total foreign countries	398,875	411,217	423,195	427,504
Channel Islands	16,556	16,343	11,631	11,583
Cape of Good Hope	317	394	259	...
Natal	1,382	514	761	496
British East Indies	4,788	4,865	3,022	3,222
Hong Kong	2,983	171	299	178
Australasia	871	790	684	88
Canada	1,212	1,151	961	1,642
British West India Islands	944	543	488	510
Other British Possessions	562	794	519	610
Total British Possessions	23,643	19,598	21,571	18,259
Grand total	422,488	430,815	444,766	445,763

It is not very easy to account for the fluctuations in the above table. For the blank record for the Cape of Good Hope one word gives the reason—war. For the first time we are now enabled to supply the figures as to exports, which are as follows:—

Exports to:	1897.	1898.	1899.	1900.
Germany	362	856	1,184	957
Holland	1,457	2,397	2,217	1,723
Belgium	2,319	1,734	2,180	1,855
U.S.A. (Atlantic seaboard)	5,712	2,526	2,067	7,189
Other foreign countries	1,781	1,393	2,284	2,812
Total to foreign countries	11,811	8,836	10,472	13,827
British Possessions in South Africa	1,181	431	624	138
Australasia	587	313	425	462
Canada	182	813	1,465	1,392
Other British Possessions	599	158	691	875
Total to British Possessions	2,549	1,965	3,175	2,767
Grand total	14,360	10,801	13,647	16,594

The totals of imports and exports are as under:—1897, £436,818; 1898, £417,120; 1899, £458,211; 1900, £462,357.

PUBLICATIONS RECEIVED.—Board of Agriculture (Intelligence Division). Annual Report of Proceedings under the Sale of Food and Drug Acts, 1875 to 1899; Merchandise Marks Acts, 1887 to 1891; Fertilisers and Feeding Stuffs Act, 1893; and Board of Agriculture Act, 1899 (Section 2, Sub-section 3). For the year 1900.—Annual Report of the Gardens-

town Botanic Gardens for 1900.—Bulletin of the Botanical Department, Jamaica, June 1901. The contents include notes on: Pupil-apprentices at Hope Gardens; Nuts; a Dwarf West Indian Palm; Diseases in Pineapple Plants; Bergamot Orange; Vanilla in Seychelles; and Potato Diseases and their Treatment.—Agricultural Gazette of New South Wales, June. The contents deal with: Plants reported to be poisonous to Stock in Australia; and Useful Australian Plants, No. 70; Scrubby Gum of the Blue Mountains, by J. H. Maiden; Soil Temperature at Hawkesbury Agricultural College, and Heat Requirements of Plants, C. T. Musson; Observations on Guinea Grass, H. M. Williams; Removing Spines from the Prickly Pear; and Plantation of Timber Trees as a Commercial Speculation, by J. S. Cheesbrough.

MR. HARRY J. VEITCH AT HOME.

It was to me a singularly pleasant experience a few days since, having been engaged for several hours in traversing the rural lanes of North Bucks, judging gardens and allotments, to look in at East Burnham Park, the beautiful and delightful country residence of this famous horticulturist, and partake from Mrs. Veitch's hands in her pleasant summer-house on the lawn of her hospitality. Had I and my friends but known that just at the moment we were enjoying our meal under such delightful conditions that the metropolis was being in danger of drowning under the tremendous rainstorm then prevailing, it is probable that our enjoyment and gratification would have been greater rather than less! Still, rain was badly needed at East Burnham Park, as Mr. Veitch showed, when later we took a walk over his pretty place, and as indeed trees, shrubs, and grass generally demonstrated. Probably that refreshment so grateful to us has been vouchsafed to the parched soil ere now. Ever generous Mr. Veitch never seems more so to his numerous friends than when spend in hand, and having in him something of the British farmer, he conducts us through his gardens, his farm buildings, dairy, stables, poultry yard, pheasantries, and other things, which here, as elsewhere, do so much to make rural life happy and enjoyable. The house is large and roomy, yet not big. It is essentially an English home. The old portion, once the home of the historian Grote, has associated with it many traditions, and has sheltered many of the great ones of past generations. The old and the new portions are as becomes the home of such a gardener as is Mr. Veitch, prettily draped with climbers, and all its surroundings are charming, whilst choice shrubs and trees have been extensively planted. So, too, have Roses, Carnations, and other favourite flowers.

There is a fine collection of fruit trees and bushes, as also of Strawberries, but in such a wooded district, where birds have not yet been taught the ethics of "mine and thine," it is found needful to severely wire and net over soft fruits to keep them secure. Even the nut bushes have to be wired also to save the fruits from the depredations of those pretty rodents the squirrels, beautiful, but ungrateful little creatures—for here animal and bird life is almost religiously preserved, for the owner is not the man "who carries the gun," or who thinks, like Pope's egotist, that all is created that he might destroy. Nature, in her bounty here, gave a site that has proved to be charmingly suitable for the making of a wild garden, yet it is not so much an attempt to create many floral beauties artificially, as so many try to do, and so egregiously fail, but it is rather found in assisting Nature to furnish florally or in other ways charms which she

cannot always supply. This woody dell, a semi-bog, has had much of its wild undergrowth removed, some large beds or clumps fashioned, rough paths formed, suitable trees, shrubs, Bamboos, and semi-aquatic things planted, and without material effort or to secure essentially garden effects, some that are very delightful have been secured. In a somewhat secluded quiet pond there are floating on the surface, and in fine bloom, many of the newer Nymphaeas, whilst round and about the margin the surroundings are quite devoid of formality. Very little out of the many things here growing was specially noted, but very fine indeed was *Spiraea gigantea*, 6 feet in height, and very noble too. A most pleasing combination was seen in large plants of *Inula glandulosa*, from amongst which peeped up spikes of the pretty *Lythrum Salicaria*, which here seemed to be so much at home. The green and silvery *Eulalia* here growing quite tall, were most effective; and very pleasant was it to see a big mass of the old *Fuchsia gracilis* and *F. Riccartonii* in rich profusion, beautiful in bloom and so luxuriant. A striking object also was the Double Pink Bumble, which seemed to be so much at home, and was almost a mass of flower. However, in so brief a visit it is not possible to be noting details. Those who want more information should go and see. They will find the park is not far from the quaint old village of East Barnham on the one side, or from the famous Barnham Breeches on the other. It is oddly enough entirely encompassed by a high road, so that it lies practically in a ring fence. That is, without doubt, an advantage. Its aspect is chiefly south, and is fairly well sheltered.

Long may Mr. and Mrs. Veitch live to enjoy the fruits of a very active busy life, and in due time to bear into retirement, full of years and honours, the untarnished reputation of a great horticultural house. A. D.

NURSERY NOTES.

MIR. DRAPS-DOFF'S EXOTIC NURSERY AT LAEKEN, BRUSSELS.

THERE are in this nursery at the present time a good many plants in full perfection, which make the place very interesting to a visitor fond of plants. From the avenue is noticeable a dark green mass of young and bushy *Rhododendrons*, with, on one side of the entrance a border of different varieties of *Euonymus*, with pyramidal and standard *Laurus nobilis*; other borders being planted with New Holland and Cape plants, *Boronia*, *Acacia*, *Epaneris*, and *Erica*. Some of the last named are specially trained into various fanciful forms, such as spiral, candelabra, palmate, and cordon-like shapes. The rest of the outside is occupied by *Hortensias*, with their pink and blue inflorescences.

In the houses a large quantity of *Orchids* are grown, *Cattleya Mossiae*, *Laelia purpurata*, and *Vanda suavis* and *tricolor*, with their fine odoriferous blossoms. There are houses filled with *Odontoglossum crispum* and *O. vexillarium* showing their numerous spikes, and amongst these special attention and selection is given to cross-breeding. The *Cypripedium*-house contains fine and varied specimens, including the *C. Curtisii*, *Chamberlainianum*, *Masterianum*, *Victoriae Marie*, and several good seedlings. Further on there is a house full of *Anthurium* having large spadices, that make the whole effect very decorative. Other plants noticed as coming in in quantity are *Gardenias*, some showing large buds, and beginning to flower. A stock of *Caladium*

Villo de Hambourg and *C. argyrites* is grown, the first one having large pink-veined leaves; the second one being the small variety, with straight stalks and white foliage, the plants being well suited for decorative purposes. A fine plant of *Platycodon grandis* was to be seen, with nicely curled fronds of picturesque appearance, and measuring 5 feet in height and 6 feet in width; it has an attractive appearance not often met with, and is valuable accordingly.

Plants for exhibition are collected in a special house, and comprise large bushes of well coloured *Codivium*, and more sturdy specimens of *Dierffenbachia* and *Maranta*. The *Dragon-houses* are a principal feature in this establishment, the collection is almost complete; small and large varieties are growing well, and a selection is reserved to produce seed. The aim of the hybridiser now is to

FIG. 21. DIANTHUS PELVIFORMIS. FLOWERS RED.

get fine colour, or some other small-leaved varieties. These plants alone occupy more than half of the glass-houses covering 5 acres of ground. V. D. K.

BOOK NOTICE.

WALL AND WATER GARDENS. By Gertrude Jekyll. (Country Life Library. *Country Life*, 20, Tavistock Street, Covent Garden; and George Newnes, 7 to 12, Southampton Street, Covent Garden.)

AMONG the many ladies who now write about gardens concerning whom our contemporary *Punch* had some wise words lately, we are always glad to listen to Miss Jekyll. She has something to say, and can say it clearly; and she has every opportunity for illustrating her books handsomely.

Wall and Water Gardens is, naturally, not so much for the owners of small plots as for dwellers in the larger country houses, where acres are under treatment. The wall garden may of course be made the habitat of many a beautiful wild or imported flower, which must be set, as in a rockery, where plenty of soil can be made available for the roots. In swampy places *Ferns* luxuriate, and in actual water, it is hard to find anything more appropriate and beautiful than the *Nymphaea*. "Delightful," says the authoress, "as the

Water-Lilies are on the margin of a wide lake, they are still better in a pond of moderate size, or even in one that has more the character of a large pool. If this has a near surrounding of wooded rising ground, not of trees overhanging the water, but at such a distance as to shut in the scene and to promote stillness of the water-surface, the pond will be a happy one for its Lilies. . . . For planting Water-Lilies in ponds, a depth of 2 or 3 feet is in many cases enough, though some are quite contented with 18 inches; but if a vigorous kind is planted too shallow, as it insists on having stalks of normal length, both leaves and flowers become untidy spread. It will probably be found that growth in tanks will prove to be the more certain method of controlling the plants, for in some cases, when the roots are in a restricted space, and can be given a special soil of good loam, the flowers are much more abundant."

A good list of these plants is contributed herein by Mr. Hudson, who has made a special study of Water-Lilies. Lastly, Miss Jekyll advises us "When to let well alone"—information that is highly valuable and necessary.

Such is the brief outline of the programme before readers of the book; pleasing and characteristic illustrations, wise and readable letterpress, and a useful index. Those who know Miss Jekyll's work will not be slow to obtain for themselves access to this, her latest production.

DIANTHUS PELVIFORMIS, HEUFF.

FOR the introduction of this plant to my garden I am indebted to Mr. H. Henkel, of Darmstadt, from whom I bought a plant in October, 1899. The trials of the following winter weakened the small plant, and it was not until June, 1901, that it produced a flower in my rock-garden, although it appears to be hardy, and so vigorous when established as to produce plenty of grass. It belongs to a class of *Dianthi* which are not very popular in gardens, because of their long stems appearing out of proportion to the small heads of flowers.

In a bare, stiff border these *Dianthi* are out of place, and it is only when seen with other plants near, which take from the bareness of the stems, that their value can be seen. *D. pelviformis* is thus not a plant for the border of the usual kind; but it may be used with advantage in the rock-garden, or in a border where stiff arrangements are dispensed with. As will be seen from the engraving (fig. 21), the small blooms, which are of a deep blood-red, are different in form from those of most of the other *Dianthi* of the same class. *S. Arnold, Carsthorpe-by-Dunelm, N.B.*

TRADE MEMORANDUM.

Will you allow me a small space in your columns to warn nurserymen and market gardeners against a young man who has called upon me among others, with a plausible story of want through being out of work. "His father, he says, was a nurseryman near Cardiff, who, before his death, lost all he had. He has been supporting a sick mother, and has consequently saved no money, and having been out of work a month has become very hard up." He will decamp with all the money he can beg or steal, and anyone upon whom he may call will oblige by communicating with the police, as he is wanted here. *E. Hammond, Pilgrim's Hatch, Breckwood.*

HOME CORRESPONDENCE.

STRAWBERRY BARRELS.—We have heard a good deal during recent years of Strawberry-growing in barrels. Many persons have given it up, finding that it was not a success, but others are delighted with the results. By the desire of my employer here, I have tried a few varieties in a number of ordinary paraffin barrels, burnt out, with holes bored round the sides. We place them on iron wheels, supplied by a firm in Paris, so that we can turn them round daily, and allow all the plants to get a certain amount of sun. We planted thirty-five plants in one barrel, viz., thirty round the sides and five round the top. When the fruit is set, we thin them to about ten or twelve on each plant. Treating them in the way described, we find them to ripen very satisfactorily. Among the best varieties we have found for this purpose, none is better than Royal Sovereign, because it throws its fruit well out, away from the barrel. St. Joseph does well, and is a splendid flavour, superior to many others. Laxton's Noble also does very well in barrels, but the flavour is poor, compared with that of many other varieties. To protect the Strawberries from birds, we place a wooden hoop about 1 foot above the top of the barrel, nailed to the barrel with three pieces of wood about 18 inches long; nets thrown over this protect them beautifully. *A. R. Pearce, Braymead Gardens, Bray, Berks.*

SURREY FLORA.—Whilst the practice so common at rural flower shows, and so much to be regretted of inviting children to present in competitions huge bunches or masses of wild flowers without taste or discrimination continues, it is pleasant to note any occasional breaks, or improvement on the practice. I found such the other day at the small cottage-show in Lord Ouslow's Park at Clendon, Guildford, where three children from Merrow, one of the parishes in the show area, presented collections of wild flowers in quantity, each kind being named as correctly as well could be under existing conditions, but only with common names. One defect of such nomenclature is, that a species has so many diverse appellations just as localities differ. One girl had with great industry collected just one or two flowers of fully one hundred species, and had, of course, a remarkably representative collection, and showed how rich the Guildford district of Surrey is in native plants. But it is so evident that could the botanical appellation of each species be added, names that are universally admitted to be exact, the gain to the children would be great. I have advised in this case to limit the number of species to be shown by any one competitor, to say thirty-six as sufficient for the purpose, good staging, and the most correct naming, to be the chief points considered in making the awards. It is to be deplored that with so many people, ladies especially, who seem to live only to kill time, that some of them cannot be induced to form wild-flower instruction-classes in their localities, as in that way they might find delightful occupation. *A. D.*

DO BULLFINCHES EAT INSECTS?—As a small contribution to the much-debated question as to whether bullfinches eat insects, the following may interest your readers. We have an extraordinarily tame nightingale, to whom I often bring aphides and green caterpillars from the roses. A half-tamed bullfinch has been left in my care, and seeing him put his head on one side and greedily ate some caterpillars I was giving to the nightingale, I offered him one. For the first time he came to my hand and swallowed the caterpillar with evident satisfaction. He will even leave his beloved Sowthistles for me, but he refuses raw meat, which the nightingale takes readily. *Janet Ross, Florence.*

PEACH EARLY ALEXANDER.—On the walls of Mr. T. F. Blackwell's kitchen garden, at The Cedars, Barrow Wood, a tree of this variety is fruiting very satisfactorily; and Mr. J.

Dinsmore, the gardener, considers it to be a variety which should be planted extensively with other kinds of wall fruits not requiring protection, his experience of it having been always satisfactory, although in point of size, colour, and flavour, the fruits produced this year are rather better than in previous years. *J. O'B.*

CABBAGES BOLTING.—Your correspondent in the *Gardeners' Chronicle* of July 6, who seems to give exposition to the confidence he has in his knowledge of the above subject, and in the virtues of "our Early Market," has said nearly all that is to be said on the subject, and most of which has been said before. The reason given by gardeners is almost universally that—among others mentioned by Mr. Alfred Watkins—viz., the seasons, which have a great deal more to do with bolting than any question as to variety, or even as to the mode of growing the seed. Cabbage-growers of different districts have each a particular date at which they sow summer Cabbages. If it is sown too early, and an abnormal season should follow, such as a prolonged winter, &c., it is considered that a percentage will bolt; so that particular care is taken to sow the seed in good time, in order to secure an early crop, whilst any extreme in this direction is avoided to prevent bolting. Some gardeners find that, when convenient, pricking out the plants from the seed-beds as soon as they are ready before finally transplanting, tends to minimise the risk of bolting in the spring. *R. B. McCombie, Teddington.*

MILDEW ON THE GRAPE-VINE.—Your correspondent, Mr. S. Williams, Bodnet Hall, Market Drayton, seems to have developed a strange theory respecting mildew on Vines. I should say his remedy, and washing or wiping the glass to destroy mildew, would have about an equal effect to that of cleaning a cottage window to cure a case of scarlatina. Mildew on the Vine in a properly constructed and heated viney never ought to be seen, and it never is with proper management. It is produced by cold draughts, and a cold, stagnant, damp atmosphere. The so-called Cucumber and Melon disease is one of those preventible diseases, prevented by proper methods of culture, and is due to the improper methods pursued. A sudden fall in the heat, or the application of cold water at a critical time, will produce it, as I have seen frequently. I have never had any disease on Tomatos, but I think, as they are of a soft, succulent, free-growing nature, their troubles come with improper application of water; and, as a rule, the Potato-disease never shows itself unless we have a damp, sultry time about the period of the blooming. I grew last year several hundred bushels of Potatos, and was unable to find one tuber diseased, as the weather was so dry at that particular season. I know the spores of these various diseases are generally present, but they can only develop when the conditions are favourable to fungoid growth. *R. M., Newbury.*

THE SEEDING OF ASPIDISTRA LURIDA.—Messrs. H. Stansfield & Co., nurserymen, of Sale, succeeded last year in securing some seeds of *Aspidistra lurida*, which were duly sown, and which germinated; and by the second week in July of the present year, sixteen plants had appeared above ground. In 1899, this firm obtained thirty seeds, which were duly sown, but they did not succeed in obtaining a single plant from them. As their method of management of seedlings may have an interest for some readers of the *Gardeners' Chronicle*, I have obtained from Messrs. Stansfield & Son the following particulars. From the time of flowering, it takes from six to nine months to mature and ripen the seeds. The pods, which are of a bright orange colour when ripe, contain from one to nine large seeds, and they burst naturally when the seeds are ripe. The seeds were sown in August last, in a sandy compost, the pots were stood in saucers which contained water to about one-fourth of their depth, and the saucers

were placed on hot-water pipes, where they remained until May, when the seedlings began to push through the soil. One seed, which was evidently overlooked, germinated while lying upon the surface of the soil, though uncovered and unnoticed. When discovered, it had put forth roots to the length of six inches, but it is several months later than the plants raised in bottom-heat, and will not show above ground for another month or more. The seeds were taken from a green-leaved form; and they were allowed to dry for a week in the sun before sowing. *R. D.*

WEATHER LORE FOR AUGUST:—

"Hot August sun and happy August days!
Fain would I bear your memory in my heart
Through winter snows and dark autumnal ways,
Long after summer and her train depart."
"All the tears that St. Swithin can cry,
St. Bartlemy's mantle wipes them dry."
"Dry August and warm
Doth harvest no harm."
"A wet August never brings dearth."
Italian.
"August rain gives honey, wine, and saffron."
Portuguese.
J. C.

ERIGERON COULTERI.

THIS promising plant was received from Mr. Amos Perry, of Winchmore Hill, early this spring, and the engraving (fig. 32), shows the first flowers it produced in my garden in June last. So far as one's short experience goes, I look upon it as one of the most promising hardy flowers introduced into cultivation this season. The flowers are of a soft white, and they possess all the elegance of petal we associate with the best of the many *Erigerons* in our gardens. It is of close, tufted habit of growth at the base, and sends up stems bearing several flowers, to the height shown in the engraving. It is a native of Colorado, and ought to be perfectly hardy in our gardens. The *Index Kenensis* refers us to Porter and Coulter, *Fl. Colorado*, 61, a work not in my possession at present. In its general appearance it reminds one of a dwarf-growing *E. speciosum*. *S. Arnott, Carsethorne-by-Dunfries, N.B.*

LAW NOTE.

DAMAGES FOR DESTRUCTION OF CHRYSANTHEMUM BLOOMS.—Sheriff-Substitute Sym, Perth, has issued his decision in a case of unusual interest to the gardening profession. James Boisant, head gardener, Castle Huntly, Longforgan, as an individual, and also as an assignee of his employer, Mr. Armitstead, sued the Caledonian Railway Company for £100 in consequence of damage to valuable Chrysanthemum blooms entrusted by him to the defenders for conveyance to the Edinburgh Chrysanthemum show in November last. A special van had been engaged for the blooms. While the van was being shunted at Longforgan it was run into and disabled by the shunting engine, with the result (as alleged by the pursuer) that the boxes of blooms were thrown violently from one end of the van to the other, spilling the water supplied in tubes to keep the blooms fresh, and many of the blooms were found crushed and cut, and many of the petals shaken off. The blooms were 141 in number, picked from about 600 plants of the choicest, newest, and costliest varieties. Expert evidence was given by Mr. McHattie, Superintendent of Parks to the Corporation of Edinburgh (who was a judge at the Cor-

show in question), Bailie Melville, President of the Dundee Chrysanthemum Society, and others. The Sheriff finds that the damage suffered by the pursuer consisted of loss of the chance of gaining the Edinburgh City Cup and other prizes, with the accompanying loss of money, loss of professional distinction and advertisement, and partial loss of time, labour, and expense devoted to the production of the blooms, which may be moderately estimated at £60, and finds the defenders liable to the pursuer to this sum in name of damages. *Scoltman.*

The Week's Work.

FRUITS UNDER GLASS.

By MALCOLM MCINTYRE, Gardener to Sir CHAS. TENNANT, The Glen, Innerleithen, Peeblesshire.

Unheated Houses.—The fruits will now have stoned and started their second swelling. As soon as they show signs of ripening, syringing must cease, but the trees will still need water at the roots, and the borders should be damped, as a moist air is necessary for the foliage. Afford copious supplies of liquid-manure to trees swelling their crop. The fruits must be disposed so that they will receive light and air from all points as far as practicable. Keep the growths thinned out, that every shoot may have space for full exposure to light and air. Syringe early in the morning, admitting a little ventilation, which may be frequently increased as temperature out-of-doors becomes higher. If it is desired to accelerate the ripening of the fruits, keep the temperature of the house through the day at 80° or 85°, but always with ventilation, and close early to maintain the temperature, but not to raise it above 90°. Syringe again in the afternoon, and supply the roots with water and moisture as often as necessary. If thinning was attended to early, the fruits will be of a good size before stoning is completed. When that stage has been passed, the crop may be thinned finally.

The Pinery. When pits and houses become vacant, before they are again filled with plants, the interior, including the glass, should be well cleansed, and if the bottom-heat is obtained from hot-water pipes, the plunging material, whether of tanner's bark or tree-leaves, should be removed if much decayed. The plan I adopt here is to sift the finer particles out of the old material (bark) with a sieve having $\frac{1}{2}$ -inch meshes, and adding new material to the rough part, and by doing it in this manner the heat is easily regulated. All brickwork should be washed with sealing water, and afterwards brushed over with hot lime-wash. The wood and ironwork should be cleansed with soap and water, using a brush, and keeping the sappy water as much as possible from the glass, which should be cleaned inside and out with water only. If necessary, the wood and ironwork may be painted, and the roof made water-tight.

Potting Pine Plants.—Suckers which were potted in June last will have filled the pots with roots, and will be in need of repotting before the roots become matted together. Queens and Black Jamaica Pines should be placed in 10-inch pots, and Cayennes and those of stronger growth in 11-inch pots. Let water be applied to the plants immediately after the repotting, and plunge them in a bed having a temperature of 85° to 95°. There is no greater mistake in growing Pines than to crowd young plants together, so that they become drawn and weakly. Give attention to the bottom-heat of beds that have been recently disturbed or upset by the removal or re-arrangement of the plants, not allowing the heat to exceed 90° at the bottom of the pots, without immediately raising them, too much bottom-heat having a most disastrous effect on the Pines bearing fruit, or those having the pots filled with roots. Examine the soil, as regards moisture,

twice a week, and maintain a moist, genial, well-ventilated atmosphere. The conditions are, at this season of the year, so favourable, that the plants grow with great vigour, therefore discontinue the use of shading, and admit air plentifully when the temperature ranges from 85° to 95°, affording the fruiting plants a night temperature of 70° to 75°.

THE FLOWER GARDEN.

By T. H. STAFF, Gardener to Lord Poltulloire, Poltulloire Park, Exeter.

Poet's Narcissus (Narcissus poetiens).—If the beds of those bulbs which may be grown to furnish cut flowers are showing signs of exhaustion, the present time is suitable for lifting the bulbs and selecting the best and

blooms. This work holds good, whether the plants are to be grown in cold frames or in the open. Keep the soil stirred, and in dry weather afford water freely in the evening. If sprinkled daily, and the under-sides of the leaves are wetted with an elbowed syringe, that persistent pest on Violets, red-spider, will be prevented from doing much harm.

Climbing varieties of the Rose, as the plants pass out of bloom, should be deprived of the wood of this season that has flowered, and the new shoots that will flower next year laid in. Crimson Rambler, Alister Stella Gray, the Dawson Rose, and similar free-growing Roses, should, if established, be freely thinned, and sufficient space afforded the strong shoots for development. Such Roses have a good effect when in bloom if plenty of space be afforded them. Gloire de Dijon, Cheshnut Hybrid, Kaiserin Frederic, and Reine Marie Henriette will not require so free a use of the *scieauze*, a partial shortening back, or cutting back close an occasional shoot, being sufficient. After tying most varieties of climbing Roses for covering arches of iron, exposed to north-east winds, I have found none so satisfactory as the first three varieties; while A. S. Gray is unequalled in this section for fragrance. After thinning, manure in some form should be applied, and water afforded frequently, as well as a light mulch.

FIG. 32. ERIOGONUM COLIFOLIUM. FLOWERS WHITE.
(See p. 198.)

THE ORCHID HOUSES.

By H. J. CHAPMAN, Gardener to R. J. MEASURES, Esq., Cambridge Lodge, Flimkien Road, Camberwell.

Heating Apparatus, &c.—A very important matter that should receive attention at this season is the condition of the boilers and heating apparatus generally. Now that the weather is likely to remain warm for several weeks, all necessary repairs can be carried out without the plants taking any harm. It is preferable to have the inconvenience of having no heating apparatus now than at a later part of the season owing to a preventable break-down. The valves will need repacking, air-taps put into workable order, and burnt-out furnaces replaced with new ones. It is good practice to drain off the water from the pipes and boilers once a year, and thus convey away a good deal of rust and the sediment from the water. "Anti-corrosion" may be placed in the boilers when at length they are refilled and the fires lighted, which in a short time will dissolve the incrustation that nearly always takes place in those parts that are exposed to the greatest amount of fire-heat.

Small-growing Laelias.—*Laelia pumila*, J. Bayana, L. praestans, and their hybrid varieties, being now in active growth, will require closely looking after in the matter of water at the root. Their smallness fits them for planting in hanging-baskets or shallow earthenware pans; and being mostly suspended near the roof of a house, where the circulation of air is greatest, and the sun has a drying effect, the compost soon gets dry. The afternoon is the best period of the day in which to apply water to basket plants, as the material is not then likely to remain for any great length of time in a dry state. Although regarded by most cultivators as suitable plants for the cool-house, better results may be obtained if slightly warmer conditions are afforded them as soon as growth begins.

Cattleya Eldorado.—The flowers of this species are not so large as those of the members of the *Cattleya labiata* group, but they appear at a season when flowering Orchids are not numerous; and where a succession of flowers is required throughout the year, *C. Eldorado* can scarcely be dispensed with. It is a plant of easy culture. There are plants here of the type and of the white-flowered varieties, which have been in this collection for many years, which are satisfactory in every point. It is found that the plants give most satisfaction when they are placed in baskets and suspended from the roof. The plants make their growth in the summer months, and produce their flowers before the growth is matured—that is, gene-

finest for replanting. The second size bulbs may be planted by woodland walks or on turf. The small bulbs may be grown on in the reserve garden, or thrown away if the stock is sufficient for the needs of the place.

Early-flowering varieties of Narcissus, such as Early Major, Baze-lman major, and princeps, may likewise be lifted and replanted, if they have been three or more years in their present situation. When Narcissus flower badly, or not at all, the time has arrived when replanting is very necessary. Narcissus and *N. jonquilla* do well when they are planted in the shade of espalier fruit-trees. Such bulbs, when of large size, are very suitable for forcing.

Violets. Examine the plants frequently, and remove every runner found on the plants, so as to give strength to the crowns, and large

rally during the month of August. The plants commence to make new roots almost immediately the new growth has reached maturity, and any needful potting or top-dressing should then be attended to. The drainage of clean crocks should be ample in quantity; the potting-compost consist of good turfy peat two parts, and chopped sphagnum-moss one part.

POTLANTS UNDER GLASS.

By D. FLINTS, Gardener to HUSSEY PARK, Esq.,
Preston Hall, Loughborough.

Streptocarpus.—Let the seedlings be shifted into 48's, and be placed in an intermediate temperature, and near to the glass, affording them shade in bright weather, and frequent syringings whilst the weather keeps hot. A compost consisting of turfy loam, leaf-mould, and dry cow-manure, and good drainage should be afforded. Till established, apply water with care, but afterwards more liberally. Weak liquid-manure is beneficial till such time as the flowers appear.

Ixoras.—As the earlier blooming species and varieties pass out of flower allow the soil to become dryish, and then carry out the pruning required to give them good-formed heads. When growth has re-commenced, let the plants be repotted into larger pots, and endeavour to let the pots be filled with roots before the winter begins. Young plants now flowering may be repotted into 32's when the bloom is past, and be afforded a place in a house having much humidity, and a warmth of 85° to 90° by day, and 70° to 75° by night. Rough turfy loam and peat in equal proportions, mixed with charcoal and silver-sand, should be used for potting *Ixoras*.

Gardenias.—The cut-back plants which were repotted, which should now be growing freely, as well as the plants raised in the spring of the present year, should receive liquid-manure once a week. Pay regular attention to syringing the foliage, and occasionally use the petroleum-emulsion. When growth is finished, afford more air, so as to mature the young wood; for unless this be done, flowering will not be satisfactory.

Rouan Hyacinths.—If flowers are wanted in November, the bulbs should be bought and potted forthwith. These early-potted bulbs take a longer period from potting to flowering than those potted much later in the season. A suitable compost will consist of loam three parts, leaf-mould one part, and some dry cow-manure and sand. Place five or six bulbs in a 6-inch pot, with a pinch of silver sand under them, and fill the pots with compost, making it moderately firm. The apex of the bulbs should be visible. Having potted the batch of bulbs, afford water to the soil in quantity sufficient to wet the soil throughout, and when drained, plunge them in a bed of fine coal-ashes 6 inches below the surface. In six to eight weeks they should be inspected, and those with the most roots removed to a cold frame, and slightly shaded for a few days, and then place them in the forcing-house. The practice adopted by market growers is to start the bulbs in boxes filled with soil, and put up or place in baskets, when they can be lifted with plenty of roots. The method does not differ in any other particular from that pursued with the bulbs when grown in the ordinary manner.

THE HARDY FRUIT GARDEN.

By C. HIGGINS.

The March-ling Cherry.—The very warm weather of July has hastened the ripening of the fruits, and rendered it necessary that the tying or nailing, or otherwise securing, of the young growths should have attention before nets are put over the trees. If the shoots are too numerous to be properly laid in, remove some of them, and fasten in the remainder thinly, so as to permit the growth to ripen properly. The shoots towards the centres of the trees may be fastened in temporarily with short lengths of Privet-twigs, or the dried stems of last year's bracken. The leading shoots should, however, be secured with nails and

shreds. If the points of the shoots are infested with black-fly, dip them in strong quassia-water, and the next morning syringe the entire tree with clean water. When the nets are put over the trees, let them hang from the coping or the top of the wall, and keep them a yard or further away from the base of the wall by light poles set afloat, so that the gatherer may easily get at the fruit, &c.

Budding.—The operation of budding may be carried on during the next few weeks; and after the late heavy rains the bark should "run" readily. Although not much practised in private gardens, budding may sometimes be employed as a means of restoring the symmetry of a tree, or of securing a new or desirable variety. Peas, Plums, Peaches, and Cherries, are all equally amenable to budding. Where bare spaces exist in the framework of a tree, the insertion of a few buds will remedy the defect, and in a season or two will restore the proper balance of growth in the tree. Where stocks are grown specially for budding, the method adopted should be similar to that employed in budding Roses, the young stock being allowed to remain at full length until pruned back to within a few inches of the bud at the winter season. By allowing an outlet for the sap by growth extension, the inserted fruit-bud remains dormant throughout the autumn, and starts away strongly in the spring. If the rainfall has been insufficient to moisten the soil, it will be advisable to apply water to the roots of the stocks before budding is begun.

Thinning the Fruits of the Apple.—Although the Apple crop in general is not a heavy one, trees of the early culdinary varieties, such as Lord Grosvenor, Lord Suffield, and Eckinville Seedling, are carrying good crops, and the fruits may advantageously be thinned by degrees, the thinnings being used in the kitchen. This will give the remaining fruits a better chance of growing to a good size; and by thinning early the fruits attain a much larger size, than when the operation is left till a later date. The drought was much against the swelling of the Apple, and many of the fruits have dropped from lack of moisture in the soil; hence the recent rains will greatly assist the trees, besides cleansing them of aphids, &c. If very large fruits are desired, the ground should be copiously watered, and weak liquid-manure applied occasionally.

THE KITCHEN GARDEN.

By J. MAINE, Gardener to the Hon. MARK ROLLE,
Bretton, East Budleigh, Devonshire.

Carrots.—The plants must be afforded plenty of water, otherwise they are apt to run to seed; and when they have reached the height of 15 inches, earth them up similar to Celery, first tying up the leaves in the manner in which Cos Lettuce is tied up to blanch it.

Cora Salad.—This plant is appreciated by some persons as a salad, and it certainly affords a change, and is valuable when good Lettuces are scarce. The seed should be sown on ground that has been manured for some previous crop, which has been dug one spit deep, and made firm by trampling it. The seed should be sown in drills 1 inch deep, and 9 inches apart. When large enough to handle, thin to 4 inches apart. Afford water freely in dry weather, and frequently hoe the ground. Seed may be sown till the end of the month of September in the south.

Endive.—Sow about present date for chief winter crop, and again in ten days. If green-curbed and improved round-leaved Batavian are sown, thin former to 12 inches, according to the size to which it grows, and transplant, if required, to the same distance apart, and afford plenty of water till re-established.

Parsley.—The June sowing should now be thinned to a distance of 6 or 8 inches from plant to plant, doing this in showery weather, if possible, after the bed has been afforded water. The thinnings may be transplanted if this be necessary, but only such as have the tap-root intact. About this date I plant a row 50 yards in length close to the foot of an

unheated Petch-house wall facing south, where the plants get overhead protection of the front lights, which are opened wide from the end of August till the first week in March. Some gardeners prick the seedlings out on a warm border and afford frame protection in hard weather.

Lettuce.—Sow a good breadth of Sutton's Mammoth or Veitch's Superb Cos and All-the-Year-Round Cabbage-Lettuces during the coming week; and another sowing of Brown Cos, Hick's Hardy White Cos, and Hardy Hamersmith Cabbage in a fortnight. Lettuce may have abundance of water in hot weather.

Sundry Operations.—Examine plantations of Broccoli, Brussels Sprouts, Cauliflower, Broccoli, Savoys, &c., and fill up gaps in the lines. Broccoli and Savoys may still be planted. After a period of three weeks of scorching-sunshine, heavy rains have fallen, so that we can dispense with the water-can for the present. Get out Coleworts as land becomes vacant, examine the hearts of these, in fact all the Brassicas before planting, as so many of them are blind, or they have bolted owing to the drought. Break off the flower-stalks of Scorzera and Salsify.

THE APIARY.

By EXPERT.

The Honey Season.—In the South of England bee-keeping will be drawing to a close, and in many cases I fear poor returns have been the general rule, particularly where bees were not fed in the spring-time; and many who have not troubled to do so must see now how very important it is that a little slow feeding should be done, because it keeps the bees slowly working, and they are not using all their stores. One cannot but notice in these short seasons of ours that when the bees have filled up the body of the hive (where no feeding has been done), that the time has gone for working sections or run honey.

Sections.—All sections should be taken off the hives now that the season is over, or the bees will commence to take them down and make them unsalable. All sections should be handled as gently as possible, and kept in the same position as when taken from the hive, otherwise the honey will run down from unsealed ones; this causes them to look very bad. Another care should be given not to put your finger through the section at the top when taking it from the hive; this, too, looks very bad. A section for market should be kept clean, all scraped and wiped with a wet sponge; nothing looks worse than to see good sections of honey placed on the market in a dirty state—it does not give the seller a chance at all. How can one expect to sell honey from a window when the section does not look fit to eat? And then one wonders how it is more orders are not received. Much has been said lately about the "no sale of honey," but I say there is no trouble whatever if the above remarks are fully carried out. Sections should not be forced on the market all at once; it will pay to hold them over for a time, but not for them to get bruised and dirty meanwhile.

Extracting Honey.—When extracting do this as far away from your hives as possible, otherwise you will cause your bees to commence robbing, and once this is going on you will find it a very hard job to stop. All shallow frames when extracted should be placed back on the hive to be cleared up, and then taken away and wrapped up in brown paper to prevent the moth from getting to them, placing a little naphthaline inside at the same time. Do not take too many frames from the body of the hive, or you will have to feed them later on in the autumn; it is a great pity to take away what is really the very existence of the inmates, and natural food must be better than artificial. All hives should have their entrances closed a little, and a careful watch kept for wasps, &c.; eight or nine frames should be plenty to winter on, too many frames left will lessen the heat of the hive.

SOCIETIES.

ROYAL HORTICULTURAL.

JURY.—A meeting of the Committee of this Society was held in the Drill Hall, Buckingham Gate, Westminster, on Tuesday last. There was a pretty display that well furnished the Hall, but did not overwork it, and in this respect, as well as in the smaller number of visitors that were present than usual, it could be seen that the holiday season has already affected these meetings.

ORCHIDS were very few indeed, and only two awards were made to Orchids, a First class Certificate to *Cypripedium Mandin* magnificum from Mr. LAW SCHO-FIELD, and an Award of Merit to *C. Argo* Rothschildianum from Mr. NEWMAN C. COOKSON.

The FLORAL COMMITTEE recommended Awards of Merit to a double-flowered variety of *Cypripodina paniculata*, to four varieties of *Carnations* from Mr. TEKNER, Royal Nurseries, Slough; to a strain of *Cloxinans* from Messrs. STURROX & SON, to *Montibertia Germanica* and to *Rose Eugene Lesaulce*.

The FRUIT AND VEGETABLE COMMITTEE recommended Awards of Merit to a large yellow-fruited Gooseberry named *Columbia*, from Cobham Hill, Gravesend, and to a patent bottle for preserving boiled fruits. Messrs. J. WHITE & SOSS showed a grand collection of Gooseberries.

In the afternoon a LECTURE upon "Some of the Plants Exhibited" was delivered by the Rev. GEO. HENSTRAW.

Floral Committee.

Presid.—W. MARSHALL, Esq., Clacton, and Messrs. Chas. T. Druery, H. B. May, E. Dean, G. Bentley, J. J. Macdonald, Jas. Walker, Chas. Dixon, R. C. Norton, Herbert J. Cuthbert, Geo. J. Shea, W. P. Thomson, E. H. Jenkins, J. H. Hill, Harry Turner, Geo. Paul, H. Selie Leonard, E. T. Cook, Geo. Gordon, E. J. Selton, and Ed. Mawley.

Mr. H. J. JONES, Ryebrook Nursery, Hatfield Green, Lewisham, exhibited a very handsome group of plants, in which there were three large specimens of *Himca elegans*, some fine single white-flowered *Petunias*, *Antypha hispida*, *Cochlosa*, *Pennis*, *Cobham*, and *Campaula Maya*. The most conspicuous plants, however, were the *Heliotropes*, several new and seedling varieties being shown. *Saxias* almost white and is freer and has much larger flowers than the old White Lady type. *Chamaejasme*, *Crocus*, *Pennis*, *H. Berlin*, *Crocus*, and *Madame Nelson*, are coloured varieties differing in degree of tint. Silver Banksian Medal.

Messrs. JAS. PAUL & SON, Rosehill Park Nursery, Norwood Road, London, S.E., exhibited a group of *Achimenes*, in pots, the colour of whose flowers varied from white to deep purple.

Miss EASTBROOK, Fawkham, Kent, made a floral display of flowers of zonal and Ivy-leaved Pelargoniums, arranged in a basket and in espaliers, with suitable green relief.

Messrs. PAUL & SON, The Old Nurseries, Chesham, made an exhibit of Roses and Philoxes. The Roses were shown in bunches in bottles, and amongst the varieties we noticed very fine specimens of *Souvenir de President Carnot*, *Alfred Colomb*, *Mrs. Sutherland Crawford*, *Madame A. Chateaux*, *Camons*, *Rose Lamberton*, a curious crimson Rose, with white margins to the petals; *Maman Cochet*, *Liberty*, *Madame Jules Grévy*, *Waltham Standard*, &c. Among the herbaceous Philoxes were choice varieties with white, rose, purple, pink, blue, and carmine flowers, and *Combed*, having flowers of nearly scarlet colour (Silver gilt Banksian Medal).

Mr. A. W. WADE, Riverside Nurseries, Cobham, exhibited a collection of Sweet Pea flowers in nine-tin varieties. Some of the flowers were shown in shallow ornamental basins, in the centre of which were weights with rings that supported the flowers in a very natural position (Silver gilt Banksian Medal).

Messrs. H. CASSELL & SOSS, Swanley, Kent, exhibited a grand group of tuberosus-rooted *Begonias* in pots, all of them double-flowered varieties. Some exceedingly good varieties were *J. W. Siam*, almost scarlet, with prettily crumpled petals; *Rosa White*, delicate blue colour, very broad petals; *Dr. Sanson*, deep crimson; *Lady E. Mohl*, salmon-pink, with fringed petals; very fine, *Lady Baltimore*, primrose yellow colour; *Countess Waldenrose*, pure white; *Mary Eddy Vivian*, salmon-pink, with white centre (Silver gilt Banksian Medal).

Messrs. STURROX & SOSS, Reading, furnished one of the long central tables with a collection of *Cloxinans*, in a number of very choice varieties, and an Award of Merit was recommended to a strain with minutely

spotted flowers. The plants had been cultivated from seeds sown as recently as January 29 last. Among the varieties were none but the following:—Spotted Ensign, white, with leucophaea-edged spotting; Duke of York, white and scarlet; *M. E. King*, white, with light blue ring; *Scarlet Queen*, a large covered with crimson on a white ground; *Princess Mary*, white, with rosy ring; *Reading Scarlet*, a very richly self-coloured variety; *Prince Edward*, a large flower with white ground freely marked with rich spotting of purple; *Suttons Purple*, very rich in colour; *Her Majesty*, pure white; *Violet Queen*, one of the most distinct of the spotted series, and many others. (Silver gilt Flora Medal).

Mr. THOS. S. WARE, Ltd., Hale Farm Nurseries, Feltham, London, exhibited a group of hardy flowers, in which *Hybaceous*, *Phloxes*, *Gladioli*, *Lilacs*, &c., were conspicuous. We noticed, *Crassula Cooperi*, a perfectly hardy species of the rockery, dwarf, about an inch high, with long spotted leaves, and white flowers with red bristly calyxes; *Campaula mirabilis*, *Kuniphoa Hodgkintonii*, *Berberis* with yellow flowers; *Camas*, crimson yellow; *Berberis*, a Composite ground, about one foot high, with yellow single flowers; *Mila biloua*, &c.

Mr. H. B. MAY, Royal Road Nurseries, Upper Talnott, London, made an exhibit of *Campaula scodifera*, of which he has now several varieties, including *C. albo pallida*, *superba*, and *capitata variegata*, the latter with variegated foliage. *C. M. M.*, and the curious hybrid, *C. B. M.* (both of which are two last named plants), have been figured in *The Gardeners' Chronicle*. All of the Campaulas were staged a creditable way. *Palms* and *Terms*. (Silver Banksian Medal).

Mr. AMOS PERRY, Royal Plant Nursery, Windmead Hill, staged a group of hardy flowers, including some good *Philoxes* with the most remarkable variegation of the exhibition. The collection of *White Lady* flowers, many of which are new varieties. They covered 2 1/2 ft. of space, and were surrounded with flowering specimens of *Stemmatocoma*. (Silver gilt Flora Medal).

SIMON MORRIS, 41, Wetham Hall, Thetford, showed plants and seeds of a large flowering yellow *Carnation*, species of *Yucca rosea*, and named *M. T. Morris*.

Mr. T. W. CARRON, Royal Cottage, Windmead Hill, showed *Carnations* of *Perla*, *Calcan*, white, and *Ornithocharis* crimson.

Composita *Heldreichii* with its long, yellow, tubular flowers, was in great display by Messrs. ROMAN VETTER & SON, Exeter.

Messrs. WALTER WOOD, Kilmield Gardens, Colchester, made a very fine display of *Carnations*, *Gladioli*, and other hardy flowers in choice varieties. (Silver Banksian Medal).

Mr. CHAS. TURNER, Royal Nurseries, Slough, exhibited four dozen double blooms of *Carnations* and *Presides*, and a large number of some good border varieties, several of which are noticed below under "Awards."

Messrs. JAMES VEDDER & SOSS, Royal Exotic Nurseries, King's Road, Chelsea, exhibited beautiful blooms of *Rhododendron roseo-jasminiflorum* hybrid, showing interestingly some green ground.

Campaula *Walteri* was given an Award of Merit last year when shown by Mrs. WILMOT, Weyley Place, Great Wares, Essex, we again show that both. The plants were in flower, and have a somewhat slender habit of growth, the tallest being about 1 foot high. The flowers are usually double, occasionally almost single, and of a pretty shade of blue-purple.

Messrs. W. PAUL & SON, Waltham Cross, Here, showed extensively double *Philoxes* in great variety and beauty of development and colouring, obtaining a Silver Flora Medal. Of these we mention may be made of *Frog-train* (a very long, an exquisite pure white flower, bearing a perfect oval of six inches diameter and 6 inches wide, of distinct tint, and very beautiful) and *White*, double, of distinct tint, and very beautiful, the latter being about 1 foot high. The flowers are usually double, occasionally almost single, and of a pretty shade of blue-purple.

white, Hecla, white and blue, and *Kosuth* (rosy crimson), and a dense truss of flowers of all colors.

Messrs. WINE & BAKER, date Chisney, 542, in Witten, exhibited *Hydrocotyle* blooms in the form of an oval number of stems and as spikes, the aperture of the flowers leaving little to be desired. There were hardly any signs of the shredded tuners on the leaves, and we may assume that in the case of this nursery, more or less have been found to be a destructive pest. High colour in the flowers were the rule, and only one yellow coloured, and but one white variety, were shown. If the flowers had a faint, it was in the fact of size on the guard petals, which gave the blooms a shaven unfinished look, at least, to heretical eyes. In a rose-coloured variety a white and a very deep crimson almost black, this defect was not so apparent (Silver gilt Banksian Medal).

Messrs. PARK & SOSS, King Street, Covent Garden, showed blooms of hardy border flowers in some variety, or novelty, we may instance *Eclimias chalcidomera* rubra, double B. var., the full coloured *Homocallis Krasno*, and *H. disticha*, double B.; well developed flower-head of the white-flowered *Agapanthus*, *Meriania tubulosa* modica, a pale blue-coloured flower; *Bacopa maritima*, a few Water Lilies shown in square shallow tanks; *Platyodon Martoni* with deep blue flowers, and a number of shrubby *Philoxes*, some *Saccolabias*, *Lilacs*, *Heliotropes*, *Sweet Peas*, &c.

Awards of Merit.

C. Walteri *Ch. M. G.*. A good border variety, with yellow ground, flower, veined deeply with red. From Mr. TURNER.

Campaula Lady Baskin. A yellow ground flower, flaked and edged with rose colour, useful for cultivation in border. From Mr. C. TEKNER.

C. Walteri *Herzog*. A yellow ground flower, flaked and edged with rose and purple. From Mr. C. TEKNER.

C. Walteri *Deep*. The flowers have a ground colour of buff yellow, with very little edge of red colour, also a border variety. From Mr. C. TEKNER.

Gladioli. A beautiful spotted strain shown by Messrs. STURROX & SOSS.

Agrostis *peruviana* *doubt B.* Messrs. D. S. THOMSON & SOSS, Wembley, showed a number of spikes of the plant, some 3 ft. in length. It is a perfectly double variety of the species with pure white flowers. The novelty will be of great value for use in spray making, and for a variety of purposes.

Anthyllus Germania. The flowers are rich reddish-orange colour, with a little red of the throat and no tinting whatever. Shown by Mr. BENNETT & SON, Holmwood, Chesham; and by Messrs. PAUL & SON, Old Nurseries, Chesham.

Rose Eugene Lesaulce. A polyantha variety, with yellow flowers 1 1/2 inch across, double, a pretty well-known garden Rose. Shown by Messrs. PAUL & SON, Old Nurseries, Chesham.

Orchid Committee.

Presid.—JAS. VEDDER, Esq., in the Chair, and Messrs. JAS. VEDDER, Esq., Mr. MOORE, Dr. B. CRAWLEY, H. M. PARRELL, E. W. BODDIE, H. T. PERL, E. HILL, W. GIBBY, W. H. YOUNG, T. W. BOND, H. J. CHAPMAN, H. A. TRACY, and P. SANDER.

Messrs. JAS. VEDDER & SOSS, Royal Exotic Nurseries, King's Road, Chelsea, were awarded a Silver Flora Medal for a very interesting collection of hybrids, principally *Catleya* hybrids, among which were *C. C. Callistolepis* *fl.*, *purpurata*, *C. Warszewiczii*, and four plants of the line coloured *C. C. Callistolepis gemmae*, two specimens of the yellow tinted *C. C. Aysnisi*, *C. Triemerii*, *E. Kaufmanni*, *C. C. Chima*, *C. Warszewiczii*, *C. C. elegans*, *Turcoman*, and a fine white petalled form of *C. C. Dinallianii*, *fl.*, *purpurata*, *X. C. Lambdeniana*, the tip of which was marked with purple. Good specimens of *Catleya C. Alanda* *fl.*, *purpurata*, *Warszewiczii* were also shown.

Sir FREDERICK WIGAN, Bart., Claydon, East Shropshire, Mr. W. H. Young, staged his collection of *Catleya C. W. Wigan* (*Schilleriana C. Pompanoniana*), a very showy hybrid, with purple-tinted sepals and petals. The lip is formed much like that of *C. Schilleriana*, the front being veined with crimson purple, with a yellow blotch in the centre, the handsome natural hybrid of *C. W. Wigan* (*Schilleriana C. labata* *Warszewiczii*, *C. porphyroloba* (*trifasciata*) *superba*, *C. C. Alanda*, a large, light coloured form of *C. Warszewiczii*, *Lulu* *Catleya C. Henry*, *Graciosa*, and flowers of *Cypripedium nymphaea*, *C. consolida*, and *C. Gleditsia*.

W. TENSLEY, Esq. Monkshold, Bromfield, Brighthelm, exhibited *Catleya Eldorado* (*Monkshold*) variety, with bluish-white flowers, having an orange coloured disc. The plant being a weak one the flower seems small.

Capt. G. W. LAW SCHOFFIELD, New-Hall-Hey, Bawtenshall, Manchester (Mr. Small), showed *Cypripedium* x *Stottium* (Charles-worthii - canthamum-superbium), a fine flower of good substance. Upper sepals white, with a small green base, the middle area tinged and striped with purple. Petals and lip tinged with brown-purple.

C. J. LEVENS, Esq., Warrnam Court, Dorham (Mr. Dimeson), showed four fine plants of *Cypripedium* x *Chlorobryum* Warrnamense (Phippiense x Curranii) for which he received an Award of Merit, December 12 1898. The large flowers had the pale line of C. Curranii, with elongated petals spotted with purple.

Awards.

Cypripedium - *Maudie* (an excellent variety) (Sunderley Livestuccum) (Hawtonum) from Capt. G. W. LAW SCHOFFIELD - A fine hybrid, distinctly intermediate between the two parents, and apparently with the free habit of growth of *C. calceolum* Sandevis. The flower, like both the varieties used in its production, had a marbled green for the ground colour, the upper part of the fine, broad dorsal-sepal and extremities of the petals being white. Plants of this hybrid had been previously shown, but the present form is the best we have observed. First-class Certificate.

Cypripedium - Mrs. Lecher's (Oakwood variety) (Arista x Rothschildianum) from NORMAN C. COOKESS, Esq., Oakwood, Wyham, Northumberland (Mr. William Murray) - A fine showy flower, with the mass-like form of C. Rothschildianum, but with the broad, yellowish-white petals, dorsal and heavily blotched with dark, chocolate purple, as in the best forms of C. Arista. The large, whitish upper sepal was closely marked with blotched lines of dark chocolate-purple. The lower sepals were similar, but have fewer lines, and the lip whitish, tinged on the face with brownish-rose. The original form, which had a yellow ground colour, and fewer lines on the upper sepal, was shown by FRANK A. REIDING, Esq., (Lubbeck, Gipsy Hill) at the Royal Horticultural Society, May 2, 1899, *see C.* - ARISTA ROTHSCHILDIANUM (Award of Merit).

Fruit and Vegetable Committee.

Present: Geo. Binyard, Alex. Chatterman, and Messrs. Jos. Child, S. Mortimer, Alex. Dean, Geo. Kell, M. Gibson, G. Norman, T. O. Lane, A. H. Peat, on W. Wake, E. Shaw Blake, and Henry Esling.

Messrs. JAS. WELCH & SONS, Royal Exotic Nurseries, King's Road Chelsea, made a grand exhibit of ten choice varieties of Gooseberries, shown in neat little baskets; the fruits being of excellent quality. On white-fruited varieties, Champagne, Bright Venus, King of Trumps, Whitesmith, Coppice Lass, Miss Nightingale, and Astrife, were noticed, and are a main article of export. Of green varieties, such as Nainit, Telegraph, Green Laurel, Pinnacled Greening, Early Green Harvey Stockwell, and surprise, can hardly be beaten, and of red varieties, Crown Bob, Warrington, Lancers, and Red Ben's Mistake, from among Scotch Hartree, and Red Champagne. The following are good yellow varieties, Golden Drop, Brown Gold, Pretty Boy, Fern, Mount Pleasant, Canon, Early Napoleon, Trumpeter, and Golden Gem. The first two varieties recently introduced by Messrs. Wrench were also illustrated by ground fruits. They are Langley Beauty, named in *Vegetables' Chronicle*, Aug. 8, 1899, p. 159, a yellow variety with few hairs, capital flavour; Golden Gem perfectly smooth, and of richer colour than the preceding one; and Langley Gage, a green variety. The exhibit was recommended a Silver Knightian Medal.

Messrs. CROSS & SON, Earlsfield Nurseries, Wisbech, exhibited fruits of Apple Early Victoria, doubtless to show the early maturing qualities of the variety, the fruits being already of very unusual size for kitchen purposes.

Awards of Merit.

Gaultheria *calabro* - This is a large, yellow fruited variety, with few hairs, and of good flavour, shown by Mr. T. R. CECILSKY, 69, High Holborn, G. J. & Co., 65, Ave. Road.

Bottle *pot* preserving tin. An Award of Merit was recommended in respect to a bottle and stopper exhibited by the FERRIS FINE GLASS BOTTLE COMPANY, 18, F. de LICA & CO., 6 and 7, Long Lane, Aldersgate Street, London, S.E. It is a glass bottle with a disc which should be only partially fixed before filling the fruit, by means of a screw band. After bottling by screwing the disc firmly on, an vacuum is caused underneath, and the pressure of the atmosphere is sufficient to keep the disc firmly in its position, although the screw band should be kept on also. To open the bottle it is necessary to make a small hole in

the disc, and thus admit air. The device is a very simple and convenient one, and makes the operation of preserving fruit by means of boiling less difficult to the amateur.

At a general meeting of the Royal Horticultural Society held on Tuesday, July 30, forty-one new Fellows were elected (making 688 since the beginning of the present year), amongst them being Lady CRANWORTH, Lady POLLOCK, the Hon. Mrs. GRETTON, the Right Hon. R. W. HANBRY, M.P., the Hon. N. CHARLES ROTHSCHILD, and CLEMENT GIBSON, Esq., M.D.

BRISTOL & DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

JULY 25.—The monthly meeting was held at St. John's Parish Room, Redland, on the above date, Mr. A. J. Hancock, president. The lecture on "Carnation Culture" was given by Mr. Skinner, of Stoke Bishop. The hearty thanks of the meeting was accorded him for his lecture.

A number of prizes for six bunches of Sweet Peas and Carnations, and for six Carnations, distinct, was awarded MRS. TALMAGE.

NEWPORT AND COUNTY HORTICULTURE.

JULY 27.—This Society held its annual show on the above date in rampy weather. The entries were considerably more numerous than those of last year, and in most cases the classes were well filled. Cut flowers were a great feature, and included Roses, Carnations, Sweet Peas, and groups of plants arranged for effect, and indoor and greenhouse plants were very good. Year classes were shown in large quantities, and were of good quality, fruit was of average quality, some stands of grapes and dishes of hardy fruit being very creditable, but Melons were generally of poor quality. There was much honey shown of good quality.

CUT FLOWERS.

For twelve varieties of Tea Roses, Messrs. S. TRESEDER & SON, Cardiff, was placed 1st with fresh blooms, its best being Model, Souvenir d'Ami, Margot, and Hon. E. Gilroy, 2nd, KING'S ACRE NURSERY CO., Hereford. Messrs. S. TRESEDER & SON also won 1st prize for twenty-four floral bouquets, and the KING'S ACRE NURSERY CO. were second.

Cactus Dahlias brought but one exhibitor, viz. Mr. W. TRESEDER, Cardiff, who staged beautiful blooms of Lord Roberts, Atlas, Aesta, LEVIN, W. T. Thomas, Florida, &c.

Carnations in twelve distinct varieties, were good from Mr. W. WALL, Tiverton-on-Avon, Bath, in 1st place; Brilliant, Nellie, Bellad, Zongara, Willie, Thos. Mrs. Hill, and Mrs. Newman, 2nd, Mr. W. TRESEDER, Mr. WALL had the best bouquets.

The best twelve bunches of hardy flowers, were from Mr. W. TRESEDER. For twelve bunches of Sweet Peas, Messrs. W. J. STOKES & SON won 1st prize.

For a collection of sweet Peas arranged in a space 9 feet by 3 feet, Mr. W. TRESEDER was the only exhibitor.

PLANTS.

The class for eight stove and greenhouse plants in bloom was won by Mr. J. CAPPER, of Cheltenham, who had Statice profusa, S. heterantha, Ixora Regina, F. Imbi, Cleocheleum, Broomlynnia, Pterocoma patens, Barmis, &c. Mr. BRYKEY, Hlanidley, Mr. W. WENTWORTH, was 2nd, with smaller plants well flowered.

Mr. J. CAPPER was also 1st for six ornamental foliage plants, showing Cotinus, Victoria, and angustifolia, Keutias Fosteriana, and Balsamorhiza, Latania borbonica, and Phlox paniculata, 2nd, Mr. BALEY, Mr. STORRETT.

With large fresh plants of Dicksonia spirata, Achromia Echinocarpa, and V. Sander-Catherine, Mero, Lepa hirta, orsata, Nephrolepis exoniensis, S. trimpunctata, &c., Col. WALTER, Mr. Powell, was a good 1st for six exotic Ferns.

The 1st prize for a group of plants 12 feet in diameter was won by Mr. J. CAPPER, and Mr. W. CARPENTER was 2nd.

Thirteen Begonias, arranged on a space 25 feet square were best from Mr. LAWSON, Mr. Long, who set up a bright, well-grown lot of plants, 2nd, Mr. WILLIAMS, Mr. W. J. Jones.

NON-COMPETITIVE EXHIBITS.

Mr. BASHAM, Fern Oak Nurseries, Bassalee, brought a fine display of fifty dishes of hardy fruit, and thirty varieties of Sweet Peas, arranged in bunches (Silver-gold Medal). Messrs. WILFRID & SON, 610, Worcester, staged four dozen varieties of Sweet Peas in good varieties. Messrs. GARREWAY & Co., of Bristol, sent a beautiful collection of stove and greenhouse plants, and the KING'S ACRE NURSERY CO., Hereford, staged Roses in

distinct varieties (Silver Medal). Messrs. S. TRESEDER & SON, Cardiff, had a good stand of Roses, arranged in bunches (Silver-gold Medal). Mr. BLACKMORE, Tiverton-on-Avon, a large exhibit of a splendid assortment of blooms of Begonia, and Messrs. HEATH & SONS, a group of Begonia and Pelargonium in pots. Mrs. HODGKINS, Beaufort Avenue, Manchester, had a collection of skeletonized leaves, Ferns, and flowers; Mr. W. TRESEDER was awarded a Silver Medal, Messrs. W. TULLIN & SON, Newton Abbot, a Silver Medal, for an exhibit of Carnations, and Messrs. JARMAN & Co., Clarend, a Silver Medal, for miscellaneous cut flowers.

BOSTON HORTICULTURE.

JULY 25, 26. Boston has held an annual flower-show for a number of years past, and as it is the centre of an extensive agricultural district, it unites with the floral display a horse and dog show. These combined have a powerful attraction for the country people, and they come into Boston in large numbers. The two days were busy, and notwithstanding the district lacked rain badly, there was a general expression of regret that the pleasure of the people was so much interfered with.

Cut flowers and vegetables are the two prime features at a Boston show. Still, fine specimen plants are grown in the locality, but Ferns, Colons, Fuchsias, zonal Pelargoniums, and others, were shown in fairly good form. Some well-flowered tuberos-rooted Begonias came from Mr. J. THOMAS; there were a few Gloxinias also in good character.

The class for a group of plants arranged for effect brought several exhibitors, but they were lacking in number, the exhibitors appearing to need an object-lesson or two in the matter of setting up groups. There were several plant classes for gardeners and amateurs.

C. W. BROWN was a leading feature, and Messrs. C. & W. Rogers of the Rose Nurseries, Peaburrough, took the 1st prize for twenty-four and for twelve varieties, and also for twelve Teas and Souvets. As it is somewhat late, the following may be taken as suitable late-flowering varieties, and they were shown in excellent condition. Star of Waltham, Caroline Te-tout, Danmark, Cho. Honor, Vert, Bessie Brown, Madeline Jas. Caplet, Souvenir Vasse (this old Rose being in excellent condition), Bladon, Duchess of Bedford, Madame Eric Gordon, Alfred Colomb, Mrs. J. Spang, Marquisess of Londonderry, Lawrence Allen, Xavier O'Brien, Prince Arthur, and Charles Leclercq. Of Teas they had Maman Corbet, Innocente Troika, Marcelle Niel, Ernest Metz, Meda, Mad me de Watterville, and others. The 2nd prizes were taken by Mr. W. H. FIETTINGHAM in two classes, and by Mr. C. T. CHAFFIN in that for Teas.

Fruit of *Hardy Begonia* plants, shown in twenty-four bunches, were another leading feature, Mr. T. B. DORRIS, a local nurseryman, taking the 1st prize with a fine assortment, and Mr. H. WALL was 2nd, such attractive subjects as Astro-rosaceus, Ladies, Delphiniums, herbaceous Phloxes, Coreopsis grandiflora, Sedum cannicola, Everlasting Peas in variety, Monticelotus, &c., were staged. Mr. DORRIS was also 1st with twelve bunches of stove and greenhouse cut flowers.

Zonal *Pelargoniums* and *Sweet Peas*, &c.—The best twenty-four bunches were staged by Messrs. H. & S. SMITH. Carnations, Begonias, Pentstemon, &c., were likewise shown.

Dahlias were represented by show, pompon, and Cactus varieties, but it is not too early to have them in fine character.

A certain amount of table space was set apart for attractive displays, the local trade competing. Mr. T. D. BRADLEY was placed 1st, and Mr. C. W. INGRAM 2nd. Very good cut flowers in several instances were shown in the amateurs' division.

Decorated tables were shown by ladies, and they exhibited some pretty designs, the 1st prize falling to Mrs. E. SWALE. The 1st prize for a bouquet went to Messrs. H. & S. SMITH, and a charming arrangement in a bowl with Lilies and lilies.

Fruit.—The better classes of fruit were somewhat sparsely represented; the best collection, which consisted of black and white grapes, Peaches, Nectarines, &c., came from the Earl of SANDWICH, Hurlingham; and Mr. W. F. CLARKE was 2nd.

Mr. J. THOMAS was 1st with two bunches of black and also of white grapes. Peaches, Nectarines, Melons, and bush fruits were in general in good character.

Touffures were very largely shown, and mainly of good character. Messrs. W. J. JOHNSON & SONS, and Mr. A. WOOD INGRAM, offered special prizes for collections and also for single dishes.

Potatoes were clean and bright in particular, and larger than might have been expected after such a dry summer.

Among miscellaneous contributions was a number of illustrations of decorations in flowers from Messrs. BALMAN & Co., 18, Goods Road.

In a spacious tent were a large number of blooms of Sweet Peas and pods of cultural Peas, competing for prizes offered by Messrs. W. J. JOHNSON & SONS, and the entries were so heavy that a spacious tent had to

GENERAL OBSERVATIONS.

The following summary record of the weather throughout the British Islands, for the week ending July 27, is furnished from the Meteorological Office:—

"The weather at the commencement of the period was fine and bright over the southern and south-eastern counties, but very unsettled conditions, with frequent thunder-storms and heavy rains soon spread over the entire kingdom, and continued, especially over the inland parts of England, until the end of the week. Some of our south-eastern coast stations, however, remained entirely free both from thunder and rain.

"The temperature was above the mean generally, but only just equalled it in England S.W., and over Ireland, and was slightly below it in the Channel Islands. The highest of the maxima were recorded on the 21-1, and ranged from 56 in England, E.S., in England, S., and between 56 and 59 in the other English districts, to 75 in Ireland, N., and 60 in the Channel Islands. The lowest of the minima occurred during the middle or latter part of the week, they varied from 45 in Ireland, N., and 47 in the Midland counties, to 50 in many other districts, 52 in England, S., and 53 in the Channel Islands.

"The rainfall varied very greatly in different parts of the Kingdom. It was less than the mean over Ireland, and only a trifle more than that value in Scotland, W. and England, E.; elsewhere the fall was large, that in the Midland Counties and parts of England, S., being quite unusual. The total fall for the week was largest at Oxford and Church-toke, where 72 inches and 69 inches were respectively recorded. During a severe thunder-storm which burst over the Metropolis on Thursday, the rainfall was exceptionally heavy, at Westminster, as much as 1.8 inches was collected in the gauge in the course of about three hours and a half; and again in Acre Lane, Brixton, 0.92 inch fell between 5 p.m. and 7 p.m. on Saturday.

"The *baro* *sum* was much less than the mean in all districts. The percentage of the possible duration ranged from 41 in the Channel Islands and England, E., to 15 in Scotland, N., and Ireland, N., and to 14 in Ireland, S.

THE WEATHER IN WEST INDIES.

In the early part of the week the weather was cooler than at any time since the middle of June, but during the last few days there has been a return to higher temperatures. The ground still remains very warm, the readings both at 1 and 2 feet deep being about 5° warmer than is seasonable. Rain fell at frequent intervals, and to the total depth of 1.4 inch, which is equivalent to a watering of nearly 5 gallons on each square yard of surface in my garden. This rainfall, together with the moister atmosphere of the last week, has had a very beneficial effect on my lawns, which are now quite green again. The sun shone on an average for little more than two hours a day, which is a poor record for the time of year. The amount of moisture in the air has been, as a rule, greater than in any previous week of the present summer. *E. M. Roberts, July 26, 1901.*

ENQUIRY.

POTAMOGETON CRISPUS.—Will some reader of the *Gardeners' Chronicle* give Mr. Mark Webster the life history of "Potamogeton crispus"? Is it an annual reproduced by seed only? or do the roots survive more than one season? He has a pond infested with it, in which Water-Lilies are growing, and he is keeping it down by constantly cutting it, but that method only tends to propagate it. He is most anxious to exterminate the weed.

ACER NEGUNDO WITH VARIEGATED LEAVES; F.T.K. This plant may be budded on the type form, or on any variety of Acer, the operation being carried out in August, and early in September. The piece of bark, together with the bud in a mature state, may take the form of a disc or an oval, accurately fitting it on to a shoot or part of the stem of about the same age and diameter, as that of the shoot from which it was taken. Buds may be taken like those of fruit-trees and Roses, and inserted in the same manner as

are those. Winter grafting under glass may be followed. The plant will strike from cuttings of the ripe and the green wood.

APRICOTS SPLIT; J. W. M. See "Diseased Peaches" in our issue for July 13 last, p. 10.

BEGONIA RUST; E. W. B. Due to a mite. Dip the leaves in tobacco-water.

BOOKS; *Inquiritive*. No modern work exists; and Miss Hassard's is old-fashioned and out of print.—*Enchiridion, The Horticultural Directory* is published at 12, Mitre Court Chambers, Fleet Street, London, E.C., price 1s.

CATALPA SYRINGIFOLIA; *Baldwin*. By seed sown in a cold frame in the autumn, or out-of-doors in April; and by cuttings of the ripe wood, inserted to the depth of 9 inches in sandy soil, as soon as the leaf falls.

CHRYSANTHEMUM; *Old Subscriber*. The larva is that of a fly, generally called the leaf-miner.

CUCUMBERS; *Allan*. The roots are badly affected with eel-worms, introduced with the loam. Turn out and get fresh soil.

DAHLIA OFFSETS; E. S. The plants should be kept to one or two main stems, all minor growths being removed. This operation may likewise be performed on the dry tuber after it has sprouted, or the growing tuber before it is planted out.

GLOXINIAS; T. W. W. See answer to "E. W. B." on "Begonia rust."

GRAPE GROS COLMAR; F. E. S. The cracking is due either to an excess of water in the border, or to the presence of too much humidity in the air of the vinery, or in other words to little ventilation. The Vines absorb water, but cannot part with it.

LANDSCAPE GARDENERS; *Coventry*. You will find their names and addresses in the *Horticultural Directory* for the current year, which is published at the office of the *Journal of Horticulture*, 12, Mitre Court Chambers, Fleet Street, E.C.

LAPAGERIAS; *A Faithful Reader*. An ordinary greenhouse, or even on a wall out-of-doors in the warmer parts of the country. The plant likes a cool, moist air, good drainage at the root, never to be dried off, and much moisture at the root in the season of growth.

MELON-LEAVES DISFIGURED; J. S. We find no fungus, but plenty of punctures caused by some species of insect. These punctures when very numerous coalesce, and give a form of "rust." Probably timely vaporisation or fumigation would save the plants from injury.

NAMES OF PLANTS; *Correspondents not answered in this issue are requested to be so good as to consult the following number*.—*D. B., Leyland*, 1, Phellodendron amurensis; 2, Castanea sativa var. heterophylla dissecta; 3, Robinia sp. (probably form of R. pseud-acacia); 4, Philadelphus microphyllus; 5, Ceanothus Gloire de Versailles; 6, Kochia paniculata; 7, Akkia quinata.—*Rev. E. D. Lear*, 1, Senecio Fuchsii; 2, Euphadium sulfifolium; 3, Adenostylis alpina; 4, Sideritis montana; 5, Melittis bifolium.—*J. P., Campanula isophylla*.—*W. W., Dorking*. The white flower is Lysimachia clethroides; the other *Veratrum nigrum*.—*P. A., Bermuda*, scy. 1, Lastrea rigida; 2, Colutea arborescens (Bladder Senna); 3, Cotoneaster alpinus; 4, Hypericum Androsaceum.—*E. G. & Son*, Stanhopea tigrina, a fine variety of it; the Fern is Davallia hirta cristata.—*J. H. L.* Cypripedium Lawrenceanum.—*D. R.* Salix herbacea (Dwarf Willow), the smallest of British shrubs.—*R. B.* 1, Thunia alba.—*F. E. A.* 2, Lastrea decurrens; 3, L. rigida; 4, Asplenium, but which species it is impossible to say from the immature barren frond sent; 5, Platyloha rotundifolia; 6, Nephrodium molle.—*W. S., Thrapstone*, Next week.—*Crimm*. Crinum Powellii and Sanvitalia procumbens.—*A. E.* 1, Centaurea musicata, Sweet Sultan; 2, Aconitum napellus, poisonous; 3, Funkia ovata; 4, Aster; 5, Chelone barbata.—*East Devon*. 1, Michauxia campanulata; 2, Lysimachia, near vulgaris;

3, Scabiosa; 4, Platycodon grandiflorum.—*W. E.* Lysimachia thysiflora.—*W. R. F.* Saponaria officinalis, double fl.; Lord Anson's Pea, Lathyrus magellanicus.—*H. H.* 1, hybrid evergreen Oak, probably between Q. cerris and Q. ilex; 2, Lycopodium arvensis; 3, possibly Blechnum boreale; 4, Celsia arcturus; 5, Tropaeolum speciosum; 6, Campanula trachelium var. alba. All the specimens, except the Oak, shrivelled beyond certain recognition.—*A. C.* Convolvulus arvensis.—*R. E. B.* Looks like a white variety of Lord Anson's Pea, Lathyrus magellanicus.—*A. S. K.* 1, Sedum Ewersii; 2, S. spurium; 3, Epilobium parviflorum; 4, Galega officinalis. Your postal order has been sent to the Orphan fund. Many thanks. If everyone did the same, the orphans would be well off.—*W. P.* 1, Galium verum; 2, Lunula dysenterica; 3, Eupatorium cannabinum; 4, Ononis arvensis.

ON-HEATED BOILER; *H. N. B.* There are several such on the market which are efficient and quite safe if placed outside the greenhouse in an enclosed stockhole, and the products of combustion not allowed to enter the house. Please see our advertisement columns, as we cannot recommend dealers.

PLANTS FOR NAME; T. W. *Browning*. If the flower the receipt of which by us was acknowledged in the issue for July 6 was of a blue colour, and it was attached to the peduncle on one side only, it is Phacelia tanacetifolia.

REFERENCES; *G. A. B.* The gentleman ought to return them to you, but there is no law to compel him so to do. If you are unable to obtain possession of them, you will be obliged to trouble your last employer for a testimonial. Employers are often unjust to their servants in withholding references entrusted to them in good faith, as without these they may be unable to obtain another situation.

TOMATO; W. T. C. We find no fungus, but only imperfect ripening, from what cause we cannot say. It is very common.

WALNUT-LEAVES WITH GALLS; F. E. S. Caused by a mite—Phytoptus sps.

ALTERNATION IN THE VARIETAL CHARACTERS OF THE TOMATO.

IN 1898 I grew upon my house-plot in Washington a dozen reputed Aene Tomato plants, obtained from a local dealer, which matured and fruited well, and seemed to possess all the published characteristics of that variety. That is, the plants were large and diffuse; haulms somewhat numerous, long, and slender; foliage of a rather light green, the petiole and mid-rib long, leaflets petiolulate, somewhat distant, and only moderately rugose; fruit of medium size, depressed-globular, smooth, evenly ripened, changing from a light to a deep red, of fleshy consistence, and well-flavoured; a tinge of yellow on partially-ripened parts, but soon obscured by the dominant red. I saved seeds from fruit of several of these plants for future propagation, because I knew of no probable source of cross-pollination from other plants.

In 1899 I grew thirty plants from those seeds in my garden plot, and without exception they possessed identical characteristics,

but all differed materially in both habit and fruit from the parent plants; they were strong, sturdy, close-set plants; haulms comparatively few, short, and strong; leaves of a darker green than were those of the parent plants, and the petiole and midrib shorter; leaflets sessile, or nearly so, not distant, and strongly rugose; fruit, in size and shape, and consistence, similar to that of the parent plants, but more delicate in colour and flavour; no yellow tint appeared, and the change from the chlorophyll-green to the deep red or crimson of the ripe fruit was through a neutral or light flesh colour. In short, these plants supplied a strongly-marked variety, as different from the parent plants as any of the varieties of Tomato are from one another. This seemed to have been a case of the production of a new variety, but as I saved no seed, I supposed it was lost. In 1900 and 1901, however, I unexpectedly but exactly duplicated my experience of 1898 and 1899, although my second experience was with Aene plants, obtained from an entirely new source.

In March, 1900, I bought of the Robert Buist Company of seed-growers a packet of their "Selected Aene Tomato" seed, gathered in 1890, from which I grew thirty plants, saving a part of the contents of the packet until the next year. As in the former case, I know of no probable source of cross-pollination of these plants; all had the characteristics popularly attributed to the Aene variety, and were the same as those described in the first paragraph of this article. I therefore assume that my unauthenticated plants grown in 1898, and those grown in 1900 from the Buist seed, were genuine Aene Tomatoes. I saved seed from fruit of several different plants of this Aene crop of 1900, believing it to have received cross-fertilisation and carefully guarded it against admixture with other seed.

In the spring of 1901, I planted the seed of my previous year's crop of Aene Tomatoes, and separately, the remainder of the seed from the original Buist packet. The latter seed germinated well, although they were then about twenty months old, and produced Aene plants, as seed from the same packet had done the year before. The seed from my crop of Aene Tomatoes of 1900, however, produced an entirely different variety, all the plants having identical characters. Strange to say also, that variety is identical, both as to plant-habit and fruit, with the one which I produced from Aene seed in 1899. The Buist Aene plants and those of the new variety are now growing and fruiting in my garden-plot, exhibiting conspicuously their respective peculiarities.

The literature of the production of new varieties of cultivated plants, at least so far as the history of individual cases is concerned, seems to be meagre. I assume, however, that every new variety is produced empirically, if not accidentally, and by seed variation. I have heretofore also assumed that every variety originated in a single plant or a single bud; but in the cases recorded in the preceding paragraphs, all the plants of the crop possessed identical varietal characters, all different from those of the parent plants. I therefore designate these cases as alternations merely to distinguish them from ordinary variation of individual plants. I am well aware of the

remarkable character of the facts I have here recorded, but as I believe that every variety of every species of cultivated plants, and every breed of every species of domestic animals, exists potentially in the aggregate of their respective species, I think I am justified in assuming that any lost variety or breed may be reproduced under the same conditions which originally produced it. Charles A. White, Smithsonian Institution, Washington, July 15, 1901.

A MIDLAND GARDEN.

(continued from p. 85.)

GARDENING is an art full of complex details, and can not be satisfactorily taught by books alone. Experience and practice are necessary to every gardener. Even old experts are continually confronted with cases in which experience fails, and the right course must be guessed at. I am often surprised when I turn to a book on gardening for advice on some special point, to find that just that point is omitted. I turn to another and am still disappointed, to a third and find nearly the same words as before, for there is much copying. The small books have not room for details, and even the large ones cannot include everything. So small a matter as the age at which Leeks should be transplanted involved a wasted hour a short time ago. The book said "when old enough," but when is that? So at last I guessed at it, and now I have learnt by experience that I was too soon; the untransplanted ones are doing best. So again with Beet. The books say "thin and transplant when they have made six leaves," but omit to say whether the two cotyledons are to be counted. I planted out (two rows of the thinnings in warm dry weather, and although I watered them thoroughly, the hot sun shrivelled them up completely, so that I gave them up for lost. Two days later there was a good soaking rain, and two days after that the plants had lifted up every withered leaf, and were as perky as ever. It was the most wonderful resurrection I have ever seen.

There is some curious and unexplained difference in the vitality of plants. Some species if once allowed to flag from want of water will never recover, while others will stand drying up repeatedly, and some such as algae and mosses will recover after weeks of apparent death from drought. Does the difference lie in the nature of the protoplasm, or of the cell-walls, or of the root-hairs by which moisture is absorbed from the earth? The vitality of seeds also differs greatly. The seeds of some species will germinate even after thirty years if kept dry, although this is at present held to be about the maximum limit, while others must be sown within twelve months or they will inevitably die. The story of Wheat from an Egyptian mummy having been made to germinate is very improbable, and has never been actually proved. While seeds are still attached to the living plant a constant change of molecular structure is going on from nutrition and development. When the seed is ripe and becomes detached nutrition ceases, but it is evident that some molecular changes continue to take place. Even ripe seeds often have to be kept some time before they are ready to germinate, and if suitable conditions are not provided at that time degeneration will set in till a critical point is reached, when the seed perishes and germination becomes impossible.

Why is it that the watering of plants never seems to do them so much good as the natural rain? Probably there are several reasons. Rain-water is generally warmer than that

from springs or wells. It is better aerated, and contains more nitrogen. It falls on the leaf-surfaces, which are active absorbents of moisture, whereas artificial watering is often given only to the roots. It contains also a trace of alcohol dissolved from the air in its fall; and this substance, which is an active stimulant to animal tissues, no doubt has a value when applied in very small proportions to plants—for the vitality of plants is of the same nature as that of animals. The two divisions of the organic kingdom had probably a common origin, and although animals have developed along a higher plane, and reached a higher nervous structure, involving powers of mind denied to plants, yet there are many indications that plants possess a mental instinct not inferior to that displayed by animals of low organisation. The wonderful way in which roots will seek their food, climbers their supports, and flowers the best position for light and shelter, can only be explained as phenomena of instinct.

I have recently paid a visit to the gardens at Wanlip Hall, in this county, under the guidance of Mr. Parker, the head gardener, a very able young man. I was struck by the beauty of the pleasure-grounds, and the general superiority of the trees and shrubs and vegetables over those in my own little place.

Wanlip Hall has been in the family of the present owner, Sir Archdale Palmer, Bart., for 150 years, and many of its trees are magnificent specimens, a group of five limes and a remarkable Beech-tree being as fine as anything I have ever seen. Catalpas, Magnolias, and *Choisya ternata* were growing luxuriantly, and apparently without winter protection. The large and varied collection of hardy shrubs was particularly interesting. In one of the greenhouses there was an extraordinary crop of egg-shaped Tomatoes, and in another a grand assortment of Begonias, *F. T. Mott*, *F.R.G.S.*, *Birstal Hill*, *Leicester*.

THE ROSARY.

ROSES AT NEWTOWNARDS AND ELSEWHERE.

To-day I remind myself of the fact that my acquaintanceship with the National Rose Society has this year come of age, and that out of twenty-one metropolitan shows of the National Rose Society, it has been my privilege to attend all, with the exception of that of 1891. I have been comparing notes and impressions between the Temple Show of the National Rose Society just past, the first great Rose show of the century, with the first show of the National Rose Society I saw twenty-one years ago at South Kensington. Truly, the comparison is a favourable one! No longer have we to be content with simple long lines of green boxes, for to-day the eye is relieved by the garden Roses so delightfully shown; while, last but not least, who can forget that vision of beauty and elegant simplicity, Mrs. O. G. Orpen's table of white, silver, and gold, adorned alone with the beautiful single Rose *macrantha*—perhaps, if I may venture to say so, the most beautiful exhibit at this great and memorable gathering. Well might one and all admit that the new departure of the National Rose Society was a wise one; the objectless was a complete success, the weather glorious, and those who worked so long and earnestly deserve the thanks they earned.

The Roses I have seen throughout the Kingdom, both in the gardens and on the bench at Dublin, Hanley, the Temple, Gloucester,

Belensburgh, and Belfast, where my holidays and judging Roses for this year ends, were on the whole exceedingly good; but I was forcibly struck with the number of old varieties, so highly prized by all of us for exhibition and garden alike, that had disappeared from the scene, almost in every case to be replaced by the Hybrid Teas, of which *La France* was perhaps the first, although for so many years considered to be a Hybrid Perpetual.

During the last five or six years, everyone interested in Roses has noticed that as one of the older kinds falls out of either the garden or the catalogue, it is replaced by a Hybrid Tea, or, a Rose of that new race. That this beautiful and distinct race will furnish the Roses of the future was in the first place very definitely fixed in my mind from the fact that in every winning box of Roses coming before my notice for the last five or six years, I have found from six to eighteen of these Roses, blooms of the greatest beauty and refinement; while in the gardens that I have been able to see it was the same story—they were planted everywhere!

Being at Belfast, I took the opportunity to see Messrs. Dickson's nursery. I went with great expectations, quite prepared to find seedlings of much merit, most of them perhaps, if Teas, white or yellow; or if hybrid Teas, pink, white, or the lighter shades of rose. I, however, very soon found that I had made my reckoning without my host, for, contrary to the usual result of expecting much and receiving little, I was permitted to see and enjoy a treat I shall long remember, more especially, perhaps, the seedlings of 1898, 1899 and 1900, many of these flowering for the first time, that will be of great value either as exhibition, garden, button-hole, or climbing Roses, and of every conceivable colour—pure white to silvery-coral, peach to deep rose, scarlet to the velvety-red, darker even than *Horace Vernet*; rich yellow, toning down to chrome and old gold, while in almost every instance each and every shoot produced from one to half a dozen flower-buds.

A remarkable feature about all these Roses is their wonderful vigour without any degree of coarseness in growth, and their tendency to flower continuously; and it may be well to add that there are under trial to-day more than 3,000 distinct hybrid seedlings, and that each one before being sent out, or even placed before the world for its admiration or criticism, is subjected to a most exhaustive trial. Thus we learn for ourselves what an enormous task is year after year being done at Newtownards. My rosarian friends often wanted a good Rose like *Bessie Brown*, *Mrs. Edward Mawley*, *Killarney*, and *Margaret Dickson*, to lighten up their stands in days gone by when too great a number of sombre, dull, red Roses predominated in their stands. They can rest their souls in peace to-day, for as the Scottish lassie at Lucknow heard "that the Campbells were coming," they may with certainty know that in due course they will be able to obtain glorious crimson of varied type, class, and form, that will raise the standard and quality of the flowers staged.

As one who spent when a boy his first ten shillings on half-a-dozen dwarf Roses (it took a guinea in those days to buy a dozen dwarfs), and who also remembers the advent and history of John Hopper, the first Rose the writer ever possessed, I should like to pay a tribute of acknowledgment to these gentlemen who have done so much in raising and placing before the world some of the finest Roses ever raised. *W. J. Grant*.

ORCHID NOTES AND GLEANINGS.

ANGULOIA DUBIA.

FLOWERS of this rare and pretty *Anguloia* have been sent by Joseph Broome, Esq., Sunny Hill, Llandudno, and also a flower of the bright yellow *A. Clowesii* for comparison. *A. dubia* was described as n.sp., n.hyb. ? by Prof. Reichenbach in the *Gardeners' Chronicle*, June 10, 1882, who remarks: "At first sight the flower reminds one of a lemon-coloured *Anguloia uniflora*, covered on the inside of the sepals and petals with numerous minute purple spots." Prof. Reichenbach suggests that it might be a natural hybrid of *A. uniflora* and *A. Clowesii*, and examination seems to indicate its intermediate character between the species named. The flowers, like those of *A. uniflora*, are more compressed than *A. Clowesii*, and the spotting inside the pale yellow flower is very suggestive of *A. uniflora*. *Anguloias* are much liked at Sunny Hill, and as with most of the Orchids, Mr. A. C. Axtell, the gardener, there grows them up to their best. With the *Anguloias* is a spray of a very pretty form of *Oncidium luridum*, a flower of a very dark coloured *O. crispum grandiflorum*, and *Cattleya Leopoldi*. Apropos of the occasional flowering of natural hybrid *Anguloias* in gardens, it may be remarked that some time ago Mr. Broome-flowered *Anguloia intermedia*, a suggested cross between *A. Ruckeri* and *A. Clowesii*, the record having been proved by the cross having been raised in gardens. At the meeting of the Orchid Committee at Chiswick, July 16, E. Roberts, Esq., of Eltham (gr., Mr. Carr), also showed a fine plant of *A. Ruckeri*, which by the more globular form of its yellow flowers, uniformly spotted with reddish-brown, seemed like *A. intermedia*.

ODONTOGLOSSUM LUTEO-PURPUREUM.

Some excellent examples of this showy *Odontoglossum* are forwarded by Mr. A. C. Axtell, gr. to Joseph Broome, Esq., Sunny Hill, Llandudno. All the flowers are large and brightly coloured, the brown marking on the bright yellow ground colour varying considerably; in one instance the greater part of the sepals and petals is of a dark chocolate-brown, and the petals of a whitish ground colour at the base. The variety *platyglossum* has broad segments, blotched with a lighter tint of brown than the other flowers, and the spotting at the bases of the petals changes to a red colour. The primrose-yellow fringed lip of this variety has one large, and several smaller light brown blotches. Flowers of good varieties of *Odontoglossum crispum*, *O. gloriosum*, and *O. cristatum*, were also sent.

ZYGOPETALUM XANTHINUM MAJUS.

A very large and finely-coloured variety of the species generally known in gardens as *Promenaea citrina*, is now in flower at Mr. H. A. Tracy's nursery, Amynd Park Road, Twickenham. The flower, which seems abnormally large for such small pseudo-bulbs to produce, measures over 2½ inches across; the petals and the labellum being 1½ inch in length, and ¾ inch in width. The flower is of a bright chrome-yellow tint, and has purple spots on the base and side lobes of the lip. The plant passes into the collection of Mrs. Ida Brandt, Riosbach, Zurich, noted for its many fine specimens of the extensive genus *Zygopetalum*.

LISSOBILIUS KREBSII VAR. PERUVIATA.

Flowers of this showy *Natal* and Eastern African plant have been received from H. Rider Haggard, Esq., Ditchingham, Norfolk, who has so interestingly and graphically set forth in his books the features of the country which the plant inhabits. The plant is *Phaius*-like in

habit, and has an erect inflorescence of many showy flowers about 1 in. across. The sepals have a greenish ground colour mottled with purple; the broadly-ovate petals which constitute the showy part of the flower are creamy-white on the face, and butternut-yellow on the exterior surface, an arrangement of colour which gives the flower a very striking and novel appearance; the lip is tinged with purple on the side lobes and base of the front lobe, the blade of which is yellow, the margins reflexed. It grows well as a terrestrial Orchid in a cool-house.

CYPRIPEDIUM FANSONI.

This beautiful hybrid, which was named in honour of Mr. Fanson, the indefatigable chief of the Orchid department of Messrs. Hugh Low & Co., is one of the finest of *C. Rothschildianum* crosses, the other parent being *C. × Morganii* (superbicus Stone), and in it the finest characters of *C. Stonei* appear with happy effect. The plant secured a First-class Certificate at the Royal Horticultural Society when it was first shown by Messrs. Hugh Low & Co., June 28, 1898; and a splendid flower now sent by Capt. G. W. Laws-Schofield, New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Shill), shows its beauties still more intensified. The large white upper and lower sepals are evenly striped with purple. The downward-curved petals are 5 inches long, and, in at the widest, ivory white, handsomely blotched with claret-purple. The large labellum is whitish with rose-coloured face, and the lemon-yellow crest covered with rose-coloured down shows a curious combination of the features of the species used in its production.

between the parents in colouring, and are almost copper-yellow, although they vary a little in different positions. *M. Burneti*, which was raised by Dr. Burnet, of Aberdeen, is considerably harder than *M. cupressus*, and will be found to thrive in districts where the Chilean *Mimulus* does not. *S. Arnott, Caresthorpe-by-Dunfriess.*

FLORISTS' FLOWERS.

PANSIES.

It was interesting to see the old-fashioned English show Pansies staged in such good character by Messrs. Dobbie & Co., of Rothesay, at a recent meeting of the Royal Horticultural Society. It was a reminder of the time—now forty years ago—when this type of Pansy was the only one grown; before the fine Belgian varieties had come to us from M. Mieliez, of Lille, and the Viola had attracted attention. At that time, the show Pansy was one of the leading florists' flowers at the Royal Nurseries, Slough; hundreds of seedlings were annually raised, and though the quality was high, the existing standard, as shown by the varieties then in cultivation for exhibition purposes, was high also, and but very few were selected for naming. At that time the best of the seedlings, when they had an expanded bloom upon them, were carefully lifted from the bed with some soil about the roots, each plant carefully wrapped in a fold of paper with damp moss, and named, securely packed so that the blooms should not be injured, and sent up to the Central Avenue in Covent Garden Market, where they were exposed for sale.

The visitor to Covent Garden Market in the present day can scarcely find an English Pansy in it; the large and striking fancy varieties having taken their place. The first attempts at developing the striped and blotched fancy Pansies were made by Mr. John Sutter when an amateur at Shepherd's Bush. Going over to France in the early forties to establish himself in business at Versailles, he took with him the best of the fancy flowers he had obtained, and while there, led them on to higher development; and it is natural to suppose some of them found their way into the hands of M. Mieliez at Lille, who in his turn raised them to higher levels, and sent them to Messrs. E. G. Henderson & Son, of the Wellington Road Nurseries, St. John's Wood, who had them grown in Yorkshire by the late Mr. William Dean, and he at once set about raising seedlings and distributing them, and by these means the race became widely known and extensively cultivated. In April and May these showy Pansies can be seen in our markets, and on the stalls and barrows of the costermongers in the streets.

The refined English show Pansies will always have a fascination for the florists. So long as the fancy varieties have large, stout, well-marked flowers, it is enough. The old-fashioned show Pansies have to conform to certain standards, written and traditional, and their advance is very slow. Their refinement will always charm. In growth the plants, though mainly vigorous in habit where properly cultivated, are more compact, tufted, and spreading, as a rule quite as free of bloom. Last autumn I divided and replanted some named show and fancy varieties; they stood the winter remarkably well, but the show varieties were decidedly the earliest to flower in the spring. Both have stood the drought exceedingly well, but having been planted early in deeply dug ground, they no doubt rooted deeply, hence their ability to stand the hot, drying weather.

The show Pansies are divided into selfs, yellow grounds, and white grounds. The self flowers are further divided into dark, white, primrose, and yellow selfs; in the centre of each is a bold, dense, well defined blotch; and this blotch should not appear to radiate into lines on its outer edge. Three very good dark selfs were in Messrs. Dobbie's collection, viz., Dr. Inch, J. T. Howard, and Allan Stewart, and while quite distinct one from the other, they were all shades of dark mulberry, depending to maroon, stout, and well formed. The cream or white selfs were represented by two varieties, Annie Blair and Bobby Harper. James Bell is a yellow self, large, and of good properties; Annie D. Lister is an attractive primrose self.

The showy yellow grounds, the yellow contrasting so finely with the dark marginal tints, were represented by Bushy Yellows, deep yellow; John Kirkwood, new of 1901, a very fine variety; and Robert M. Wenley.

A selection of a dozen of the finest fancy Pansies will be found in the following:—William Maxwell, large, blue blotches, edged on the petals with white and rose; and W. P. A. Smyth, bluish-purple blotches, edged pale yellow and rose, both new of 1901; Agnes Mabel, purple blotches, with a combination of white, purple, and rose, a very fine variety; Colonel M. R. G. Buchanan, one of the finest fancy Pansies ever raised, having a very striking combination of colours; David Gold McKay, plum-crimson and white, a fine exhibition flower; David Russell, a large yellow self, with solid black blotches; James Campbell, dense violet blotches, margined with clear sulphur; Lady Sybil, an immense cream self, with glossy mauve blotches; John Menzies, dark blotches, purple and white; Miss Noil, a large and striking flower, marked with crimson, purple, and white; Mrs. Wm. Steel, bluish-purple, cream, and light purple, extra fine; and Tom Walters, a combination of purple, red, rich yellow, and light maroon, extra fine.

Additions of new varieties are annually made to the fancy section, but the actual advance seems to be more lateral than forward. Here in the south we have few opportunities of comparing the new with the old. In Covent Garden market in early spring it is possible to see trays of plants of very fine varieties, which are seen to the best advantage, because bloomed mainly under glass. They are propagated by means of cuttings and root division. They are purchased and planted, but many die, not because they lack constitutional vigour, but because they are imperfectly planted and left to fate. If the ball of roots be gently opened out, planted in moist, well-prepared soil, with some grit about the roots to encourage action, lightly sprinkled overhead for a few days, and shaded from the sun, there is no reason why they should not do well and become objects of beauty in the garden. *R. D.*

CONTINENTAL NOVELTIES.

A NOVELTY IN GRAPES.

According to *Le Jardin*, Mr. J. Riffault, of Chalons-sur-Marne, has succeeded in raising a new variety from that much-valued Grape, Gros Coulard, syc. Chasselas Gros Coulard, which is greatly superior to the seed-parent. This novelty, after several years' trials, has shown great hardiness as against frost, and great fruitfulness. The berries are of a very large size, of a golden-yellow tint, and possess a delicious flavour. The fruit ripens earlier than Chasselas de Fontainebleau, and can be preserved till June. This new Grape will be introduced to commerce either this autumn or the next by the firm of Gilbert & Prendeur, of Chalons-sur-Marne.

FIG. 33. MIMULUS BURNETII (LITTLE'S) FERTENSIS.

MIMULUS BURNETI ×.

This desirable hybrid *Mimulus* (fig. 33) I owe to the kindness of Mr. Robert Lindsay, of Kaines Lodge, in whose garden I saw it in bloom last year. It is a hybrid between the well-known *M. luteus*, a doubtful native plant or an escape from cultivation, and the Chilean *M. cupressus*, which has been widely cultivated. When grown in a dryish border of sandy peat, where the plant figured was cultivated, it develops a good deal of the habit of *M. luteus*, and is more erect-growing than its other parent, although not so tall as the first, as will be seen from the figure. A plant in a boggy piece of soil, close to a tank for Nymphsias, is of more tufted growth, and in Mr. Lindsay's rock-garden it was scarcely so tall as the specimen shown. The flowers are intermediate

ARCTOTIS STECHADIFOLIA.

This species, also known as *A. grandis*, was shown recently by Mr. A. W. Wade, of the Riverside Nursery, Colechester, and we have also received specimens from Mr. Gumbleton. It is a dwarf, shrubby Composite, with angular, hollow stems, covered, like the leaves, with grey down. The leaves are nearly sessile, oblanceolate, remotely toothed, and gradually tapering to the base. The flower-heads are surrounded by an involucre of several rows of scales, the inner ones twice the length of the outer ones, and somewhat membranous; the ray-florets are whitish, shaded with blue. The plant is very attractive (fig. 31), and deserved the Award of Merit it obtained; but it was introduced as long ago as 1799, and suffered, we presume, to go out of cultivation, as it is not included in Nicholson's Dictionary.

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 88—91.)

The following extracts from remarks kindly sent us by our correspondents who contributed to the Table of Reports published in the last issue of the *Gardeners' Chronicle* are interesting, as they explain in some cases why the crops in particular districts have been good or bad. Observations upon experiences with varieties of fruits under stated conditions are always valuable. It should be remembered that the following notes were written during the third and last weeks in July, and since then the severe drought, of which almost all our correspondents complain, has been succeeded in many districts by copious supplies of rain. We therefore refrain from repeating many notes relative to the great need of rain then experienced, the circumstances being no longer the same.

0. SCOTLAND, X.

MORAY OR ELGINSHIRE.—The fruit crops, with the exception of Apples, are as good as possible. Apples gave every promise of an abundant crop, until the gales in June destroyed the flowers as the fruits were beginning to set. *Thos. Macdonald, Balfour Castle Gardens, Kirkwall.*

SUTHERLANDSHIRE.—Apples are a poor crop, except on young trees. Pears, Plums, and early Strawberries have also light crops, but Elton Pine, our best late Strawberry, particularly in light soil, had an excellent crop. *D. McVellie, Dunrobin Castle Gardens, Sutherland.*

1. SCOTLAND, E.

ABERDEENSHIRE.—Whilst some Apple-trees on walls have a large crop of fruit, standards in general have little. Pears are only grown on walls here, and they have a poor crop, but the fruits will be of good quality. Plums are good; but Cherries are a thin crop, and the fruit is inferior. Strawberries and small fruits, with the exception of Black Currants, are plentiful. *John Forrest, Haddo House Gardens, Aberdeen.*

—The fruit crops in this district are somewhat variable. We had a good show of blossom, but a great deal of it failed to set. Apples, Pears, and Plums are much under the average. *John Brown, Delgaty Castle Gardens.*

BAFFINSHIRE.—The fruit prospects were very promising; buds and blossoms were plentiful; but there followed a very severe fortnight in the month of March, with bitter cold winds and continuous frost—on several occasions nearly 20°. Pollen was very deficient in blossoms of all kinds, no doubt owing to the buds

having been but imperfectly ripened. I never saw crops here more in need of rain, with the thermometer standing over 80 in the shade daily. *J. Fraser Smith, Cullen Gardens, Cullen.*

BERWICKSHIRE.—The Apple crop is the smallest for some years, owing to dull, cold weather having prevented the blossoms from setting. Lane's Prince Albert and Stirling Castle are exceptions, and bear good crops. Pears look well. *Dominic du Comice* is still our best Pear on the wall. *John Cairns, The Birsal Gardens, Coldstream.*

FIFEHIRE.—Large fruits are very disappointing after such a grand show of blossom. *Wm. Henderson, Balbirnie Gardens, Markinch.*

—The fruit crops in the middle and eastern districts of Fife shire are extremely variable, crops of certain kinds being heavy and light in the same locality. Plums are very thin; while Pears, such as *Bourre d'Amalins* and *Louise Bonne* of Jersey are heavy on bush and thin on wall-trees. Large-fruited Apples, especially *Codlins*, are cropped best, and the only blanks among these are among trees which were not sufficiently thinned last season. Gooseberries and Black Currants are scarce, while the Red and White varieties of Currants are abundant. On the whole, average crops will be the general rule, but owing to the heat experienced lately, the size and quality will be good, should the needed moisture come soon. *W. Williamson, Tarril Gardens, Cupar.*

FORFARSHIRE.—In the gardens here there is a good average crop. Apples had very favourable weather when in bloom, and set well, but many trees, even after thinning, have shed a good quantity of fruit, doubtless owing to the very dry season. Small fruits are plentiful, with the exception of Black Currants. Strawberries have been a very heavy crop, and there was no waste this season from damp or slugs. Of course, Royal Sovereign in the best of seasons has a lot of moulded berries, but there is always plenty left, it bears so well. *W. McDonald, Brechin Castle Gardens.*

—The fruit crop is a very good one, Gooseberries, however, have suffered somewhat from the ravages of caterpillars. Strawberries on light soils are small, owing to continued drought, but as a rule are plentiful and of good quality. Wall-trees and orchard fruits are looking well, and give promise of a good harvest. *Thos. Wilson, Glamis Castle Gardens.*

HADDINGTONSHIRE.—The present is another abundantly fruitful year, only Apricots and Apples being slightly under average, and the quality promises well. The abnormal drought and great heat have considerably damaged the Strawberry and small fruit crops, late Strawberries failing to swell, and the earlier were very quickly over. I have never seen Pears larger and finer. *R. P. Bootherton, Tyninghame Gardens, Preslandick.*

—The fruit crop is not so good as was expected, owing to the very dry weather experienced in this district. In the month of May we had rain on ten days, measuring 2.1-16 inches; for the month of June, rain fell on nine days, with a total of 1.1-13 inches; and during this month (July), up to date, rain has only fallen on two days, the 6th and the 11th, measuring an 18th and a 10th of an inch respectively. Although Strawberries have been good, there was a promise of a splendid crop, had there been more rain. Small fruits are a very good crop. *George Taylor, Breanmouth Park Gardens, Dunbar.*

—I do not remember having seen fruit-trees of all descriptions more profusely flowered; and they were fortunate, except in the case of Apricots, Peaches, and the earliest Pears, to escape the severe frosts at the end of March and early in April; consequently the prospects of a good fruit harvest are very promising. The ravages of insect pests have been severe, especially in gardens where no preventive measures in the way of spraying have been adopted; the hot, dry weather, and absence of even occasional showers, favouring the increase of enemies of plant-life. *Thos. H. Cook, Gosford Gardens, Longquidry.*

KINCARDINESHIRE.—Although most of the fruit-trees showed plenty of blossom they set very badly, owing, I think, to the wood having not been sufficiently well ripened last year. This has also been a bad year for caterpillar, and green and black fly. We had quite a gale, accompanied by intense cold, about the beginning of June, which swept much of the newly-set fruit off the trees. *John M. Brown, The Gardens, Blackhall Castle, Banochry.*

MIDLOTHIAN.—Orchard trees in this district had an unusual wealth of blossom, but the weather at the time was sunless, north-east winds prevailing, with a continuation of very low night temperatures, the result being that the set of fruit was disappointing. Varieties of Apples that bore well last year have no fruits this season—*Blenheim Orange* for instance. Varieties poor last year are good this, such as *Warner's King*. Pears are a good crop; Victoria Plums are heavy; Apricots medium; small fruits of all kinds are a very heavy crop; Strawberries were extra fine in crop and quality. *James Whylock, Dalkeith Gardens, Midlothian.*

PERTHSHIRE.—Plums are a remarkably heavy crop, especially the following varieties: Victoria, Kirk's, Jefferson, and Pond's Seedling. These had all to be heavily thinned. Cherries are also abundant, and of grand quality, the most prolific being *May Duke*, *Elton*, *Governor Wood*, *Late Duke*, *Welder's Early Black*, *White Heart*, and *Morshos*. *M. McIntyre, The Glen Gardens, Innerleithen.*

6. SCOTLAND, W.

AVESHIRE.—The fruit crops here are decidedly the best that have been for the last ten or more years. *D. Buchanan, Burgangy Gardens, Dalry.*

—Apples, Pears, and Plums, owing to good weather in the month of May, have very fine crops, and I never saw the foliage and fruit in such a clean state. Bush-fruit is also very good, and the foliage healthy. *David Murray, Culzean Gardens, Muighole.*

DUMFRIESHIRE.—Strawberries were a heavy crop. *Royal Sovereign*, *Monarch*, *Fillbasket*, *Trafalgar*, *Waterloo*, and *Latest-of-All* have done well, and kept up a succession in the order given. Apples look well, and are an average crop. *John Urquhart, Haddon Castle Gardens, Ecclecleuchan.*

—With regard to Apples and Pears, in the south-west of Scotland it is a very noticeable fact that many varieties bear naturally heavy crops every alternate year; and as far as the amount of crop is concerned, this is the year of small things. There are a few varieties of Apples that disregard this rule, and on kinds such as *Dutch Collin*, *Keswick Collin*, *Ecklinville*, *Lord Salfield*, *Warner's King*, *Hawthornden*, *Northern Greening*, *Duchess of Oldenburgh*, *Cellini*, &c., the trees in most cases are very healthy, and the quality of the fruit promises to be very good. Stone fruits

FIG. 31. ARCTOTIS STUECHADIIFOLIA (GRANDIS).

From a specimen shown at Chiswick, by Mr. A. W. Wads, July 16, 1861. (See p. 152)

such as Plums, Cherries, Peaches, Nectarines, and Apricots, are bearing a very good average crop. Small bush fruits are giving a very satisfactory return this year, and the weather being dry and warm, they are being gathered in excellent condition. Strawberries were a first-class crop. Rarely do we have weather that allows us to secure this crop in such fine condition as we have done this year. *John Mackinnon, Terregles, Dumfries.*

WILTSHIRE.—Apples are slightly below the average, but promise well for size and quality. Pears and Plums are heavy crops; small fruits abundant, and owing to the dry weather have ripened well. Strawberries have suffered somewhat from want of moisture, and later crops from this cause have not fulfilled earlier expectations. Figs are a heavy crop, and well advanced. Peaches and Nectarines thin, but healthy. *James Day, Galloway House Gardens.*

2. ENGLAND, N.E.

DURHAM.—Apples suffered attacks from fly and caterpillar during the time they were in blossom, and many fruits subsequently fell from the trees. *R. Draper, Seaham Hall Gardens, Seaham Harbour.*

NORTH MERLAND.—The Strawberry crops in this northern district have been enormous, and the quality was excellent. Owing to the immense crop of Apples there was last year, the crop is generally small this year. Plums and small fruits are very abundant. *James Noble, Woodburn Gardens, Darlington.*

YORKSHIRE.—Apples suffered from caterpillars and fly during and after the flowering season. Pears were spoiled by the caterpillars attacking the inside of the fruits. Gooseberries and Currant-trees bear heavy crops, and are free from the leaf-eating caterpillar. *Jno. McClelland, Ribston Hall Gardens, Wetherby.*

In this district the Apple crop is very much under average, and the trees are looking badly, having suffered much from American-blight and caterpillar. In some places there are plenty of Plums, in others none. Pear-trees bear a good crop, and the trees look well. Cherries are good and clean; bush fruits abundant and good. Strawberries have been a splendid crop here; they are strawed early, and when in flower were afforded a good watering. A fresh plantation is made every year, and this gives the finest fruits. Varieties grown are Black Prince, Royal Sovereign, Noble, President, Sir J. Paxton, Gunton Park, which is excellent now (July 19), and for preserving the old Grove End Scarlet is still the best. One of the most satisfactory fruits grown here this dry season is the Logan Berry, it is a very valuable addition to our hardy fruits, with a distinct flavour of Blackberry, Raspberry, and a dash of something you have not tasted before. When the fruits are thoroughly ripe and black, they make a fine dish for dessert, always rather sour, but very agreeable. They are excellent when cooked in any way, whether cold or hot, so long as the flavour is not spoiled by too much sugar. It was planted here two seasons ago between a row of Apple trees in one of the fruit quarters, about two yards apart. The growth last season was very strong, and they have borne abundance of fine fruit, the slight shade of the Apple trees seems to have been favourable to them those two dry seasons. They are as strong as the strongest Brambles. The fruit is much appreciated here, and will have to be grown extensively in the future; it is a handsome fruit when well grown, and black, about twice the size of the ordinary Raspberry. In

gathering, the fruit does not part from the stalk like the Raspberry. *Baileys Woods, Udsall Gardens, York.*

— Never had a more abundant crop of Strawberries, nor finer fruits of Royal Sovereign, Héricart du Thury, and Elton Pine—the latter just coming in (July 20); others over. *J. Simpson, Stamford, Sheffield.*

— Owing to the drought, Raspberries and Strawberries have severely suffered. Gooseberries have been attacked badly by caterpillars; in many instances not a leaf is left. Other fruits look remarkably well. *John Suell, The Gardens, Farley Hall, Otley.*

— Apple-trees carried so heavy a crop last year it has left them less productive for the present season; some trees showed very little blossom, and the cold east winds prevailing at the time the fruits were setting, caused most of them to drop off. Pears set a good crop, but much damage has been done them by caterpillars, which have eaten the heart of the fruits away. *John Alsop, Bolton Holme Gardens, Beverley.*

— The fruit crops in this neighbourhood are disappointing; most trees blossomed well, but there is not much fruit. Apples make a poor show, many fine-bearing varieties, such as New Hawthorned, Lane's Prince Albert, and Lord Grosvenor, not having a fruit on them. Pears are a fair average, some kinds bearing well. Plums are very irregular, but generally under the average. Strawberries dried up instead of ripening. Small fruits are abundant and good. Insect pests are very prevalent. *J. S. V. Cox, Wigginton Gardens, York.*

(To be continued.)

FOREIGN CORRESPONDENCE.

ITALIAN METHOD OF COOKING THE FRUITS OF LAGENARIA.

We have read your note on "Botanical Vegetables," published in the *Gardeners' Chronicle* on July 6, concerning *Lagenaria leucantha longissima*, but we think the way of preparing this dish as indicated is not much used in Southern Italy, where the fruit is mostly prepared as follows:—Cut them into pieces about 3 inches long, take out the seeds, and fill with a stuffing of mince-hashed meat, &c., then boil or bake, and serve with a Tomato sauce. This is really not a bad dish. The flowers of several kinds of Gourds also are made use of. They are dipped into a paste made of flour and eggs, and then fried in oil or fat, furnishing also a dainty dish. *Dennmann.*

JAPANESE VEGETABLE PRODUCTS, SOY BEANS, AND RUSH MATTING.

As an instance of the amount a bye-product may be made to realise, a statement made by the British Consul at Biogo and Osaka may be of interest. It is a fact well known that Soy, which is so much used in this country as the base of many of our well-known table sauces, is obtained by boiling the beans of *Glycine hispida* with an equal quantity of ground Barley or Wheat, and leaving it covered twenty-four hours to ferment, after which salt is added and more water, the whole is stirred at least once daily for a period of about two months, when the liquid is poured off, filtered, and kept in wooden vessels, becoming brighter, clearer, and of better quality by keeping. It is exported from China and Japan in considerable quantities. From the small beans also a large quantity of oil is expressed, which is of a sweet and pleasant taste. It is used for burning, and generally for edible purposes. For the preparation of Soy, over 2750,000 worth of beans were imported into Biogo and

Osaka during the year 1899. Four-fifths of this supply were derived from China, the remaining fifth from Corea. The residue after the expression of the oil is made into large round cakes, similar in shape and nearly as large as a grindstone, weighing about 60 lbs. These are used chiefly for manuring the wet Rice-fields, but an increasingly large quantity is used for food for cattle. The value of the bean-cake or oil-cake, as it is otherwise called, imported into Biogo in 1899 was close upon 2350,000, being a good half of the total intake for the whole empire. The value of these two forms of bean-produce was thus over 21,100,000.

The well known Rush-matting, which form such an excellent floor covering, especially in summer, and is made from the culms of *Cyperus tetragonis*, is said to have shown a slight falling off during the year under review, but the exports were still well over half a million rolls, of the value of 2375,000. The price is gradually rising, owing to the increasing scarcity of the Rush. The higher grades of this handsome floor covering have nearly disappeared, owing to the operation of the United States tariff, which imposes a very heavy duty on grades costing more than 16s. per roll. Hence, more than 70 per cent. of the total quantity manufactured is of the inferior grade, costing just under that margin.

In the same report from which the foregoing information is obtained, a curious light is thrown on the manufacture of those rugs and carpets which have appeared in our shops under the name of Sakai rugs; these are said to be made of cotton, hemp, and wool, and the bulk of the cheaper sorts were formerly made mostly from old gunny-bags obtained from India; but in consequence of the prevalence of the plague at Bombay a year ago, the shipment of these bags was stopped, and the manufacturers are now "falling back on the canvas wrappers of American bales of cotton." As this kind of goods were getting into disrepute in America, a guild was formed to frame precautions against this inferior work being produced in future. London, it is said, now takes more than three-fourths of the output; the profits, however, are so exceedingly small at Sakai, that the production of the rugs is declining. *John R. Jackson, Kew.*

MARKET GARDENING.

FIELD TOMATOS.

So far as I am able to form an opinion, the crop of field Tomatos is most satisfactory in every respect, the plants being sturdy, clean, and furnished with large clusters of fruits, many of which consist of twelve fruits each. I am referring to plants which have been properly attended to in the way of stringing them up to the wires and removing of all lateral growths at the right time; the plants being stopped at the third or fourth cluster. Owing to the beneficial effect of the recent and much-needed rains, the fruits are swelling up and ripening well. In order to help in this direction, all side growths should be kept pinched, and the large, compound leaves should be cut back to within two or three leaflets, so as to let plenty of light and sunshine reach the fruits.

In marketing the fruit, the latter should be picked under-ripe, graded, and packed in pecks lined with three half-sheets of blue tissue-paper, the ends being turned down over the fruit, and secured in position with two or three cross-ties of raffia. The quality of the fruit being indicated on the address-label attached to each peck as first, second, or

third, as the case may be. Each peck will hold 12 lb. of fruit when filled up to the rim, the peck measure itself weighing 2 lb. However, each peck should be placed on the scale to see that the weight is right before tying down the paper in readiness for despatching to market, the pecks being packed one above the other in the cart as well as in the railway-vans in perfect safety as regards the fruit contained therein. *H. W. Ward, Essex, August 5, 1901.*

TREES AND SHRUBS.

COTONEASTER HORIZONTALIS.

This distinct-looking shrub is a conspicuous object at the front of the conservatory at Gumbesbury House. It has a flat and fan-shaped habit of growth, which justifies its specific name, the branches with their many shoots spreading horizontally. The shrub has a pleasing aspect when the fresh green foliage appears in the spring, when the numerous blossoms appear; and finally when the fruits colour, and assume their rich autumn tints. The plant thus possesses decorative value for nine months in the year. *R. D.*

SPECIES OF CRATEGUS.

In the last number of the *Revue Horticole*, M. Henry gives full descriptions of three species, viz., *Crataegus Korolkowi*, *C. pinnatifida*, and *C. pentagyna*; *C. Korolkowi* has pinnately-lobed leaves and yellowish fruit, of the size of small Peas, which ripen early; *C. pinnatifida* has the leaves less divided, and the scarlet fruits are sometimes turbinate, sometimes globular (see *Gardeners' Chronicle*, 1896, p. 620). *C. pentagyna* has less deeply divided leaves, and small subglobose, purplish-brown fruits.

NOTICES OF BOOKS.

THE SOUTH SEA ISLANDS.

A BROCHURE composed of Notes of a Holiday Cruise among the South Sea Islands has reached us from Mr. R. Cheeseman, Brighton Nurseries, Victoria. The publication is the more pleasing by being written primarily for a smaller public than that to whom it is now (by request) addressed; so that while the writer lays no claim to being "thorough and exhaustive," he cannot be charged with "book-making." He says that:—"These beautiful islands (the new Hebrides group) and their fast-decaying races, were very interesting to me. . . . Islands that should be looked upon as every part of our island continent, and should by every means in our power be retained."

Mr. Cheeseman, who travelled in company with Mr. Peter Burr, has an eye for the botany of the country round which he travels. We are told that:—"From Lord Howe Island alone are obtained the famous Kentia Palms, used so extensively throughout the world for decorative purposes. Kentias *Fosteriana* and *Behoreana* grow on the coast, and for some distance up the hills. *K. Canterburyana* grows towards the tops of the mountains, and *K. Moorei* on the extreme tops, which are usually in the clouds. The climate is genial and moist. There is no evidence of an aboriginal population in this island. The present inhabitants—all whites—number 109. They are all engaged in collecting Palms and Palm-seeds for export. The seeds are collected all the year round. About 20 tons were brought to Sydney by the *Menapue* on our return, for re-shipment to Melbourne."

Leaving that neighbourhood the author moves on to find that, on Norfolk Island, "the well-known Norfolk Island Pine grows everywhere, on the tops of the hills, and down to the water's edge. We measured one—22 feet in circumference 6 feet from the ground. It grows to a great height, is pyramidal, and clothed with branches almost to the ground. Fugosia Pattersoni is quite a timber tree here. Both should prove valuable for coast planting."

In and out among the islands went our traveller, making ninety calls in very brief time. "Our first call is at Anclauhat Harbour, Anclium . . . where much of the soil is rich, and the vegetation very rank, and difficult to penetrate. Crotons grow from 15 to 20 feet high. They are very conspicuous objects in the forest. Some are coloured dark crimson, almost black, others scarlet and yellow, and yellow. They are all seedlings, and some reproduce themselves. The majority of the young seedlings seen about were green, many of them with traces of variegation, which will probably intensify as they age. The beautiful Tree Fern, *Alsophila excelsa*, grows abundantly to a height of 60 feet; the stems are thin but strong—they grow very rapidly here."

These extracts suffice to show the style of the pamphlet, and will, we trust, induce British readers also to take an active interest in islands of which it can only be said that they are as valuable as they are beautiful.

FLOWERS AND GARDENS: NOTES ON PLANT BEAUTY. By Forbes Watson. Edited, with a preface, by the Rev. Canon Ellacombe. (John Lane; The Bodley Head, London and New York.)

MR. WATSON'S book was written during his last illness, when, conscious of the approaching end, he completed it with matter nearest to his hand, rather than with amended materials for which he had no time to seek. So says his friend and first editor, J. B. Paton. We have now a re-issue of the book, edited by Canon Ellacombe, and after the thirty years that have elapsed since its first appearance, it is pleasant to see it again.

Mr. Watson was a pioneer, and a bold one. He had no patience with formal bedding (in his day the great feature in gardening), or with the distorted productions of the florist. For him the best flowers were, if not actually those of the hedgerow and copse, at any rate those which were thoroughly at home under captivity, and so seemed in sympathy with their environment. As an advanced thinker on these subjects, and one fighting against the egot Public Opinion, Mr. Watson is certain to positiveness, and assertive to aggressiveness, with no sympathy for half-measures, nor for those who differed from him. The carefully-chosen words of a poet are but food for his scorn when he chooses to disagree with them; and so, indeed, are other authorities.

Flowers and Gardens shows the progress of the last thirty years very clearly. Much of the system inveighed against has faded, forgotten and unnoticed, and a more natural style is preferred, and we may add that the careful grammar and somewhat fantastic imagery of the author reads nowadays like what is known as "fine writing," the flow of adjectives being curiously typical of an elaborate and now somewhat old-fashioned style.

But it is to the intentions we must look, and if Mr. Watson's flights of fancy are not to be followed by us, we can thoroughly appreciate his earnest and then original wish, not merely to encourage natural rather than artificial

effects, and to draw attention to details of beauty individually, and as part of one great scheme, but finally to see, in that oft-quoted "Primrose by a river's brim," food or meditation and original thought and graceful healthy fancies.

HEADINGTON-HILL HALL.

HEADINGTON-HILL Hall, Oxford, the residence of George Herbert Morrell, Esq., M.P., is a mansion in the Italian style, massive and rich in architectural embellishments, erected about 1860. The house occupies a commanding position on the crest of the hill bearing its name, in the midst of gardens, and, surrounded as it is by a series of grandly-formed terraces, walks, and shrubberies, forms a noble adjunct to the old university city, whose ancient and modern buildings lie at its feet, enshrouded with the foliage of the stately Elms, &c., in the several college gardens and groves.

The park and gardens possess many fine timber trees, but are most famous for the extensive and choice collection of Conifers, planted in 1856-57, under the direction of the late Mr. W. H. Baxter, Curator of the Oxford Botanic Garden, who laid out the grounds, and harmoniously disposed some 150 forms, including of *Abies* 12 varieties, *Acers* 6, *Cupressus* 8, *Junipers* 25, *Magnolias* 6, *Piceas* 10, *Pinus* 10, *Thuja*s 5, and *Wellingtonias* 12; these last-named have attained to over 50 feet in height, with a 19 feet spread of the lower branches.

The park is divided by two main roads, but a large portion, with the 4 acres of kitchen-garden, are connected by an open-work ornamental girder bridge, resting on colossal rugged masonry, spanning the coach road to London; the south park being in a measure entirely detached.

There are two lodge entrances, furnished with noble wrought-iron gates in flagstone work; and from the lower or Oxford lodge, a boldly sweeping carriage-drive leads up to the house to the well-dressed grounds. A pleasing expanse of lawn, well broken but not crowded with groups of shrubs, ascends gently to the terraces on the south and west fronts, the ground from thence rising abruptly.

The grand entrance to the house has a somewhat plain appearance, every view being shut out by a steep laurel-hedged bank 200 yards long and 25 feet deep, the broad walk above it, some 19 feet wide, forming a delightfully cool promenade beneath the shade of stately Elms and Yews, and which forms a protection to the terraces on the north and east. The terraces are well formed, the slope being rendered exceedingly easy for bedding purposes. On the widest terrace is a fountain formed of four nymphs' heads supporting a shell, down which the crystal fluid descends in copious streams to a massive circular basin.

One great advantage the display has is its position, and the splendid background of the noble Elms which overshade the wide, deep, sloping "Laurel bank" that stretches the whole width of the lawns and house, forms a charming perspective. All around are to be seen towering *Sequoia gigantea*, Cedars, standard *Robinias*, Irish Yews, and close-trimmed standard Hollies. These give the place a unique appearance, inasmuch as there is no other such residence or garden situate on a sloping hill-side overlooking the University city with its groups of towers and spires. Surveying the scene from the upper terrace, and descending the broad flight of stone steps which divides the Laurel bank into equal portions, we encounter half a dozen specimens of

the Chili Pine (*Araucaria imbricata*), whose rigid or horizontal, large, flat, sharp-pointed, glossy green leaves give the trees a most majestic appearance, and one very fine specimen stands on the terrace near the mansion. On this plat there are two long, angular beds filled with the golden tri-color zonal *Pelargonium Mrs. Pollock*; two other beds are occupied with white *Marguerite* Daisies mixed with the dwarf fragrant *Heliotropium peruvianum*, some tree-like examples of the same being set as dot-plants. A central circular bed has a specimen *Dracena australis*, surrounded by a massing of the brilliant scarlet *Begonia Vesuvius*, the edging of this bed being a dense margin of white and green variegated *Eunymus*.

The fountain terrace is a stage lower, and here are twenty-two beds to pattern, set out between and around a dozen standard *Robinia* incensis, whose umbrella-shaped heads afford but little shade to the dwarfier subjects enclosing their stems. The two centre circular beds are edged with the trailing yellow-flowered *Stoncrop*, *Sedum* acre, encompassing a massing of *Violas* in variety. The other beds consist partly of flowering and partly of carpet plants in considerable variety.

North-west of the mansion, between some *Sequoia gigantea* and the half-dozen closely-trained standard Hollies, runs a long semi-circular bed of dwarf Rose trees; and disposed on the lawn are beds of *Petunias*, double white Stocks, French Marigolds, and dwarf bronzy-leaved zonal *Pelargoniums*, &c., the beds of *Asters* being margined by a double line of ruby-coloured *Sedum*. A fine clump of *Pampas*-grass and a pyramidal dome of silver variegated *Eunymus* are objects of interest on the lawn.

Time would fail to recount the beauties of the many forms of trees and shrubs. Suffice it to say that the Indian Cedars (*Droodera*) which skirt the upper carriage-drive are equal to any in the county, and those who are inclined and have the time will be much interested in inspecting the gardens at Headington-Hill Hall, &c.

VEGETABLES.

EARLY PEAS.

Of its earliest Pea this year was Chelsea Gem, which we gathered outside on May 25 from a sowing made on February 4 in small boxes. These bore good crops, and were fully three weeks before those of the same variety that were sown outside. 4 Sow Peas in long shallow boxes 6 feet by 2½ and 3½ inches, one side of which is fastened by a staple and a plug of wood, and the plants are very easily transplanted by simply removing the fastening after a small trench has been prepared. A spade is passed along the other side, and the whole mass slides out into the trench without any damage whatever. English Wonder makes a good succession to the above, and neither require Pea-sticks.

Carlton's Early Morn is still the best Pea for early work amongst the Marrow section, being fourteen days in advance of any other variety of the same type. The haulm grows 3 feet high, so that the crop can be grown on a border without interfering with the fruit-trees on the wall.

Springtide is another very early good Pea, and a prolific cropper; the haulm is about 2 feet 6 inches in height. Carlton's Daisy is another fine, second early, and is one that will stand gentle forcing as well as any Pea I know of; bears fine pods filled with large, good flavoured Peas. Veitch's Anne is another

modern Pea of the first quality, a prolific cropper, and the pods are well filled with Peas.

Water should be afforded Peas in all cases before the plants appear to want it, for should they show signs that something is wanted, they are probably checked at that stage so much that the production of Peas will cease. The various sowings should be examined carefully at short intervals of time. A heavy syringing with clear soft-water occasionally in the evening works wonders with the Pea; should mildew be found, syringe the haulm with flowers-of-sulphur. Sulphur mixes very well with milk, and also clings to the leaves, and is much better than water for mixing into a paste. Care should be taken that the under part of the foliage is thoroughly wetted. W. J. Cook.

The Week's Work.

THE ORCHID HOUSES.

By H. J. CHAPMAN, Gardener, to R. L. MEASURES, Esq., Cambridge Lodge, Flodden Road, Cambridge.

Cattleya superba is another autumn-flowering species possessing high-coloured, attractive flowers. Some cultivators find this plant difficult to manage, but I am of the opinion that its cultivation is not nearly so difficult as that of many *Cattleyas* of the labiate section. It does best when grown in baskets in the usual sort of compost of peat and sphagnum-moss, not in the ordinary *Cattleya*-house, but hung near the glass in a bright part of the East India-house or the plant-stove. The species requires abundance of water at the present season, that is, while in active growth; but after flowering and growth are ended, only sufficient root-moisture is required as will retain the pseudo-bulbs in a plump condition.

Dendrobiums.—Early-flowering *Dendrobiums* that have completed their growth, should be removed from their present conditions to others which, although favourable to the ripening of the pseudo-bulbs, will not tend to induce secondary growth from the base. It is necessary that this subjection to altered conditions should be effected in a manner that no harm from check will result to the plants. Place them first in an intermediate temperature, and gradually prepare them until it is quite safe to put them into a house where they may rest. If there is no structure set apart for this purpose, ainery where the foliage is falling, or has already fallen from the Vines, will answer well. The species which will need attention at the present season, are *D. aureum*, and the early-required plants of *D. nobile*. Among the hybrids *D. s. Ainsworthii*, *D. s. enosium*, *D. s. Cassiope*, *D. s. endocharis*, are earliest with us, but as the season generally is late, do not remove these until they are quite ready, or the pseudo-bulbs may shrivel. When the plants are placed in the resting-house, only sufficient water should be afforded to retain the newly-made growth in a plump condition.

Laelia anceps, &c.—Both sections of this species will now be rapidly pushing up their flower-spikes, and will need every encouragement to induce them to properly develop and mature their pseudo-bulbs. Afford the plants all the light possible by removing any shade that has been employed. During the middle of bright days throw open the ventilators. Syringe the plants freely overhead the first thing in the morning in bright weather, and again an hour or so before opening the ventilators. Close the house in good time in the afternoon and again syringe overhead, and an amount of sunlight will be husbanded that will dry up the moisture before evening, and less fire-heat will be necessary. *Laelia autumnalis*, *L. Gouldiana*, and other species and hybrids belonging to the Mexican section, should be placed in the same conditions.

The Cool House.—*Mastdevallias* that may require repotting shortly will include *M. Barryana*, *M. Veitchii*, *M. ignea*, *M. Davisii*,

and the hybrids that have been derived from this section. These should now be carefully inspected, and be sponged if necessary. The small scale which infest the undersides of the leaves is very troublesome, but it may be easily removed by careful washing with a soft sponge. If cleaning is delayed until after the plants have been repotted, it will be difficult to work among the leaves without loosening the plants in the potting compost, which will be harmful. One of the most interesting plants among the many species of *Pleurothallis* is *P. punctulata*. It is one of the rarest and finest; its glaucous foliage is most striking, and should not be sponged. The plant is now growing actively, and should be placed in a light position at the warm end of the house. It succeeds most satisfactorily suspended near the roof-glass in the *Mastdevallia*-house, and requires a liberal supply of root moisture at all seasons of the year.

FRUITS UNDER GLASS.

By MALCOLM MCINTYRE, Gardener to SIR CHAS. TENNANT, The Glen, Eimerlicthen, Peeblesshire.

Cherry House.—The trees are now rich in wood and plump in bud. The leaves, too, will not be capable of much further effort in elaborating the sap and storing it in the buds and wood, and as at this juncture any undue excitement will cause the trees to start into growth, the trees should be exposed to the air as much as possible. The border should not be allowed to become dry, and if the trees are weak, liquid-manure may be afforded. In order to keep red-spider in check, wash the trees occasionally with the garden-engine or syringe, and wherever the roof-lights are portable, by all means remove them, so that the rain and dew may cleanse the foliage and invigorate the trees. Black aphides are troublesome on *Cherry*-trees, but the leaves and wood, with their hard texture, are not inviting to them; and whenever they appear syringe the trees with an insecticide, or dust the affected parts with tobacco-powder. *Cherry*-trees in pots are very interesting, and they are easily grown. They offer such a large variety, and afford fruits over so long a period of time, that it is a wonder they are not more often cultivated. With very slight forcing they ripen their fruits in the month of May, and afford a succession of fruits till the outdoor *Cherries* are ready for use, giving a succession of fruit for dessert from May till September. Early Rivers, Empress Eugénie, May Duke, Archduke, Royal Duke, Governor Wood, and Late Duke are admirable for pot-culture.

Vines for Early Forcing.—A period of rest is absolutely necessary for permanent Vines about to be hard forced, but though it is most desirable that the wood should ripen early and the foliage drop naturally, these processes must not be unduly hastened. The house or houses ought to be set wide open, and a current of dry air maintained, if need be, with the aid of a little fire-heat in dull, damp weather. As soon as it is seen that the Vines have finished their growth, shorten all laterals to about half their length, and remove sub-laterals, shortening long young canes as necessary. On no account should the foliage left on the Vines be syringed daily. Well coating the leaves with flowers-of-sulphur is the best remedy for red-spider, and may be applied in the case of all Vines from which the fruit has been cut. As a rule, the best results attend the practice of confining the roots of extra hard-forced Vines in narrow inside borders, and the smaller and better filled with roots these are, the oftener should some portion be renewed. In the case of partially-exhausted borders, these may well be freshened up from the surface, the first proceeding being to fork away the old soil well down to the roots. Then give a good soaking of water, or, better still, liquid-manure, prior to affording a liberal top-dressing with a rich compost consisting of turfy loam, bone-meal, mortar-rubbish, and charred garden refuse. This being done while yet the foliage is green, many fresh roots will find their way into the

new soil, and still more, late next season. When, however, the borders are much exhausted, a surface-dressing is not sufficient, and it is better to remove about 3 feet or 4 feet from the front, or say one-half of a narrow border, and to replace with a loamy compost, or a mixture somewhat richer than that of which the borders were originally composed.

Mid-season Houses.—There is more shanking and want of colour in Grapes than usual, possibly the result of last year's cold, wet weather and want of sun. The Grapes have been slow in acquiring bloom and colour, but the berries are as large as usual, and pronounced excellent in quality. Red-spider has been rather troublesome. I find thinly coating the pipes, whilst hot, with a wash of sulphur and skim-milk the most efficacious remedy. Copious supplies of water through a good surface mulching, and occasional supplies of liquid-manure of a sustaining rather than a stimulating kind, are most contributory to a satisfactory result. Fire-heat has been necessary in order to safely afford ventilation by night; the heat, however, should be moderate.

Late-houses.—Continue to afford supplies of water through a good surface mulching, and until the Grapes are well advanced in colour, for most late Grapes take a long time to perfect thoroughly, and some, particularly Mrs. Pince (which has often a large percentage of stemless berries), even after appearing finished, are not coloured up to the shank, which may be due to stopping supplies of food too early. The Grapes may shrink from the same cause. All late Grapes require a long time to perfect, and the further advanced they are at this date the better. Afford a temperature of 70° to 75° by day artificially, and 80° to 85° with sun, closing sufficiently early to increase it to 90°. When the sun is beginning to wane, afford enough top and bottom ventilation to ensure a circulation of air, and allow the temperature to gradually cool. The pipes should, if necessary, have a little heat in them to prevent the temperature falling below 65° at night.

THE HARDY FRUIT GARDEN.

By C. HERRIN.

Summer Pruning of Apples and Pears.—Bush and pyramidal-trained trees may now be safely summer-pruned, and probably but little lateral growth will be the result. It is wise to allow the length of shortened growths to carry at least four or five leaves, and should any secondary growth take place it would occur in the upper two buds, which will be removed at the winter pruning. The thinning of the growths will allow sun and air to reach all parts of the tree. Where Apples are desired for exhibition purposes, the trees should be looked through, and promising fruits relieved of any foliage that may be shading them, with a view to obtaining the best colour. The fruits may also be supported so that the eye of the Apple stands out prominently to the sunlight, otherwise if left in a drooping position the stem side of the fruit only will be coloured. With these bush and pyramid trees the leading shoots should be shortened only to about two-thirds of their length. Bush Plums may be treated similarly, and any suckers springing from the base must be cut clean away.

Strawberry Plants for Early Fruiting.—The runners layered a few weeks since may be removed from the old plants for a few days, and they will then be in a suitable condition for planting on borders. The best way to obtain early fruit is to plant strong runners in August on a warm border which has been well manured and deeply dug for a previous crop, and which requires now only to be slightly forked over and a little short Mushroom-bed manure worked in. These early-planted Strawberry-plants will ripen their fruits ten days earlier than older plants. They should not be allowed to stand after the first crop has been gathered, and may therefore be planted 1 foot apart each way, planting quincunx fashion.

Before planting, level the ground and tread it, to make a thoroughly firm rooting medium. Water the young plants before planting, and afterwards. Do not bury the crowns when planting, but make the soil firm about the roots. Place a slight muck of short manure round each plant. When layered in pots, little check is experienced when planted out, but water should be applied freely in times of drought.

THE FLOWER GARDEN.

By T. H. STADE, Gardener to Lord Poltimore, Poltimore Park, Exeter.

Mixed Borders.—Frequent attention should be given, in order to maintain an attractive appearance, removing spent flowers and flower-stems, particularly of such plants that form seed freely. Oriental Poppies, *Pyrethrum roseum* in variety, and other plants which die down partially after flowering, should have attention at that stage. The early-flowering annuals should be removed, and their places filled up with late summer-flowering plants from the reserve garden. Stir the surface frequently, and rake off weeds. Place stakes to the taller Michaelmas Daisies and other tall-flowering plants.

Trees and Shrubs.—Any of these spring-planted, and not as yet re-established, should still be supported with stakes and guying-wires; and an examination of the fastenings should be made, in the event of more space being required in those, and all supports should be firmly fixed in the soil. Do not forget to place a soft pad between the stake and the bark, so as to prevent abrasion of the latter.

Summer Bedding.—Make observations on the present season's bedding, and note any new combination of colour that has pleased, and the adaptability of fresh plants which may have been used. It is always interesting to try a few new plants, or rather fresh subjects every season; and although they may not always prove a success, one gains a better knowledge of what will, and what will not, thrive and give pleasure. While Devonshire and the west generally are more favourable for the growth of half hardy species of plants than some other counties, success largely depends on the aspect, altitude, and soil. Of new plants tried for bedding at Poltimore this summer, mention may be made of *Acalypha musaica*, and *Draena Sanderei*; the first-named plant answers very well as a "dot" plant for placing over dwarf-growing species forming a carpet, and of a colour in contrast to it; its reddish-bronze leaves are very effective. The plants do not make much growth, but retain their foliage well, and they should be of good size when planted out. *Draena Sanderei* has not been so successful, but this may be due to the plants not having been freely exposed to the sun before they were planted, for the sun has caused some of the older leaves to turn yellow, although the growth made outside retains its natural variegation. *Pelargonium Raspaal Improved* is effective planted sparingly over a carpet of *Antennaria*, with *Nicotiana sylvestris*, *Anthemiums*, and *Grevilleas*, interspersed among them, the bed being edged with yellow *Tropaeolum Mrs. Clibran*. Of *Ageratums*, a new variety, *Princess Victoria Louise*, is a pleasing addition. The plants grow with us about 6 inches high. The flowers are white, while the thickly placed stamens are light blue in colour, forming a pretty contrast quite distinct from other varieties; and its effect is pretty with tall plants of *Lyx-leaf Pelargonium Mme. Crousse*, variegated *Phlox*, *Anthemiums*, and *Alternanthera major aurea*. As a ground-work in medium sized beds, *Amblyon vexillarium* is useful and pretty, requiring very little attention in pegging down.

Propagation of the more tender plants, such as *Alternantheras*, *Coleus*, *Mesembryanthemums*, and *Impatiens*, must now be commenced. Take a few cuttings at a time, so as not to disfigure the beds. *Alternantheras* make roots best in pans about 2 inches in depth, and being put in chiefly to furnish stock, do not

require so much soil, which should be of a sandy nature. After inserting the cuttings, place them in a close frame facing south. Artificial heat is not necessary. The cuttings should be watered once, and then sprinkled daily overhead according to the weather; and during bright sunshine, shade may be necessary part of the day. A little air should be admitted early in the day to prevent excess of moisture.

Zonal Pelargoniums.—Take cuttings of these, and insert them in boxes or 4-inch pots. The plants will keep better in pots during the winter. When the cuttings have been inserted, place the boxes or pots on a hard base in an open sunny position.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HESSEY PARK, Esp., Prestwold Hall, Loughborough.

Draena rubra, *D. congesta*, and *D. gracilis* raised from points or roots, if advanced in growth sufficiently to require larger pots, say 18's, should be shifted forthwith. With a little assistance from manurial waterings, useful decorative plants can be grown in this convenient-sized pot. Place the freshly-potted plants in a close intermediate temperature till re-established, and afterwards afford them air to dry during the warmer part of the day, closing the house about 1 P.M., after damping down; and later in the day damp the paths, &c., again.

Ficus elastica and *F. radicans variegata*.—Useful plants for decorative purposes, if they were raised from "eyes," will now be growing freely, and may be shifted into 18's, and placed in a light house or pit; and as soon as the plants have attained the height of 15 to 18 inches, afford them cooler treatment, so as to restrain the growth.

Chrysanthemums. Owing, probably, to the excessive heat, I find Japanese varieties are very precocious in bud formation. The buds formed in July being too early, should be removed, and the growths at the base of the bud reduced to one shoot, selecting the strongest and best placed. This will necessarily add another foot to the height of the plants, and the second crown-bud will be selected for flowering. Pinch out all lateral growths below the break, and afford the plants a weak stimulant occasionally. Look out for black aphid, and dust the leaves with tobacco-powder in the early morning, when the foliage is damp with dew. To trap earwigs, place bean-stalks amongst the growing plants, look them over every morning, and blow the earwigs into a can of hot-water. Make all the growths secure to a centre stick, and tie all the stakes to a wire to prevent the plants being blown over by winds.

Freesia refracta alb.—Shake out old bulbs which have been exposed to the effects of the sun, and select the largest and best only for repotting. Unless the bulbs are well developed and fully ripened, they will not succeed. The stock should be supplemented by fresh purchases annually, and now is the time to obtain them. Early potting is essential. Place seven bulbs into each 5-inch pot, using a compost of loam, road-grit, and leaf-mould. After potting the bulbs, place them in a cold frame, and do not give much water until some growth has been made, and the roots are active. Let them grow in frames, or on shelves near to the glass, until the flower-spikes are seen, when they may be afforded a temperature of 50° to 55°.

Retarded Lily of the Valley are now very popular, they may be had in flower so easily from September onwards. As the refrigerators or cold storage-houses are only opened at intervals, orders should be placed in time to secure crowns being despatched either fortnightly or monthly as required. Upon receipt, pot twelve to fourteen crowns into a 6-inch pot, and place them in a light position on a shelf in an intermediate temperature; syringe twice or three times daily, according to the state of the outside atmosphere. In a fortnight or three weeks they should be in bloom.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK BOLLE, Bleton, East Baddlesly, Devonshire.

Winter Spinach.—This important crop should be sown between the 12th and 18th of the present month, and it is well to make two sowings on or about these dates. The crop may follow Peas or Potatoes; and the land should receive a moderate dressing of soot or wood-ashes, and be dug a foot deep a week or so before sowing the seed. Fitting rain, moisten the drills a few hours previously to sowing the seed, as a dry soil is always detrimental to the germination of Spinach seed. Till the plot well and evenly before taking out the drills, which should be drawn 1 inch in depth, and 15 inches apart.

Onions (Tripoli).—For standing through the winter I make two sowings, the first about August 15, and again in the last week of the same month. Let the ground be deeply dug, and manured if necessary, as Onions require a fairly rich soil. Before getting out the drills, which should be 1 inch deep, and 9 inches asunder, make the ground fairly firm by treading or drawing a light roller over it a few times, and rake off all stones, &c.

Chervil.—Where this is required to flavour salads and soups during winter, a small sowing should be made now in shallow drills 8 inches apart, and the young seedlings thinned to 1 inches apart as soon as fit. In ordinary winters, Chervil remains quite fresh with us, and self-sown seedlings appear plentifully. In colder countries it may be necessary to give it a sheltered corner.

Leeks.—Those planted out in trenches early in May should be earthed up as is usual with Celery, but first remove any weeds there may be; and if at all dry, afford a good watering with diluted drainings from the cow or farm-yard. Where the dibber was used in planting, as advocated in my Calendar for April 27, the ground should have the flat hoe plied between the rows; this will act as an earthing-up as well as tend to promote growth.

Cabbage.—Watch for slugs among the first sowing, and dust the plants frequently with lime and soot or wood-ashes. Keep the seedlings constantly moist. The last sowing should be made without delay, also a little of the Red Cabbage for pickling.

Celery requires frequent attention, and it is better to go over the rows about every fortnight, adding a little fresh soil each time, than to earth them up too heavily at any one time. The soil should not be made too firm about the plants until the final banking-up is done. From four to six weeks should be allowed for blanching. The remarks made a month since in respect to the early rows, apply also to later ones, as regards affording water and keeping the surface-soil in a loose condition.

General Remarks.—The recent rains appear to have been general, and with us have greatly improved crops; but fine weather having again set in, do not neglect to afford water to such crops as Peas, Beans, Turnips, Celery, &c., twice or so each week. Keep the flat hoes moving between all crops where they can be conveniently worked. Afford spring-sown Asparagus a light dressing of salt to accelerate growth before running the hoes between the rows. Cabbages planted out here in June are infested with caterpillars; hand-picking is the surest remedy. Dust the plants overhead occasionally with soot and lime when the leaves are moist. Watch Cauliflowers, Savoyes, &c., or caterpillars may soon cause them much injury.

EXCURSION TO GLASGOW.—On August 1 Messrs. WM. FILL & Co., nurserymen and seedsmen, Hexham, treated their *employees* to their annual excursion. The party, numbering nearly sixty persons, travelled to Glasgow, where they visited the exhibition, &c. Much appreciation was expressed of the firm's kindness and generosity.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intimation of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUG. 10	Coniston Horticultural Show
TUESDAY, AUG. 14	Royal Horticultural Society's Committee Meeting.
WEDNESDAY, AUG. 15	Bishop's Stortford Horticultural Society's Show.
THURSDAY, AUG. 15	Swansea Horticultural Society's Show Tantallon Burnie Horticultural Society's Show.

SALES.

FRIDAY, AUG. 15.—Established Orchids at Protheroe & Morris's Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick 62.5.

ACTUAL TEMPERATURES:—

LONDON.—August 7 (6 P.M.): MAX. 79; MIN. 55.

August 8.—FINE, WARM

PROVINCES.—August 7 (6 P.M.): MAX. 72; HOME
Counties; MIN. 53, N.E. Scotland

In connection with the condition of the fruit crops which has recently occupied so much of our space, we venture to call special attention to the following paragraph on the ripening of the fruit, and of the ripening of the wood. The latter phrase is constantly made use of by gardeners, but few of us ever stop to think what it really means. We have extracted the following from a recent number of the *Comptes Rendus*, from a paper by M. F. KOVESSE on the proportion of water in relation to the ripening of woody plants:

"It has been demonstrated that the production of fruit on woody plants is governed by the climatological conditions of two consecutive years. Thus the year following a year of drought yields abundant harvests, and a year following a wet season but a poor crop. Further, the quantity of fruit is in proportion to the ripening of the wood of the branches that produce the flower-buds. One of the causes that play an important part in the ripening of the wood is the quantity of water available for them. This supply of water produces two other very important effects:—1st, It influences the distribution of the fruit branches on the plant; 2nd, It contributes to the building up of the plant. In fact," concludes the author, "the form of a tree, as well as the position of its flowering branches, are, in great part, determined by the circumstances attending the ripening of the wood. Further, the degree of ripening of the branches, and consequently the number of flowers and of fruit borne the following year, is greater when the quantity of water

received by the plant is less. These facts give valuable information with regard to the proper pruning of trees and of the Vine, it being necessary to regulate the quantity of water received by the plant. It is needful to know the quantity and the arrangement of the roots in the different layers of soil in which they exercise their functions, and the properties of these layers as regards the water they contain. In some cases pruning of the roots themselves is possible, and this must be practised with a view to attaining the desired result."

HÆMANTHUS (See Supplement).—Visitors to the last Temple Show will remember the very striking exhibit made by l'Orticole Coloniale, of Brussels. Such a display of species and varieties of this noble genus has never before been got together. A general view of the group is given in our Supplementary Illustration, and for a descriptive and cultural account we may refer our readers to our number for May 25, 1901, p. 332. In the same issue a special illustration was given of *H. mirabilis*, a form with broad perianth segments of a salmon colour.

FLOWERS IN SEASON.—The Carnation appears to be the most popular flower in bloom at the present time, for we have to acknowledge blooms of this delightful border and pot-plant from four of our readers:—

Mr. JOSEPH BROOME, of Sunny Hill, Llandudno, whose choice collection of Orchids has been frequently remarked upon in these columns, sends us flowers of seedling varieties he has raised in the open ground, and which are now blooming for the first time. They are all very beautiful, and include self-coloured and yellow-ground flowers, flakes, bizarres, and fancy varieties, and the general quality is so high, that one almost wonders if it be worth the trouble to have named Carnations if seedlings may be trusted to give such a satisfactory result. If Mr. BROOME selects the best of the varieties he has sent, and cultivates them another year, his collection will be a valuable one.

Messrs. WALSHAW & SON, Scarborough, send blooms of a variety named Madeline Reynolds. They are bright crimson in colour, of fine form, with rounded petals, and very fragrant. Messrs. WALSHAW describe the plants as of good habit, and very free in flowering.

Messrs. LUNG & MATHER, Kelso, Scotland, forward blooms of a new self-coloured Carnation named Sir R. Waldie-Griffith, which we can hardly over-praise. It is a bold flower, with well-rounded petals, very slightly fringed, and good calyx. In colour it is very distinct, and may best be described as rich orange-scarlet, with a slight amber or yellow tint in the older petals. Though not heavily perfumed, it is fragrant, and the variety is an excellent one. The same firm send Keltom Rose, Primrose League, Duchess of Westminster, and other varieties, whose qualities are already known.

A correspondent who modestly wishes to be known as R. B., sends two seedling varieties, one of which is a very pretty yellow self-coloured variety, but not better than some of the same type already in gardens. The other, a purple self, is small, and generally inferior.

THE SEASON OF WASPS.—Have any of the readers of the *Gardeners' Chronicle* experienced unusual trouble from wasps this year? Our correspondent, Mr. CHAS. SIMPSON, Newby Hall Gardens, Ripon, Yorkshire, says that in those gardens, there is quite a wasp plague. They are clearing off all outside fruits, and the

Grapes, Peaches, and Nectarines had to be encased in muslin bags even before the fruits began to colour. Between the dates July 10 and August 1, Mr. SIMPSON has taken as many as 127 nests; yet this has seemed not to lessen the damage the insects are doing. On July 30, thirty-two nests were taken, and on other days, twenty, seventeen, fifteen, twelve, and so on. This is an extraordinary record, we should suppose, and perhaps some of our readers may like to know the means by which the nests were taken. Mr. SIMPSON dissolves cyanide of potassium in water, then, after soaking some cotton-wool in the liquid, pushes the wool into the hole containing the nest. After the wasps have been killed the nests are dug out and destroyed, and if this is not done, some of the grubs are said to hatch and find a way out of the hole.

A COMPETITION FOR YOUNG GARDENERS.—From an advance copy of the schedule of prizes to be offered at the next spring show of the Royal Caledonian Horticultural Society, to be held on May 7 and 8, we observe that prizes are offered to under-gardeners only, for the best plans, drawn to scale (10 feet to inch), for laying out as a garden a piece of ground about 20 acres in extent. A sketch plan is given showing what features, including house, already exist on the site that is to be dealt with. Competitors will have to send with their plan a description of it, and among other things describe how roads would be made, how the planting would be done, the character of the planting, &c. We heartily commend this feature of the schedule as being likely to do those young gardeners who are sufficiently energetic to take part in the competition a great deal of good. The plans have to be in the hands of the secretary, Mr. P. MURRAY Thomson, not later than April 1, 1902.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held on Tuesday, August 13, in the Drill Hall, Buckingham Gate, Westminster. The lecture on this occasion will be on "Tender Plants for Outdoor Gardening," by Mr. WM. TOWNSEND, Messrs. KELWAY & SON will show a large collection of Gladioli.

The syllabus for the examination in horticulture has been revised recently by the Council, on the advice of the examiners. Intending students should send a penny stamp to the Secretary of the Royal Horticultural Society for a copy of it.

Our readers are again reminded that the schedule of prizes to be offered at the Fruit Show to be held at the Crystal Palace on October 10, 11, and 12, may be obtained from the Secretary of the Royal Horticultural Society, 117, Victoria Street, Westminster, but applicants must enclose a postage-stamp. In addition to the list of prizes, an authoritative list of dessert and cooking Apples, Pears, and Plums, is included.

THE "BOTANICAL MAGAZINE" for the present month contains coloured illustrations and descriptions of the following plants:—

Bulbophyllum grandiflorum, Blume, t. 7787.—a native of New Guinea (see *Gard. Chron.*, 1895, vol. i., p. 122, fig. 129).

Paeonia lutea, Franchet.—A yellow-flowered tree Paeony, native to the mountains of Yunnan; t. 7788. Flowered at Kew.

Helichrysum Guelicini, Engler, t. 7789.—A native of Kilauea, flowered by Mr. GUMBELTON (see *Gard. Chron.*, 1900, vol. ii., p. 333, fig. 103).

Strobilanthes gossypinus, T. Anderson.—A shrub, the herbaceous portions of which are covered with fulvous down; leaves shortly-stalked, elliptic acuminate; flowers arranged

in terminal panicles, lilac, tubular, irregularly five-lobed at the limb. The shrub is a native of the Nighiri Hills, and is said to die after flowering. Kew; t. 7790.

Gladiolus sulphureus, De Graaf, t. 7791.—With this is cited as synonymous *G. Adlami*, Baker, in *Gard. Chron.*, 1889, l., 233, the earlier name having been overlooked even in the *Index Kewensis*. Native of the Transvaal.

GLUT OF PEAS AT EDINBURGH, AND CONSEQUENT POOR PRICES.—The following letter, written on August 3 by one of our Scotch correspondents, shows that growers of Peas in the Edinburgh district have had to accept exceedingly low prices lately, and that this is due to the later sowings having "turned in" sooner than they were expected. The effects would probably have been less disappointing had there been better means existing to distribute the greater supply over a larger area than usual:—"The price obtainable for the best quality of green Peas at present is far from satisfactory. For the last ten days, Duke of Albany Peas have been selling at 3d. per peck in Edinburgh market, and at the auction sales for even less—in some instances at 1d.; so that market gardeners are at their wits' end. Yet many people in town and country are willing to pay a fair and reasonable price, were means taken to distribute the supply. Why should co-operative societies not take advantage of such offers to place home-grown articles before their members? The continuous drought has caused the later sowings to be ready sooner than would have been the case in an ordinary season, so probably in a fortnight or three weeks the large surplus will have disappeared, and prices will go up. People will then ask why green Peas are so dear, when they were selling so lately at 2d. to 3d. per peck. There is great room for some advance price-list to be displayed as the seasons come, intimating to the public that such and such vegetables and fruits are to be had at prices within the reach of all. Foreign fruits are always displayed in prominent positions in every conceivable place, thus showing that shopkeepers have a preference for them."

CANNELL'S CHAMPIONSHIP BELT for the best fruit, flowers, and vegetables, the latter grown from seeds supplied by Messrs. CANNELL & SONS, Swanley, and exhibited by the various gardening societies in Kent, was, we are informed, contested for at a show held at Eynsford on Monday last. All the productions were of great excellence, and although the Eynsford Society was awarded 1st prize, Chislehurst 2nd, and St. Mary Cray and Orpington 3rd, the difference between them was trifling. The judges pronounced the exhibits the best that this popular county prize has ever brought forth.

MORE ROYAL NURSERYMEN.—Messrs. DICKSONS, LTD., the well-known seed merchants and nurserymen, of Chester, who for many years held special warrants of appointment to her late Majesty Queen VICTORIA, and to his Majesty the KING, when Prince of WALES, have now been honoured with a warrant of appointment to his Majesty King EDWARD.

GRAPE DIAMOND JUBILEE.—We are informed by Messrs. D. & W. BUCHANAN, of Forth Vineyards, Kippen, that they hope to show their new black Grape, over which there has been so much controversy, at the Shrewsbury show, to be held on August 21, and at the great fruit exhibition at Glasgow on September 1 and 5. Messrs. BUCHANAN suggest that if some Grape cultivators will also show fruits of the variety Black Morocco at these exhibitions

there will be afforded good opportunities for visitors to compare the one with the others. We may add that Diamond Jubilee is not so good at Kippen this year as last, owing, it is said, to the roots having been excessively pruned.

"ICONES SELECTÆ HORTI THENENSIS."—The fifth and sixth fascicles of this work are before us. As we have before stated, the work is devoted to the description and illustration of the plants growing in the collection of M. VAN DEN BOSCHÉ, of Tirlemont, Belgium. The lithographic illustrations are excellent, and the critical remarks of the editor, M. DE WILDEMAN, are very serviceable to botanists. The plants recently figured are *Cardiospermum grandiflorum* var. *hirsuta*, t. 61; *Berkheya radula* (de Wild.), t. 62; the *Stobea radula* of Larvey; *Eriogonum Jamesii*, var. *flavescens*, t. 63; *Cinnamomum pedunculatum*, t. 64; *Bakea microcarpa*, t. 65; *Hermania candicans*, t. 66; *Rhipsalis rhombica*, t. 67; *Leucopogon lanceolatus*, t. 68; *Amsonia Tabernemontana*, t. 69; *Dioscorea caucasica* (Lipsky), t. 70, a plant of great interest as an outlier of a tropical genus. Another species, if we mistake not, has been found in the Pyrenees.

M. ED. ANDRÉ.—Our excellent colleague has been promoted to the grade of officer of the Mérite Agricole. We applaud with both hands, as our neighbours say.

ECONOMIC PLANTS.—Recently in the Winter Garden of the Jardin des Plantes, Paris, a collection was got together of no fewer than 400 species of plants suitable for cultivation in the colonies for economic purposes.

"VINE CULTURE UNDER GLASS."—By J. R. PEARSON, revised and edited by C. E. PEARSON, Chilwell Nurseries, Loddham, Notts. Seventh edition. (Nottingham: THOS. FORMAN & SONS, Sherwood Street.) As the preface to this edition remarks, "Many works on Vine-culture have been published during the last thirty years." However, there is always room for a good book, and the small volume before us is both practical and up-to-date. There are accounts, with illustrations, of the best sorts of vineries of all sizes, instructions for planting and managing Vines, and a good list of sorts appropriate for various environments. The book is small enough for the pocket, and inexpensive, so can often be carried about for immediate consultation, while larger and more ambitious tomes have to be left upon the library shelves.

A MORE THAN CENTENARIAN.—*American Gardening* records the death of BARNEY MORRIS, who for over thirty years was employed as a gardener in Prospect Park. BARNEY MORRIS was born in Cavan, June 10, 1792.

SYNDICAT CENTRAL DES PRIMEURISTES FRANÇAIS.—This association of French market-gardeners has lately held at Carpentras an "Exposition d'Emballage," at which different methods of packing were exhibited. The packages for market purposes must be strong, light, elegant, and moderate in price. The syndicate complains of the ill-treatment of the consignments made to the railways, and of the delays in forwarding the goods. On reading the document, we thought at first we had to do with the South Eastern or London, Chatham & Dover Railways, but on reading a little further, we found that this is one of the cases in which they do not manage things better in France.

"CYCLOPÆDIA OF AMERICAN HORTICULTURE." We have already alluded to the issue of the earlier volumes of this im-

posing publication by Professor BAILEY, assisted by many experts, and have now to record the issue of the third volume, beginning with the letter X and ending with Q. We have nothing to add to our eulogies of preceding volumes. This one does but emphasise our opinion of their excellence. Some portions are, of course, of local interest only; but, on the whole, the work is one of reference wherever gardens and gardeners are found. One deficiency we note, and that is the absence of adequate references to the monographs of garden genera published in these columns and in the *Journal* of the Royal Horticultural Society by BAKER and others, such as Iris, Lilium, Brodiaea, Passiflora, Nepenthes, Helioscocus, Sedum, and many others. We find only occasional references to the various Conferences which have been held at Chiswick and elsewhere, wherein the species of various genera have been enumerated and collated for garden purposes. The book is published by Messrs. MACMILLAN & CO.

THE CONGO STATE.—MM. DE WILDEMAN and DURAND have published the first fascicle of a systematic enumeration of the plants collected in the Congo State by M. A. DEMEYRE. Beginning with Rannunculaceæ, the present instalment ends with the Leguminosæ.

JOURNAL OF THE FRENCH HORTICULTURAL SOCIETY.—The *Journal de la Société Nationale d'Horticulture de France*, for June includes the Society's Reports, articles on the Cucumbers of Traïon (Austria), by M. TAWONNY; Use of Bougainvillea Sanderiana, by M. LÉON DUVAL; and, Bouillie à la Sonde as a Remedy for Mildew, by M. RENÉ SALOMON. Various notes and briefer papers complete the volume.

OSBERTON.—The Right Hon. F. J. S. FOY-JAMIE kindly threw open his gardens to the public recently, at a charge of one shilling a head, for the benefit of the Gardeners' Royal Benevolent Institution. Amusements and means of refreshment were provided. The arrangements were carried out by Mr. ALLSOPP, the head gardener. The plant-houses, fruit-houses, herbaceous borders, Rose-gardens, flower-beds, carpet-beds, the lake, the Rhododendrons, the wild garden, the rockeries, the sweet-garden, filled with fragrant plants, planted for the behoof of a former squire, who was blind; the kitchen-garden, all came in for their share of admiration and interest. Some five hundred people visited the gardens.

CHINA ASTERS.—Mr. FREDERICK ROEMER, of Quedlinburg, sends us a plant of his Extra Early Hohenzollern Aster, white; and in proof of the earliness of the flowering season he also sends a plant of Queen of the Market Aster, white. This season the Extra Early Hohenzollern flowered about eight days sooner than Queen of the Market. It has very large white flowers, and is well worth cultivating. M. ROEMER also encloses a plant of his last year's novelty, Helianthus Perleo (Helianthus cucumerifolius nanus compactus). This strain has proved to be a good novelty too. With these came flowers of Nemesis strumosa of the different shades of orange, red, and rose.

OTTERBURN TOWER, NORTHUMBERLAND.—According to *The Builder* this property has been lately in the market, but was withdrawn from sale. The estate comprises about 1320 acres, with the manor of Otterburn, and is situated on the north bank of the Rede. The Tower still includes portions of the stronghold built in the Tudor period. In the Otterburn ward of Elsdon, at the meeting of the Otterburn and the Rede, is the site of the

battle fought on August 10, 1388, between the Earl of Northumberland and his son, Sir Henry Percy, Warden of the Marches, and an invading army of Scots, led by the Earls of Douglas, Moray, and Denbar. As they were returning to Yedburgh from Newcastle, the Scottish forces were entrenched at Green-clesters, where their camp may yet be traced. FROSSARD describes the encounter, and upon the old ballad is founded the modern one of Chevy Chase.

THE WIDENING OF PICCADILLY.—It is now decided that, in view of the Coronation ceremonies next June, the widening of Piccadilly along its southern side by the taking of a strip out of the Green Park, and the setting back of the railings will soon be put in hand. We understand from *The Builder* that plans prepared at the Office of Works provide for an increase of the width of the thoroughfare, which varies from 68 feet to about 100 feet between Walsingham House and Hyde Park Corner. It is hoped that the alterations will be so managed that the large trees that it was at first feared would have to be sacrificed will, after all, remain undisturbed, but, unless the thoroughfare can be widened at its eastern end the proposed alteration will not be of much use.

THE TREE LOBELIAS OF TROPICAL AFRICA.—Our valued correspondent, Mr. W. BOITING HEMSLEY, writes us as follows: "My article on this subject (*Gardeners' Chronicle*, June 29, 1901, p. 417) was written in the Channel Islands, where I had no books for reference, and consequently it is not so complete and correct as it might have been under more favourable circumstances. What I most regret is having quite forgotten an article on the same subject by Mr. EDWARD G. BAKER, which appeared in the *Journal of Botany* for 1891, pp. 65-70, illustrated by plates 410 and 411. Mr. BAKER there gives a synopsis of all the species then known of this group, including two new species, which are fully described and figured. The new species are *L. Gregoriana* and *L. Tayloriana*, Baker f. The former is from Mount Kenia, where it was discovered by Dr. GREGORY, of the British Museum, who states that it grows from 8 to 14 feet, at elevations of 12,500 to 13,500 ft. Some dead ones were found at an elevation of nearly 150,000 ft. *L. Tayloriana* was named in honour of the Rev. W. E. TAYLOR, who first discovered this species on Mount Kilimanjaro, on the slopes above Morang, as far as 10,000 feet. *Lobelia squarrosa*, which I inadvertently attributed to Baker filius, was described by his father, Mr. J. G. BAKER, in the *Kew Bulletin*, *L. telekoi*; Schweinfurth is another species from Mount Kenia, which I had overlooked."

GERMAN IMPORT DUTIES.—Herr LUDWIG MÖLLER gives in the *Gärtnere Zeitung* a list of proposed tariffs on garden produce. Fresh Potatoes are to be allowed free entrance into Germany from August 1 till February 14; from February 15 till July 31 they are to be subject to a duty of 12 marks per 100 kilogrammes. All other fresh vegetables will pay 50 marks between December 1 and June 30; and between July 1 and November 30, 5 marks per 100 kilogrammes. Living trees, plants, shrubs for transplanting, will pay 20 marks; leaves, grasses, &c., for ornamental purposes, 100 marks; fresh flowers, blossoms, buds, &c., 300 marks; Palm-leaves made into fans, 150 marks; and all kinds of bulbs, 10 marks per 100 kilogrammes. Herr MÖLLER gives no hint as to the proposed duty on foreign fruits.

TOO MANY COOKS.—A correspondent writes:—"After years of travail in connection with the acquisition of Spitalfields

Market, the London County Council at their meeting last week determined to have nothing more to do with the scheme. Years since we drew attention to the scheme proposed by the Council, the purchase of all property rights, the getting out of plans, &c., for a new and improved market-place—a long labour which ended in the introduction of a Bill into Parliament, accompanied by one from the Corporation, both of which were remitted for consideration to a committee, which threw over the Corporation Bill. Ultimately, my lords' had the Bill before them, when up started the Stepney Borough Council, who asked for the insertion of a clause enabling them to take over the whole concern from the London County Council; the clause was objected to strenuously by the Council, but the Stepney folks won the day, and, after years of labour and heavy expense, the whole affair has come to an end. The market at the East End is one of great importance—its customers come from all parts of London, principally from the E., N., and N.E. districts, and doubtless 'under new management,' its popularity and usefulness would have greatly increased, to

FIG. 38.—TAXUS CANADENSIS.
(See p. 115, col. B.)

the profit of many a market gardener in Essex and elsewhere; nor would the foreign producer have suffered, and the general public would have been the gainers. It is sad to think that a good market could have been built at less cost than the outlay for the abandoned scheme."

PLANT PORTRAITS.

APPEL SCHÖNER VON BOSCOOP (Hemlock of Boskoop, said Monthollet Genevois).—An old variety, whose value is becoming generally recognised in Germany, well adapted as a standard for orchard cultivation, the tree being a vigorous grower, and forming a rounded crown. It is not frost tender, succeeds in exposed positions, and on poor but not dry soils. Leaves early and abundantly. The fruit is large, round to high, and does not wither, and is suitable for the kitchen or for dessert, and it keeps from December to May. Colour greenish-yellow, and red with darker stripes on the sunny side. A coloured drawing is given in a prospectus by M. Paul Hubert, of Halle, on the Waal, attached to *Die Gartenwelt* for July 27, 1901.

NURSERY NOTES.

THE HANDSWORTH NURSERIES, SHEFFIELD.

SOME four miles or so distant from the heart of the busy borough of Sheffield are the Royal Handsworth Nurseries of Messrs. Fisher, Son, & Sibray, Ltd., whose business was commenced in a very small way about the middle of the 18th century. Some of our readers will probably remember that years ago Mr. Fisher and Mr. Sibray were the active and controlling members of the firm. But the personality having altered, the Chairman and Managing Director is now Mr. William Atkinson; whilst his son, Mr. W. Penrose-Atkinson, is a director also.

Some part of the present nursery ground has, no doubt, been devoted to the cultivation of nursery stock for many years; but other portions have been acquired during recent years, as the increased needs of the business have demanded a greater area upon which to raise plants for supply. This area is now about 200 acres, of which 120 acres are at Handsworth, the other 70 acres being at some distance from the home establishment. To some of our readers who may not have seen these nurseries, and who look upon the firm as essentially a hardy tree and shrub cultivators, it will seem strange if we refer first to—

PLANTS UNDER GLASS.

But it was in the glasshouses that we commenced our inspection of the place on a recent occasion, and so pleased were we at the general appearance of the plants therein, that there seems no apology necessary for adhering to the same plan now, and it will involve no disparagement to the outdoor department, the management of which merits all possible praise.

The glasshouses afford an explanation of the circumstances by which the firm is able year after year to exhibit at the Royal Horticultural Society's "Temple" show, in May, so fine a collection of choice varieties of trees and shrubs in pots, many of them deciduous species, in a condition considerably more forward than the same species would be out-of-doors at the time, even in the south. These plants are encouraged to make early growth in a first-rate house or spacious corridor, from which open out, upon one side only, eight excellent plant-houses 100 feet in length each. The corridor, unlike the houses, is maintained at a temperature little higher than that of the Temperate-house at Kew, though there exists means of increasing it when desired. When we saw the structure, some of the plants one sees at the Temple had been removed out-of-doors, but it contained splendid specimens of greenhouse ornamental species, and others of a half hardy nature.

One of the houses that open from the corridor was filled with excellent pot plants of *Lapageria*, and from every plant strings were taken to the roof of the house; the young growths being tied in as often as necessary, are kept free from entanglement with each other—and in the best possible condition for taking down at the end of the growing season, and wrapping around the stakes in each pot.

In one house were plenty of *Odontoglossums* of different species; and in another a collection of miscellaneous species of Orchids requiring increased warmth, as *Laelias*, *Cattleyas*, *Coleogyas*, *Dendrobiums*, &c. *Cypripedium Mastersonianum* was in flower, as was also *C. Druryi*, a striped flower upon a yellow ground

FIG. 36.—SPECIMEN PLANT OF ILEX WILSONI, IN MESSRS. FISHER, SON, AND SIBBAY'S NURSERY. (SEE P. 118.)

The fragile-looking *Aralias* are grown in great numbers at Handsworth, and each plant is a representation of perfect cultivation. A. elegantissima was present in a bigger batch than that of any other variety. In addition to those kinds in general cultivation, there was a batch of plants of a sort resembling in general habit *A. gracillimum*, but the leaves are very pale green, with flesh-coloured midrib, and a somewhat silvery appearance.

A stove with miscellaneous contents contained fine batches of *Caladiums* and *Anthuriums*, of which some good seedling forms of *A. Scherzerianum* were remarked; *Eucharis grandiflora*, *Codiaeums*, and *Cordylines*, as well coloured as the best collections in the south; and several species of ornamental plants less common in gardens.

The greenhouse section of *Rhododendron* is cultivated in large numbers, one of two new houses that were erected last year being filled with good plants. These were not in flower, but Mr. Atkinson showed us four new varieties the firm will distribute, and described them as follows:—*R. jasminiflorum* "Handswoth variety," with longer tube than the flowers of the type possess, and that quite conceal the stamens; Duchess of Portland, blush-pink; Countess of Yarborough, a white variety, which, except in the colour of the flowers is very similar to the well-known Princess Royal; and Duchess of Westminster, a cross from *R. Taylori* and *R. jasminiflorum*, which partakes of the characteristics of *R. T. rubra*. In a stock of varieties of *Rhododendron* (*Azalea*) *indicum* we were shown a variety of *R. amena* named *Posteriana*, which is described as having brilliant red flowers, and to those who admire the exceedingly free-flowering qualities of *R. amena*, but who do not like the colour of the blooming, this red one should be greatly appreciated.

Palms, and many other species of plants, are cultivated in these houses, but we cannot enumerate many more. Amongst a few plants we must mention, however, is a collection of *Sarracenia*s, including *Cheloni* hybrids, which were in capital condition, and possessed unusually good colour. These were growing in full sunshine, and are watered overhead three or more times a day.

In the corridor already alluded to, and in other houses, we saw some of the best specimens of several greenhouse species of ornamental plants that we have seen for a long time. These included *Araucaria excelsa*, 7 feet high, splendid plants, unusually glaucous, bigger and nobler in all their parts than the type. The variety was said to be "Napoleon Baumann," and greatly impressed us with its majestic appearance. *A. Cunninghamii*, a very elegant species, nearly 4 feet high; *Draecena australasica*, with leaves something like those of *D. indivisa*, but with red midrib; *D. lentiginosa*, *Aralia pulchra*, 8 feet high, which Mr. Atkinson says has proved effective for sub-tropical bedding; *Elaeagnus*, useful for interspersing with the delicate Japanese Maples, &c. Of the Maples themselves, the Handswoth firm has a prodigious stock, including infinite variety, but as they have so frequently been exhibited, we need not now refer to them in detail. A variety of *Plumium tenax*, with much variegation, and brownish-red margins to the leaves, must complete our reference to inside plants.

HOLLIES AND YEW, &c.

The out-door grounds are so full of interesting plants that we hardly know which to remark upon in the space at our disposal, but the very fine Hollies and Yews are certainly amongst the strongest features the nurseries possess. The Handswoth firm has introduced

to commerce a good number of varieties of Holly, of which Handswoth Silver Striped, Mundy, and Wilson are most valued. There are large stocks of saleable plants of these and all other desirable Hollies of every section. In a corner of the nursery there are handsome specimen plants of all the varieties that have been raised at Handswoth, and others. The visitor is bound to admire these noble plants, most of which are pyramidal or cone shaped, for when thus far developed, the characteristics of each variety become plainly marked, in the green-leaved section as well as those variegated with silver and gold colour. In photographs, one of which we reproduce on page 119, of *Ilex Wilsoni*, a correct illustration is given of the ornamental character of specimen Hollies. *I. Wilsoni* has big leaves, rather larger than those of *I. Shepherdi*; they are unusually thick, and the plants bear berries. The variety was awarded a First-class Certificate by the Royal Horticultural Society in May, 1899. Handswoth Silver Striped makes a very shapely plant, and is evidently of good constitution. *I. Handswothensis* belongs to the small green-leaved section; they are flat, and have long spines. *Marnocki*, has dark foliage, and at Handswoth produces berries of large size and brilliant colour on two and three years old wood. Among the seedling Hollies, which have been raised from the best of the named sorts with green leaves, are numerous forms that would fulfil the requirements of individual tastes. These Hollies and Yews, like everything else in this nursery, are of the very best quality; they are cultivated well, with ground around each of them, exposed on all sides to the influences of sun and wind, and there is no crowding observable anywhere. Fewer plants to the acre can be grown in this manner, but they make satisfactory progress, and succeed well in any suitable locality to which they are eventually removed.

The Yews are in every respect as good in condition as the Hollies, and in addition to the well-known English (*Taxus baccata*) and Irish (*T. fastigiata*) Yews, there are endless varieties of either, and some that may even be hybrids, that are of exceeding interest. *T. adpressa* (Gordon), regarded as a species by some, and as a variety merely of *T. baccata* by others, is not only a good, deep green-coloured plant itself, but has given a wonderful variety of seedlings. The new golden-leaved variety, known as *grandis*, and shown in fig. 35, is probably one of its seedlings, and may be strongly recommended as a gold-variegated form of that type. *T. adpressa variegata*, also raised at Handswoth, and awarded a First-class Certificate by the Royal Horticultural Society on August 27, 1889, was present in considerable quantities, as were the golden variegated Irish Yew, the variegated Devonston Yew, the golden English Yew, &c.

To be continued.

LAW NOTE.

THE BRITISH HORTICULTURAL ASSOCIATION, LTD., (BANKRUPTCY CASE).

A SITTING for the public examination of certain persons connected with this company was held at the London Bankruptcy Court, before Mr. Registrar Hood. It appeared that the Association was incorporated on December 20, 1898, to carry on business as nurserymen and florists, and to enter into an agreement with George Haynes and Edwin Thomas, the voluntary liquidators of the Metropolitan United Floral Company, Ltd., whose share-

holders were to receive shares in the Association.

The winding-up order was made in October, 1900, and the statement of affairs showed unsecured liabilities £2,659, and assets nil. The total deficiency as regarded contributories amounted to £11,566.

Mr. E. T. Morgans stated that he was secretary of the Metropolitan United Floral Company, Ltd. He had also been known under the name of Edwin Thomas, and had used the name of Thomas Morgans. The promoter and managing director of the Metropolitan United Floral Company was Mr. Greenfield. That gentleman offered him the post of secretary, and he accepted it, as he was able to do the work during the evening. He was otherwise engaged during the day. He also stipulated that as secretary he should drop his surname, and use the name of Edwin Thomas. Mr. Greenfield had no objection to that, as he only wanted the work done properly. Witness received 10s. per week as salary.

Witness was questioned at some length with regard to the sale of shares of the British Horticultural Association, from which it appeared that advertisements were inserted in the newspapers. The shares thus offered were stated to be in a well-known commercial company, possessing a great future and paying 20 per cent. The owner needed money, and the offer was described as an unusual opportunity. Witness had acquired shares from Mr. Greenfield and others, and he applied the monies received from the advertisements in payment of those shares, and estimated that he made a gross profit of about 10 per cent. for himself out of the sales.

The Official Receiver: Having sold some ordinary shares to a lady, you write to her stating that as you had also £200 of preference shares for sale, you thought as a matter of courtesy that you ought to make her the first offer of them?

Witness said that was so, but the lady did not purchase the preference shares.

Witness, on being further examined, said he became connected with the company with a view to making money, but instead of that he lost money.

Mr. W. Fallas, who succeeded "Edwin Thomas" as secretary, said he became a director in 1899. No dividend had been paid to the shareholders.

In reply to Mr. Alexander Thomas, he admitted that it was stated that the company had a large and valuable connection among the moneyed classes.

Mr. Thomas: You were very fond of the expression "the moneyed classes." Who invented it?

Witness: I do not know.

Mr. A. H. B. Greenfield said the businesses which the Metropolitan United Floral Company was formed to acquire, were valued by Mr. Frederick Knights at £6,100. Mr. Knights was in his employment, but he had a larger salary than 16s. per week. There was no ground whatever for the suggestion that the valuation had been written out at witness's suggestion.

Eventually the examination was closed.

NEW INVENTIONS.

A NEW KIND OF BAND FOR FRUIT TREES.

A TRAP girdle for insects frequenting fruit-trees, the so-called Hofmeister Gürtel, has been brought into commerce by M. Richard Zorn, of Hofheim, in Taunus. It consists of corrugated sheets of thick paper or cardboard,

one being laid on the top of the other, and bound round the stems of the trees in the form of broad bands. The corrugations afford just the right kind of hiding-places for insects during the winter season, and immense numbers of them may be destroyed by detaching the bands, and immersing them in boiling water. When the girdle is dried, it may be used again. The fibrous materials out of which the girdle is manufactured has the advantage that it is used by various water-pipers in spinning their cocoons and webs. The girdle is covered on the outer side with a piece of waterproof paper, which can be smeared with the usual sticky grease that is used to arrest the ascent of the winter-moth. If, when a girdle is bound to the stem of a tree, the inequalities of the bark do not permit it to lie quite close to the trunk, and there are interstices by means of which insects could creep up the stem, these are closed by pressing in a fillet of clay along the upper edge of the paper. "*Illustrirte Garten Zeitung*" for July.

HOME CORRESPONDENCE.

FLOWER-SHOW TENTS.—Probably everywhere on hot days the excessive heat found in flower-show tents makes itself felt. We well remember how distressing it was in most of the tents at the Temple Show and at the Lily Conference at Chiswick. The heat was as trying in the fine tents provided at Richmond, and was specially marked in the huge one provided for the National Rose Society's display, causing the flowers to suffer and drop excessively quite early. One reason for this great heat was the pitching of the tents in a stereotyped way in a sort of half-circle, end on end, thus making a bold show of canvas, but in all cases enabling the sun to play with no less force broadside on the tents, and with potent effect. Those who wish to keep their tents as cool as possible during the sun's meridian should pitch tents not quite north and south, but slightly south-west and north-east; the sun would not play with such force on the eastern side early in the day as it would on the western side later. But without doubt the greatest heat force is exercised on the south side from 12 P.M. to 3 P.M., whereas were the tents' end on at that time to the sun, the effect would be greatly weakened. It seems never to occur to tent-erectors that abundant ventilation is needed, and they put up all the canvas to fit close and tight. Yet in the hot days in autumn, how wise would it be to keep the shady sides very open, either above the flowers or below. It is not merely that flowers suffer at shows in such great heat; visitors suffer also, and instead of enjoying a show, look on the exhibits cursorily and wearily, then gladly get outside for relief. *A. D.*

WEeping ELM, WITH IVY.—Having hundreds of trees with ivy upon them, at certain times the ivy is cut right up as high as I can fancy; but I do not consider it so injurious as many may suppose it to be. I have three Lombardy Poplars, from 70 to 80 feet high or more, about equal in height; one is bound up with ivy, which at the base is 1 foot diameter or more, and the tree looks like being bound with large cords in every cross way; but occasionally this Sampson bursts the ivy, and then it hangs loose from the tree. Now, respecting those three, there is not a bit of difference to be seen in their appearance or health; so that I consider it is not injurious to this species. But as for the Elm, I should leave it on the tree if I admitted it being there, and cut all the upper portion off as far as it was left; and I think no injury will occur, and the tree with the green stem will be very pleasing to my eye at least. But many men, many minds—that is my view of it. I know if the ivy gets the master of its supporter, and entirely covers the top, it will kill it, of course slowly smothering it. *J. C.*

SOME HERESIES—NOT PROVEN.—It is hardly fair to the practical gardener, for a visitor, after passing through one winery without fire-heat, to suggest that fire-heat is unnecessary for the cultivation of such varieties of grapes as Black Hamburg, Lady Downes Seedling, and Muscat of Alexandria (see ante, p. 78). It is not remarkable to get a good set without fire-heat, as the atmosphere can easily be kept correspondingly dry to aid in the fertilisation of the flowers, but it would be remarkable to finish properly any variety of Muscats without fire-heat. This season, the weather during April and May was exceptionally dry. I hope "W." will enlighten us later in the season with regard to growing Muscats without fire-heat, as the tuel bill is a serious item in the financial accounts of a garden. *C. P. C.*—Our correspondent's words were "This seems to suggest that a high temperature is not always required for Muscats when in bloom." *Ed.*

MONTERETIA GERMANIA.—Earlier in the year I spoke in the columns of the *Gardeners' Chronicle* of the coming of this excellent plant. The plant has now flowered, and on Tuesday week last was shown from two different sources. Without doubt, it merits every word of praise that has been given it. The plant has been obtained by crossing the well-known *Crocsmia aurea imperialis* with some of the more vigorous-growing of the *Montretias*, and certainly the larger, more widely-expanding, and flatter flowers of the *Crocsmia* are readily seen in the new kind. But however good the Drill Hall examples were, the plant growing in the open is much more promising, by reason of its greater vigor and freedom. This much may be said from small corns that were planted quite late. Each corn has developed two fine flowering growths. At present, however, my plants are only in bud. The plant may be described as *Crocsmia imperialis*, possessing the hardness and freedom to flower of the best *Montretias*. It is earlier, too, than are *Montretias* generally, and in the size of its flowers and the decided self-toned, deep red-orange, it is in every way distinctly meritorious as a garden plant. *E. H. Jenkins, Hampton Hill.*

MELONS CROPPING FREELY.—Looking through the garden at Holly Bowers, Chislehurst, Kent, recently, I noticed a splendid crop of Melons. There were twelve plants carrying forty capital fruits of an estimated total weight of 120 lb. They were growing in a small, 10-foot span-house, which allowed barely 15 inches space between the plants. *H. S.*

WEEDS ON LAWN.—Of all the pests that infest a lawn, I find the common Yarrow (*Achillea Millefolium*) the most difficult to get rid of. It has covered large patches in my lawn. It would be endless trouble to try to pull out every bit of its running roots, and I do not wish to have the expense and unsightliness of taking up all the patches and resodding and re-sowing them. What can you recommend as the best method of exterminating it? Will any of the lawn-sands or lawn-manures destroy it and give the grass the victory in the struggle between the two? The long season of hot, dry weather has made the Yarrow stronger and thicker than ever, and the grass weaker. *Despondent.*—If you keep it well mown it will not be objectionable. Any thing that favours the growth of the grasses, such as sulphate of ammonia, &c., will correspondingly injure the weeds. *Ed.*

CROPPING OF FIGS IN ISLE OF WIGHT.—I have read with interest your account of the fruit crops in the different counties of England. I have lived in the Isle of Wight for a very long time, and I have never seen anything like the crop of Figs, which seemed to be coming in my garden (St. John's Vineyard, Ryde) when I left the place about ten days ago. Mr. Meham of St. Clare, used to say that abundance or scarcity, with regard to Figs, turned absolutely on the temperature of the month of May, and this year he is conspicuously right. We had no frosts at all in May, and we have a super-

abundance of Figs. I wonder if it is so in other parts of the country? Worthing, for instance. *H. Eiebank (Rev.).*

WALL GARDENS.—I have a long low wall with a flat top, 18 inches wide, on which I wish to grow about a score kinds of the most beautiful alpine and rock plants suitable for such a position. I intend to put bricks on edge all along the outer edges of the wall-top, and to fill the space between them with soil for the plants to grow in. With so shallow a depth of soil in so dry a position, judgment and experience are needed for the selection of suitable plants, and I shall be glad to have your correspondents' advice. Moreover, the plants must be perfectly hardy for this inclement climate, and I also wish to have only such kinds as flower very profusely, and are brilliant or attractive in colours (no whites, or only one or two, wanted). They must also be dwarf for such a situation, and some of them should over-flow the brick edging, and hang down the face of the wall. I should allow to each kind of plant a space of about a yard in length. As I wish to prepare this wall-garden soon, I should like to know what kind, or mixture of soils would be the most suitable for the majority of the plants, and also whether autumn or spring would be the safest time for planting them. Please mention the colour of each that is recommended. *Stonecrop (Lancashire).*—We recommend our correspondent to consult Miss Jekyll's *Wall and Water Garden*, and shall be glad to record the experience of our correspondents, if they will oblige us with their remarks. *Ed.*

STRAWBERRY VEITCH'S PERFECTION, AND OTHERS.—I am sorry to hear that this Strawberry is a shy bearer with some growers. It may not be free enough for market growing, but for private consumption where very high-class Strawberries are appreciated, I am confident to Strawberry in cultivation is of better flavour or brighter appearance. We have had it here from the first, and never failed to have a good crop. We have a patch growing on a border facing north which supplied us with good fruit until the end of July. Our soil is far from being a good Strawberry soil; it is of a very dry nature, and requires very much manure. We have a good depth of workable soil, resting on 8 or 10 feet of sand and gravel, so that the water and manure pass away quickly. By the following treatment we seldom fail to have a good crop of Strawberry's of good quality, but the beds have to be renewed every two years. We layer in large 60's pots as soon as it is possible to get young layers. When the young plants are established, they are planted in well prepared quarters, and should the weather be dry, these young beds need to be afforded the same attention as regards water as plants required for forcing the following spring. It is no use to put out half-starved runners at the end of September, and expect to get from them a crop of good fruit the following summer. I do not believe in mulching the beds in autumn with strong farmyard-manure, but just as the flower-spikes begin to open we shake between the rows a little artificial manure—any of the well-known Vine and fruit manures. The following varieties we find do well in this garden, as well as that above mentioned; but they are not so good in flavour: *Gimton Park*, a grand cropper of good quality; *Latest-of-All*, heavy cropper for late supply; *Leader*, enormous cropper and size; *Royal Sovereign*, for early supply, and for pots; *Trafalgar*, very large, good Pine flavour; *Veitch's Prolific*, heavy cropper, a very long time in use, not ripening its fruits at one time. *F. J. Thorne, Southampton Park Gardens, Becks.*

GENISTA VIRGATA.—One of the best flowering shrubs in my garden just now is *Genista virgata*. It is not much as a small plant, but my plant is now 7 feet high and 2 feet across, and very showy. It has been in bloom two weeks, and will continue another two. Its general effect is like a small edition of *Spartium pinnatum*, and seems perfectly hardy. *W. R. Fyler, Verwood, Dorset, July 31.*

PROLIFEROUS ROSE.—I enclose Rose, which you will see now has its third flower in succession from the same stem. It was grown by A. H. Cole, Esq., the Star Hotel, London Road, Croydon, Wm. Purvis, Croydon. [A prolificiferous Rose, in which two flowers were formed, one above another, from the centre of the primary Rose, Ed.]

FREE AND PLANT LABELS.—I quite agree with what Mr. Harrison Weir last week wrote on p. 86 of the last issue of *The Gardeners' Chronicle*, except that he does not mention the best label, which is an embossed lead or zinc label. This lasts for years, and should anyone send out plants with it, I am sure he would command an increased sale. J. W. Groomes, *Wargrave Lodge, Wargrave-on-Thames, Berks.*

— I read Mr. Harrison Weir's interesting article with much interest, but I should like to remind Mr. Weir that what he proposes, viz., that the nurseryman should attach permanent labels to trees and plants at the time of sending them from the nursery, is no new idea. I believe that any respectable nurseryman will be pleased to do this when so desired. I have never experienced any difficulty in this matter. I have found that all that is necessary is to order the kind of label one wishes, and the kind of wire to be used (which should be copper, or some kind which will not rust), and the trees or plants will arrive with them attached. I have used the "Stratford" label rather extensively, but I like the "Acme" much better; it is neater, and will last a lifetime. For pot-plants I have also used the "Acme," also the "Celluloid," and both are durable and neat. It must, of course, be understood that these labels will be extra to the cost of trees or plants. But in no case have I known any nurseryman charge more than the usual retail price, that is, they charge nothing for the labour of placing the labels on the trees. I quite agree with Mr. Weir that if this were universal, very much annoyance and disappointment would be saved. *T. Arnold, The Gardens, Cirencester House.*

A NEW PLUM.—Right in the midst of the large collection of bush Plum-trees growing at Chiswick is a tree of a variety not there several years since by the well known firm of John Fraser & Co., then of Lea Bridge, under the name of Fraser's Early Yellow. When the Fruit Committee was taken to see it on Aug. 2, they found a bush of somewhat dense, erect growth, that it was evident had been heavily laden with pretty bright yellow fruits, oval in shape, about the size of a blackbird's egg, and parting freely from the stone. The fruits have no special flavour, but they ripened the earliest of all Plums, being ready for gathering on July 17. They are a week earlier than those of Rivers' Favorite, which here is even earlier than Rivers' Early Profile. The Committee regarded this Plum as being for cooking purposes, and especially for market, a valuable acquisition, and unanimously agreed that it be recommended for a First-class Certificate. X.

Obituary.

JOSEPH MEREDITH.—Many of our older readers will regret to learn of the death, on the 5th inst., of the well known Grape-grower, Joseph Meredith, late of the Vineyard, Garston, at his home, Rose Mount, Offley Hay, near Ecclestone, Staffs. So passes from the scene of his labours one who was renowned for good cultivation, and up to the last a keen gardener. It is almost a coincidence that the place he created and gave such a famous name to has also ceased to exist, a railway having taken the ground. The deceased's prize winnings will be well known to old Grape-growers, and his most notable prize, that of her late Majesty Queen Victoria, which took the form of a cup, which he won in face of the best Grape-growers of two continents, in the City of Hamburg, has never yet been surpassed.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 20.—Present: Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Drury, Saunders, and Bowles; Drs. Muller, Cooke, and Rendle; Prof. Hartog; Rev. W. Wilks, and Rev. G. Henslow, Hon. Sec.; Visitor, M. Mary Mitchell, President of the Horticultural Society, Geneva.

Helianthus, supposed hybrid.—Mr. Bullman sent a flower, of which he writes:—"I think it is a real hybrid, the seed-bearing parent was the annual variety north-of with Harpalium, and possibly with *H. multiflorus* as well." Not having blossoms of the parents for comparison, it was thought inadvisable to express an opinion as to the true nature of the hybrid.

Potatoe.—Leaves of Peas attacked by this common parasite were received through Mr. Grant, of the Yorkshire College, Leeds, from Mr. G. Broche, of The Gardens, Gimble Park, Solihull. This insect is practically not injurious to the trees unless in excessive quantity. M. Mitchell observed that such was also the experience of fruit-growers in Geneva.

Eggs on Apple-stems.—CAPTAIN SHORE, F.R.H.S., sent specimens, observing that "a pound of Apples were bought in Worthing about April. They were of Tasmania origin, and on the stalk of each, as well as on the hollow portion of the Apple adjoining the stalk, were some reddish eggs." Mr. SAUNDERS undertook to examine them.

Apples split.—Mr. WOODS observed that he had noticed that many Apples had the flesh split open this season, but not the stones. Mr. BOWLES remarked that he had experienced a similar occurrence in previous years, and attributed it to the extreme drought.

Cowslip potatoes.—Dr. MASTERS exhibited flowers of both male and female Cowslips in which the axes had thrown out other blossoms. He undertook to report upon the monstrosity. It was, however, a remarkable fact that the three specimens came from Ireland, Dorsetshire, and Middlesex, respectively, within a few weeks of each other. As far as he knows, no such occurrence has ever been recorded.

Wood Leaved Malva.—Young Ash-trees were received from Mr. L. Lloyd, F.R.H.S., of Blandford Lodge, Chiswick, who observes that "the whole tree, the stem being a foot thick, and branches, were all barked. The tree is about 100 feet high. Similar borings occur in both *Lilac* and *Laburnum*."

CHISWICK

AUGUST 2.—A meeting of the Fruit and Vegetable Committee was held here on this date. **Present:** Mr. J. Wright, V.M.H., in the Chair; and Messrs. W. Farr, G. Woodward, G. Wythes, J. Mortimer, G. Kell, H. Esling, and A. Dean. As the full quota of nine members was not made, no Awards of Merit could be given, a matter which was much commented on, as no committee sitting at the Drill Hall, however large, can form so exact an estimate of the merits of Chiswick-grown products as can those members who see them growing. Out of a large collection of Potatoes, some old for comparison, but mostly new, some twenty first and second early varieties were lifted, and of these five were selected for cooking, a test that is always well conducted at Chiswick. Of these, three marks were given to Early Jubilee, a dattish, white Kidney, having short top, ready on July 31, and of excellent quality; to Sharps' Express, also white, and a capital cropper; and to glory of Donagh, oval, white, round, excellent cropper, and unequalled. Two marks were given to King of the Earths, dattish, white, round, very early, and good cropper. The remainder of the Potatoes will be seen a few weeks later. A large group of some thirty stocks of Cabbage was next seen. The larger number, however, were late, and far too coarse for garden culture. The seed in each case was sown on March 5. Seed of each stock will be sown again this month for a winter and spring trial. Three marks were given to Barr's Best-of-All, having solid, green hearts of very conical form; also to Barr's Little Queen, a good selection from Ellan's Early, and here better than the stock under that name; and Improved Nonpareil, from NEPTING & Co., the best of the several stocks of that old variety. Some fairly good hearting Cabbages gave an excess of outer leaves. A small trial of dwarf Kidney Beans on a south border showed two varieties of exceptional excellence.

Surrey Profile, a thin-seeded sport from Sutton's Magnum Bonum, beans long, straight, and hand-one; and Fawn, the seed khaki-coloured, a sport from Synthle's Goshalt, beans long, very ham-tone, green, and smooth. Mr. GEORGE WOODWARD brought up from Barham Court, Maidstone, fruits of a Gooseberry, loose and on branches, the latter showing marvellous protractancy; a very large green and white Gooseberry, locally known as Howard's Lancer. The fruits were exceedingly nice. Mr. Woodward stated that it was not only the greatest cropper, but the earliest to furnish green Gooseberries for gathering he had ever seen.

It was unanimously agreed that this Gooseberry and all the things receiving three marks that day, be recommended to the next full meeting of the committee for Awards of Merit.

Mr. JOHN WRIGHT, at the request of the committee, undertook to write to the council and ask that Mr. S. T. Wright be empowered to vote as a member at the Chiswick meetings.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 18.—The following awards were made at the meeting held on the above date:—

FIRST-CLASS CERTIFICATE.

Acineta Hibernica, Charlesworth & Co.
Cypripedium & *L. Anson*, G. W. Law, Schofield.

AWARDS OF MERIT.

Cattleya gress var. J. Richardson, J. Richardson, Esq.
Cattleya Gaskelliana var. Mrs. Hamer Bass, Hon. Mrs. Bass.
Cattleya × *Martiniana*, P. Sander & Co.
Cypripedium *Kingdianum*, Low's var., H. Low & Co.

CULTURAL CERTIFICATE.

Odontoglossum crispum Needwood var., Hon. Mrs. Bass.

MID-ANNANDALE HORTICULTURAL.

JULY 27.—The annual show was held at Lockerbie on the above date, and proved highly successful, the entries being quite up to the standard of former years. Fruit showed a slight falling off in respect of numbers, but the exhibits were better in quality than they have been for a number of years. The floral display was enhanced by an attractive stand of Roses shown by Messrs. J. PALMER & SONS, Annan. The majority of the prizes in the vegetable department were carried off by Mr. J. McDONALD, got to Miss JARDINE, of Dryfeholm; Mr. W. M. LEAN, got to JARDINE PATERSON, Esq., of Balgray; and Mrs. FARRELL, Eaglesfield; Mr. M'LEAN, Mr. McDONALD, and Mr. J. Allan, got to JOHN PATERSON, Esq., of Arindell House, Dumfriesshire, were the principal prize-takers in the fruit sections.

The show of Turnips, Potatoes, and Onions was particularly good, and the 1st prize for a collection of vegetables was awarded to Miss MARGIE CARLILE, Balgray.

THE MIDLAND CARNATION AND PICOTEE.

JULY 28, AUGUST 1.—This was the eleventh exhibition of this Society, which has grown materially in strength during the last six years. The very fine blooms which Messrs. JONES, BROWN, and SMITH are able to grow at Handsworth; and Mr. R. SWENHAM in the Bristol Road, Birmingham, shows that the Carnation is an excellent town flower, despite the incidences of climate and atmosphere. It generally happens that some one exhibitor exhibits in unusually strong character, and on this occasion Mr. R. CRIVAN (CARTWRIGHT), who resides at King's Norton, was victorious all along the line, showing flowers of the finest quality in most of the classes in which he competed.

The show was held, as usual, in the Exhibition-house of the Botanical Gardens, and Mr. W. B. LAYHAM, the Curator, had set up in every available spot neatly-draped tables; on each side of the Exhibition-house the cut blooms were backed by foliaged plants of various kinds, or else by equally flowered Picotees; and overhead stretched for a considerable distance flowering branches of Bourgevinville variegata, *Lagereria rosea*, and festoons of *Cubaea scandens* albiflora.

A glance over the tables showed that while the selfs, yellow-grounds, and tonics were very fine in quality, many of Mr. MARTIN R. SMITH'S and Mr. DOUGLASS BAIRD'S blooms were in extremely good character, the white sport, however, and white Carnations and edged Picotees lacked size, substance, and marking, the summer heat and drought were too much for them; the flowers were brought on to maturity quickly, and had not time to mature their substance.

Carnations, selfs.—There were eight competing stands of twelve varieties in class 1. Mr. R. C. CARTWRIGHT,

Shirley, Southampton, secured the leading award for a group that had but few faults. Mr. G. Best, gr. to R. F. LEVING, Esq., The Vine, Basingstoke, was 2nd. Mr. PEEL was also very successful in the classes for specimen plants.

Suit-wooded plants such as Begonias, Fuchsias, Colons, and Pelargoniums, were shown creditably. Cut flowers were a feature of the show. Roses were well staged by Mr. W. Neville, gr. to F. W. FLOTT, Esq., Twyford, Winchester, in the classes for twenty-four distinct; for The Vine, Basingstoke, and the same number of P. V. varieties.

Herbaceous flowers were numerous and good. For twelve bunches, Mr. B. LADHAMS, The Nurseries, Shirley, Southampton, easily won premier award with a grand display of such choice sorts as *Coropsis Eldorado*, *Gaillardia "Roundhubs"* Queen, *Platycodon grandiflorum albina*, *Trifolium Otto Erikel*, &c. Mr. W. Hunt, gr. to J. Moss, Esq., Blackwater, was 2nd.

There was a class for a collection of flowers grown out-of-doors to occupy a table space of 6 feet run. Mr. HENT secured the premier prize with a bold group of such flowers as *Glaucidium bronchelyensis*, *Lilium*, *Monarda didyma*, *Pilox*, *Scabiosa*, &c. All tastefully displayed. Mr. W. Temple, gr. to W. R. MITCHELL, Esq., Ibsen Grange, Basingstoke, was 2nd.

Cactus Dahlias were good. For twelve bunches distinct, Mr. S. CLIFTON, Winchester, won 1st prize. Mr. HENT won for Sweet Peas among five competitors with representative collection.

Fruit was a feature of the show. Mr. Bowerman, gr. to Lord Bolton, Hockwood Park, Basingstoke, won for six dishes with really fine Grapes, Melons, Peaches, and Neectarines. The best black Hamburgh Grapes came from Tibley Hall, Basingstoke, where Mr. PHILLIPS (gr. Mr. J. Foster), had succeeded in colouring them perfectly.

Mr. BOWERMAN won premier prize for two bunches of any other black Grape, and for two of any other white.

Peaches, Neectarines, Cherries, Apples, and Plums, were well represented.

Vegetables were numerous and good. Mr. BOWERMAN was the chief prize winner for a collection, closely followed by Mr. BEST and Mr. Kuehler, gr. to Sir WYNHAM PORTER, Malshanger Park, Basingstoke.

NON-COMPETITIVE EXHIBITS

Mr. B. LADHAMS arranged a display of hardy cut flowers.

Messrs. G. J. KIMM & SONS, Woking, staged herba ceous flowers and cut roses.

ABBEY FLOWER SHOW, LEICESTER.

August 6, 7.—This show is an annual fixture, looked forward to with great interest by the inhabitants of this thriving town. It is held in the most spacious of the municipal parks, which, under the care of Mr. John Linn, is fast now to be seen in the full flush of its summer beauty. The committee of the Abbey Park flower-show is composed wholly of the members of the Corporation of Leicester; any surplus derived from a show is devoted to beautifying the town in some way, or in adding to the attraction of the four or five public parks provided by the municipal authorities. There are a large number of allotment gardens in and about Leicester, and many of the artisans are keen gardeners. Further, the present Mayor, through the local branch of the Kyrle Society, has placed in the Society's hands the sum of £50 to be given as special prizes for the best-kept allotment gardens. The weather, though dull, was fine and cool, and an enormous number of people visited the show on the opening day.

PLANTS

are not generally a leading feature at Leicester. The first six stove and greenhouse plants came from Mr. W. VANCE, Leamington, Mr. W. Blakeway, gr. to P. H. MENEZ, Esq., M. P., Rugby, was 2nd. Mr. BRAKEWAY had the first six specimen Ferns.

Groups arranged for effect in a space of 60 superficial feet were a great feature, quite a line of them filling the interior of a large tent. Mr. CYPRICK, of Cheltenham, a event last year appears to have of the 1st in a group at Leicester, as all that competed followed the method adopted by Mr. CYPRICK, who obtained the 1st prize of £20, with a group so refined and effective, that it left nothing to be desired. Mr. J. Thompson, gr. to J. W. TURNER, Esq., Littleover, Here, was a very good 2nd, and two other prizes were awarded.

CUT FLOWERS

There was but one collection of hardy herbaceous cut flowers to occupy a space of 5 superficial feet. That from Messrs. HAINES & SONS, Bedale and Hethel, and a very excellent collection of bold and striking effects it was. In addition to the 1st prize of £5, a gold medal was also awarded.

ROSES

These are always a prime feature at Leicester, and though the season is somewhat advanced, some very

good blooms were staged. The best thirty-six varieties came from Messrs. A. DICKSON & SONS, Newtownards, Belfast, 2nd, Messrs. D. & W. CROFT, nurserymen, Dundee.

With twenty-four varieties, Messrs. D. & W. CROFT came to the fore; Messrs. A. DICKSON & SONS took 2nd place.

Messrs. A. DICKSON & SONS had the best twelve Teas, which included Mrs. E. Mawley, *Manan Cochet*, *Saint-Catherine*, *Yardon*, *The Bride*, *Cherise Maréchal*, *Bridesmaid*, *Imogene*, *Pirola*, *Muriel*, *Graham*, *Princess of Wales*, &c.; Messrs. D. & W. CROFT were 2nd.

With twelve Roses one variety, Messrs. DICKSON & SONS and Messrs. CROFT were placed equal 1st, the one with J. S. Mill the other with Alfred Colomb. Mr. FRETTON-GRAM came next with Mrs. J. Laing.

With twelve Teas, one variety, Messrs. D. & W. CROFT came 1st with *Lurline*, but much dressed; Messrs. A. DICKSON & SONS, 2nd.

In the Amateurs' Division, the best twenty-four Roses came from Mr. W. BOYES, Derby.

With eighteen varieties, Mr. M. WHITTLE, of Leicester, was 1st; Rev. J. H. PEMBERTON and Mr. W. BOYES were placed equal 2nd.

Mr. WHITTLE was also 1st with twelve varieties, and the Rev. J. H. PEMBERTON 2nd.

CARNATIONS AND PLOUMES

Mr. R. C. CARTWRIGHT, King's Norton, followed up his successes last week at Birmingham by taking the 1st prize with twelve varieties of bizzaro and lake Carnations. Messrs. ANTIDALE & Co., Sheffield, were 2nd.

With twelve y-blow-ground Carnations, Mr. CARTWRIGHT was again 1st. Mr. A. R. BROWN was 2nd. Robert Hodgkiss and J. S. Healdyly were the best bizzaros, Gordon Lewis the best lake, Benbow and Cecelia the best silks.

With Twelve Picotees, Mr. CARTWRIGHT was again 1st. With twelve bunches of stove and greenhouse cut flowers, Mr. JOHN KELWORTH was 1st, and Mr. GEO. BROWN, Leicester, 2nd, the latter having the best twelve bunches.

Of hardy annuals, Mr. W. WRIGHT, Jun., Syston, had the best twelve fancy Pansies, while Mr. C. WESTON was 1st with twelve bunches of Violets.

The best bouquet for the hand came from Messrs. ANTIDALE & Co.

Baskets of flowers were delightful, a considerable space of tables being devoted to them. Show and fancy Dahlias and Cactus varieties were also staged, and they were good for the season.

Cut Begonias, double and single also, were very finely shown by Messrs. B. R. DAVIS & SONS, Yeovil, who took the 1st prizes in each class.

FRUIT

Twenty-two classes open to all were set apart for fruit, and in the collection of eight dishes, Mr. J. H. GOODBYE, The Gardens, Elvaston Castle, Derby, came in 1st with two bunches each of Black Hamburgh, Muscat Hamburgh, and Muscat of Alexandria Grapes; Barrington and Royal George Peaches, Elrige and Red Nipper Neectarines, and *Aloué*, 2nd. Mr. A. M. GOODBYE, Nottingham, addresses we may say, are somewhat imperfectly given at the Abbey Park show.

Mr. GOODBYE was also 1st in the class for eight dishes; Mr. J. READ, The Gardens, Brothly Park, came 2nd.

With four varieties of Grapes, two bunches of each, Mr. GOODBYE was again 1st, having in good character *Madresfield Court*, *Muscat Hamburgh*, *Great Muscat*, and *Muscat of Alexandria Grapes*. Mr. A. McCulloch was 2nd.

Mr. GOODBYE was an easy 1st with two bunches of well-finest black Hamburgh, and 1st for two bunches of *Muscat of Alexandria*, and for two bunches of any other black, having well-finest *Topas Marie*.

In the class for five bunches of white Grapes, Mr. GOODBYE, Nottingham, addresses we may stage Canon Hall Museum, was ruled out of the competition. Mr. READ came in 1st with an unnamed semi-berried Muscat.

The best dishes of Peaches came from Mr. NISBET, Derby Gardens; and Mr. S. COLE was 1st with a good dish of Neectarines. A few Melons were shown; Figs, too, were present. There were some good Cherries, and also waterberries. The best dish of dessert Apples was Beauty of Bath. Red, white, and black Currants were shown in their respective classes; and Tomatos included among the fruits were well represented.

VEGETABLES

Fourteen classes were given up to open-class vegetables, and they were shown in very fine character. Despite the drought, the development of vegetables has been most satisfactory, as far as evidence was afforded on this occasion. In the Cottagers' Division, in which vegetables could be shown only by those residing within four miles of the market-place, Leicester, the produce was highly favourable to the attention of growers.

Special prizes for collections and dishes of vegetables were offered by Messrs. HAINES & SONS, Leicester, in two divisions; by Mr. R. PRINGLE, seedman, Leicester, Messrs. YARDE & Co., seed growers, Northampton, Mr. JAMES WRIGHT, seedsmen, Leicester; and others.

NON-COMPETITIVE EXHIBITS

Miscellaneous exhibits included a very fine and effective group of plants from Messrs. VEITCH & SONS, Exotic Nurseries, Chelsea Cold Medal.

Gold Medals were also awarded to Messrs. B. S. WILLIAMS & SONS, Holloway, London, for a collection of foliage and flowering plants; to Mr. W. BENTLY, Leicester, for Roses; to Mr. ADOS PEREY, Winchester Hill, London, for a collection of cut flowers; to Messrs. HINDON BROS., Warwick, for a collection of Sweet Peas; to Mr. S. MORRHEAD, Swiss Nursery, Farnham, for Dahlias; to Mr. J. H. WATTS, nurseryman, Worcester, and to Mr. B. DEVEREAUX, nurseryman, Rabbiny, in each case, for cut flowers; to Mr. W. BOYES, Leicester, for plants and cut flowers; to Messrs. J. PEED & SONS, nurserymen, Lower Norwood, for plants, including *Gloxinias* and *Streptocarpus*; to Messrs. B. R. DAVIS & SONS, Yeovil, for a collection of Begonias; and to Messrs. W. CLIBURN & SONS, Altrincham, for a fine collection. And silver medals to Mr. W. E. PARTISON, for a collection of Violets; to Messrs. HARRISON, seed merchants, Leicester, for plants, Sweet Peas, &c.; to Mr. PRINGLE, seedsmen, Leicester, for cut flowers; to Messrs. JONES & SONS, Shrewsbury, for Sweet Peas; and to Mr. CHARLES HOLDEN, florist, Leicester, for floral decorations. A small Gold Medal was awarded to Mrs. HODGKINS, West Didsbury, Manchester, for skeleton leaves and flowers, and floral decorations.

MARLOW HORTICULTURAL.

August 7, 8.—The quiet and delightful riverside town of Marlow is *en fête* during the present week, and a portion of the attractions takes the form of a flower show. The exhibits themselves were of excellent quality, but keener competition is needed in the majority of the principal classes.

The group and plant section was more conspicuous for quality than for quantity. In the class for a group of miscellaneous plants arranged for effect in a space not exceeding 72 square feet, there were two exhibitors, of whom E. RILEY, Esq., gr., Mr. T. W. JORDAN, was easily 1st; Sir W. CLAYTON (gr. Mr. J. Sharpe), was 2nd. For fine foliage plants the above growers exchanged places.

T. O. WETHERED, Esq. (gr. Mr. M. PARSONS), won easily with three Ferns, having most creditable plants.

Mr. J. SHARPE was in great form with *Calladiums*, showing clean, fresh, well-coloured examples.

Mr. T. W. JORDAN showed three fine *Fuchsias* in one class, General Roberts, secured the prize for the best plant in the show. Mr. JORDAN was also 1st for six tuberos-rooted Begonias, four zonal Pelargoniums, and three Colons, staging creditably in each instance.

Taken as a whole, fruit was not particularly good. The value of the exhibits was minimised by the absence of the names of the exhibitors.

For a collection of six kinds, Mr. W. PARSONS was 1st. For two bunches Black Hamburgh, Mr. T. W. JORDAN just went in front of Mr. W. PARSONS, and won most of the other classes.

Mr. C. AMBERSON, Thames Bank, was easily 1st for six Peaches, and for a collection of four dishes of hardy fruits, distinct. Kitchen Apples were good, but dessert Apples and Pears were not up to the mark.

Mr. T. W. JORDAN was very successful in the vegetable classes.

NON-COMPETITIVE EXHIBITS.

There were several exhibits "not for competition," by far the finest being contributed by R. W. HUDSON, Esq., Bamesfield, Great Marlow (gr. Mr. Jas. Gibson). There were really two groups, one being of vegetables and the other of miscellaneous foliage and flowering plants.

Mr. CHARLES TURNER, Slough, sent Sweet Peas, and hardy herbaceous flowers; Mr. E. F. STUBB, Maidenhead, herbaceous flowers and *Cactus Dahlias*; and W. and R. OWEN, Maidenhead, Camias, &c.

HANDBOOK OF THE DESTRUCTIVE INSECTS OF VICTORIA.

—This includes notes on the methods to be adopted to check and extirpate the pests; and is prepared by order of the Victorian Department of Agriculture by C. FRESCU, Government entomologist. The volume before us is Part III. of a publication that has already been of great value to agriculturists. The explanations are practical rather than intricately scientific, and aided by clear and good coloured plates, should help every grower to determine and to cope with his insect enemies. Plates and descriptions of the most valuable (Victorian) insect-destroying birds are also given, and an appendix includes engravings of new designs in spraying-apparatus and other appliances of use against insect pests.

MARKETS.

COVENT GARDEN, AUGUST 8.

CUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES. s.d. s.d.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES. s.d. s.d.

FRUIT.—AVERAGE WHOLESALE PRICES. s.d. s.d.

REMARKS. Some Raspberries on Saturday last in boxes at 12s. per cent. There are now out on benches at 2s. 6d. to 3s. Limbs in boxes at 5s. Melon Pans in boxes of 24 or 25, at 16d. to 18d. California Plants at 6s. per case. Aubergines 1s. 6d. dozen. Gooseberries and Raspberries are nearly over.

POTATOS.

St. Malo, Charbonn, Bedford, and others, 10s. to 12s. John Bath, 3s. & 3d., Wellington Street, Covent Garden.

FRUITS AND VEGETABLES.

GLASGOW: Aug. 7.—The following are the averages of the prices recorded since our last report.—Raspberries, 2 1/2 to 3 1/2 per lb.; cherries, English, 3d. to 4d. do.; Gooseberries, Warringtons, 2s. to 3s. 6d. per half sieve, do. Sulphur, 2s. 6d. to 3s. 6d. do.; Irish and Scotch Warringtons, 12s. per cwt.; Apricots, 5s. to 6s. per half sieve; Apples, Lisbon, 8s. to 10s. per case; Green Gages, French, 5s. to 7s. per doz.; Italian, 3s. 6d. to 4s. per basket; Bananas, Canary, 9s. to 12s. per crate; do. Jamaica, 8s. to 11s. do.; oranges, English, 1s. to 1s. 3d. per lb.; do. Dutch, ground, 1s. to 1s. 6d.; do. black, 7s. to 9s. per barrel; do. Genesee, 10s. to 1s. 1/2 per lb.; do. new, 1s. 3d. to 2s. 3d. do.; Currants, red, 1 1/2 to 2 1/2 do.; do. black, 3 1/2 to 4 1/2 do.; do. Scotch, red and white, 2 1/2 do.; do. black, 3 1/2 do.; do. Pears, Dutch, 2s. 3d. per basket; 2s. per sieve and 1s. to 1s. 6d. per bushel; Melons, Valennois, 5s. to 7s. per case; Amos, 5s. to 6s. per case; Tomatoes, English and Genesee, 4d. to 5d. per lb.; do. Scotch, 5d. to 7d. do.; Cucumbers, 2s. to 4s. per dozen; Mushrooms, 1s. to 1s. 3d. per lb.

LIVERPOOL: August 7.—Wholesale Vegetable Market.—Potatoes, per cwt.: Early Regents, 3s. 9d. to 4s. 9d.; Kidneys, 4s. 6d. to 5s. 9d.; Up-to-Date, 4s. 9d. to 6s. 3d.; Turnips, 10d. to 1s. per dozen bunches; Swedes, 3s. 9d. to 4s. 9d. per cwt.; Carrots, 8s. to 10s. per dozen bunches; Onions, foreign, 2s. to 3s. 6d. per cwt.; Parsley, 10d. to 1s. per dozen bunches; Lettuces, 1d. to 1 1/2d. per dozen; Cucumbers, 1s. 3d. to 1s. 6d. do.; Cauliflowers, 10d. to 1s. 6d. do.; Cabbages, 6d. to 1s. do.; Peas, 6s. 6d. to 7s. per hamper; Beans, 2s. 9d. to 3s. 6d. do.; do. Kidney, 1s. 3d. to 1s. 6d. per peck; Scarlet Runners, 1s. 3d. to 1s. 6d. do.; St. Johns, 1s. 3d. to 1s. 6d. do.; Grapes, English, 1s. 6d. to 1s. 9d. per lb.; foreign, 4d. to 5s. 6d.; Pines, English, 2s. each; Apples, 3d. to 6d. per lb.; Pears, 3d. to 6d. do.; Tomatoes, 2d. to 6d. do.; Currants, black, 5d. to 6d. do.; Peas, 1s. 4d. per peck; Cucumbers, 3d. to 4d. each; Mushrooms, 1s. per lb.; Brakenhead, Potatoes, 1s. 3d. to 1s. 6d. per peck; Peas, 1s. 3d. to 1s. 6d. do.; Cucumbers, 2d. to 4d. each; Cherries, 3d. to 6d. per lb.; Currants, black, 4d. do., red, 1d. and 5d. do.; Apricots, 1s. per dozen; Gooseberries, 2d. to 3d. per lb.; Oranges, English, 2s. 6d. do.; foreign, 4d. to 5d. do.; Mushrooms, 1s. to 1 1/2d. per lb.; Peaches, 3d. to 4d. each.

CORN.

AVERAGE PRICES OF BRITISH CORN per imperial qtr. for the week ending Aug. 3, and for the corresponding period of 1900, together with the difference in the quotations. These figures are based on the Official Weekly Return.

Table with columns: Description, 1900, 1901, Difference

injury from ingress of air, but in practice it is not found necessary to bury fruits that have been bottled and boiled carefully. They will keep perfectly good in ordinary conditions for a year or longer period.

CHRYSANTHEMUM LEAF-MINER: J. K. The grub of a fly. There is no remedy but picking off the leaves and burning them.

CELEBRATE A SALAD OR VEGETABLE: W. S. The chairman of the committee of a Floral and Horticultural Society says that pending an answer from us as to whether the Cucumber is a "salad" or a "vegetable," the prizes in a particular competition that took place on August 5 are being held over. The question, fortunately, is a very easy one. The Cucumber is undoubtedly a fruit just as much so as is a Melon. But the Cucumber differs widely from the Melon in the uses to which it is generally put; albeit some persons eat salt to their Melons rather than sugar, and say that the flavour of the fruit is thereby rendered more piquant. The Cucumber is classed in gardens as a "vegetable," but for culinary purposes it is commonly used as a salad. We must now turn to the schedule, and this reads, "Collection of nine distinct varieties of vegetables (salads excluded)," and this absolutely excludes any vegetable most commonly used as a salad.

GRAPES DISEASED: C. B. The Grapes are badly "spotted," from the presence of a fungus. Burn all the affected berries, and ask us what to do next spring. It is too late now.

INSECTS: P. W. Hooley. The leucist is a male Copiophora cornuta. It is a species occasionally met with in this country among freshly imported Orchids. You may possibly find others, but it has not been known to survive the same colour as the males, but have rudimentary wings, and the body is furnished with a very long saddle-like ovipositor (see figs. 27, 28, p. 124). You may possibly find others, but it has not been known to survive the same colour as the males, but have rudimentary wings, and the body is furnished with a very long saddle-like ovipositor (see figs. 27, 28, p. 124). We regret the insect was completely smashed during transit, and therefore quite undeterminable. — J. Worship. Thanks for specimens of the dipterous larvae. We will give the name should we be successful in rearing the perfect insect.

IVY PARASITE ON: T. R. A Dodder, Cuscuta epithymum. Cut it away, and burn it at once before the seeds ripen. We do not think it will do much mischief if you keep it in check; and the plant is interesting.

LILY: Madonna. We generally see this do best when fairly exposed to the sun, but it will also do in the shade.

SYMPLICARIS PERDIS: Veritas. Found in N. America, N.E. Asia and Japan. Figured in the Botanical Magazine, 321. It is known as the Meadow or Skunk Cabbage, and belongs to the same Natural Order as does the Arum. The plant is hardly, and being an aquatic perennial, growing about 1 foot high, should be planted in a wet situation and in peaty soil. The flower-spines, produced in May, are purple and green, or greenish-yellow.

MARKET ENQUIRIES: H. L. H. A sieve is half a bushel, it should contain 24 lb. of fruit, or 28 lb. of Potatoes. Bunches of Carrots contain from twelve to thirty roots, according to the district from whence they come. In some cases they are tied up in fan-shaped bunches, carefully selected and "graded," and these fetch the highest prices; in others less care in selection is exercised, and the "chumps," or inferior roots, are sold for what they are worth for horse or cattle food.

MUSHROOMS: D. J. The botanists have shown how these can be grown without manure. They have done their part. It is now for the practical man to turn the knowledge to account. At present the matter has not advanced beyond the stage of a laboratory experiment, but there is no reason why some enterprising experimentalist should not turn it to commercial account. He would, of course, have to reckon on considerable loss in the first instance.

APRICOTS: R. J. H. We cannot offer an opinion unless fruits were sent for examination. You might cut open some of them and see if they have formed stones perfectly.

BOOKS: L. B. Ferns and Fern Culture. By J. Birkenhead, Sale, near Manchester. Price One shilling.—C. B. Boulger's British Trees (Cassell & Co.).

BOTTLING FRUITS: W. Young. Select whole, ripe fruits, and put them into bottles as closely as possible, leaving very little air-space between them. Fill with water up to the shoulder of each bottle. Then put the bottles into a flat copper or bath containing cold water, sufficiently deep only to cover the bottles to the shoulder. Boil for twenty-five minutes in the case of Plums, and twenty minutes in that of Morello Cherries. The stoppers should be put on the bottles whilst the fruits are still boiling, and this is an exceedingly important detail. There are various patent stoppers to be had, and an excellent one was described on p. 102 in our last issue. We may add, that some put a tablespoonful of sugar to each bottle of fruit before applying the water. Theoretically, preserved fruits, and everything else, will keep best buried in earth, there being less fluctuation in the temperature, and less liability of

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number:—W. S. 1, Juniperus virginiana; 2, Cupressus, perhaps Goveniana or macrocarpa; 3, Juniperus virginiana; 1, Cupressus, Benthami probably; 5, J. virginiana var. Schottii; 6, J. virginiana.—H. L. H., Stanhopea fragrans, native of Mexico; a very fine specimen.—P. W., Mandelburg, Cattleya venosa, a natural hybrid between C. Loddigesii Barrisoniana and C. Forbesii.—Arvicola, Catalpa bignonioides, Dendrobium bathousianum, D. draconis (bathousian).—R. E., Bristol, Cattleya granulosa, near to the variety Dubuyssoniana.—F. E. A. 1, Pteris crenata (chilensis); 2, Blechnum polypodoides; 3, Polypodium aureum; 4, Polystichum aculeatum; 5, Notochloa chrysophylla; 6, Athyria n. filix-femina Frizelliae.—C. A. B. 1,

Sonchecio Jacoinea; 2, Silphium laciniatum; 3, Lysimachia vulgaris.—J. L., Ashbourne, Hedyosarum coronarium, called French Honey-suckle, because it is not a Honey-suckle.—Fino, 1, Nephrolepis davallifolios Irrenus; 2, Thunia alba; 3, Carex variegata; 4, Dietyogramma japonica variegata; 5, Sempervivum arachnoideum; 6, Datura Stramonium.—J. B., 1, Tabernaemontana coronaria, fl.-pl. (scind in flower); 2, Cissus discolor; 3, Alceaia macrophylla variegata; 4, Maranta picta; 5, probably a Cypripedium (scind in flower); 6, Maranta Veitchi. The tickets were wet, and not easy to decipher.—Aphor. A Picotee, probably Salix fragilis, impossible to say with certainty from a leaf.—F. B., Cotoneaster, probably C. mummularifolia.—White Wooden Box with Name, 1, Viburnum Opulus; 2, Tannus communis; 3, Glaucium luteum (Norm Poppy); 4, Agrostis-

temna coronaria; 5, Thymus serpyllum var.; 6, Acrena; 7, Cynanchum Vincetoxicum; 8, Epilobium lanceolatum album.—H. K. A form of the common Thyme, T. vulgaris.—Sweet Pot., 1, Centaurea ruthenica; 2, Cimicifuga racemosa; 3, Centaurea glastifolia; 4, Eryngium alpinum; 5, Lychnis chalcidonica; 6, Ononis arvensis alba.—Abington, Melilotus officinalis.

ROOTING LAURELS: Gosfield. The common Laurel or Sweet Bay will root moderately easy if cuttings be taken 3 to 4 inches long during next month, and inserted in a sandy soil under hand-lights in comparative shade. Perhaps you have not afforded the cuttings the protection of a hand-light, and have failed for this reason. You might also increase the plants by layering some shoots during next month or in October.

SOUVENIR DE LA MALMAISON CARNATIONS: Malmaison. An expert in the cultivation of these plants replies to your queries as follows:—"Repeat the plants at once into 8-inch and 9-inch pots, using a compost of good turfy-loam three parts, and leaf-soil, peat, lime-rubble, and sand, one part. Should the loam be of a retentive nature, then a few pieces of charcoal may also be incorporated with the whole. A small quantity of bones may be used, but only given in proportion as the loam is rich or poor in plant food. Liberal drainage must be provided, and the soil also will require to be firmly pressed (not rammed) home around the sides of the root-mass. Assuming that the growths have not been thinned out, no time should be lost in selecting the very best placed and strongest. The number to be left must be regulated by the strength of the individual plant; from six to twelve growths may be taken as a guide, though I have flowered them in quantity with as many as fifteen; in the absence of any information as to the strength of your plants, I give the foregoing in the belief that the plants are well grown. Place a neat stick to each growth as the work proceeds, allowing every one plenty of room for the admission of light and air. Water must be sparingly given, and the plants should be exposed to light and air in a well ventilated house. J. F. M."

TOMATO DISEASE: Tyro. If you read your Gardeners' Chronicle you would know that it has been repeatedly figured and described. Burn all the affected plants, as it is very infectious. On no account sow seed from affected fruits.

WEEDS ON LAWN: W. H. N. The most effectual method by which to eradicate Plantain and Dandelion from lawns is to dig them out, and obtain every bit of root that is possible. The preparation known as lawn sand, procurable from the trade, will keep them under for a time, but it is doubtful if it will kill in all cases the bottom half of the roots, and failing this the plants will produce three or four heads each in place of one. Sulphate of ammonia is also useful by improving the grass and thereby smothering the weeds.

"NATURE-STUDY."

WE take the following extracts from an address to the schoolmasters attending the vacation course at the Harper Adams Agricultural College, Newport, by the Principal, Mr. P. Bodworth Foulkes, B.Sc., F.F.S., on August 1. To arouse in intelligent interest in the surroundings of everyday country life, is not only to sweeten existence, but also to put within reach the opportunities for material advancement.

In the early nineties of last century, the subject of Nature-study had commenced to arouse the attention of teachers all over the United States of America. The movement was started by the Universities, and very soon grew to large proportions, in fact, one University, in 1899, was mailing over 1,200 letters a week in connection with this branch of its work alone. The work was done principally by correspondence and by the publication of leaflets mainly for the use of teachers. These leaflets contained notes of instruction, explanation and advice. At the American Educational Exhibition in Manchester, in February last, some of the results, as well as the methods of teaching Nature-study, formed a very important section of a most interesting exhibition.

Germany, too, provides us with an example, which we would do well to copy. One chief feature, perhaps, of all the German education work may be said to be the numerous and colorful studies of sciences. This is particularly the

case in their High Schools and Colleges, where I have seen collections that would do credit to any English museum.

"In an American description of Nature-study, the purpose of the work was stated to be 'to improve agriculture.' 'We believe,' this description ran, 'that the most fundamental thing we can do is to give a new enthusiasm and a new point of view to the coming farmer. Nor do we hold that the coming farmer alone should be reached in order that farming be improved. We want to do something to elevate the tone of country living, and this can be done only when a general public sentiment is awakened. While we desire to reach all the schools with the purpose of improving country life, we do not believe it to be wise to make the teaching of technical agriculture compulsory in any school, not even in the rural districts. To force the teaching of agriculture is to make it perfunctory, and of no avail. The teacher must be trained. Public sentiment must be awakened. A desire must be created. It is a question whether any technical or professional work should be introduced into the elementary schools; but it is always advisable to awaken the pupil's interest in the things with which he lives.'"

"The subject of Nature-study is one which is eminently suitable for all children, and I would not by any means confine it entirely to country schools.

"The primary object of all Nature-teaching is to encourage and promote in children the power of observation, and such observation should be encouraged so that when the school days are over the child is in full and complete sympathy with, and takes an intelligent interest in the pursuits and occupations which are open to dwellers in the country. It is, in other words, the rational training of the child's intelligence. Every child is naturally inquisitive, and such inquisitiveness should be encouraged, developed, and trained into a habit of enquiry and research, so that the simple phenomena of Nature may be wondered at, spoken of, and understood.

"Beginning with the youngest pupil, the simplest objects must be taken in such a way that the child does not think that he is learning a lesson. Once having interested the child, a succession of work may be arranged which will lead upwards, and finally, in the case of older students, lead to a useful knowledge of the work which is to be the means of livelihood in subsequent years. This may be brought about by the teacher taking those simple subjects which are to hand at the different times of the year, and such subjects should be treated in the simplest and most elementary manner. It is not desirable to lay before a child such definite facts as names, and dates, or, at any rate, to expect a child to learn by heart such names or dates, but to make the object of such interest that, when subsequently the child's eye comes across a similar object, it will observe, and lead to nothing, perhaps, its surroundings or its variations from the object explained in the school-room.

"For this reason, Nature-teaching should, as far as possible, be always accompanied by objects, and, whenever a sufficient number of objects are attainable, it is beneficial that each child should handle these for himself. The success of the teaching will depend upon the attractiveness of the subject. The greater the skill of the teacher in this direction, the greater the benefit to the pupil. Fortunately, the subject is one which does not require the expenditure of large sums of money upon apparatus and diagrams, for no subject in the school curriculum lends itself so well or as so

many means of demonstration. The variety of the subject is again a great advantage to the teacher, and such lessons may be taken as can be illustrated, or such objects chosen as may be watched and handled by each pupil.

"There are very many simple pieces of apparatus which can be made without expense, and which will materially assist the teacher to explain the processes of Nature. It is not necessary to have a complete chemical or biological laboratory in order to show the elementary principles of matter or the germination of some common seeds. Nor is it necessary to have a complete entomological collection when discussing the cabbage-butterfly or the common wire-worm. A great deal may further be done by the pupils copying these simple experiments either at home or in school, when time permits.

"We may define Nature-study as being an acquiring of sympathy with Nature, or, in other words, sympathy with what exists. Nature Study in the school is the teaching of the youth to see and to know the thing nearest at hand. It is not a definite exact knowledge, and some authorities accuse Nature-study as being a failure because it does not teach definite facts, and does not teach strict method and accuracy. Accuracy and method are both highly desirable and absolutely necessary features, and while accuracy is a prime requisite in Nature-study, it is an accurate searching for truth that is required rather than such an accuracy of method as we find in a subject like mathematics.

"The essentials in Nature-study may be said to be:—

"First: The keen love of Nature. This is, to a large extent, instinctive; but it may be cultivated, and, if absent, a personal interest may be aroused in the individual.

"Secondly: Observation, which should be direct, discriminating, and accurate. The absence of this essential may ruin the whole work, and yet, if overdone, may cause the subject to degenerate into a dry, uninteresting lesson.

"The third essential is a desire to know more than is seen. This essential follows the others; it is the secret of the whole of the work, and, unlike all other school work, it comes of itself.

"Fourthly: Nature-study must be spontaneous. To make it a lesson taken from books robs it of all its interest. It cannot be made a subject for examination, for there again the life of the subject would be done away with.

"We live in an age of specialists, and the temptation is, particularly in the scientific world, to put aside all other branches and to go deeply into one small branch, which appears the most attractive. The old type of naturalist is, now-a-days, hardly ever to be met with. This is a state of things which, in some ways, is beneficial to the country at large, as it enables the teacher to go deeper and to allow a more thorough study to be made. But, at the same time, there is not the general interest taken in Nature. Perhaps of all real students of Nature, the 'keeper' is the most thorough; but here, we generally find, as specialising, the knowledge is confined to the animals which it is his duty to observe. Richard Jefferies—an author who was a true lover of nature—brings this very clearly out in describing, in some of his works, a very typical form of gamekeeper. Personally, I have been surprised at the wonderful power of observation which many keepers possess. Such power of observation is, as a rule, to these men a second nature. Take again, as an example of the necessity for the power of observation, the case of the shepherd. Here, acute power of observation is an absolute

necessity, for it is a matter of life or death to the sheep, and often to the shepherds themselves in the case of flocks on the mountain pastures. The best shepherds are generally those whose fathers and grandfathers have been shepherds before them: the power of observation runs, so to speak, in the blood. Their knowledge of weather is often remarkable, and frequently more reliable than a barometer.

(To be continued.)

LOGAN GARDENS, WIGTONSHIRE.

Mrs. McDONALD, of Logan House, in this picturesque parish, is one of the most ardent amateur horticulturists within the range of my acquaintance. Through the kindness of this gifted lady, I have many opportunities of visiting those beautiful gardens and grounds, which she loves so greatly and so effectively superintends. They are at present extremely attractive—a series of floral pictures of the most artistic description.

Mrs. McDonald is a great lover and cultivator of Roses, and all the finest varieties of Hybrid Perpetuals, Teas, and Hybrid Teas, also such superb climbers as Turner's Crimson Rambler, Rêve d'Or, Cranioise Supérieure (which flowers profusely from June to September), the Ayrshire Ramblers, so prolific of their floral affluence; Gloire de Dijon, and Bouquet d'Or, luxuriate there. An exquisite climbing Rose, which the Lady of Logan should add to her already extensive collection, is the supremely lovely Claire Jacquier, whose opening buds, more refined in their aspect than those of William Allan Richardson, are strikingly contrasted with the expanded flowers. It is one of the greatest ornaments of my own garden this year.

Mrs. McDonald's favourite Roses are the Teas and their beautiful hybrids, especially such varieties as Marie Van Houtte, Papa Gontier, Madame Lambert, Medea (undoubtedly the grandest of lemon-coloured Roses raised by Mr. Wm. Paul, of Waltham Cross), Madame de Watteville (which I find very unreliable), Clara Watson (which should be grown more extensively in Logan Gardens), Madame Perrot Ducher, the nobly-endowed and very fragrant Viscountess Folkestone, and Gloire Lyonnaise.

Almost rivalling the Roses are the magnificent Spiræas, especially *S. gigantea*, which in these gardens is worthy of its name; *S. japonica*, *S. palmata*, and *S. Aruncus*, with its fan-gleaming, creamy-white, feathery plumes. Many beautiful forms of the graceful Clematis adorn the garden walls, they are also made radiant with the innumerable scarlet pictures created, as if through some artistic instinct, by *Tropæolum speciosum*, which also flowers picturesquely amid the branches of venerable trees with a charming effect.

In the centre of Logan gardens is a shady circular enclosure, sacred to the memory of the late Mr. McDonald and his sister, Mrs. Patrick Stewart, which is a garden in itself, filled with Wallflowers, York and Lancaster and Provence Roses, and other fragrant old-world flowers, greatly cherished by the present proprietor, Mr. Kenneth McDonald, for the sake of those who used to tend the "flowers of remembrance" so lovingly there. On either side of these the quite modern *Nemesia* flowering most abundantly, with many fascinating and tenderly tinted forms, deepens the interest of this tranquil scene.

Mrs. McDonald has for many years been an earnest cultivator of Oriental Lilies, of which the most successful have been the great Himalayan *Lilium giganteum*, which here reaches a height of fully 10 feet, and blooms magni-

ficently; *Lilium auratum platyphyllum*, which also grows impressively; *Lilium Humboldtii*, *L. Szovitzianum*, which should be assigned an opener and sunnier situation, that it may have an opportunity of revealing its powers; *L. Kramerii*, *rubellum*, *Burbankii*, *speciosum*, *dalmaticum*, *candidum* (with splendid effect among the Roses), *davuricum*, and other species, are extensively cultivated. The flowering of new varieties recently brought from islands in the South Pacific Ocean, outwardly resembling *Lilium longiflorum*, but doubtless distinct, is awaited with great interest.

To this fine collection of Lilies might be added *Lilium Washingtonianum*, a very beautiful and most fragrant native of California, which invariably flowers on the confines of July. *David R. Williamson*.

BRODIAEA CROCEA (L. WATS.).

This is the first time this pretty little species has been illustrated (fig. 39). It has a small, ovoid, truncated bulb, linear leaves, a

FIG. 39.—BRODIAEA CROCEA.

slender naked peduncle a foot long, and an umbel of 6 to 15 inches in height; yellow flowers, with a funnel-shaped tube shorter than the oblong lobes. The lobes are keeled with green, and the filaments are flattened and very short, the two rows of three each being unequal in length. It is a native of the mountains of the north of California, and was first described by Professor Wood in 1868 under the name of *Southeria crocea*. It has also been called *Milla crocea* and *Triteleia crocea*. *J. G. Baker*. [Flowers were described lately by Messrs. Wallace, of Colchester.]

ORCHID NOTES AND GLEANINGS.

RHYNCHOSTYLIS CELESTIS.

A good specimen of a fine variety of this charming blue-flowered Orchid has been in bloom for some time in the collection of George C. Raphael, Esq., Castle Hill, Englefield Green (gr. Mr. H. Brown). The plant, which is more often seen in gardens under the name of *Saccobolium celeste*, is stated by the collector Robinson to have been found "growing upon isolated

trees in the Rice-fields of Siam, these trees being charred stumps which had survived the fires used in clearing the ground." Doubtless they are to be found in more happy situations also, but importation of the plant is seldom made, and generally in small quantities only, consequently it is not often met with in gardens. The variety at Castle Hill has upright spikes of many pretty sky-blue flowers, the comparatively large labellum being violet-blue. *Vanda cerulea*, *V. cornu-sensum*, and other *Vandas*, *Saccoboliums*, and *Arides* thrive well at Castle Hill, and bloom regularly. Some interesting and showy species have lately been received from Mr. Oscar Raphael (Mr. G. C. Raphael's son), who is an enthusiastic traveller in unfrequented places, especially in India and to the confines of Tibet. Some noble specimens of *Dendrobium nobile* and other *Dendrobiums* received from these regions are flowering well, and will in due time give a fine show of flowers.

CYPRIPEDIUM DORIS.

Raised and first flowered by Norman C. Cookson, Esq., in 1890, this fine hybrid between *C. venustum* and *C. Stonei*, may almost be regarded as old, but in point of beauty it will compare favourably with many of the newer arrivals. The broad, dark green, slightly mottled leaves constitute it a sturdy-looking plant; and its tall inflorescences of large flowers, with some of the aspect of those of *C. Morganii*, render it highly ornamental. When the earlier plants flowered out of the batch raised, the influence of the *C. Stonei* parent was not strongly pronounced, but in the strong specimen now flowering with George C. Raphael, Esq., Castle Hill, Englefield Green, the features of that species are the more prominent. The large dorsal sepal is shaped much like that of *C. Stonei*, but is broader, yellowish-white, with numerous green lines following the veining; the lower sepals are similar but smaller; the showy, arching petals yellowish-white, with numerous large chocolate-purple spots, except at the base and apex; lip large, light purplish-brown. With it in flower is another of Mr. Cookson's hybrids, *C. × Bryan* (*philippinense* × *Argus*), also very distinct; a plant of a very fine form of *C. Curtisii*, with much more white than usual in the flowers; *C. superbium*, and some hybrids, among which the Castle Hill form of *Selenipedium stenophyllum* (*Schlimii* × *carolinum*) is an elegant though not large-flowered variety with white flowers tinted with rose, and beautifully spotted on the inside of the lip and side-lobes with purple.

CHRYSANTHEMUM CULTURE.

"TAKING" THE BUDS.—If there is one detail in the cultivation of large Chrysanthemum blooms that is of more importance than any other, it is that of "taking" or "choosing" the buds to produce our flowers. Experience with the different varieties will only thoroughly teach beginners in their cultivation in various localities the proper time to do this. If the buds are not selected at the best time for each variety, it is useless to expect flowers of first-class quality. It is not that upon a particular day of the month all buds must be "taken," but that the state of each individual plant must be considered when the wish-for-bud appears. As a general rule, what is known as the crown bud, is the one selected for producing large blooms, but in some instances this particular bud will not produce the best results, and the terminal one a month later should be chosen.

As a general rule, plants which are grown to produce large blooms, show several buds

during the season of growth. What is known as the first break is formed from the middle of April to the same time in May, and sometimes even later than that; assuming, of course, that the plants are allowed to grow away uninterruptedly from the cutting stage until this same first break is formed, which is caused by the natural tendency of the plant to form a flower-bud in the point of growth.

This bud is removed, and the shoots limited to three, as near to the point where the bud was produced as possible. These same selected shoots grow rapidly away, and in time produce each a bud which is termed a "crown" bud. When this bud shows at the correct time for a

are loose and flabby, more like inverted saucers than globe-shaped, which many varieties ought to be. They cover space enough, but are devoid of depth and solidity—the two most essential points in a good flower.

In removing the shoots which cluster around the bud, great care should be used, or an accident may easily occur; but the operation should be carried out directly it can be determined that the bud is perfect in form. The best time for this operation is in the early morning, or in the evening, when the dew is upon the plants; the shoots at that time are quite brittle. If the stem is held securely in the left hand, and the young growths

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See *Tables, ante*, pp. 88—91.)

(Continued from p. 126.)

3. ENGLAND, E.

ESSEX.—Taken on the whole, the crop of outdoor fruit is light; but this is not to be wondered at, seeing the immense crops that were secured from the trees last year. However, small trees in the nursery of the following varieties of Apples are carrying nice crops of clean though small fruit:—Worcester Pearmain, Beauty of Bath, Old Nonpareil, Quarrenden, King of the Pippins, Frogmore Prolific, and Miller's Seedling. *H. W. Ward, Lime House, Rayleigh.*

LINCOLNSHIRE.—The fruit crop is an average one with the exception of Pears and Plums. Plums are much infested with black and white flies. Apples appeared at first to be plentiful, but owing to the drought many have fallen. Small fruits are abundant. Strawberries have never been so good with us before; quality and quantity being excellent. *John Rowlands, Manor Gardens, Bardney.*

— Apples, Pears, Plums, Cherries, and Apricots, showed a splendid display of bloom, but the May frosts and subsequent drought have been exceedingly injurious. *J. D. Coward, Haverholme Gardens, Skefford.*

CAMBRIDGESHIRE.—The poor fruit crops here are the result of a hail-storm that occurred on May 29. *W. Backham, Dalham Hall Gardens, Newmarket.*

NORFOLK. Before returning this report, I have visited several other places in the neighbourhood, and find the fruit crop of 1901 generally very unsatisfactory, with the exception of Strawberries, which have been in most cases a very good crop. Apples, Pears, and Plums are very poor. This condition I believe to be due entirely to overcropping last season, as the weather in spring was favourable for the setting of what bloom there was. *E. Parstow, Shadwell Court Gardens, Thetford.*

— Apple-trees are looking very healthy, but the crop is a poor one, though some trees are bearing freely. Cherries and Apricots are the best crops of the year. *Wm. Alban, Gindon Park Gardens, Norwich.*

SUFFOLK. After the heavy crop of Apples last season, and the consequent weakening of many trees, one can hardly be surprised at seeing so many trees destitute of fruit this season. Pears and Plums, too, are short crops. Cherries were plentiful until the fruits began to colour, but the irritation and loss to growers through the depredations of birds has been very great this season. Peaches and Nectarines on open walls are good crops. Apricots not so plentiful. Among small fruits, Gooseberries have been a heavy crop; Black Currants not so plentiful; Strawberries abundant and good. *J. Wallis, Orwell Park Gardens, Ipswich.*

— In this district the Apple crop is a failure. This is not owing to climatic changes during the blooming period, but to the entire absence of blossom. Pears are an average crop, and promise to be good in quality. The same remarks also apply to Peaches, Apricots, Plums, and Cherries. Strawberries were a heavy crop and remarkably good. Other small fruits are abundant. All fruit-trees and bushes are making good growths, and are fairly clean. *H. Fisher, Flitton Hall Gardens, Bungay.*

1. MIDLAND COUNTIES.

BEDFORDSHIRE.—Apples in this district are a complete failure, and small fruits have suffered

FIG. 19. YELLOW GOOSEBERRY "CORHAM."

Recommended an Award of Merit when shown at a Meeting of the Royal Horticultural Society, on July 30. From Mr. T. K. Chickney, Cobham Hall Gardens, Gravesend. (See *Gardeners' Chronicle*, August 3, p. 102.)

variety, and is "taken," then all other things considered, it will develop into a perfect flower. If it were possible to name a day as the most suitable for all varieties, but it is not, then I should name the 21th of August; still, buds formed about that date invariably develop good blossoms.

It will be safe practice for those persons who have not had previous experience, to "take" the buds of all varieties that form after these notes appear, or have just previously formed; as to remove these would not allow time to develop another growth, and give another bud in time to produce full-sized blooms. The objection to buds formed too early is that the blooms do not come "kind," as it were; the flowers are coarse in petal, which much oftener reflex than incurve in the case of incurved varieties. The flowers then

which are intended for removal be bent suddenly down, one at a time, they snap off. After a little practice, this method of taking off superfluous shoots is more expeditious than cutting them off with a knife; but if the operation is effected during the middle of the day, when hot and dry, the shoots are quite tough, and the risk of damaging the flower-bud is much increased.

When the growths have been removed, the whole energy of the plant will be concentrated to the development of the flower-buds. The inexperienced cultivator errs in allowing the shoots to remain too long before removing them; all this time they are extracting nutriment from the plant which ought to be centred in the swelling of the flower-buds as rapidly and as evenly as possible. *E. Molyneux.*

from the prolonged drought. The rainfall here from April 15 up till now (third week in July) has been only 2.11 inches. *H. Nimmo, Cranfield Court Gardens, Woburn.*

— The fruit crops in the gardens here give every promise of a fair average crop, and all small fruits, with the exception of Black Currants, are over an average crop; Gooseberries in particular, which are one of the finest crops this season I remember to have seen. *Geo. Mackinlay, The Gardens, West Park.*

— The season has been an exceedingly unfavourable one, yet we have here an abundance of fruit generally, though the prolonged drought has affected its commercial value very adversely. Plums are a heavy crop on many varieties; Victorias, for instance, are loaded to such an extent that we have to prop up the branches. Rivers' Early Prolific, Monarch, Czar, Prince Engelbert, and Demiston's Superb, are similarly well cropped; as also are Damsons of some varieties. Apples are more irregular, but Potts' Seedling, Duchess of Oldenburg, White Transparent, King of the Pippins, Ecklinville, Lane's Prince Albert, and several others are well cropped. Pears are bearing fairly well on the higher ground, but these and the Apples are under-sized. Gooseberries have been most plentiful, but Red Currants, Strawberries, and Raspberries have suffered severely from the effects of the drought. Black Currants have been abundant in some parts of the county, for instance, at Eaton Bray one grower alone has sold 16 tons from about 6 acres of land, the fruits being fine, and bringing a good price. In some districts Apples and Plums are scarce, and the crops appear to have been much affected by local conditions. Fine fruit will be scarce, much sorting will be needed, and the selling price will be low for the bulk of the produce. *R. Lewis Castle, Woburn Fruit Farm, Ridgmont, Beds, August 10.*

BUCKINGHAMSHIRE.—Fruit crops are a fair average in this district, with the exception of Apples on orchard standards. Pyramids on the Paradise stock are carrying a good crop of fine fruits. Pears on walls are very poor, but are much better on pyramids. Strawberries were good, but soon over. Bush fruits abundant and good. *Chas. Page, Dropmore Gardens, Maidenhead.*

— In this neighbourhood the fruit crops are very partial, but Cherries predominate. Peaches and Nectarines are abundant, but in some places the trees are badly infested with red-spider. Among earliest Peaches, Alexander came in first this year, the first fruit was gathered on July 15; and Waterloo and Amsden June ripened subsequently. Amongst Strawberries of recent introduction I find Laxton's Leader produces very large fruits of good quality; Trafalgar is also a desirable variety, and Millbasket a splendid cropper of first-rate quality. *G. T. Miles, Wycombe Abbey Gardens, High Wycombe.*

— With few exceptions the Apple crop in this district is a failure, the trees however are in a fairly healthy condition, and free from insect pests. Of bush fruits there is an abundant crop—Gooseberries in particular—and the quality is good. Raspberries are better than we have had for many years. In some Plum-orchards the crops are good, whilst in others near by scarcely a fruit is to be found. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

— Plums such as Victoria, Green Gages, Prunes, and Damsons, are all bearing good crops; Apples are not half a crop. There are

no fruits of Blenheim Orange Pippin, and very few Cox's Orange Pippin, White Transparent, Duchess of Oldenburg, Ecklinville, and Keswick, have good crops. *J. Smith, Mentmore, Leighton Buzzard.*

CHESHIRE.—Many varieties of Apples have very little fruit upon them; Lord Suffield, Potts' Seedling, and Grenadier have average crops. Pears are rather better than Apples; Jargonelles, Williams' Bon Chrétien, Louise Bonne of Jersey, and Thompson's standards have good crops; of Marie Louise there is next to none on standard trees, though on trees against walls there are good crops. *Robt. Mackellin, Alney Hall Gardens, Cheddle.*

HEREFORDSHIRE.—We have 7 acres of Apple-trees, and not a bushel of fruits. *W. R. Morley, Fyghlestone Gardens, Berkhamsted.*

— Apples, Pears, and Plums are under average crops, due, I think, to the trees having exhausted themselves by carrying heavy crops last season. There was also a deficient rainfall during the later summer months last year when the fruit-lands were developing. This spring there was only a small quantity of bloom, and this set well, and was uninjured by frost. Pears are a better crop than Apples or Plums. Cherries are over average, perhaps a little under in size, but they are clean and free from cracking. Small fruits are average, but I make an exception with Raspberries, which are much over, particularly two varieties, Bonnet and Superlative. Of Strawberries, the crop has been large, and of splendid quality. *George Norman, The Gardens, Hatfield House.*

LEICESTERSHIRE.—Apples are very scarce in this neighbourhood, the best crops being on young trees on the Paradise stock, and some of the standard trees situate in the cottage gardens. Our own large trees in orchards under grass flowered very sparingly, and have scarcely any fruit; some of these bore heavily last year, and the primary cause of deficiency in the crop this season is exhaustion of the soil, and a consequent loss of vigour in the trees. Pears have suffered much from an attack of the mildew (*Diplasia pyricola*), this gets worse every year in spite of all measures taken to destroy it; the Pear slug (*Eriocampa limacina*) has been unusually troublesome this season. Strawberries have been exceptionally good, especially Waterloo from a north border; many of the fruits weighed 2 oz. each. The rain on June 30 and July 1 (1.01 inch) was just enough to save this crop. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

NORTHAMPTONSHIRE.—In the gardens here we have not a single Apple, and the Pear crop is a very thin one. There was but little bloom on Plums, Apples, and Pears in the spring. Strawberries have been very plentiful indeed; and Currants (Red, White, and Black) are good in size and quality. Blight has settled on the Plum and Cherry trees. *H. Kempshall, The Gardens, Leampit Hall, Northampton.*

NORTHAMPSHIRE.—Taken collectively the fruit crop is satisfactory. All kinds set well, and passed through the spring without injury from frost. Since then the crops have been considerably damaged through insect attacks of various kinds. The long drought and excessively dry atmosphere has caused Apples to drop freely, Pears to crack, and a good percentage of stone fruits to shrivel during the stoning stage. Bush fruits are very plentiful, but small in size. *J. Roberts, Welbeck Gardens, Worksop.*

— Owing to the drought and easterly winds, aphids of all kinds have been very pre-

valent, and fruit-trees have suffered in consequence. Small fruits set spicadid crops owing to absence of spring frosts. Wall fruit generally is very good, and I a full crop. Pears on Quince in the open air are cropping well, but standard trees are almost a failure. *J. R. Pearson & Sons, Chilwell Nurseries, Leabham.*

OXFORDSHIRE.—The worst of all the fruit crops here is that of the Apple. There was no bloom at all on the trees in the garden. Pears-trees bloomed well, but the flowers set badly. This is a Cherry county, and the crop is heavy, and the fruit good. The Apple and Plum crops are poor, owing doubtless to last year's heavy crops. *A. J. L. and Wynford Court, Sand's Oxford.*

— It is difficult to explain the vagaries of the Apple and Pear crops in this district. In a well-managed sheltered orchard not a quarter of a mile from these gardens, containing local bearing varieties in young and old trees, there is not a bushel of Apples. I have a sprinkling of both Apples and Pears on all trees in the garden excepting Blenheims, Dunclow's Seedling, and Cox's Orange Pippin. Some trees of the latter variety in good condition are without a single fruit. Pears are a moderate crop; Monarch (Knight's) bears with me a heavy crop this year. Easterly winds with bright, scorching sunshine in the early stages of growth may account for a good deal in some situations, but does not explain the failure in sheltered situations. The Collins carry the heaviest crops this year. All foliage is healthy and clean. We are sheltered from wind, and have an elevation above sea-level of 528 feet. The soil is a heavy loam. Our rainfall for the first four months of the year was as follows:—March, 2.16 in.; April, 2.71 in.; May, 1.28 in.; June, 1.70 in. *James A. Smith, Sarsden House Gardens, Chipping Norton.*

SURRESHIRE.—Apples promised well, but the bloom was cut badly by east winds, and the crop is very irregular; some trees of my own are carrying full crops, and looking well, but there are gardens near where they are a failure. In my own case, the trees are well sheltered from the morning sun. My best are Cox's Orange Pippin, Bramley's Seedling, Potts' Seedling, Ribston Pippin, Nonsuch, Bess Pool, and Red and White Astrachan. *A. S. Kemp, Broomway, Staines.*

STAFFORDSHIRE.—This has been a very peculiar season for hardy fruits, but fortunately in this district, we escaped with only very slight frosts during the period the trees flowered, and a good set followed. Insect pests, and aphids in particular, A. crasi on the Cherries, and the blue variety A. pruni on the Plums, have been more troublesome than I have ever known them to be. *Geo. Woodgate, Rolliton Hall Gardens.*

WARWICKSHIRE.—The Apple crop is under average. Trees of Blenheim Orange have no fruits, and the crop on Dunclow's Seedling (Wellington) and Mère de Ménage is poor. There are plenty of Pears, and the trees are clean and promising. Cherries were very good. Apricots are good in quality, and plentiful. The small-fruit crop has been far above average, both in quantity and quality. Strawberries were abundant and good. *James R. Lyon, Curlew's Park Gardens, Warwick.*

— Owing to long drought, which brought in its train innumerable pernicious insects, the Apple and Pear crops in this district are thin. Strawberries have been a good crop, as have Gooseberries, Currants, and Raspberries. For prolonging the Strawberry season we have nothing to equal the old variety Eleanor. *H. T. Martin, Stoneleigh Abbey Gardens, Kenilworth.*

WARWICKSHIRE.—Notwithstanding the absence of frosts during the whole of the flowering period of Apples and Pears, there will be a marked deficiency of both fruits throughout this district. The deficiency is somewhat singular; in some orchards a few trees are found to be in full fruit, whilst others are as completely without, and from personal observation this appears to be the case within a radius of 5 miles from my house. Plums are not even so

plentiful as of yore, and a slender one is apt to forget, but during the observation of many years, this is the only one in which I have failed to notice that either Kidney Beans, Potato, or other tender plants, have been touched by frost; so that the causes of decided "under average" amongst both Apples and Pears must be looked for, from the deteriorations working of some other physiological influences, which perhaps some learned scientist will be able to explain or

LILIES AND THEIR CULTURE.

(Continued from p. 67.)

MINIATURE LILIES.—Under this heading I have grouped together a few Lilies of small growth which are not generally easy of cultivation, that is to say, they do not last more than one year unless they are given special attention. Their bulbs range in size from that of a large Pea to a Walnut. They are easily damaged, and must be carefully enveloped in sandy grit when they are planted, as they are not very free rooters, losing most of their basal roots as well as their stem roots every year. They start into growth in early spring, and reach the flowering stage without making more than a few basal roots, these being produced in greater number and strength after the plants have flowered. On the other hand, they will make vigorous stem roots if planted in a suitable compost, far outnumbering the amount of basal roots these plants produce in a year under ordinary conditions, inasmuch that success or non-success depends on the number of stem-roots it is possible to encourage. If they are planted in a dry soil, they make no stem-roots at all, their flowers are, as a consequence, puny, and the bulbs perish after flowering. Given a good soil of a friable nature, in a position sheltered from winds, in full sunshine, and if they are well watered whenever they approach dryness, they will thrive and multiply at a rapid rate. Their flowers, though small, are among the most brightly-coloured of the group, and are invaluable for cutting. The plants would look best on a rockery where there is the necessary amount of moisture. They would well repay the trouble of preparing a special place for them.

One of the brightest of all Lilies is *L. tenuifolium*, a species that produces a slender stem a foot high (as a maximum), clothed with numbers of linear leaves barely 2 inches long, and from six to ten rich terra-cotta or scarlet tubulate, nodding flowers on a loose spike. The flowers span an inch across, and may be roughly described as like those of miniature chlorobanicums. Everyone who sees the plant wants it.

Lilium concolor is another pretty species growing about 9 inches high, and bearing two to three erect, flat, star-like, crimson flowers, slightly spotted at the base. Its variety *Cardinal* is a rich yellow flowered form, slightly spotted and heavily flushed with chocolate colour as the flower ages.

L. pulchellum is a taller plant, 1½ ft. high, with erect spikes of flowers of a rich tint of crimson, heavily spotted black in the lower half of the flower. It is the rarest of the concolor forms, and somewhat difficult to grow.

L. rubellum, figured on p. 12, a beautiful new Lily, may be included in this group on account of its cultural affinity. It grows 1 to 2 feet high, and bears from one to three funnel-shaped, rich rose-coloured flowers, each measuring 2½ inches in length and span. A little canine spotting occurs in the tube of the flowers. It is one of the earliest of all Lilies to flower.

The kindred *L. Krameri* (*L. japonicum*), a slender autumn-flowering plant attaining a height of 2½ feet, is included in this group on cultural grounds. It produces solitary trumpet-shaped flowers, with spreading limbs of a pale pink colour. It is a very delicate Lily, and rather difficult to grow. It succeeds well under the conditions given for miniature Lilies. Although its roots are further advanced when it flowers than is the case with those of *L. rubellum* and *L. concolor*, it is always necessary to keep the soil well tilled and damp throughout the growing season, for

FIG. 11.—CYPRIDIUM MATELLI MAGNIFICUM.

First class Certificate. Described on p. 102, *Gardener's Chronicle*, August 3.
Photographed by Mr. H. J. Chapman.

favourably circumstanced, and will be much under average. Cherries are better, more particularly Morellos on bush trees, which are really fine. Hazel and Walnuts are plentiful, especially the latter, of which there are some grand trees around Leze. Strawberries of all varieties, where well grown, were good and plentiful. The hot weather ripened them so quickly as to produce unremunerative prices in the market, and their continuation was shortened by an atmosphere of abnormal heat. Red and Black Currants and Raspberries are plentiful and good. Without reference to a

throw light upon. The wild Crab Apple in hedgerows, and also cultivated varieties in my grounds, are practically fruitless. This is further proof that although frost was absent all during the flowering season, there existed some other element which was seriously prejudicial to the setting. The foliage of trees, and the general healthful appearance of the sylvan beauties of the country, were never, perhaps, seen to better perfection than they are this year. W. Miller, *Berk. Hill.*

(To be continued.)

the flower is large in proportion to the plant; and any check the plant may receive from drought will invariably result in a withered bud. A few colour-forms of *L. Kramerii* have occasionally appeared, including a white one, but they have usually been of a more delicate constitution than the type, and have ultimately disappeared. A multi-flowered form is grown in Japan, which may turn out to be an improved rubellum, judging from paintings of the plant. All the *Lilices* in this group are perfectly hardy plants, natives of colder climates than our own. The secret of success with them is in the careful management of the stem-roots. *Geo. B. Mallett.*

(To be continued.)

FOREIGN CORRESPONDENCE.

FERTILITY OF FIGS AND THEIR POLLINATION.

IN Tournefort's *Travels in the Levant* he tells how Figs fall immature from the trees, unless the Fig-grower introduces male flowers, and a small wasp to carry the pollen through the aperture at the apex of the Fig to the pistillate flowers inside. In California a large orchard of Smyrna Figs behaved in the same way—the fruit fell from the tree at an early stage, as an over-crop of young Apples do in an orchard. He sent to the Old World for male plants and the Fig insect-fertiliser, and now has bountiful crops. The Figs are put up in marketable shape, and are equal to the best in the markets of the Old World. A Fig orchard that was a disastrous failure has become a valuable commercial enterprise. Some of these Figs sent to me seemed hollow. One eminent microscopist could find no radicle or cytoblasts, another thought traces could be discerned. I settled the question by washing out and sowing the seed, and they grew beautifully. There seems no doubt but that these Smyrna Figs behave as they are represented to do.

Now I have been looking at and eating Figs grown in the open air and in glasshouses for over half a century, Figs of many varieties, though I do not remember any one that might be called especially the Smyrna Fig. I never knew any one to fall off for lack of pollination. With the results of my Californian friend's Fig orchard before me, I suspected that possibly there might be a few staminate flowers near the apex in Figs generally, and that the "Smyrna" Fig was a wholly pistillate kind. I only grow a few Figs in my garden, just to have them; not being hardy in Philadelphia, we have to bury them under the earth in winter for protection. I have only Early Proflie, Castle Kennedy, Angelique, White Ischia, and Brown Ischia. The first crop has been ripening since July 25. They are fine large fruits, some nearly as large as duck eggs, and of delicious flavour. I can now say they are purely pistillate, no trace of an anther anywhere within the flower. The seeds are certainly hollow, as a Pine seed is when unfertilised. I need not give illustrations, but we all know that many things will perfect a "fruit" without perfecting seeds. The Navel Orange may, however, serve for one who may not have met with an instance. It is no surprise that the receptacular "fruit" of the Fig will perfect without maturing seeds.

Now, why should this "Smyrna" Fig behave in this way? This is what troubles me. Do any of your readers of the *Gardeners' Chronicle* know anything about it? *T. M., Philadelphia, U.S.A.*

INDIA.

FLORA OF THE SOUTH LASHAI HILLS.—In the spring of 1899, Dr. A. T. Gage, Curator of the Herbarium, Royal Botanic Gardens, Calcutta, made a short botanical excursion into a portion of the South Lashai Hills as far as Fort Langleh, one of our outposts. Dr. Gage describes the general features of the flora of the South Lashai Hills, which run N. and S. between latitude 22° and 24°, longitude 92° to 94° E., as practically the same as those of the adjacent Burmese hills; epiphytic Orchids being very much in evidence, chiefly species of *Dendrobium*, which form masses of colour on the trees. Among these he found sixteen *Dendrobes*, including such old favourites as *formosum*, *anceps*, *cretaceum*, *transparens*, *Devonianum*, *fimbriatum*, *chrysanthum*, *aggregatum*, and *chrysoxanthum*, *Oberonia iridifolia*, *Bulbophyllum Lobbianum*, *Eria convallarioides*, *panicea*, *bambusifolia*, and *tomentosa*, with *Phajus maculatus* and *abusus*. He also found six species of *Coleogyne*, among them *Gardneriana* and *maculata*; four *Pholidotas*, two *Cymbidiums* (*lanceifolium* and *pendulum*), *Phalenopsis cornu cervi*, *Aerides Fieldingi* and *odoratum*; the pretty *Renanthera Indochiniana*; *Vanda teres* and *coriacea*; *Saccobolium papillosum*, and a single "Slipper Orchid," viz., *Cypripedium vilosum*. The great Scitamineae order was represented by *Hemiarthris burmanica*, *Hedyclium villosum*, *Carex zosteria*, *Anomum dealbatum*, and *Alpinia malaccensis*. Among Palms were found *Pinanga gracilis*, *Caryota urens*, *Licuala peltata*, and *Calamus tenuis*. The Aroids were also well represented, chiefly by species of *Rhaphidophora* and *Pothos*. There were also a good many Ferns found, among them the beautiful *Pteris bianrita* and *Asplenium sylvaticum*; altogether twenty-three species. Three Jasmines were found, among them the pretty and distinct *J. Listeri*, collected by Lister in the Chittagong Hill Tracts in 1876. The entire scene was towered over by huge specimens of *Dipterocarpus turbinatus*, *Toddalia aculeata*, the so-called "Wild Orange of the Nilgiris," was also found. In common with this were found its near relatives, *Murraya exotica*, *Microcinnum pubescens*, *Clausena sultriflora*, and *Citrus medica*, all of these now being placed under Rutaceae.

Dr. Gage, who was able to get together 317 species, Orchids coming first with 19, Ferns 23, Leguminosae 18, Ericaceae 15, Rubiaceae 11, Euphorbiaceae 13, Acanthaceae 11, and Compositae 10 species, these among Phanerogams; of the remainder there were one order with 8 species, one with 7, ten with 6, three with 5 species, nine with 4, ten with 3, thirteen with 2, and twenty-eight with 1 species. The tour commenced on March 15, and ended on April 30. *Indian Gardening.*

HERBACEOUS PHLOXES.

THE very large collection of these beautiful hardy plants, now so freely blooming in the Royal Horticultural Gardens, Chiswick, affords to the Fellows of the Society an admirable opportunity to make selections of what may seem to them to be the best varieties. With so many diverse colours or markings, it is but natural that selections should differ very much. Just as the tastes of the selectors differ, there seems to be no doubt but that pronounced colours produce the best general effect, although there are few varieties that do not seem to be charming when looked at closely. It is one of the excellent features of herbaceous Phloxes, that if some plants or stems be pinched back early in their growth, they will branch out, and thus, if others

remain untouched, to bloom early, greatly prolong the flowering season. Still further pinching tends to produce comparative dwarfing. Where several plants of a variety are grown, some of each variety can thus be stopped, and late bloom ensured.

To have good effects from Phloxes in borders, plants should be put out in triples anglewise, as if in that way a dozen heads be produced, the effect is very telling. Some young shoots taken off quite early in the spring, when but from 2 inches to 3 inches long, should be inserted into pots as cuttings every year, thus ensuring a continuous stock of young plants; a further advantage is that the new season's shoots are thus thinned, and that is beneficial, as stocks should not carry more than three or four stems at the most.

Plants from cuttings the first year may be finely flowered in 6-inch pots, on single stems, in cool-houses or conservatories, or for outdoor groups, or they may be plunged into beds to fill vacant places. Then in the autumn they may be planted out into borders, to bloom for two years, after which they should be replaced by younger plants. Being somewhat free surface-rooters, it is needful to give ample moisture as the plants age; the stems also become more crowded and tall each season.

With respect to varieties, a selection of a dozen made at Chiswick is thus:—*Sylphide*, 30 inches, pure white, very fine; *Berencie*, pure white, 20 inches; *Croix du Sud*, white, red eye, very charming, 2 feet; *Regulus*, rich rosy-carmine, 2 feet; *Jacques Benuet*, pink, red eye, 2 feet; *Parthenon*, rosy-lilac, 16 ins.; *Cameron*, white, rose eye, 2 feet; *Cocquelicot*, brilliant vermilion, 30 inches; *Comet*, bright rosy pink, 2 feet; *Montagnard*, intense crimson-red, 30 inches; *Lebenger*, red, shaded purple, 30 inches; and *Fernando Cortez*, reddish-carmine, shaded rose, 2 feet.

A further selection of twelve, made a few days subsequent to seeing the Chiswick collection, gave the following as very beautiful at Long Ditton:—*Avadameh*, pure white, 18 inches; *Les Orlives*, lilac, red eye, 18 ins.; *Huri Marger*, white, with rose eye; *Marquis de Breteuil*, carmine-pink, 16 inches; *Le Siecle*, rosy-carmine, 15 inches; *Regulus*, deep carmine, 18 inches; *Joelyu*, deep scarlet, 18 inches; *Le Maquart*, purple, 16 inches; *Robur*, violet-purple, 20 inches; *Tempete*, rosy-carmine, shaded crimson, 2 feet; *Paul Bert*, white, flushed and shaded blue; and *Souvenir d'Emile Leibig*, soft, clear pink, with magenta edge. *A. D.*

NURSERY NOTES.

THE HANDSWORTH NURSERIES, SHEFFIELD.

(Continued from p. 128.)

EVERETT'S SHRUBS.—*Aucuba japonica* is one of the commonest and best plants for a shrubbery, or for planting under trees. The variegated varieties, when planted as single specimens or in groups upon the lawn, are exceedingly decorative providing they berry freely, which they will generally do if care be taken to plant both sexes near to each other. At Handsworth we not only saw a large quantity of the shrub, but the plants were more freely variegated than is commonly the case. *Beberis aquifolium*, *B. empetrifolia*, and *B. Darwinii*, the two latter being the parents of that extremely ornamental plant *B. stenophylla*, were all noticed in excellent condition. Messrs. Fisher, Son & Sibary cultivate a very large stock of a broad-leaved Box, of uncommonly good habit and colour, named *Handsworthensis*. In the nur-

FIG. 12.—SPECIMEN PLANT OF *ILEX HANDSWORTHIENSIS* IN THE HANDSWORTH SUBSERIES, SHEFFIELD. (SEE P. 132.)

series, this variety grows so freely, planters of Box in shrubberies would do well to make acquaintance with it. Gold and silver variegated Box, and a pendulous variety with green leaves were observed. *Eunymus*, *Eurya*, the *Brooms*, *Cotoneaster*, and other species of ornamental evergreen shrubs, were upon one hand or the other. The Tree Ivies deserve special mention, there being an uncommonly good stock of plants of all sizes, in pots and in the open ground, for planting amidst shrubs, or for any purpose.

The evergreen flowering shrubs include a fine collection of *Rhododendrons*, and it being held to be necessary to supply these plants to colour, and to flower at certain dates, a considerable portion of the stock consists of named varieties. Two varieties are specially recommended by the firm for flowering early in the season; they are *Handsworth White* and *Handsworth Scarlet*. There was an excellent stock of the useful *Olearia Haastii*, and of many species of so-called American plants. In passing, we observed in bloom *Genista pilosa*, a pretty little prostrate species, that merits a place in the rockery.

DECIDUOUS SHRUBS.

The patch of brilliant colour we observed at *Handsworth* from a batch of plants of the golden-leaved Elder will not be easily forgotten. Not only were the plants of exceptional colour, but the variety was that with lacinated leaves. What could be more effective for affording colour in pleasure-grounds than this plant? A representative collection of single and double-flowering *Lilacs* is grown, and the *Weigelas*, *Philadelphus*, *Prunus*, *Rubus*, *Spiraea*, *Viburnum*, *Deutzia*, *Hydrangea*, *Cytisus*, &c. A new variety of *Cytisus* named *Handsworthensis* is described as an excellent form of *C. Scloppkensis*, with flowers that are almost pure white.

ORNAMENTAL AND FOREST TREES, HERBACEOUS PLANTS, &c.

We have not the opportunity at the present time to refer to the forest trees at *Handsworth*. There may not be anything particularly new among them, but there is an excellent stock of all the species known to be useful for any purpose.

Of the ornamental trees, the golden and variegated-leaved Elm, Beech, and Oak, are of principal interest. *Quercus robur concordia* (golden), *Q. v. argentea* (silver), *Q. coccinea*, the scarlet-leaved Oak, so effective in autumn; *Fagus sylvatica aurea marginata*, *F. s. argentea marginata asplenifolia*, *F. s. cristata*, *F. s. laciniata*, and *Purple Norwegiana*, are some of the best Oaks and Beeches. One of the best varieties of Elm for street or park planting is one called *Wheatley*, and Messrs. Fisher, Son, & Sibbery export this in large quantities to America.

There is an attractive avenue of Beeches through a part of the nurseries, the varieties purple *Norwegiana* and purple *pyramidalis* having been planted alternately. An exceedingly bold variety of the so-called *Service-tree*, *Pyrus aria himalaica*, with exceptionally large, very white leaves, attracted our attention, and the purple-leaved *Beech* near by afforded a good contrast.

In a large collection of Limes, the best for ornamental purposes are the varieties known at *Handsworth* as *crimson-twigged*, *orange-twigged*, and *red-twigged*.

Conifers take their place in the nurseries at *Handsworth*, and few species or varieties exist but may be found there. We noticed the very effective *Cedrus atlantica glauca*, *Picea pungens glauca*, and some unusually good young plants of the *Umbrella Pine* (*Sciadopitys verticillata*).

Of hardy climbers in pots there were many, and it was said that of shrubs and other plants there were as many as 250,000 in pots plunged in the ground, that they may be sold at any season of the year.

In this review of Messrs. Fisher, Son & Sibbery's Nurseries we cannot describe the herbaceous flowering plants or fruit trees, but collections of both kinds are cultivated there.

Our illustration (fig. 42, p. 131) shows another of the fine specimen Hollies referred to in our last issue.

The Week's Work.

THE HARDY FRUIT GARDEN.

By C. HERRIN.

Cleaning Strawberry-beds.—Established beds that are to remain for another season should be pelleted of all superfluous growth forthwith, and the ground cleared of weeds and rubbish, before the beds become a crowded mass of foliage. Where runners have not been specially layered for forming new plantations, select the best rooted runners before cleaning the ground, and plant them temporarily on a partially shaded border, until the new quarters are ready to receive them.

Strawberries for Main and Late Crops.—Following the planting of runners for the production of the earliest crop mentioned in last week's Calendar, preparations should be made for those of the main and latest crop. If the site has not been previously trenched and prepared, a piece of ground should be chosen that requires little preparation, ground which has yielded some light crop since it was trenched, and which, if forked over and afforded a dressing of thoroughly rotten stable-manure, will suffice. When this has been done, if the ground is dry, apply water in sufficient quantity to moisten it thoroughly, and the next day it will be in condition for levelling and treading over to make quite firm. Presuming the runners have been layered into pots for planting, a good crop of fruits may be expected next year if attention be given to watering, &c., during the next few weeks. As these plants are usually allowed to stand for about three years, they should be planted at a distance of 2 feet apart each way, another foot being allowed at every third or fourth row, to serve as an alley and convenience for working among the plants.

Varieties to plant.—One of the most popular varieties grown at the present time is undoubtedly *Royal Sovereign*, which, besides fruiting early when on a warm border, is one of the best all-round varieties for general cultivation, and the fruits being firm, travel well. A rather darker fruit is preferred by some, which the new variety "The Laxton" promises to supply. *President* is a variety of excellent flavour, but somewhat soft for packing; while *Sir Joseph Paxton* is an old market favourite that crops well, is of good colour, and is one of the best for packing. Other good varieties are *Lord Sullield*, with large, handsome, dark crimson fruits, richly flavoured; and *Empress of India*, a fine dark fruit with a slight Pine flavour. Later varieties include *Veitch's Perfection*, a good variety of the British Queen type, and *Waterloo*. Two good varieties for latest cropping are *Elton Pine* and *Oxonian*, which should be planted on a border having a north aspect.

FRUITS UNDER GLASS.

By MARGARET McINTYRE, Gardener to Sir CHAS. TESSNART, The Glen, Innerleithen, Peebles-shire.

Peaches and Nectarines.—Trees started in December and early January will still need to be kept moist at the roots, or the flower-buds will fall later on. If any of the trees look weakly, afford them liquid-manure in place of clear water. It must be remembered also that if water be applied when unnecessary it will tend to sour the soil, and destroy the fibrous

roots. The ammonia and nitric acid in rain-water help to prevent the buds from starting prematurely. Any laterals that are still green and unripe should be retained. Early-forced trees do not as a rule make strong growth, and they form generally a larger proportion of single fruit-buds than trees grown under more favourable conditions. When pruning, do not cut back the wood that will bear next year, unless it is of unusual length. Very little pruning will be needed if disbudding has been done properly, but no more wood should be tied in than will be required to replace the bearing wood of the current year, and to renew worn-out growths. Any trees which have grown too vigorously must be lifted, and their roots laid in firmer material nearer the surface. Others that may show symptoms of weakness should have the old soil carefully removed from amongst the roots, in place of which put a compost of turfy loam and steamed bone-meal and wood-ashes, the two last-named ingredients in the proportion of a bushel to a cart-load of loam. These operations require to be performed as soon as the leaves have matured, but before they fall from the trees. Afford a good watering both to the lifted and replanted trees.

Succession Houses.—Cut away shoots that have borne fruit, unless such as are required for the extension of the tree, and if the other growths are too numerous they will also need to be thinned. This will allow the foliage to be more readily cleaned by repeated syringings. If fruits are ripening, maintain in the hours a free circulation of air, and afford sufficient water only to the roots to prevent the foliage becoming limp; damp the surface of the house occasionally.

Late Houses.—Thin and regulate the summer growths, and if they are laid in thinner than is customary with mid-season trees, the wood will have a better chance to ripen. Strong growths must be cut back or removed altogether, as they induce an unequal distribution of sap, and bring about unfruitfulness and gumming. Endeavour to secure moderately strong, short-jointed wood, and ventilate the houses early in the day, closing in good time so as to increase the temperature by sun-heat, which will not do any harm after evaporation has been going on for some time if care be taken to admit a little air before nightfall. The night and early ventilation tends to the solidification of the growth and its ripening. Keep the trees free from red-spider by forcible syringing until the fruits give indications of ripening. The borders must be well supplied with water or liquid manure, and be mulched with soft manure.

THE FLOWER GARDEN.

By T. H. ST. AUG, Gardener to Lord Baltimore, Puttmore Park, Exeter.

Clethra, or Sweet Pepperbush.—As these shrubs are now commencing to bloom, I may direct the attention of intending planters to them, that they may be planted later in the season. *Clethras* are most useful for planting where a continuance of flowering shrubs is desired throughout the summer. The plants are not expensive, nor are they fastidious as to soil. *Clethra alnifolia* is most frequently seen, and it forms a compact-growing shrub, varying in height according to the nature of the soil; it grows most rapidly, and attains to its largest size in a moist situation, and in fairly heavy land—near a stream, for instance. Their sweet-scented, feathery spikes of white flowers show above the light green leaves of the plants. The plants require little attention after they are established, beyond removing the spent flower-spikes. Some that were planted in these grounds about four years since have now grown into nice-sized bushes. Another one is *C. acuminata*; but *C. alnifolia* is the best for general planting.

Olearia Haastii is another pretty shrub, flowering in August, its neat, compact habit rendering it useful for many purposes. I have planted them in beds of medium size, and they

are also effective as single bushes in the shrubberies. There are several varieties of Olearias, but for ordinary purposes *O. Haasti* is probably the most reliable and hardiest.

Hydrangea paniculata grandiflora.—The flower-trusses of these will soon be expanding, and the plants should be afforded a thorough soaking with water or liquid-manure if at all dry; they may need some support whilst in flower. Standard plants of these *Hydrangeas* especially should be securely staked. While the dwarf-growing plants of these are useful in beds, standards with 3 or 4 feet stems are very suitable for growing over some low-growing shrubs, and they appear to give equally fine trusses of bloom.

Gallonia (Hycinthus) caudatus.—The flower-spikes will need to be supported, and if the bulbs are growing among small shrubs, see that the flower-spikes have sufficient room to be effective. The stock may be increased by sowing seeds, or in less time by planting bulbs later in the season.

Humea elegans.—Sow seeds in light, sandy soil, in pots or pans, and place them in a close frame until germinated; they are useful alike for subtropical bedding, groupings, and cutting purposes.

Roses.—Cuttings of any favourite kind may be put in, selecting fairly ripe wood for the purpose; they may be taken off with a heel, or cut across just below a joint. A close, one-light frame, containing a few inches of sandy soil or grit, and road-scrappings mixed with it will answer. Insert the cuttings a few inches apart, and let them remain until new growth has commenced. It is preferable to put them into small pots than in the frame. Place one cutting in each pot, and when nicely rooted shift them on as required. When dibbled in a frame, many of the cuttings may callus over to form roots, but fail to make much progress if potted up, as they are injured by any disturbance at that stage. The cuttings put into small pots should be plunged in fibre or ashes in the frame, and sprinkled occasionally overhead with water, keeping the frame moderately close.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK BOLLE, Becton, East Bullerly, Devonshire.

Cauliflower.—The coming week will be a good time to sow seeds for plants to stand through the winter. Select an open position, and deeply dig the soil, adding manure if necessary. Make the soil moderately firm, and take out shallow drills 6 inches apart from each other, watering the same a few hours previous to sowing the seed. If the weather be very dry, cover the seed-bed with a few mats until the seeds have germinated, then immediately substitute a net for the mat. The net will need to be supported by a few forked sticks to keep it clear of the plants. Afford the plants water when this is necessary, and dust them occasionally with wood-ashes when the leaves are moist. Early London, Sutton's First Crop, and Veitch's Autumn Giant are good varieties for early sowing.

Spring-sown Onions are bulbing up well, and should there be any stiff-necked plants, gently bend them down with the back of a wooden rake. The crop should be ready for lifting towards the end of the present month.

Turnips.—Make another good sowing of the varieties Snowball and Veitch's Red Globe for late winter and early spring use (see Calendar in *Gardeners' Chronicle* for July 27). Those sown about that date may need water, and should be frequently dusted with lime and wood-ashes. Thin the plants to 1 or 6 inches apart, which work should be done when the soil is in a moist condition.

Potatoes.—Should the ground be required for another crop, second early varieties may be lifted. The varieties Surprise and Supreme have enormous crops here. The tubers are of good size and quality, and quite free from

disease. Too much care cannot be exercised in clearing small tubers from the ground when lifting the crop.

Tomatoes.—Gather the fruits as soon as they ripen, and feed the plants with some approved stimulant twice or more times each week. Plants prepared for winter fruiting must not be neglected in the matter of water, and the timely removal of all side growths; and if standing in the open, make them secure against wind by fastening the stake to a horizontal-strained wire, similar to that used for *Chrysanthemums*. Mould loam, with a fair sprinkling of bone-meal, is a good root medium for the final potting. Be firmly to encourage short-jointed growth, and use pots not exceeding the 10-inch size. *Tomatoes* planted out against walls or fences should be examined once a week, cutting away all superfluous foliage, to expose the fruits to the sun. Water the plants abundantly during dry weather.

Salads.—Mustard, Cress, and Radishes may still be sown on cool positions. Late Radishes need a sheltered corner, and should be sown in the first week of September. The ground must not be allowed to get in any degree dry.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to RUSSEY PARK, Esq., Freestwood Hill, Longborough.

Paper-White and Double Roman Narcissus.—Amongst the early-flowering bulbs, these are of first-rate importance. The cultivation they need is similar to that I have previously advised for Roman Hyacinths. Pot five bulbs into a 6-inch pot, and plunge the pots in ashes for a few weeks until the bulbs have commenced to grow, and have filled the pots with roots, when they may be removed, and subjected gradually to the light. Pot successive batches of bulbs to maintain a supply of flowers from November to January.

Early Tulips of the Due Van Thol varieties may be started as soon as the bulbs are obtained. Where large quantities are forced, a convenient method is to start the bulbs in boxes, putting fifty bulbs in each box. They should be plunged in ashes just as bulbs in pots. They are best brought on afterwards beneath the stages of the forcing-house, or the bulbs should be covered with moss until the flowers are so far advanced and the stem-growth sufficiently lengthened to be of use for cutting. The bulbs can then be potted up, six bulbs in a pot, and arranged as to height and time of flowering in a more satisfactory manner than when the bulbs are potted in the first instance.

Salvia splendens, and Eupatoriums.—Plants growing in pots may now be transferred finally to 6-inch pots. Use a generous compost of loam, leaf-soil, and well-decayed manure, adding a little bone-meal and fine mortar-rubble in place of sand. Plunge the pots in a bed of ashes, and pick off all flowers as they appear. Sprinkle the plants after hot days, and when they have filled the pots with roots afford them waterings with liquid-manure.

Bonnetias.—Continue to pinch the growths, as a means of obtaining a good head to the plants. Plants growing in frames, whether planted out or not, require frequent supplies of water, and an abundance of air at all times. Before lifting the plants, take the precaution to cut around each with a sharp spade ten days or a fortnight previously. Plants that were rooted late are in a condition to be transferred to 5-inch pots for flowering, after which they should be placed in a frame, and for a time shaded and syringed daily. Afford more ventilation as the plants become established in their pots, and apply an occasional dressing with an artificial manure, such as Clay's or Standen's. A small teaspoonful of manure to a 6-inch pot will be sufficient. Water this in as soon as it has been applied.

Tree Carnations.—Pot on the late batch of winter-flowering Carnations, and put them in frames, where they must be afforded ample protection from heavy rains, but expose the

plants fully to the sun. Tie the growths of the earlier-potted plants to neat painted sticks. Any tendency to flowering that the early-propagated plants may show may be stopped by pulling out the young embryo buds and pinching the shoots. Put *Marguerite Carnations* into 6-inch pots in which they will flower. Formerly we used to plant these out and lift and report them in September; owing to the failure of the buds to swell and develop, the practice was abandoned, and the system of continuous pot-culture adopted. A compost of turfy loam, leaf soil, with fine pounded charcoal and mortar-rubble, is the best to encourage root action. Pinch out the most gross-growing shoots, and frequently turn the plants round, allowing space for the air to circulate amongst the plants. It is essential that Carnations of every type be afforded an abundance of fresh air.

THE ORCHID HOUSES.

By H. J. CHAMMAN, Gardener to R. I. MANSFIELD, Esq., Cambridge Lodge, Finsbury Road, Camberwell.

Laelia-Cattleya elegans.—There has been considerable difficulty in the past in distinguishing the difference between *L. C. elegans* and *L. C. x Schilleriana*, and even now one frequently sees the latter hybrid labelled *L. C. x elegans*. Yet they are perfectly distinct. *L. C. x Schilleriana* is from a cross between *Cattleya intermedia* and *Laelia purpurata*, and *L. C. elegans* is doubtless a hybrid between *C. guttata* and *L. purpurata*. The ground colour in *L. C. Schilleriana* is bluish-white, with a crimson front lobe; the latter hybrid generally has deeply suffused purple flowers, and a lip of totally different shape. *L. C. x elegans* now developing growths must be encouraged in every way. This hybrid succeeds best when grown in baskets, in a slightly higher temperature than that of the *Cattleya-house*; suspended over the *Vandas* they do capitally. Afford the plants as much light as possible, and shade only from the sun during the very hottest part of the day. They require a liberal supply of water, and should be dipped in such a manner that the compost will be thoroughly wetted. The varieties most in demand are the highly-coloured or *Turcici* type, and they are among the most expensive of this section of hybrids. *L. C. Schilleriana* is much more variable, possibly owing to the varied tints of colour seen in *L. purpurata*, one of its parents. These hybrids are also making growth. They succeed best in warmer conditions than those of the *Cattleya-house*.

Cattleya Bowringiana is now rapidly extending its growths, and should be placed in a light position at the warmest end of the *Cattleya-house*. Care must be taken not to over-water this plant, especially during periods of dull weather; the least excess of water at the root causes the outer shields of the growth to turn black at the base and the growths to decay. Too much shade will also cause damping at the present season of the year. Hybrids partaking of the parentage of *C. Bowringiana* are generally similar to it in growth; and the above remarks will apply also to these—*C. Mantini*, *C. Mrs. Wheatley*, *C. Portia*, &c. *Parysitis*, are among the best of this section. They succeed best suspended close to the roof-glass, and are generally late before starting into growth, needing a little more heat than that provided in the *Cattleya-house* to induce them to mature their growth before the winter months.

Hybrids of *Laelia Percini* and *Cattleyas* constitute some of the most beautiful of the autumn and winter-flowering kinds. They are frequently despised because the flowers are smaller than those of most other *Cattleyas*, but there are many among them of great value. They succeed best suspended near to the roof-glass, and should be grown in well-drained baskets or shallow pans. They possess a good constitution, and growing through the bright months of the year, they are comparatively easily cultivated. Potting may be done immediately after the flowers have been removed.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Aug. 21	(Shropshire Horticultural Society's Exhibition at Shrewsbury (two days).
THURSDAY, Aug. 22	(Royal Horticultural Society of Perthshire's show (three days).
FRIDAY, Aug. 23	(Strathleven Horticultural Society's Show.

SALES.

FRIDAY NEXT.—Imported and Established Orchids, Roman Hyacinths, Lilium candidum, Bulbous, Kew's Seeds, Bulbs from Constantinople, &c. at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick.—61.5

ACTUAL TEMPERATURES.—

LONDON.—Jan. 11 (6 P.M.): Max. 71; Min. 60.
 Annot. 15.—Dull, rainy, warm.
 PROVINCES.—Jan. 11 (6 P.M.): Max. 61, Cornwall; Min. 58, N. E. Scotland.

THE Official Report of His Majesty's Commissioners for the Paris-International Exhibition, 1900, is now issued. It is evident that, although Britain and her Colonies were represented, the results were by no means as satisfactory as would have been the case had more space been allotted for our exhibits, and had circumstances been different. As it was, it is not surprising that many of the largest and most important arts and industries were but poorly represented. As regards the horticultural section, the secretary of committee Mr. LIONEL EARLE says that:

"The representation of horticulture at Paris was a matter of extreme difficulty. The committee interviewed some of the largest nurserymen and fruit-growers of England, and found that they were unwilling to incur the expense of exhibiting, as they had little trade with France or the continent. The fruit-growers added, that their trade with France had been killed by protective tariffs, and stated that, whereas formerly they used to grow considerable quantities of Grapes for the Paris market, they had now ceased to do so. The principal growers of fruit were invited by Sir TREVOR LAWRENCE to attend a meeting summoned at the Crystal Palace during the fruit show in October, 1899, and the chairman, Mr. VEITCH, and Mr. LIONEL EARLE, attended to see whether anything could be done to secure the proper representation of horticulture. Finding that the market-growers were not inclined to participate, the committee decided to appeal to private owners of large gardens in England, but this appeal also met with little or no response, and with the exception of the Kew exhibit, British horticulture was practically unrepresented except at one or two of the periodical shows." It is, therefore, not surprising to find most of our best known British firms unmentioned in the list of "Awards," but in the same section (horticultural) in the class for fruit and fruit-trees, it is gratifying to learn that, "there was no fruit during any period of the exhibition comparable to that of Canada or the United States in those sections in which they competed. Canada was the only British colony that exhibited fruit at the Paris Exhibition, and received thirty-one Gold Medals, four Silver, and three Bronze, and two Grand Prix. By far the finest flavoured fruits amongst Apples, Pears, Plums, Peaches, and Grapes came from the Crimea, Russia. Next to the Crimea came the French and the German, referring to European fruit only, Canadian and American would rank with

French fruit generally. Swedish fruit all lacked flavour. On October 10;—France exhibited about 7000 plates Apples and Pears; Germany, 500, and Russia 1000; Sweden, 37 sets of Apples, 10 varieties of Pears; Bulgaria, 52 Apples, and 4 varieties Pears. France also exhibited Grapes (open air) in great variety; Russia (Crimea) exhibited Grapes (200 plates) exceedingly luscious. There was a small Spanish exhibit, and also a small exhibit of Italian fruit, both very poorly displayed." It is to display and to proper management of exhibits that much success is owing.

"The British manufacturers," says one writer in the report, "are ever anxious for foreign trade, but they want to obtain it without trouble, and to force the foreigner to take what they make, instead of setting themselves together to make what the foreigner requires. . . . the Exhibition, so far as we Britishers are concerned, has been a complete failure—want of organisation, want of thoroughness from the beginning to the end. No taste was used in any section, even in the manufacture of cases and the putting together of them; whereas throughout the German sections it was easy to remark that an intelligible policy and action had been carried out from the commencement." With all these disadvantages, the superiority of some of our most ancient industries remains uncontested, and the productions unrivalled. "For strength, quality, and above all, for purity of bleach, the Irish linens are by far the best shown, and are unequalled by those from any other country." This should prove an inducement to still further develop the linen industry of Ireland, both in small hand works and in large factories, as the value of it is undoubted, and has long been known, whereas many other suggested schemes for Irish arts and industries are not yet advanced beyond the experimental stage.

OUR SUPPLEMENTARY ILLUSTRATION this week represents a beautiful group of the hardy Rhododendrons, or Azaleas as they are best known in gardens. Though these plants make a glorious effect upon slopes, and in other positions in the pleasure-grounds in districts where they succeed, their most common use is for forcing into bloom early in the spring. The economy of the plants, by which they store up during their period of growth the necessary material for their flowers, and develop the flower within the bud to such an advanced degree before losing their leaves, enables the horticulturist to force those buds into bloom at unseasonable times as easily, nay, more easily, than many varieties of bulbs. The trade in these Azaleas each year between this country and the Continent is enormous, the best varieties being raised in the neighbourhood of Ghent, Belgium. The group of plants shown in the photograph was exhibited by Messrs. R. & G. CRIBBER, Southgate Nurseries, London, N., at the Temple Show, in May, and was one of the finest exhibits of the kind we have seen in this country. A description of some of the varieties then shown was given in the *Gardeners' Chronicle*, May 25, on p. 2 of Supplement.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—On the 13th inst., by permission of Captain FORRESTER, the gardens and grounds of Battle Abbey, Sussex, were thrown open on behalf of this institution; 1,255 people paid for admission, and a sum of £31 7s. 6d. was obtained. The gardener, Mr. W. CAMM, has reason to be satisfied with the result of the efforts he has made.

BRITISH FERNS.—The magnificent collection of Ferns got together by the late E. J. Lowe, Esq., is to be disposed of as a whole or in

Separate lots by private contract or otherwise. Fern-lovers will not need to be reminded of the excellence and variety of the collection, nor of the superb condition of the specimen plants. Altogether, there are about 3,000 plants, and innumerable seedlings. Hundreds of Certificates, dozens of Medals, and two Challenge Cups, have been allotted to these collections. Fern-lovers should communicate with HUGH LOWE, Esq., Shirenewton Hall, Cheshire.

MESSRS. WATTS and BALLANTYNE, are we informed, have been appointed nursery and seedsmen to His Majesty, by Royal command.

THE HAILSTORM IN THE HAWICK DISTRICT, which is described in a letter on p. 138, Mr. FORBES informs us that the hail, or "rather lumps of ice," in some instances measured over 2 inches. It was the "most disastrous storm within living memory." Over 1000 panes of glass were broken in Mr. FORBES' nursery, while in the grounds plants and flowers have suffered to an alarming extent. Luckily the newest range of houses, which contained the stock of the new Begonia Caledonia, escaped with but slight damage. Although the storm was at its worst for ten minutes only, it continued for five hours, during which time the rain fell in torrents, and the thunder and lightning hardly ever ceased.

A FLORISTS' OUTING.—On the 3rd inst. the employes of Messrs. STEWART & Co., Florists, of Bayswater Terrace, London, W., had their first annual outing. The party proceeded in brakes to Ripley, in Surrey, a distance of about twenty miles, and a very enjoyable day was spent in that beautiful neighbourhood. The arrangements were carried out by Messrs. Wood and COOPER, the heads of the indoor and outdoor departments respectively.

FLOWERS IN SEASON this week include another consignment of Carnations. They are seedlings of the past two years raised by Messrs. R. W. PROCTOR & SONS, New Square, Chesterfield. The flowers include some very pretty and bright colours, but probably the earlier blooms would be larger in size than those we have received. Messrs. WEBB & BRAND, of Saffron Walden, send us some blooms of double Hollyhocks, which are doubtless nearly faultless from the point of view of the florist. We regret that they do not appeal to us quite so forcibly. They are much too symmetrical and ball-like, and the less orthodox flowers whose guard-petals being longer than the centre ones, help to relieve the rather heavy-looking flowers, are prettier. But the single Hollyhocks are more attractive even than those. The florists' double varieties, however, possess a variety of colours, and to those who like them, Messrs. WEBB & BRAND'S strain may be recommended. The flowers were obtained from plants raised from seeds sown in June last year. They were planted out permanently in August and September.

HOW TO SELECT PLANTS.—It is not enough to select, but we must select wisely. Mr. F. A. WAUGH, discoursing at the Western New York Horticultural Society about Plums, makes a remark that should be taken to heart as regards all plants. He says that "the selection of any single variety depends not merely upon what the variety is itself, but upon all the circumstances under which it is to grow. This is a fundamentally important and a very obvious principle, but one which has been repeatedly forgotten in horticultural dis-

ussions. This principle may be expressed by saying that no variety can exist or be judged separately from its environment. The two must be examined together. This rule is absolute."

MISSOURI BOTANICAL GARDEN.—We have received the Twelfth Annual Report of the Missouri Botanical Garden, and learn that various improvements are in progress, and others completed, and that considerable additions have been made to the herbarium. Scientific papers in the volume include those on: Disease of *Robinia pseudo-acacia*, by HERMAN VON SCHRENK; Crotons of the United States, by A. M. FERGUSON; An Undescribed *Agave* from Arizona, by J. W. TOURNEY; A *Crataegus* Peltata, by WM. TRELLEAVE; A Pacific-slope *Palmetto*, by WM. TRELLEAVE; and Garden Beans cultivated as Escallons, by H. C. BRUSH, and already referred to. Illustrations other than those peculiar to the articles are those of: A Great Sleet Storm; A Winter Scene; Among the Aloes; The Octopus Plant; and, A Group of Iris. These add much to the attractions of the publication.

OVER-SEA FRUIT CROPS. A glance over a goodly number of Canadian fruit-crop returns show, in small fruits of various kinds, a complete failure. Apples appear to be a failure in Ontario; there seems a better outlook in the western districts. From the United States reports, it would seem that the recent heat wave has played a disastrous part. There has been a general decline in Apples and Peaches as compared with the previous report; almost every important Peach-growing State has the promise of over an average crop, but in the Apple-producing States the crop will be generally poor. The condition of Grapes is excellent.

MESSRS. HOGG & ROBERTSON, seedsmen, Dublin, whose exhibits of Tulips, Daffodils, and other bulbous flowers, have elicited much attention in this country, have been honoured with the Royal Warrant of appointment of seedsmen to His Majesty the KING.

ARCHBISHOP GOETHALS.—Indian papers are mourning the death of the Roman Catholic Archbishop of Calcutta, who was an enthusiastic gardener, and an active member of the Agri-horticultural Society since 1878.

MR. PETER BARR has earned for himself a new cognomen. We long ago hailed him as the Daffodil King; now we must liken him to PETER the Hermit. As each mail comes in, we read of his fervid praises of the Daffodil—now in the States, now in Japan, in Eastern Australia, in Western Australia, in New Zealand. Really, if we shortly hear of him lecturing on the Daffodil from the deck of the *Discovery*, within the Antarctic Circle, we shall have no reason to be much astonished. What is surprising is the vitality of the man, his freshness, his zeal, his enterprise. After an active and successful business career, he might fairly claim well-earned repose; but that is not his view. To go everywhere and see everything—many do that; but PETER BARR does more—he contrives to do good wherever he goes, and the hospitality of our colonists is amply repaid by him.

STOCK-TAKING: JULY.—In the past month there were four Sundays—in July, 1900, there were five; and this to some extent influenced the total of the imports. Last month's total was £16,928,822—that for July in last year £10,261,167. This an increase to be recorded of £2,761,655. Duty-free articles of food bulk largely in this increase.—Wheat from Australia and India, from America and elsewhere.

Strange to note also, Russia helps to swell the list with a large supply of butter, though Denmark still leads the way. The following are a few excerpts from the "Summary" table in the Trade and Navigation Returns for July:—

	IMPORTS		Difference
	1900	1901	
	£	£	£
Total value	14,244,347	16,928,822	+2,684,475
A. Articles of food and drink duty free	11,985,875	14,371,242	+2,385,367

The value of the imports for the past seven months is £205,596,327, against £295,899,033 for the same period in 1900—an increase for 1901 of £9,607,291. Coming, now, and briefly, to—

EXPORTS.

These amounted to £21,355,771 for last month, against £21,559,557 for July in 1900—a decrease of £203,786. A greater decrease was looked for, but a rise has taken place in sundry exports to the East. The value of the exports for the past seven months is £163,182,169, against £168,927,321 in 1900—thus showing a decrease of £5,745,152. We can only hope for the lowering of this deficit as the month goes on.

A NEW DICTIONARY.—We have received intelligence of a new trilingual technical dictionary or technolexicon in German, English, French, which is to be published by the Society of German Engineers, Dr. HUGERT JANSSEN is the editor, and his business address is 49, Borothenstrasse, Berlin. Circulars have been widely circulated asking for the co-operation of societies, authorities, establishments, &c., to furnish the names

of contributors qualified for the work. Each of these contributors or collaborators "will do well to begin by collecting the technical words and expressions of his speciality (or specialties), giving the source of each. Besides, his interest in the good cause will induce him to note down all other technical words and expressions missing in his dictionary that occur to him in his every-day work, or that he hits upon in reading." It is desired that those who collaborate will collect the words and expressions in a special notebook; that other helpers will refer the editor to technical dictionaries already existing, and that yet others will send their "price-lists, catalogues, business announcements, newspaper advertisements, &c. . . . If these societies, associations, &c., after having been applied to by us, do not in time endeavour to obtain the active assistance of firms . . . it will be utterly impossible to avoid gaps in our technolexicon." It will be noted that the wording of the circulars is not very happy, as it infers an obligation on the part of the "collaborators." Instead of this being the case, it is business men and craftsmen in every department who are asked to devote gratuitous labour to the perfection of a technolexicon. No doubt a trilingual technical dictionary would be a valuable work to future readers, and we hope that the editor and his kindly assistants will succeed in compiling one that shall be of standard utility.

THE RAMSEY ABBEY GARDENS.—The Ramsey Abbey gardens (Huntingdon) have never looked better than they have this year, and the presiding genius, Mr. SKARROOK, has every reason to be proud of his handiwork. One of the most promising effects is the training of Turner's beautiful Crimson Rambler in the Acer Negundo variegatum. Another very pleasing picture has been produced by combining the purple Clematis with the Acer Negundo. The beds of flowers have all been laid out artistically, and with good taste. One of the most effective beds has a ground of *Heliotrope*, Madame de Bussey, edged with *Polygonium* West Brighton Gem, and dotted with standard *Polygonium* Vesuvius. Another bed that instantly attracts attention has a groundwork of *Polygonium* Manglietia, edged with dwarf *Ageratum*, and dotted with *Calceolaria amplexicaulis* and *Fresia* Lindley. Then there is another plot very pleasing to the eye; the groundwork of this is of *Petunias*, with standard *Aloysias*, edged with *Festuca glauca*. Amongst other beds, the following are worthy of mention:—One with a groundwork of *Polygonium* H. Jacoly, edging of Mrs. Mappin, with dot plants of Golden Privet and Greyville; another with a ground of Atkinson *Polygonium*, edged with *Alyssum maritimum* and dot plants of Acer Negundo variegatum and *Ricinus embogiensis*; another set out with the Ivy-leaf *Polygonium* Madame Crousse, with edge of a light blue *Lobelia*, and dot plants of *Encalyptus* and *Ricinus embogiensis*. The Roses, dwarfs, standards, and climbers, can be numbered by their thousands; while thousands of Carnations of the new-west and choicest of varieties are blooming in all their glory. A grand show is also made by about 12,000 dwarf *Antirrhinum*s.

DOUBLE GYPSOPHILA.—Flower-botanically interesting double flowers may be, it is rarely that they exceed in beauty the single flowers. There are exceptions to this rule, and there are reasons why double flowers are sometimes preferable. The double *Gypsophila* shown lately by Messrs. D. S. THOMSON & SONS, Wimbledon (see p. 101), is excellent for bouquet

work and decorative arrangements generally. For these purposes it has all the advantages of the single form, with the additional qualifications of fuller flowers, which last longer in beauty. The flowers are interesting structurally; the sepals and outer petals are normal. Within them is a crowd of petals, some of which represent stamens, and here and there is a perfect stamen. From the axils of the sepals spring short stalks bearing secondary flowers, of the same structure as the primary one; the ovary styles and ovules are normal. The flower is thus not only doubled by the addition of supernumerary petals, but "proliferated" by the development of secondary flowers within the primary one.

PUBLICATIONS RECEIVED.—*Annual Administration Report of the Forest Department of the Madras Presidency, for the year ending June 30, 1900.* "The season was generally adverse to natural reproduction, and many failures and disappointments in cultural operations and experiments have to be ascribed to the drought. . . . The total amount of forest produce extracted was greater under all heads than in the previous year. . . . The Government notes with special satisfaction the measures taken to extend and promote the growth of trees and shrubs, the leaves and twigs of which are used by the ryots for field manure. . . . Satisfactory progress was made in settlement work, and also in the preparation of working plans; steady attention was paid to meeting the requirements of the people, and reconciling their wants with the restrictions necessarily imposed by effective conservancy; while a considerable revenue was realised in excess of expenditure. All these circumstances testify to the general good management and work of the department."

BOOK NOTICE.

THE STORY OF WILD FLOWERS, by Rev. Prof. Henslow. (George Newnes.)

IN pre-Darwinian days, it was too much the custom to make collections of wild flowers, count their spots, measure their hairs, and investigate their more prominent characteristics, then to dry them and put them away in their appropriate pigeon-holes in the herbarium. Even from these imperfect methods of study, great enjoyment was obtained by those who had a fancy for plants; and the eagerness with which a plant more interesting than usual was lighted on in the course of a ramble, afforded a degree of pleasure which the modern laboratory botanist cannot appreciate. It is certain, also within limitations, that a better knowledge of plants in general was obtained than is the case now. A man may be familiar with the variations of fibro-vascular bundles, or the intricacies of karyokinesis, and not be able to recognise the genus, perhaps not even the order, of the first weed he comes across. Still, it must be admitted that our predecessors had not much insight into the significance of the structures they examined, and were fond of referring the varying conformations to some ideal type which they borrowed from Goethe, or some other transcendentalist. They did not sufficiently realise that the type had no real existence, and that they were co-relating the appearances they met with to an intangible abstraction, rather than attributing them to the variations of a living being capable of being influenced by external circumstances,

one moreover inheriting its characteristics from a long line of ancestors.

The use of the word "families" is sufficient to show that our predecessors did not altogether overlook the facts of consanguinity and genealogical descent, but in any case, the full meaning of the "natural" system was never so clearly shown in pre-Darwinian days as it is now. The late Mr. Grant Allen did good work by directing the attention of the lay public to the life-history of plants, but he often allowed his imagination to outrun his facts, and was apt to treat assumptions as if they were demonstrated truths. From this point of view Professor Henslow is a more trustworthy teacher. He does not, as he often tells us, believe in "natural selection" as an agent in the production of new varieties and species. Indeed, the term natural selection has always seemed to us unfortunate. Substitute for it a capacity of adaptation to varying conditions, and some, at least, of the difficulties attaching to the idea of selection disappear.

Mr. Henslow's present book, to a large extent, deals with those adaptations as they are presented to our notice in the plants of our fields and hedgerows. The ways and life-habits of roots, leaves, tendrils and flowers are touched on, and plants that climb and plants that consume insects and do other things, once considered marvellous, receive attention. They are still marvellous enough, no doubt, but now that they are recognised as phenomena pertaining to the plant as a living organism of precisely the same character as an animal, they fall into line and order as regular manifestations of the energy of living beings, and not as something apart and proportionately inexplicable.

From this point of view we may take exception to the word "freaks," as used in Chapter xvi. There is really nothing freakish in the ordinary acceptance of the term about the malformations of plants. If we did but know the reason why, we should no doubt find them as much the result of law and order as any other variations of structure. A chapter on the evolution of kitchen vegetables is a novelty in a book of this character, but one that may be highly commended. A similar chapter on garden-flowers would cause many to take more intelligent interest in their plants, and in their gardens, than they do at present.

It will be seen that the ground covered by Professor Henslow in a popular book of some 250 small pages is very extensive, too much so to permit of anything like adequate treatment, but it is well calculated to arouse interest and stimulate curiosity—the first requirements for an intelligent appreciation of *The Story of Wild Flowers*.

VICTORIA PARK, TIPTON.

ON Monday, July 29, a public park, 33 acres in extent, was opened at Tipton, in Staffordshire, by the Earl of Dartmouth. The park was designed and the work carried out by Messrs. William Barron & Son, of Elvaston Nurseries, Borrowash, whose plan we reproduce at fig. 13.

The site was composed entirely of old coal-pit mounds. Seven disused pit-shafts had to be either filled up or bricked over; and as one of these occurred in the centre of the lake, which is 4 acres in extent, many difficulties had to be overcome.

A cricket ground of over 5 acres has been made; also a lawn-tennis ground and bowling greens.

HOME CORRESPONDENCE.

A FINE CAMPANULA.—What was, I think, by far the finest specimen of that beautiful and popular hanging pot-plant, *Campanula isophylla alba*, I have ever seen, and perhaps many others also, was hung at a small show held in the school of South Park, Reigate, recently. The plant was in a 9-inch pot, and was so finely furnished with foliage and flowers all round, and to a depth of 2 feet, that it had a circumference of 6 feet. A finer object to stand in a garden on an Ivy or other creeper-covered pedestal could hardly be conceived. The exhibitor was a Mr. Durrant, a local amateur, who had every reason to be proud of his very perfect and beautiful specimen, A. D.

HYBRID SUNFLOWERS.—Mention is made on p. 120 of a supposed hybrid between *Helianthus annuus* and *H. rigidus*. I wish the same hybridiser would try to cross *H. annuus* and *H. decapetalus*, and tell us the result. I have always believed that the Sunflower known as *H. multiflorus* originated in this latter cross. We have at least four varieties of it in cultivation; all are entirely barren. At least for twenty years or more I have searched and inquired in vain for a fertile seed of *H. multiflorus*. The single form is said to have been introduced from North America in 1699 by Lord Leinster. A double form was in common cultivation in the eighteenth century. Miller, in his Dictionary, calls the plant "the single perennial Sunflower." Asa Gray says it undoubtedly belongs to *H. decapetalus*, a species producing fertile seed plentifully in cultivation; but between the largest *H. decapetalus* and the smallest *H. multiflorus* is a wide interval without intermediate forms. Both flowers and leaves of *H. multiflorus* appear to be between the two suggested parents, *C. Watley-Dod, Edge Hall, Malpas*.

FLOWER-SHOW TENTS.—In respect to the note on p. 119 in the last issue, I may say that some years ago I was at a horticultural show where the tent had but one opening, the heat was so intense that the plants and flowers were drooping and withering under it. An appeal was made to some of the members of the committee to open the tent on the opposite side, but they declared the remedy would be worse than the evil, that it would cause draughts, and that people would not be able to enter without catching cold or being blown off their feet. Two of the exhibitors then took it upon themselves to open the tent on the opposite side. Within half an hour the tent was cool, the plants had ceased to flag, and the flowers had revived, notwithstanding that the power of the sun was still increasing. *Outlook*.

STRAWBERRIES AND MELONS AT FARNLEY HALL.—In my note upon the Strawberry crop, see p. 110, I was writing of the locality generally. Our plants were nearly all young. On July 23 I gathered the finest fruits I ever have gathered during the last fifteen years. They numbered fifty, ten of which weighed 16½ oz.; the largest fruit was 8½ inches in circumference. I was awarded 1st prize at Tadeaster Show. The fruits were picked from plants which were forced in 1900 (spring), eventually planted out under a north wall. Though we had not what might be termed a heavy crop, we were gathering handsome fruits for dessert, generally twice a day for a period of about five weeks. The variety alluded to above is Royal Sovereign. I would like to know what is the record weight for the same number of fruits. What is the average weight for two Melon plants to carry? I may say that I have cut 60½ lb. from two plants; eleven fruits in all, heaviest 6½ lb. These plants were grown in a box about 3½ feet by 2½ feet. *Ans. Small, Farnley, Otley, Yorkshire*.

MANURING STRAWBERRIES.—On p. 119, there were some remarks by Mr. Thorne, who does not believe in manuring Strawberries at this

time of year. I venture to say that here, if I did not annually manure our Strawberry plants as soon as the crops are gone, and the plants cleared of old leaves, we should get very little fruit. All growers know that the plant must make fresh growth and roots for the following year's crop; and with soil like ours, which is moderately heavy and very strong, we should get poor crops unless we well manured the plants now. The only growers that I would advise not to manure at this season are those who have a light soil containing much nutritive matter. In such cases too much rank growth would be made. I may add, that our Strawberries always open well, my sorts are Vicomtesse, Royal Sovereign, Sir Charles Napier, Monarch, and Latest-of-All. A. J. Long, Wyfold Court Gardens.

wall were more or less open, so that soil could be added freely to a depth of, say, 18 inches, such would be the freedom given for root-action that any wall, provided it received some skilled attention till the plants were established, could be made to grow many plants as well as they succeed in the border, while others would do even better. I place some emphasis on this, for the simple reason that the more depends on the structure itself, the amount of soil available for the plants, and the subsequent care in attending to the plants, than in the mere operation of planting. "Stonecrop" says he is going to place "bricks on edge" on the top of the wall; and it is to be hoped it is to be more than one brick deep, for the soil will be far too shallow, and become very dry. I would

S. nepalensis, &c.; *S. lingulata*, *S. Aizoon rosularis*. These four constitute the best of the crustaceous species for this kind of work. If another was desired I would name *S. cochlearis*, a rather scarce but very charming plant. These all have plumes more or less of white flowers, exquisitely dotted with brown or dark orange spots, and colonies of them are most attractive. Of the *S. onocrotogonis*, none are better than *Sodium spirium* in all its forms, *S. grandiflorum*, and *S. oppositifolium*. And of *Sempervivum* I would specially urge in favour of *S. arachnoidum* and *S. a. Liggeri*, more for the unique effect of their wobbled masses of rosettes, than for any effect in flowering. These are beautiful when given monks or corners where they may cluster together at will. Of other plants, the entire genus

FIG. 14. PLAN OF NEW PARK AT DEPTFORD, KENT (SEE P. 135.)

WALL GARDENS.—A correspondent, "Stonecrop," at p. 119, seeks information in respect to this phase of gardening. Too frequently the positions where walls could be erected to grow many plants with perfect success are occupied otherwise in the garden; while not a few of the walls that are "specially erected" for growing these plants are utterly inadequate for the purpose. In the instance described, however, there appears to be sufficient room on the summit of the wall, and the wall is available on both sides, as well as the top. It is to be regretted that your correspondent did not give the height of the wall. If there is not room for plants that trail long and freely, the wall is robbed of one good feature. Your correspondent only asks for "a score of the most beautiful alpine and rock plants suitable for such a position," without stating what the "position" is; nor is it stated what depth of soil is likely to be afforded at the top. This last is the more important item, because one cannot but infer that the wall is of ordinary build, and therefore solidly composed through and through. If the centre of the

suggest that the opportunity be now taken of removing some of the central parts of the wall, so that the cavities formed may be charged with soil. Such a proceeding, provided the height of the wall permits, will be much better than building too much on to top of the present erection; and "bricks on edge" are not picturesque. The whole subject is so interesting when it is well carried out, that the matter of the walls and their building should be controlled by the planter to some considerable extent, and in the case of new erections this is quite possible. Much depends also on the aspect, as this will influence the plants considerably in respect to moisture. I will endeavor to supply a list of plants that will best supply the rather exacting conditions of "Stonecrop." These are "most beautiful," "perfectly hardy," "flower very profusely," and are "brilliant or attractive in colour." It is scarcely likely all these requirements will be forthcoming, and what will be beautiful to one is often lightly regarded by another. However, some of the most suitable of wall plants are included in the list below. *Saxifraga longifolia*, *S. corymbosa*, often called

Aubletia, suggests itself as among the best of trailing and trailing plants. All are good spring flowering, and give rare masses of colour, rich and pale violet, blue, rose and reddish tints. The yellow *Alyssum*, the rose coloured *Speranaria nemorosoides*, the soft velvety masses of *Troximus lanuginosa*, the alpine *Phloxes*, and especially those nearest allied to *P. setacea*, with *P. verna*, and *P. divaricata*. Then again there is nothing finer than *Aubretia lanuginosa*, and with its trailing profusion of rose-pink flowers for three months in succession, is much the best of the free-growing kinds. *Draba aizoides*, yellow; *Ehrharia* thus *distans*, and *E. serpyllifolia*, blue; *Onosma latifolia*, golden yellow tubular flowers; *Corydalis lutea*, *Zauschneria californica*, *vermillion-scarlet*; *Campanula muralis*, pale blue, a gem; *C. sarragenia*, C. g. alba, blue, and pure white. *Erodium* in variety all are good; *Veronica prostrata*, blue, *Theris* or *Candytuft*; these are white-flowered, but certainly must figure among hardiest and best. *Dianthus caryophyllus*, *Avicula microphylla*, crimson, &c. In addition to the foregoing, there are among the more minute growing plants, some beautiful

species of the early Saxifragas, and the like for which corners could be found, or even arranged in masses. For all the foregoing, a good and sandy-loam would be suitable for the majority, while such as Saxifragas, Scempervivums, Sedum, Dianthus, may be assisted with the addition of old mortar with the soil. As to planting such places there is no better time than early autumn, say October; if the plants are well established in pots, they may be planted from September to end of March, provided daily attention is afforded them in respect to watering, &c. But for the majority the early autumn is preferable. E. H. Jenkins, *Hampton Hill*.

THE YARROW ON LAWNS.—There can be no doubt but that the past three or four hot, dry summers have very greatly favoured the growth of this weed on lawns, as in many directions now one sees it displacing grass so much that the verdure is far more that of the Yarrow leafage and much less that of grass. Those who may contemplate the making of new lawns, whether by means of turves or by sowing seed, should be most careful to see that, in whichever way, the most careful piece of the Yarrow found is ruthlessly exterminated while yet young. Care should also be taken that this very common wild plant is not allowed to flower in the vicinity of lawns. When first in evidence it is well to expend some labour in extracting the roots, in putting some fine soil over the places thus made bare, and in sowing good pasture seed, also to top-dress liberally with soot, basic slag, and sulphate of ammonia, so as to give the grasses every possible help. The use of a coarse iron rake over the Yarrow patches helps to keep them in check, but it is a case in which once the enemy gets a foothold it is very difficult to expel him entirely. A. D.

THE PROPERTIES OF THE SWEET PEA.—Every member of the National Sweet Pea Society will appreciate your references on p. 94, to the Society and its work. As the committee undertake to deal with seedlings, and did indeed do so on the first day of the exhibition at the Royal Aquarium, it may interest lovers of the fragrant flower if I give the part culms of a standard of properties the committee have drawn up and adopted as a basis for the future. So far the properties constituting quality in the Sweet Pea have not been defined, and the committee of the National Sweet Pea Society which is composed largely of Sweet Pea experts, have, as a guide to their own proceedings laid down the following points as criteria in estimating the value of a new variety. 1. *Form*.—The standard must be erect, waved, or only slightly hooded. The standard, wings and keel to be in such proportion to each other as will constitute a harmonious and well-balanced flower. 2. *Number of Blooms on a Stem*.—No variety shall be recognised that has not at least three blooms on a stem, gracefully disposed. 3. *Colours*.—Distinct and clear self-colours are most to be desired, and therefore striped, watered, and edged flowers will not be awarded certificates, of merit unless they present quite new or remarkable combinations. 4. *Exceptions*.—Perfectly distinct new colours, such as approaching the line of *Sylvia patens*, the yellow of *Cassius grandiflora*, or the scarlet of the *zonal delavandora* shall be recognised, even if the variety should fall short of the foregoing properties. The committee insist upon all seedlings submitted to it being named, in order that a record of the variety may be made for future reference. R. Dean.

THE SEASON OF WASPS. We have destroyed some dozens of nests in and around the gardens here without making any apparent difference to the great numbers which are attacking not only all kinds of fruit, but spoiling Fuchsias and other flowers. We have found the nests three and four together within the space of a few yards. To destroy them we use turps or tar, the former, though more costly, being most effectual. One gill is sufficient to destroy any nest where the formation of the

hole will admit of its reaching the comb. This must be done at night, when the wasps are all at home, and there is no further need to dig out the nests. We only use cyanide of potassium in very difficult cases, where turps or tar cannot be poured in the hole leading to the nest, for it is dangerous where there is poultry or life-stock of any description. I was told the other day, at a large garden not two miles from here, they had not yet been troubled much with wasps. *William Wilkins, The Gardens, Whitley Abbey, Coventry*.

—As you suggest, on p. 111, I think Mr. Simpson's experience must be a record. We killed some dozens of queen wasps, this season as usual, but wasps are still numerous, though they do us very little damage, being kept down in the following manner: I boil 1 lb. of commercial arsenic in 1 gallon of water for 20 minutes, then boil it. Half-a-pint is put into a wide-mouthed bottle, adding sugar to make it syrupy, also a little beer. The mixture is put into any pieces of glazed crockery that will hold a spoonful or two, and fragrant of fruit, if any, put in and sprinkled. They seem fonder of curran than fruit, so pieces of flesh or fish will answer, cooked or uncooked. Last year the wasps attacked our Cherries. Smudgy broken crockery were placed on the top of the wall, and replenished daily with the mixture. In three or four days not a live wasp was to be seen, but numbers of dead ones were on the top of the wall and on the border. This year it is the Gooseberries they have attacked first, but they are kept down, and as soon as a wasp is seen in the vinery it is my practice to provide some of the mixture, and I would not hesitate to undertake to keep them down in any garden by commencing in time. We have a number of Vineries here, but I do not lose a score of berries in a year—and very little else, since I adopted the above method. *Wm. P. Roberts, Chestnut Hill, Preston*.

TREE AND PLANT LABELS. Mr. Harrison Weir and other writers on this subject overlook the fact that most fruit trees travel by rail from the nursery to the buyer. If metal labels were wired to each tree before being tightly drawn together in a bundle, the trees would be cut and marked in all directions by them. We always advise our customers to order "Aene" labels at the same time as they do the trees, and attach them when planted, though this may be done at any time within the first twelve months, now that the name of the tree as well as that of our firm is printed on the temporary labels. *J. R. Pearson & Sons, Chiswell Nurseries, Loudham*.

TERRIFIC HAILSTORM AT HAWICK, N.B.—This part of the country was visited with a most terrific hailstorm on Saturday, Aug. 10, accompanied by a heavy thunderstorm, and followed by deluges of rain. The hailstones were in many cases as large as marbles, causing the sewers in the town to get choked, with the inevitable result of flooding in the lower parts of the town. The damage done to growing crops is incalculable. Vegetables of every description are broken and smashed to a pulp, and bedding plants are completely ruined. Where flower-gardeners looked gay on Friday, there is nothing but destruction. Fruit trees have suffered severely. Apples and Plums are strewn on the ground in wholesale fashion, and late Gooseberries and Black Currants are beaten into the earth. The glasshouses are entirely ruined. The Buchloch Nurseries, belonging to Mr. John Forbes, have suffered worst in this respect, whole houses being left with scarcely an entire pane of glass, and the damage done by falling glass is very great. The plants in the outside nursery are entirely wrecked. Wilton Hill Nurseries, owned by Mr. George Wood, are no better, whole houses being destroyed here also. Allotment gardens, of which there are several hundred, have undergone the same treatment, and the glasshouses

belonging to the amateurs are all destroyed. The gardens here present a pitiful sight, and we have a quantity of glass broken in the greenhouses. The hailstorm occurred only in a small area extending a few miles. *R. Turnbull, Striches Gardens, Hawick, N.B.*

SOME HERESIES NOT PROVEN.—In reply to "C. P. C.'s" remarks on p. 119, I beg to say that the inference drawn by your correspondent, "W.," in the issue of the *Gardeners' Chronicle* for July 27, p. 78, is a practical and reasonable one in the circumstances indicated in his communication. Last year the Grapes in a large vinery here were practically grown and ripened in a cool-house, and four rows of 1-inch hot-water pipes which existed were not used. This house (200 feet by 25 feet) is planted, the first half with thirty-four Canon Hill, twenty Muscat of Alexandria, six Madresfield Court and Black Hamburg canes; the second half being planted with Black Alicante, Gros Colmar, and two Vines of Apple Towers, and one of Lady Hunt. All the varieties mentioned ripened their crops satisfactorily enough. In the *Gardeners' Chronicle* for September 15, 1900, will be found a letter describing in detail the conditions under which the crop was grown, and it proves that the above-mentioned Grapes may be grown and ripened in a cool vinery in seasons like those which we have experienced during the past four years. This year my Grapes are also ripening satisfactorily in the same vinery in which no hot-water has been turned on in the pipes since the early part of March, 1900. Of course, where a regular supply of ripe Grapes has to be placed on the table by a certain date in May onwards, fire-heat must be used. In conclusion, I may be permitted to repeat what I have stated in my letter published in the *Gardeners' Chronicle* for September 15 last, as already stated, namely, that my vinery was treated in the matter of ventilation and moisture entirely in accordance with the requirements of the Tomato-plants planted therein, as well as the thousands of young plants grown on in pots and boxes for planting out-of-doors by the end of May and early in June; abundance of fresh air being admitted to the house day and night in order to promote and maintain a sturdy growth in the plants, and at the same time to harden them off preparatory to removing them out-of-doors. As an old grower, and a successful exhibitor of Grapes and other choice fruits at the leading metropolitan and provincial shows, my last five years' experience leads me to say that equally good, if not better, results may be obtained through using less fire-heat, and by admitting more fresh air in the process of forcing. *H. W. Ward, Rayleigh, Essex*.

POPPLES.

Few people seem to fully realise the decorative properties of these flowers—in all ways various, both in flower, foliage, growth, habit, time and season. Beloved by the poet, and by them and others used as descriptive of dream-like reveries, or for its pain-assuaging or ameliorating virtues; while that of a certain line is said to be "a poppy-red," this would doubtless most generally be in allusion to our "field Poppy" (*Papaver Rhæas*), and not less so to our garden species, *Papaver orientale*, and perhaps the larger more crimson bracteatum. What a grand show these latter make in the fresh spring-time, the sweet of all the year! From a slight eminence look down on a hundred or so of these in the full bloom of their vivid beauty, and as they catch and bend with the breath of the "May"-scented breeze, they flare and flicker like a sea of fire. Descend, as I have done, and take any individual flower, and if the sun shines, what a marvel it is, as its petals "be abroad," to catch the warm, life-giving rays. In the centre are the black stigmas, blue-black at the lightest, and these set in a blacker bed, made by

the bases of the scarlet petal surroundings. "What flowers!" "What foliage!" How the Mulberry-leaf green helps to add splendour to the highest-stem-supported flower! Then there are those black blotchless, orangy-scarlet throughout, some to a crimson more inclined, but in a way, all scarlet, a blaze of floral beauty, strong in its powers of self-assertion, and like it, too, none the worse for being, as such should be, short-lived; for even beauty tires that hath no change. So pass we on with the gathering lightful days, to newer lives and other sweet engagements. Now it is the refined, the elegant, the tender blossom, fragile modest beauty of the love-tender and love-reared Shirley Poppy, the peerless peer from the lowly-born, the child of "selection" allied with "culture." This, unlike the former, must be, or should be, closely viewed. It can be looked on without the stand-point rise, though not of the four-foot giant height, it is scarcely a dwarf, and when in clusters, and clothed with its "all different flowers," its

early morn adds a new joy to the garden-lover's happiest hours. If the man who could make two blades of grass grow where there was only one before was a public benefactor, then what shall be said of the Rev. William Wilks, the creator of the Shirley Poppy, of whom John Ruskin wrote that "it added another and a new pleasure to life."

And now to the old garden Poppy (*Papaver somniferum*), which country folk call "The July." Here is another high order of beauty and art tutoring a plant of singular attractiveness, even its very foliage azure-grey, as it is of curious almost fantastic forms differentiates it from all else. In the garden it takes its place as something apart from the other plant life. Its manner of growth keeping, by contrast, to the observation of those far less pretentious, but when in bloom its floral grandeur is superb. Just now I can look on in my little "home of flowers," scattered in one, two, three, or grouped a hundred and more, in the full bloom and pride of youth and beauty. For manifold

description, too grand and glowing for the painter's art. Here I must leave them, one and all, to the reader's most vivid imagination, which should be great, strong, and lasting. *Harrison Weir, Poplar Hall, Appledore, Kent.*

DELPHINIUMS.

The two varieties of Delphinium illustrated in fig. 11, were shown by Messrs. Kelway & Sons, Langport, Somerset, at a meeting of the Royal Horticultural Society on July 2.

The single flower, Dorothy Daniel, was more than two inches across, deep purple in colour, with creamy-white centre, and the Floral Committee recommended the variety an Award of Merit. Though not included in the "Award" list on that date, the variety William Kelway, with double flowers, is very admirable. In colour, it is a delicate shade of mauve and light blue. Each of the varieties is well worthy to represent its section of these useful border plants.

FIG. 11. TWO CHOICE DELPHINIUMS.

beholding is a luxury to the sense. And all this loveliness, all this varied colour, and colour markings, came and has come from the humble and too often despised red field Poppy (*Papaver Rhoeas*), and this, because it was "trained up" in the way it should go, through the appreciative will, persevering energy, vigilance, and unresisting zeal of one who designed "a new delight," a reflective pleasure, a noble beauty, and "made it." Look at a bed of these "Shirley Poppies." Their variety baffles words to describe, and the florist's hand that fashioned outvies the painter's art. They must be seen, and even then their rarity of delicate lines, tints, and markings, seem but as handlings of others; view the master-hand in colouring and moulding. Extraordinary are some of the blendings, these even unthought of times since are realities now. One of a clear scarlet, with blue-grey stigmas and stamens, and each petal entwined with a grey edging. Was ever such combination seen before? And now there are hundreds whose blossom to watch for at

top and colour the sight is magnificent, and dwarfs description. There in the hot sun, with uplifted heads, in the full glare, or in the more restful light of dewy eve, or in the hazy glomming; it is all the same to their many-coloured, never ending beauties. Gorgeous at all times, the eye revels and the senses more than delight in their magnificent beauty. What art-endeavour are these to Nature grown, while their dazzling floral brilliancy is beyond compare! One can only gaze in pleasurable wonder. There is the almost black, many-petalled, deep and sombre; the glowing scarlet, carmine-blooded, by its side softer tinted orange-red, like a ball of fire; then lavender, again a more varied scarlet, some purple, crimson, many of the rose's hues, some salmon shaded, these in tender vegetation to the pure and lovely white, all rounded or long petalled, and full doubled, even to almost bursting. Still, in the quiet, early morning, they stand as if conscious of their transcendent beauty, each and all "a thing of beauty," ones seem, to be "a joy for ever." Beyond

HAMPTON COURT.

The BRASSIA. In these fine gardens, so well managed by Mr. J. Gardiner, the public may enjoy such a varied display of flowers as very few wealthy estate owners can boast. Mr. Gardiner informs us that practically the whole of the 131 large beds which are in the chief combination have to be changed three times a year, viz. in spring, summer, and autumn, and the broad border under the wall, which is one of the finest borders of its kind in the country, and which is 600 yards long, requires continually re-arranging in one part or other, although a certain proportion of the plants are hardy perennials. In the gardens this year several important facts are noted. For example, it is shown that this year is a very fine one for Roses, which during all the long period of dry, hot weather, made a grand display in all parts of the garden. With the rains came a check, but the prospect of a fine and long display, extending into the winter, seems assured. The

Clematis also, which in some previous years went off here and there in the most unaccountable manner, have this year borne gorgeous displays of bloom, some of the plants which had seemed to die last year, even before the flowers expanded, being as good this year as those previously unaffected. Flowering Clematis outdoors are finer than usual this year, and some of the rarer shrubs, which usually flower but sparsely or not at all, are this year blooming profusely. The best example of this kind is a large and finely-formed tree of *Kohleretia paniculata*, in what was, until about five years ago, when it was thrown open to the public, the private garden, and which is literally covered with large panicles of pretty yellow flowers with reddish centres.

The before-mentioned long border beneath the wall, covered with Clematis, Roses, and other flowering wall-shrubs, is made up of herbaceous perennials, dwarf shrubs, bedding-plants, and showy annuals; but it is so arranged by planting in groups that there is great variety of effect, and a very dissimilar character about the different sections, although the whole combine to give one brilliant effect from end to end viewed from any point. In the various groups in the border, the Salpiglossis are very showy, the double Hollyhocks harmonise well with the shrubs on the wall behind them; a panel of double yellow *Marrubium*, groups of tuberous Begonias, Fuchsias, Puloxes, Montbretias, Galatias, Asters, &c., make a great show. The various groups are skilfully linked by uniformity in the edging, and between all the groups of summer flowers appear many herbaceous perennials in bloom.

In arranging the numerous large beds, much skill has been displayed, and while carpet-bedding and old-time bedding-plant displays are almost reduced to the vanishing point, still examples of them are retained in order that all styles of gardening may be represented. Of carpet bedding, there is one very pretty design, principally in Alternantheras, and of the scarlet *Pelargonium* class of bedding, the three or four beds around the fountain this season, will bring no reproach, for the hot, dry weather has suited them admirably; they are masses of brilliant colour. On the other hand the single tuberous Begonias, which have largely displaced the *Pelargoniums*, are not quite so satisfactory this year, the show of them only now becoming important. On the contrary, the dwarf, double-bedding Begonias *Lafayette* and *Count Zephrin* have been thickly studded with brilliant flowers all through the season, and will continue well into the autumn.

The plan is copied in many of the large beds is to have tall specimens of showy things, with a carpeting of dwarfier plants beneath. The effect is good, and a greater amount of show is made than when the effect is on one plane. Among the more striking were noted in one bed, tall plants of the orange-coloured *Streptosolen Jamesoni*, with an undergrowth of *Begonia* edged with *Lobelia* and variegated *Koniger*; another had tall *Campanula pyramidalis*, carpeted with *Verbena venosa* and *Centaurium candidissimum*, edged with variegated *Koniger* and *Eleocharis*. A very effective bed was one of tall blue *Plumbago capensis*, with pink *Hydrangeas* beneath. Another fine bed was of dark-foliated *Azalea tricolor*, planted with clumps of white *Lilium longiflorum* and *Iresine Lindenii*, the whole edged with *Chlorophytum variegatum*. Large plants of the fragrant white *Bouvardia Humboldtii corymbiflora*, plentifully flowered, carpeted with blue *Violas* and edged with *Stellaria graefiana aurea*, was novel

and effective. The *Fuchsia*-beds were very fine, so also *Chelone biolata*, with *Violas*. Among the many showy flowers in the herbaceous borders, the salmon-scarlet *Phlox Coquelicot* is one of the showiest; the *Carnations* are fine and well flowered, and all parts of the garden in the best possible trim, notwithstanding its great extent and the fact that it is visited by large numbers of visitors, especially in the summer months. In what used to be the private garden, *Rhus Cotinus*, *Kohleretia paniculata*, and other flowering shrubs are very beautiful, and in the basin in the centre are a number of the rose-coloured hardy *Water-Lilies* now so popular.

The famous Vine, now sixty-eight years of age, is again bearing a very large number of bunches; and the fine *Yews*, 300 years old, which run beside the main walks, and are such

THE LATE JOSEPH MEREDITH, OF GRAPE-GROWING FAME.

a fine feature in the gardens, are still vigorous, and not exhibiting signs of decay, as so many trees in the neighbourhood of London do, &c.

MR. NAYLOR'S NURSERY.

The extensive walled-in kitchen and fruit gardens of Hampton Court, with the ranges of glasshouses let for the purposes of a nursery, and for the past few years in the occupation of Mr. James Naylor, are in fine condition, and worthy to be alongside the fine public garden; a state of things which did not exist for some time before Mr. Naylor took it over. At present, in the open ground, there is a splendid stock of all the shrubs and trees used for decorative work in and around London, and the quarters in which they are planted are well and trimly kept. Quantities of *Roses* also are grown both indoors and out, the varieties *Niphetos* and *Catherine Mermet* especially.

Chrysanthemums and bedding plants are grown largely; herbaceous perennials, and hardy flowering shrubs; *Tomatos*, *Cucumbers*, *Palms*, *Ferns*, *Bouvardias*, *Pelargoniums*, &c.

In one house is a very fine pink *Verbena*, an improvement on the one now in favour in the market as a pot plant; and some seedling *Heliotropes* of a fine type, one or two of which have extraordinarily large heads of bloom, and very fine individual flowers.

The various fruits, which form a very important feature in these nurseries, are satisfactory beyond the average this year, *Apricots* being unusually good and plentiful. &c.

THE LATE MR. JOSEPH MEREDITH.

MY first acquaintance with Mr. Meredith was during the years 1851—56, when I was an under-gardener at Trentham. He was frequently in the habit of making visits to his brother-in-law, Mr. Fleming, whilst I was there. Meredith was a man of marked kindly character, and had more than an average share of natural ability, so that in anything he undertook to do, success would be sure to follow. I think it was during the spring months of 1861, after I had been three or four years at Combe Abbey, when my newly-planted Vines, then growing in the best turfy-loam the park could produce, and the Grapes were beginning to make a mark for me, that I had an opportunity of visiting Mr. Meredith at his Vineyard, Garston, near Liverpool. He was pleased to show me his Vines, all of course in the best health. He took great pride in opening the door of a little cupboard, to show me some nice Lady Downes's Grapes; he had them in bottles. These he told me he intended to keep as long as he could, and then send them up to one of the Royal Horticultural Society's meetings.

I happened to have also in an cupboard just a similar lot, of which I said nothing to Mr. Meredith, but waited until he had shown his; then I sent up mine. Of this trick Mr. Meredith did not forget to remind me when next we met. Some time after that, we met at the Crystal Palace. We were showing Black Hamburg Grapes. He was awarded 1st & 2nd. It was generally allowed we should have been placed equal; but Mr. Meredith very humorously said how pleased he was that the judges gave him the benefit of the doubt. It was about this time that Mr. Meredith began to carry everything before him in the way of Grape-growing. As Achilles was the great hero of the Iliad, so Meredith was the great hero amongst the Grape-growers of his day.

Just before he went to Paris with Grapes, he called upon me at Combe to see what mine were like, and whilst with me the late Mr. Lane, of Berkhamsted, also came in. The latter had some idea that he would find Mr. Meredith with me. Over the circumstance of their meeting they had some friendly banter. For the impetus given to Grape-growing, the present generation of gardeners owe much to the lead given them by the late Mr. Meredith, who was the undisputed pioneer of all modern Grape-growing; and it would have been exceedingly interesting, had the Fates so spared and favoured him, to have continued a little while longer with us, so that he could have taken his place and still have won immortal honours in his old and favourite field of Grape cultivation.

I can give no particulars as to the manures, artificial or otherwise, Meredith used. Whatever he did in this way, he evidently managed to maintain always an active and healthy root-action. This was the true key. I take the liberty of summarising added to his skilled overhead culture, which led to the grand and masterly finish we always found upon Mr. Meredith's Grapes. Health and vigour form always the first and best defence against the insect pests and sundry ills that Vines are heir to. *W. Miller, Berkswell, August 14.*

ENQUIRIES.

BASIC SLAG.—"Enquirer" asks readers to be so good as to relate their experience of the use of this substance for crops in general, and for grass in particular. In what proportions per acre should it be used?

BUSINGALIA BASELLOIDES.—Has any reader of the *Gardeners' Chronicle* had experience with this climber? I have tried it in various ways without having seen it flower. It is planted-out in the greenhouse, and grows very rapidly. The plant should flower in August, but I am afraid it will not do so. I have tried it in a warm-house with no good results. *A. J. L.* [The flower is not very remarkable. Ed.]

and HEMSLEY in the *Journal Linn Soc.*, vol. 28, p. 611. It is the most probably known fact that the plant will succeed on old-booms in this country, but the Rev. H. EMBANK sent a spray to the meeting, gathered from the open at Nymple's St. George, S. Molton (First class Certificate).

Orehid Committee.

Present: Holly J. Vetch, Esq., in the Chair, and Mr. T. de B. Clowley, W. Cobb, E. Hill, J. Douglas, H. M. Pollett, W. H. Young, and H. J. Chapman.

Mr. J. VETCH & SONS sent a group including three very nice varieties of Cattleya, *x* Atlanta (*guttata* *x* Warszewicz), these differing considerably from each other in colour and shape, but illustrating the free-flowering characteristics of the hybrid. *Laelo-Cattleya* *x* *Prisyraxis* (*L. pumila* *x* *C. Bourningiana*), *Laelo* *x* *Spiridonia* (*L. spirata* *x* *C. purpurata*) and *Laelo-Cattleya* *x* *Nyctalea* (*L. crispata* *x* *C. Warszewiczii*) are very similar to *L. C.* *x* *exoniensis*, and would be difficult to distinguish from the older hybrid. *Cattleya* *x* *Stobie* (*A. Vanda* *x* *Mendeli*) has creamy-white sepals and petals, spotted with miniature purple spots, the open lip bright purple on the front lobe, yellow on the disc, the side-lobes pure white (Vote of Thanks).

J. W. THORNTON, Esq., Brockhill, Weedon, sent a pretty variety of *Laelo-Cattleya* *Atlanta*.

J. S. MOSS, Esq., Bishop's Walkham, sent a cut flower of *Laelo* *x* *Isola* (*L. Isola* *x* *Dayana*).

Sir J. MITCHELL, Maudslayi, Duns N.B. sent, Mr. J. Hamilton, semi-hybrid between *Laelo* *x* *Frederica* and *C. velloziana*, which would be difficult to distinguish from *L. C.* *x* *elegans*.

Col. M. A. SWINLENBOW, Swinfin Hall, Lechliff, sent, Mr. H. Collymore, sent a white variety of *Laelo-Cattleya* *Edwardsii* (a distinct pink in the sepals and petals).

Fruit and Vegetable Committee.

Present: W. G. Binyard, Esq., Chairman, and Messrs. J. G. Chelvi, W. Bates, W. F. S. Mortimer, Alex. Dean, W. Pope, Geo. Kell, H. Markham, Geo. Woodward, F. Q. Lane, Jas. H. Vetch, W. Pompart, W. Walk, J. Wilford, and Geo. Reynolds.

Messrs. H. WASSER & SONS, Swanley, Kent exhibited a collection of fruits and fruit trees. The Apple tree in pot were very well cropped, and were good specimens. We noticed the following varieties: Dimples of Seeding (Wellington), Bismarck, Lady Seeding, Devonshire Quarrenden, Warner's King, Gey's Orange Pippin, Bramley's Seeding, Starling Castle, Yorkshire Beauty, Red Ayrshire &c. Fruits in dishes included Peas and Apples. Of Peas, there were Louise Bonne of Jersey, Jargonelle, Princess, Bourne d'Amiens, Fitzmesson Duchess, and other early or second early ripening varieties. The most conspicuous varieties among the Apples were Bismarck, Twenty Ounce, Emperor Alexandre, Grenadier, Warner's King, Beauty of Bath, and Mrs. Gladstone. There were pretty fruits of Tomatos Golden Nugget, and later ones of Cardinal's King, a first class heavy cropper and variety. Altogether there were forty-five of the fruits (Silver Knight Medal).

Messrs. W. RAY & CO. Mount Pleasant Nurseries, Tottenham, Kent, exhibited fruits of their new Cherry "Noble," which has been figured and frequently described in these columns.

Messrs. H. E. W. LOCK, Sheep Street, Wellingborough, showed fruits of a variety of Red Currant bearing the name of Lock's Clumpin Red.

Dr. BENJAMIN Worthing, showed a nice new fruit of the Cape Gooseberry, *Physalis Peruviana* (Cultural Communication).

An excellent collection of fruit was shown from the garden of Miss ABAMSON, South Vills, Regent's Park sq., Mr. G. Kell, which were very noteworthy, remembering that the fruits were grown in a spot not more than two miles from Charing Cross. Of Grapes we noticed Black Hamburg, Foster's Seeding, Muscat of Alexandria, and Buckland Sweetwater. There were many dishes of Plums, Peaches, Cherries, Melons, Nectarines, Tomatos, &c. (Silver Knight Medal).

A collection of eighteen dishes of Peas was exhibited by Alderman A. WILKIE, Fox Hills, Leeds, Huddersfield sq., Mr. B. Lockwood (Silver Knight Medal).

Awards.

Gooseberry Howard's Lemon. A large green variety, of good flavour, shown by Mr. Geo. Woodward, sq. to Rother Lee, Essex, Earlham Court Estate, near Maidstone. Some sprays that were exhibited were crowded with fruits (Award of Merit).

Bramley's Olden Jargonelle. Messrs. JAS. VETCH & SONS have a cane, 7 feet high, of this variety. It was very abundantly cropped with jet-black fruits, which we thought to possess but little flavour (Award of Merit).

Plant Early Yellow.—A very early variety, with small buds of very moderate quality. See notes on p. 120 of our last issue. From Mr. J. FLEASER, South Woodford, Essex (First-class Certificate).

French Beans, South's Egan and Savory Profile, exhibited by Mr. A. DEAN, Richmond Road, Kingston-Thames. See p. 120 in our last issue (Award of Merit).

Calabrus Little (Quercus) Bachelors, from Messrs. BARR & SONS, King Street, Covent Garden, London, W. C.; and *Improved Nonpareil*, from Messrs. NETTING & SOSS. See p. 120 in our last issue (Awards of Merit).

Patatoes, Gey's of Dundee, from Mr. R. D. HUGHES, 35, Middle Lane, London; *Early Jubilee*, from Messrs. FISHMAN & ROBERTSON, Manchester; and *Express*, from Messrs. CHAS. SHARPE & CO., Ltd., Sheldon. See p. 120 in our last issue (Awards of Merit).

The Lecture.

In the afternoon a lecture on "Tender Plants for Outdoor Gardening," by Mr. W. J. TOWNSEND, Southminster Lodge Gardens, Wokingham, was read by the Secretary.

Among the plants recommended for this purpose were *Fuchsia*, *Habrostrum*, *Christina*, *Newell*, and *Amantia*, *Abutilon*, *Canary Bird*, *Brilliant*, and *Boule de Neige*, *Solanum*, *Isambard*, *Ivy-leaved Polygodium*, *Polygonum*, *perispermata*, &c. Some sensible directions were given as to planting *Fuchsias* and other species in such a manner that the effect of each plant is not destroyed by its neighbour, the system described by Mr. Townsend being known as the "plant system," standard plants over a carpet of dwarfier species, as practised in many of the London parks, and in those belonging to the Zoological Society.

Mr. JAS. HINDON supplemented the list of plants grown by Mr. Townsend, having seen *Bougainvillea glabra* and *Swainsonias* used to excellent effect in the garden under the charge of Mr. Townsend.

Mr. Geo. BINYARD (Chairman) and that *Cassia corymbosa*, *Crematos*, and *Streptosolen Jamesonii*, were also capital plants for use in bedding.

It is curious, however, that none of the speakers mentioned the choice, the use of which has softened the appearance of the bedding in London during the past five or six years.

HARLOW HORTICULTURAL.

JULY 14.—This society held its annual show at Moor Hill, Essex, the pretty country seat of John Falgout, Esq. The nurseries were erected in the park, in which the sports were also held. The cottagers' classes were well filled, though the effects of the drought could be plainly seen. A large tent contained the ladies' table decorations, there were eighteen tables, making quite a feature of the show. There was not much competition in the fruit classes.

Miscellaneous groups of plants arranged in a space 10 feet by 6 feet in square were very good. Mr. DELERGES, sq. to JOHN FALGOUT, Esq., Moor Hill, was awarded with an elegant group of well grown plants. *Acacia*, *hyssopus*, *Croton*, *Humulus*, and *Gloxinia* being a new of the finer plants employed. Mr. GARDNER, sq. to E. WEBB, Esq., of Dorrington House, was 2nd.

For a collection of twelve distinct kinds of vegetable, Mr. DELERGES was 1st. He had very fine *Onions*, *celery* *Peas*, *Tomatos*, and *Beans*.

The grounds were thrown open by kind permission of J. Falgout, Esq. Mr. GARDNER and Mrs. DEARDS are joint hon. secretaries.

NATIONAL AMATEUR GARDENERS.

(LIVERPOOL BRANCH.)

AUGUST 1. The holidays are just now at their height, but that did not deter many members from being present, consequently the Common Hall, Locksley Hey, presented a fine floral picture. Members are enthusiastic, and although the classes are not large, there is keen competition, and a lively interest maintained.

Mrs. STAFFINS took the leading honours with excellent spikes of gladioli, and in the open class for a plant in bloom with a large-flowered *Lilium auratum*, for six Tomatos, and the President's prize class for a *Fuchsia*. Mr. DODD had grand *Gloxinia* flowers, also a rich assortment of cut flowers for the open class prize. Very striking single *Beconias* and *Curtis Bellias* came from Mr. ROBINS. Carnations from Mr. TRYSLEY were faultless, blooms of the heavy-edged "Nigel" being amongst the best met with this season. The President's prize for cut blooms was divided between Mrs. MORRIS and Mr. ROBINS. There were two table decorations from J. Reed, and again a division of the prize between Mrs. STAFFINS and Mrs. HENNER. From a professional standpoint, the judgment over the latter class was considered by some to be decidedly at fault, the former lady, with a charming arrangement of

Sweet Peas, pink Carnations, and handsome traceries of *Coloza* and *Sunlay*, being many points in advance.

Instead of the usual monthly lecture, the evening was devoted to questions and answers, and very profitably too.

THE BRITISH PTERIDOLOGICAL.

AUGUST 5. In accordance with their annual custom the members of this Society assembled at the Institute, Bowness, Windermere, on the above date, with the object of comparing notes respecting the progress of British Fern-culture and discovery, and hearing papers read treating of this interesting branch of study generally.

The attendance was highly satisfactory, also the exhibition of photographs, plants, and fronds of new and improved varieties. Among those present were Mr. C. T. DRURY, F.I.S., V.M.B.; Mr. C. B. GREEN, Acton; Messrs. SMITHES, J. EDWARDS, Manchester; J. L. SMITH, Blackpool; W. TROUGHTON, Preston; J. LOVECLAD, Huddersley; J. GARNETT, W. MARTIN, W. F. ASKEW, Bognor; W. H. ALKINSON, Batley; S. HUDSON, Nelson; R. WHITEHEAD, Lancaster; J. GOTT, J. WIPER, G. WHITEWELL, (Don See a kenald).

After the usual formal business had been transacted, embracing an entirely satisfactory report as regards funds and increased membership, the PRESIDENT (Mr. CHAS. T. DRURY) addressed the meeting, and in the course of his remarks announced that the new Fern-book, *The Book of British Ferns*, was now in the press, and would shortly appear, beautifully illustrated, and replete with matter which should interest both the general reader and the expert. This book will be the outcome of a resolution passed last year, and the efforts of a committee specially appointed to formulate a list of British Fern varieties on the strict lines of the symmetrical and botanical, and will contain numerous articles and papers contributed by the editor and compiler, Mr. Drury, and others.

The officers of the Society were re-elected *en bloc*, and the President then read a most interesting paper contributed by Dr. F. W. STANSFIELD, who was unavailably absent, on "The Culture of Some Difficult British Ferns," in which he dealt at length with such special and peculiar varieties as are particularly exacting in their demands upon the cultivator's care, being either "finely," or weakly in constitution, or whose habitats and environments are naturally such as it is difficult to imitate under culture. This led to an animated discussion, in which it transpired that a vast deal depended upon the locality in which the growers dwell, so that the list of Ferns found difficult in one place varied entirely from that in another locality.

Mr. C. B. GREEN, of Acton, followed, after an interval for lunch, with a capital paper on the Hart-stoigne, "Scopolendium vulgare, its Varieties and Culture," which treated solely of this beautiful species in its numerous varietal types, and their peculiar needs, likes, and dislikes, not forgetting some valuable suggestions as to their culture, and the most successful methods.

The papers having been read and discussed, a very large number of fronds were laid on the table, in conjunction with some photographs and plants, some of which showed marked advance, especially among the filamentous, frilled, and crested Hart-stoignes. Among new wild finds, there was exhibited a very neat, almost triplicate form of *Lactuca promopoma*, found by Mr. TROUGHTON on the previous day in Kentmere, where a few of the party gratified themselves at an opportunity for a hunt. Mr. Drury exhibited a splendid bipinnate or "omulicium" form of *Polypodium vulgare*, found by one of the members in Cornwall, a decidedly finer form of that section than any hitherto seen. Mr. H. BOLTON, of Carnforth, exhibited a very beautiful mucrate, fan-like, and crested-erumpin Hart-stoigne (*S. v. crispum*) fan-like in appearance.

Both the Secretary (Mr. G. WHITEWELL, Serpentine Cottage, Kendal) and the President (Mr. STAN ROAD, Acton, W.) would be glad to communicate with British Fern-lovers desirous of joining the Society. The subscription is very small, and the object, the encouragement of the culture of our beautiful British Fern varieties, of an interesting and patriotic.

WEST DERBY HORTICULTURAL.

AUGUST 5.—This is one of the best of the shows in the Liverpool district, and was held in the Rectory Field on the above date.

The miscellaneous group class was the leading feature, Mr. GEORGE OSBORNE, sq. to Dr. DUFFES, The Brook, winning with a bright arrangement consisting of choice foliage and flowering plants, set in a groundwork of *M. multiflora* Fern, the fronds of long form, of richly-colored *Trochis* Golden Ring, and clothed with *Caladium argenteum* and faint foliage of *Adiantum Dazzle*, one of the oldest yet the best of scarlet flowers for grouping.

Mr. OSBORNE also scored in the classes for twelve Gladioli (chiefly *Lemnos*), hybrids, twelve bunches of *Clarkii* Fern, the fronds of long form, of richly-colored *Trochis* Golden Ring, and clothed with *Caladium argenteum* and faint foliage of *Adiantum Dazzle*, one of the oldest yet the best of scarlet flowers for grouping.

Mr. Eastaff, gr. to G. LAIBOURN, Esq. had the best six Dahlia (Cactus), Staying Night, Esquisite, Miss Webster, Starfish, Mrs. J. J. Crowe, and Britannia. Other classes for cut flowers & of vegetables were well competed.

FRUIT.—Ways of special quality here. Mr. W. Cross won 1st prize for six dishes, in which Black Hamburgh and Buckland Sweetwater Grapes, May Duke Cherries, and Elrage Nectarines were in capital condition.

Mr. T. Gault, gr. to P. WALKER, Esq. had fine bunches of Misset of Alexandria Grapes. Mr. Cross following with richly-coloured Buckland Sweetwater, also winning the class for six dishes of hard fruit.

Next *Campbell*—Mr. C. A. YOUNG, Floral Nursery, West Derby, had a charming collection of Carnations arranged in Banchon stands; Messrs. BOSTON, Cactus, Dahlias; and Mr. J. SKILL, gr. to Mr. HUBBARD, Knotty Ash, grand Black Hamburgh Grapes, and herbaceous plants; and Mr. TWIST, gr. to Mr. H. GIBBONS showed fine Campanulas.

NORTH WARWICKSHIRE HORTICULTURAL.

AUGUST 5.—Through the kindness of H. H. C. Hoare, Esq., this Society held its twentieth annual exhibition in Pennis Park on the above date, when the well-wooded park was thronged with visitors. Last year's exhibition resulted in a loss to the Society of £50, through a wet day. As far as could be judged, this year's show will be a decided financial success. The exhibition is one of the best in Warwickshire.

The arrangements were carried out by Mr. J. Ellison (Secretary) and a committee in a very praiseworthy manner.

GRAPES.

For a group of plants, arranged for effect in a space not exceeding 120 sq. ft., T. B. SMITH, Esq., Copple Hill, Gravely Hill, near Birmingham, was 1st, W. L. GORDON, Esq., St. Chad's, Lichfield, following.

Stove and greenhouse plants were not well shown, and there were few of them. Some well-grown specimen Palms were staged, as was a splendid trio of specimen Polka-gonims. The premier prize winner in the latter class was J. HURT, Esq., Sutton Road, Erdington.

Table decorations were a pretty feature, several extremely beautiful arrangements being made. Looking down the length of these tables, one could not help but be struck with the superiority of the small Peppercorns and Sweet Peas over any other flowers utilised. Mess. M. LINDLEY, of Birch Hill, Edgbaston, was divided 1st.

For six specimen Chrysoms, A. PIERKINSON, Esq., St. Bernard's, Wilde Green, was 1st, 2nd, E. J. BARON, Esq., Gravely Hill.

Roses were shown well for such an unfavourable season, some twelve entries being made in two classes.

Sweet Peas, arranged in various ways, were very conspicuous.

VEGETABLES.

Selblom was a fine display here, even than was staged of this show year. Messrs. SMITH & SONS' 1st prize for a collection was won by R. G. BROWN, Esq., Edgbaston, J. BISHOP, Esq., Sutton Coldfield, being 2nd.

For Messrs. CHURCH'S prize for a collection, E. S. MOORE, Esq., York Lodge, Edgbaston, was 1st, J. BOWEN, Esq., Edgbaston, being 2nd. Many excellent dishes of fruits were staged of the Alca Craig and similar types. Thirteen bunches of Chumbers were entered in one class. All other vegetables were shown and well grown.

FRUIT.

A. PIERKINSON, Esq. was well to the fore for three bunches of black and white grapes.

For a single Melon, S. A. EBBLEY, Esq. was 1st.

Some twenty dishes of Gooseberries were staged, all of them of high merit, this fruit being extremely well grown in the district. All other fruits were well represented in their respective classes.

NON-COMPETITIVE ENTRIES.

Included a grand table of herbaceous annual flowers in great variety, from Mr. T. B. GIBSON, Wandleby Nursery, Sutton Coldfield. A group of plants in flower, as well as cut flowers, was effectively set up by J. AUSTIN & CO., nurserymen, of Gravely Hill. This firm was awarded a Royal Horticultural Society's Medal. A similar award was also made to Mr. A. F. PHILLIPS, of the Aldridge Nursery, for a like exhibit.

MADRESFIELD AGRICULTURAL CLUB.

AUGUST 8.—By permission of the Right Hon. the Earl of Beauchamp, President, this Club held its eighth annual show in the park at Madresfield. The day was fine, and there was a large attendance.

The exhibits were numerous, exceeding those of former years; and the quality of the animals excellent, now especially the horses; some of its prize winners would have won similar honours at any show in the country. At lunch time the President took the chair, and the company had the pleasure of listening to a general and practical speech from his lordship. A

glance around the tent at once assured a visitor that his lordship and tenants well understood each other.

In these days when one hears so much of depression in agriculture, it is good to see a large landlord on such occasions making with his own tenants and other farmers, arrangements to meet since the previous show, and discussing agriculture generally, and the merits and value of the animals and various breeds. Without going into details of the prize-winners, it may be mentioned that the President took the premier award for the best team of draught horses in the show. G. H. Richards.

KIRKCUDBRIGHT HORTICULTURAL.

AUGUST 8.—The annual exhibition of the Kirkcudbright Horticultural Society was held in Bonhill Park in rather unfavourable weather. The entries in nearly all the sections were more than those of last year, and despite the heavy rains of the past few days, flowers were shown in beautiful flower, cut flowers and pot plants being both very good.

In the gardeners' class, William McMillan, gr. to the Countess of SHERKILL, Edinburg, carried off the majority of the prizes for pot plants, and in cut flowers and fruit, James Allan, gr. to JOHN PURROSE, Esq., Arundel House, Dumfries; and JAMES DUFF, Threave, divided the honours. Mr. DUFF also being well to the fore with vegetables.

In the amateur classes, the principal prize-takers were W. McCORMACK, Threave, and G. BENSON, Bange. Messrs. KERR BROS., Dumfries, had a fine display of Cactus, Dahlias, Gladioli, Sweet Peas, &c., and Messrs. T. SMITH & SONS, Edinburg, showed a beautiful stand of Roses.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

AUGUST 12.—The usual bye-law committee meeting was held on this date. Eight new members were elected, and one nominated. The amount paid to sick members since the last meeting was £610. The Treasurer reported having £100 in the bank, and is instructed to invest £100 in the best available speculation stock.

TROWBRIDGE HORTICULTURAL.

AUGUST 11.—Trowbridge, generally so full of visitors on the day of its Annual Flower Show, was practically empty for the rain fell in steady downpour, and but few found their way to the show grounds, but being about the railway station and other places, but the rain would cease. It was of course a great financial loss to the Society.

PLANTS.

Several of the peculiar features of a Trowbridge Show are still maintained, one of them is the Linnæus Trowbridge Exhibition, which JAMES LAY has ceased to exhibit, but GEO. TUCKER, of Hiltopion, has come to the fore, and grows splendid specimens according to the old style. There is with six plants, the like of which probably will not be matched in the kingdom. His dark varieties are charming, and truly favourite, the light ones Mr. H. BOWMAN, Mr. BUCKLE, Tucker-Royal and Western, Barry, Mr. H. C. GIBBET, gr. to T. D. FOXBORO, Esq., Hinton, Charterhouse, was 2nd. He has Elegance, Duke and Arabella and Western Beauty, very fine. Mr. TUCKER was also 1st with four specimens. He had the well-developed plants of Arabella, Finesse, Lorraine, and Mrs. H. BOWMAN, and Mr. CHRISTIE 2nd. Very good specimens are also shown by working men in other classes.

Next in importance come the stove and greenhouse plants; and here Mr. Matthews, gr. to ST. R. W. BROWN, Bath Trowbridge, was 1st with a very good lot, shared among them *Almondia*, *nobilis*, and *Williams*; *Almondia* *speciosa* *major*, *Erica* *Lewini*, *non elegans*; *Poinciana* *contorta*, *Baroness*, *Lyra*, *concolor*, &c. Mr. GEO. TUCKER, nurseryman, Hiltopion, was 2nd. Mr. TUCKER was 1st with six plants, all very good *Stephanotis* *floridula*, *Staph. Giffithi*, *Erica* *Lewini*, *Alca superba*, and *Convolvulus* *speciosa* *major* were the principal ones. Mr. H. MATTHEWS was 2nd.

The best new or rare plant was *Campanula* *B. linnæi* *major*, *Gloxinia* *tricolor* were very good too. Mr. J. KERRY, Mr. G. TUCKER, and the best prize-takers, several specimens of single flowered *Egonopsis*, and Mr. W. P. CRANK for the same number of double *Egonopsis*, in admirable character.

There are two classes for groups of plants, and it is required that one be in a circle, the other a fan circle. In the former case Mr. J. C. POPE, gr. to E. BERRY, Esq., Frome, was 1st.

In the other class, Mr. J. KING, gr. to E. HADFIELD, Esq., Trowbridge, was 1st.

A very fine feature was the class for twelve Lilies. The President, Mr. A. P. STANFORD, taking the 1st prize with a finely developed lot of plants, chief among them some spreading *Trip. Friesii*, a splendid *Davallia* *Meyeri*, and *Gyanogranium*, *Chrysophylla*, *Chelidonium*, &c.

guns, some fine *Adiantums*, &c. Mr. G. TUCKER came 2nd, also with excellent specimens, and two equal 3rd prizes were given.

With nine fine foliated plants, Mr. H. MATTHEWS was 1st, Messrs. E. S. COPE, nurserymen, Bath, being 2nd.

CUT FLOWERS.

Roses were much better than usual, and generally small. With twelve trebles, Messrs. G. COULING & SONS, were 1st.

The eighteen bunches of garden Roses, from Messrs. COULING & SONS, was an excellent feature. They staged an excellent character, Bardon Job, Climbing Sistrano, Princess de Monaco, Archduke Joseph, Mademoiselle de Brant, &c.

Asiatics, quilled Victoria, and Comet types, were all in much better character than could have been anticipated. Messrs. MATTHEWS and TUCKER were 1st and 2nd, with twenty four bunches of stove and greenhouse cut flowers. Messrs. W. J. STOKES & SONS, Hiltopion, were the only exhibitors of twenty-four bunches of hardy flowers, taking the 1st prize with a good selection of Snow-Janes, Pompano, such, and Cactus Dahlias, very good, the latter specially so. Messrs. J. CRAY & SONS, KEANES & CO., and T. CARL, were the leading pot plant winners. Gladioli, Sweet Peas, Carnations, and Panseys, were all good.

FRUIT.

The best twelve dishes came from Mr. W. JOHNSTON, The Gardens, Roof, Aston, who had Black Hamburgh and Misset of Alexandria Grapes, Sea Eagle Peaches, Pines, Pineapple Nectarine, Figs, Plums, &c. Mr. GORDON, 2nd, to Lady ASHBURTON, Rousay, was 2nd. He had the same varieties of grapes, two dishes of Peaches, two of Nectarines, Figs, &c., which appeared on the whole to carry a few more points than Mr. STOKES'S collection.

With six dishes Mr. HALL was 1st, and Mr. STOKES, 2nd. Mr. HALL was 1st with two bunches of Black Hamburgh Grapes. Mr. H. CLARK, gr. to G. E. GORDON, Esq., M.P., 1st, with two bunches of Black Misset, having Madresfield Court, Mr. STOKES was 1st with two bunches of Misset of Alexandria Peaches, Nectarines, Morello Cherries, Appriots, and Plums, were also shown in good character. Dessert Apples, in pairs of dishes, were very good, *Asiaticum* and *Beauty of Bath*, the best, but *Golden Bunch*, *Parson's Nonesuch*, and *Empress of Alexander* were the best Calinary Apples, Windsor and Jaconelle the best Pears.

VEGETABLES.

were not so numerous as usual, but what there were given in quality. Messrs. WEBB & SONS, Messrs. SELLON & SONS, and Messrs. TOWNSEND & SONS, special prizes, brought good competitions, and the best were exhibited in admirable form. Altogether, the reputation of the Trowbridge Show was well maintained.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period August 14 to August 19, 1901. Height above sea level 404 ft.

WIND.	DIRECTION OF WIND.				TEMPERATURE OF THE AIR.				TEMPERATURE OF THE SOIL AT 3 IN.
	AVEAM	DAY.	NIGHT.	RAINFALL.	At 1-foot deep.	At 2-foot deep.	At 4-foot deep.	LOWEST TEMPERATURE ON GRASS.

AUGUST 18	100								
AUGUST 19	100								
MEANS									

Remarks. The weather during the first part of the week was dull and rather cold with a little rain, becoming brighter and much warmer afterwards.

GENERAL OBSERVATIONS.

The following summary record of the weather throughout the British Islands, for the week ending August 19, is furnished from the Meteorological Office:—

"The weather during this period was unsettled and rainy in all the more western and north-western parts of the kingdom, but mostly fine over eastern, central, and southern England. On Saturday thunderstorms were experienced in most parts of Great Britain, and also at a few places in Ireland.

"The temperature just equalled the normal in England, S.W., but was above it elsewhere; in England, E., and S.E. the excess was as much as 4°. The highest of the maxima were generally recorded on the 19th, when they reached 91° in England, E., 89° in the Midland Counties, S. in England, E., 85° in England, S., and 82° in the Channel Islands. In Scotland, W., and in Ireland, N., the thermometer did not exceed 69°. The lowest of the minima were registered, as a rule, either on the 6th or 7th; they ranged from 41° in England, S., and 45° in Scotland, E. and W., and England, S.W., to 50° in England, N.W., 51° in Ireland, S., and 54° in the Channel Islands.

"The rainfall was considerably in excess of the mean over Scotland and in Ireland, N., and just equal to it in the Channel Islands. Elsewhere the fall was less than the normal, that at our stations in England, S., and E. being very slight. In some localities, however, the rainfall during the thunderstorm on Saturday was exceptionally heavy—at Aberdeen 1.54 inch was measured, while at Gairloch (Lewisshire) as much as 2.0 inches fell during the space of two hours.

"The bright sunshine was deficient in all districts except England, S. The percentage of the possible duration ranged from 47 in the last-named district, 44 in the Channel Islands, and 11 in England, E., to less than 20 in the north-western and extreme northern parts of the United Kingdom generally, and to only 5 in Ireland, S."

THE WEATHER IN WEST HERTS.

A WEEK of changeable, but on the whole, warm weather. On two days the temperature in shade exceeded 80, but on two others did not rise above 69, while the night readings were quite variable. At 2 feet deep the temperature of the ground is at the present time 4 warmer, and at 1 foot deep 2° warmer, than is seasonable. Light showers of rain occurred on several days, but the total measurement for the week amounted to less than a fourth of an inch—hardly sufficient to moisten the surface of the ground. No measurable quantity of rain water has come through the bare soil permeation gauge for ten days. The record of bright sunshine proved good, averaging nearly nine hours a day. The winds were of about average strength, and the direction almost exclusively some southerly or westerly point, while the atmosphere remained, as a rule, very dry. *E. M. J. Exhthalmist, August 13, 1901.*

ANSWERS TO CORRESPONDENTS.

APPLE SCHONER VON BOSKOOP: Pineapple. Write to one of the many nurserymen at Boskoop, Holland, whose addresses you will find in the *Gardeners' Year Book*. You should have no difficulty in obtaining trees, the variety being very well known there.

BEECH-TREE: B. W. Examine the tree to see if there are any white scale insects (*Coccus*) upon it. If there be none, we cannot guess the malady without a knowledge of the local conditions, or seeing the affected tree.

BEETLE: T. & Co. *Dytiscus marginalis*, common water-beetle.

BOTANICAL TERMS: M. M. The word Phloëm is Nicotian's term for the bast elements of a vascular bundle; it is separated from the wood (xylem) by the cambium. Xylem, means the woody elements of a vascular bundle, possessing tracheal tissue. Instead of consulting the admirable book you mention, you would do well to procure *A Glossary of Botanic Terms*, by B. D. Jackson, published by Duckworth & Co., last year—a work wholly devoted to the explanation of botanical terms.

FUNG: Subscriber. The malady is caused by a fungus (*Cercospora Bollenia*), which was figured and described in the *Gard. Chron.* for July 7, 1900, p. 5. In that article Mr. Geo. Massee said that although admittedly a very destructive parasite when present in quantity, no serious attempt has been made to arrest the progress of *Cercospora Bollenia* beyond collecting and burning all diseased

fallen leaves. Probably spraying would prove to be of service in checking the spread of the fungus if taken in time. The genus *Cercospora* contains about 250 species, all parasites, and in many instances good has resulted from the use of dilute Bordeaux Mixture.

GARDENER'S NOTICE: T. B. A head gardener is a domestic, or menial servant, in the eyes of the law, and in the event of no contract existing to the contrary, is entitled to one month's notice, or money in lieu of that notice.—*E. G.* An under gardener paid by the week would probably have some difficulty in establishing a claim to notice for a longer period.

GLOBE ARTICHOKE: H. M. B. Varieties differ in the amount of flesh upon the crown. We would advise you to get a fresh stock from a reliable seedsman, and cultivate the plants strongly.

HYACINTHS, TULIPS, AND NARCISSES, FOR VARIOUS PURPOSES: Hyacinth. Our "Notices to Correspondents" would need to be commenced on the first page of each issue, and could not be completed on the last, were we to answer many such omnibus questions as you have asked. If you have no knowledge of the particular varieties of these bulbous plants, we should advise you to place your orders with a reliable firm of seedsman, and leave the selection of varieties to them. They know them well, and are not likely to abuse your confidence.

INSECT: E. Donner. The insects that made such "sad havoc" as you describe upon your Peach-trees, and on Ferns, made their escape owing to the "sad havoc" the postmen wrought upon the box in which you sent them—albeit the box appeared to be made of block tin. Thanks for information respecting your two years' service; but we must remind you that we do not publish a directory.—*G. H. S.* Caterpillars of the bull-tip moth (*Pygera bucephala*), a very common species. The parent insect lays its eggs on the outer branches of various forest trees; and the caterpillars feed in colonies, completely defoliating the branches. *C. R. V.*

MESSEMBRYANTHEMES: Mrs. A. Lomp. Write to Messrs. H. Cannell & Sons, Swanley, Kent.

NAMES OF FRUITS: H. McL., Manchester. Very small, poor fruits. Send again when they are approaching ripeness.—*J. R., Guildford.* Probably Golden Noble, but very much over-ripe.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*Veritas*, *Laelia xanthina*.—*J. Mc C.* 1 and 2, both *Silphium laciniatum*. No. 1 has a so-called double flower, owing to the production of ligulate flowers where ordinarily tubular flowers are formed. It is the "Compass plant" of the Americans.—*H. V. S.* 1, *Pteris argyrea*; 2, *Blechnum occidentale*; 3, *Xophodium molle*; 4, *Lastrea aristata variegata*; 5, *Pteris Wimmerii*; 6, *Pteris serrulata cristata*; 7, *Adiantum hispidulum*; 8, *Selaginella Willdenovi*; 9, *Gymnogramma chrysophylla*; 10, *Adiantum capillus-veneris*; 11, *Pteris erecta Mayr.*—*H. L.* 12, *Crocina luteiflora*. Ferns next week. *C. G.* *Medicago cehinus*, Calvary Clover; *Ononis arvensis*, Best Harrow; *Medicago lupulina*.—*G. C.* 1, *Thuya occidentalis*; 2, *Thuopsis delavata*; 3, *Cupressus Lawsoniana*; 4, *Juniperus virginiana*; 5, *Cryptomeria japonica*; 6, *Juniperus chinensis*; 7, *Hypericum Androsium*.—*S. N. I.* *Cuscutera*; 2, *Asclepias curassavica*; 3, *Trachelium caput-meduse*.—*J. W.* 1, *Ceanothus azureus*; 2, *Catalpa bignonioides*; 3, *Escallonia rubra*; 4, *Calycanthus occidentalis*; 5, *Ceanothus*? no flowers; 6, *Rhus Cotinus*.—*J. B.* 1, *Claytonia perfoliata*; 2, not recognised, please send fresh specimen.—*T. B.* Should address the editor on such matters; *Saponaria officinalis*, double fl. var. The leaf of the hard-wooded shrub is probably a *Metrosideros* "Bottle-brush." Send when in flower.—*T. H. P.* *Lycocateria formosa*.—*H. S.* 8. Perhaps the leaf of an *Erythrina*, but this is a mere guess.

OUT-HEATED BOILER: H. M. B. The hot-water apparatuses of which you send illustrations would not be harmful if used with care, because if such care were exercised, no appreciable volume of smoke could occur. At the same time, one can imagine the lamp being carelessly lighted, turned too high, and emitting such a smoke that in a closed house would undoubtedly cause injury to tender plants. If you have a stove placed inside the house, you must be prepared to afford the increased care then necessary.

PLUM EARLY YELLOW: Pineapple. This variety was sent to Chiswick by Mr. Fraser, of South Woodford Nurseries, Essex, and probably you could obtain trees from him.

SPURGE FLAX: X. We have heard *Daphne Mezereum*, so-called, but it is a name that would best be ignored, for the plant is neither a Spurge nor a flax, nor anything like either.

SPANHOPEAS TIGRINA AND WARDIANUM: W. D. The plants having just flowered there can be no better time to remove them to larger baskets than now. If you wait until our next issue, some directions for doing this work will appear in the *Orchid Houses Calendar*. See "The Week's Work."

TOMATO DISEASE: W. K. Your fruits are attacked by the "Black Spot" fungus, *Cladosporium lycopersii*, figured and described in the *Gardeners' Chronicle*, October 1, 1887, p. 109, and frequently repeated. Remove and burn any fruits as soon as they show signs of disease. Another season obtain fresh seeds and soil, and in the early stages of growth spray the plants with the Bordeaux Mixture.

WEEDS: E. R. If you succeeded in proving damage to your own garden the Court might grant you an injunction.

COMMUNICATIONS RECEIVED.—Secretary, Baddia Society.—Secretary, Shropshire Horticultural Society.—Secretary, National Co-operative Society (with thanks).—*Dr. M. C. C. D. Macintosh*—*E. R.*—*W. R. F.*—*H. J. H.*—*J. P. & Sons*—*P. W.*—*H. R.*—*H. J. E. D.*—*H. T. M.*—*F. M.*—*J. O'B.*—*A. P.*—*S. A.*—*F. P.*—*W. Rook*—*E. J.*—*S. E. D.*—*S. Weldon*—*G. W. Rigby*—*A. B.*—*Kempshall*—*E. Webb*—*S. J. M. L.*—*Orden*—*S. Noorjy*—*H. W. G.*—*H. Berkeley*, California, request sent.—*E. P. L.*—*Cook*, London.—*W. E. G.*—*W. G.*—*W. L. J. C.*—*J. S.*—*Dr. Bremer*, Berlin.—*H. M. H.*, Barnstead.

GARDENING APPOINTMENTS.

MR. W. S. RAYNER, for the last four and a half years at Enville Gardens, Staffordshire, has been appointed Gardener to **KANDEL I. MULLERS**, Esq., Stratton Court, Stroudhire.

MR. JOHN BOND has succeeded **MR. W. EARL** as Gardener to the Dowager Countess of HARGREY, at High Ashor, Bocking.

MR. EDWIN CHAMBERS, late Steward and Gardener to **FREDERICK BENNETT**, Esq., Thongston Park, Barr, King's County, Ireland, has taken the Col. COKE, D.L., J.P., Brookhill Hall, Alfreton, Derbyshire.

MR. JOSEPH THOMSON, for the past four years Gardener and steward to **WILLIAM EDWARDS**, Esq., at Abbot's Hill, Hound Hempstead, Herts., as Gardener to **EDWARD STRICKLAND**, Esq., Lyddhurst, Haywards Heath, Sussex.

MR. E. PERKINS, for the past two years orchid grower at Ting Park, the seat of **LOD ROBERTSON**, Esq., as Gardener to **H. P. BURBELL**, Esq., Brooklands, Mitcham, Surrey.

MR. W. W. GALE, for the past sixteen months Gardener to **L. S. DYER**, Esq., Westleigh, Claven Arms, Salop., as Gardener to **CHAS. SUTTON**, Esq., Riverside, Cookham, Berkshire.

RECENT CHRYSANTHEMUM LITERATURE.

A LITTLE more than four years ago, I contributed an article under the above heading to this journal (see *Gard. Chron.*, March 6, 1897). On looking over some later acquisitions, it has occurred to me that a few notes bringing the subject up-to-date may prove welcome to such growers as are interested in the flower from other than a purely cultural standpoint.

During the interval that has elapsed, it cannot be said that any great effort has been made on the part of horticultural authors to produce anything of a very striking character in the way of a handsome book on this popular flower. About a score, principally cheap unpretentious pamphlets, have been the output, and several of these are simply reprints from official publications, such as the journals of local horticultural societies.

Considering the activity on the part of the

French, who are now well over the threshold of the enthusiasm for growing the Chrysanthemum as an exhibition flower, whose shows are yearly increasing, and who are much occupied with everything concerning its progress, it is not surprising to find that since my last contribution they have augmented the literature of the subject by the largest number of independent treatises. Of re-prints or re-issues of works already published it is not intended in this article to take account, or it might certainly be extended. One of the earliest, and decidedly one of the most important new works, is the little volume issued by the French National Chrysanthemum Society, containing the papers read at its Orleans Conference in 1897, and judging from enquiries that have been made of me it contains matter that might prove useful to some of our English growers. Especially is this the case in such articles as Diseases and Parasites, Fertilisation, and the best manures and composts, all three articles being written by men well qualified to speak on such subjects. Following closely on the publication of this was one by M. Calos, of Havre, who issued a little pamphlet the same year (1898) called *Le Chrysanthème, ses Histoire, sa Culture*. M. Ernest Baltet the same year issued as a reprint from the *Journal of the Société Horticole de l'Aube* a short brochure entitled "Culture du Chrysanthème," which he continued in the next year by one called "Chrysanthèmes Rustiques en Plein Air." The only remaining treatise published in 1899 was one by M. Ragot, entitled *Culture Rationnelle du Chrysanthème, précédée de l'Histoire de son Introduction en Europe, &c.*, but the somewhat limited size of this little treatise leaves very little scope for the author to do full justice to the question of history. The following year saw two new works, one a curious Franco-Japanese kind of pamphlet, entitled *Tout le Monde Chrysanthémiste, Méthode Japonaise simple et sans Engrais*. The author, T. Oasna, of Kumamoto, Japan, being chiefly concerned with the recommendation of growing the Chrysanthemum in "terre de Campfire." The other, *Le Chrysanthème Histoire et Culture*, by J. Loebot, being by far the most imposing of the series, and indeed, the only one worthy of the name of a book. A brief notice of this has already appeared in the columns of the *Gardeners' Chronicle*.

I think America is justly entitled to the next place, *Chrysanthemums of 1896*, by L. H. Bailey and Wilhelm Miller; and the *Fourth Report upon Chrysanthemums*, by Wilhelm Miller, being respectively Bulletins 136 and 147 of the Cornell University, are similar in form and style to the one mentioned in my previous article. *The Chrysanthemum, its Past, Present, and Future*, by Edmund M. Wood, looks very much like a separate reprint from the *Transactions of the Massachusetts Horticultural Society*. The copy in my possession is dated 1898. In the ensuing year a compact and handy little book, for which I am indebted to Mr. Leonard Barron, was published by *American Gardening*, called *How to Grow Chrysanthemums*. It is well printed, and contains several very useful illustrations, not the least important of which are those dealing with diseases affecting the plant.

English authors have little to boast of in the interval of four years. *Modern Chrysanthemum Culture for the Million*, by Geo.

Garner; *The Show Chrysanthemum and its Cultivation*, by C. Scott; *The Chrysanthemum*, by H. J. Jones, issued by Biggs & Son in their handy series, are small, inexpensive pamphlets. One other, however, H. J. Jones' *Portfolio of New Chrysanthemums*, which was issued early in the present year, is a distinct artistic effort, reminding us very much of his previous *edition de luxe*, which he called the *Chrysanthemum Album*.

Belgium has only contributed one addition to the literature of the Chrysanthemum, viz., *Traité sur le Supplément à la Liste Descriptive des Chrysanthèmes d'Hiver*, by M. O. de Meulenere. From frequent enquiries that are made of me for dates and raiser's names, I cannot but regard M. de Meulenere's literary work as a very useful one. Unfortunately it appeals to only a limited section, and I understand this catalogue will in future cease to appear.

Holland, like most of our near neighbours has its Chrysanthemum Society. On the occasion of its show in 1897, the Nederlandsche Chrysanthemum Club, as it is called, issued an official handbook and catalogue, in which Mr. J. K. Biddle wrote a long account of the origin and history of the Autumn Queen, to which was appended a cultural guide and other matter. This has subsequently been re-issued.

From other countries, Denmark, Italy, Germany, and Portugal, where the flower is advancing in public estimation, nothing of a bibliographical nature appears to have made its appearance since the last communication. It will be remembered that reference was made to what was then a new feature in connection with Chrysanthemum literature, namely, the appearance of periodical publications devoted mainly or exclusively to the dissemination of Chrysanthemum news, and the names of several such were given.

One of these, the *Nord Horticole*, the official organ of the Northern French Chrysanthemum Society, has ceased to exist; but *Le Chrysanthème*, issued by the French National Chrysanthemum Society at Lyons, still appears at regular intervals, and in its way has no rival. The *Journal of the Chrysanthemum* section of the National Horticultural Society of France is still supplied to members, and has been enlarged and much improved in every way. New comers in this department of literary activity remain to be noticed. Of these *Il Crisubano* is certainly the best. This is the official publication of the Italian National Chrysanthemum Society, and is a most creditable production for so young a society. It is larger in form than any of the others, is well printed, frequently illustrated, but is rather meagrely supplied with news other than local. The newest aspirant of this description for public favour is *L. Soleil d'Automne*, the monthly organ of the Swiss National Chrysanthemum Society, a publication more on the lines of the defunct *Nord Horticole*, in which Chrysanthemum matters are very largely dealt with.

Altogether, we may fairly assume that while literary workers are paying such attention to the Chrysanthemum, there is good ground for supposing that its adherents are still a numerous company, and that the flower, as I have before observed, has not yet entered upon the period of decline that was predicted of it by some well-meaning but mistaken people a few years ago. *C. Harman Payne*.

LILIES AND THEIR CULTURE.

(continued from p. 145.)

LILIUM LONGIFLORUM AND ITS ALLIES.—This is a group of very popular Lilies, embracing such species as *longiflorum*, *sulphureum*, *Browni*, *odorum*, and several others. All have long, funnel-shaped, fragrant flowers. A few are not absolutely hardy, save in select situations, whilst others have been rendered less so by continued cultivation under glass, and by the selection of larger-growing sports without regard to hardiness. One in particular, *L. longiflorum* var. *Harrisii*, is best left alone, owing to its liability to disease, and the possibility of its affecting other varieties of the same species. They are all vigorous-growing plants, having abundance of both

atmosphere, frequent syringing, weekly fungigation, and an occasional application of a very weak solution of nitrate of soda or diluted drainage from cowsheds when showing flower, are stepping-stones to successful cultivation under glass. Anyone can grow longiflorums, provided they water carefully—too little being even less harmful than too much. A well-grown plant should have raised itself bodily fully an inch in its pot by the time it is fit to flower by means of the development of roots below. It should be at least 3 feet high, and should bear eight or ten flowers. A periodical reselection takes place on Japanese Lily farms, and several distinct forms (horticulturally) are now sent over, all of which are marked improvements on the *Lilium longiflorum* of twenty years ago.

longiflorum, named *formosanum*, is also good, planted earlier than *longiflorum* does, compared with which it is distinct in its dwarf stature (cf. fig.), and in the bronzy tint prevailing on the outside of the perianth. The flowers are not so large, nor so freshly produced, as in *longiflorum*; but notwithstanding these shortcomings, the plant has its value for general planting. The flowers have the fragrance of *L. odorum*, not of *L. longiflorum*.

L. eximium *Wilsoni* is a big-growing form of *longiflorum*, having pure white flowers, differing from the type in the markedly revolute tips of the petals, and in the greater length of the tube; it is the finest of all longiflorums, but is only suitable for pot culture (see fig. 17, p. 147).

Albo marginatum is a form resembling the

FIG. 46.—FIELD OF LILIUM ALEXANDRE CULTIVATED IN JAPAN BY MESSRS. L. BOEHRMER AND CO.

kinds of roots. *L. longiflorum* is the most freely-grown Lily in the genus; tons of cut flowers are produced by this plant for the London and provincial markets, and its cultivation has become a great industry. In the first place, it is not absolutely hardy; it will flower well the first year, if planted about March, and freely watered throughout the summer; half the bulbs will die in the succeeding winter, and the survivors will not flower well in the succeeding year. To all intents and purposes it is an annual, in that profitable cultivation ceases after it has flowered once.

Lilium longiflorum may be grown in a variety of ways; planted in beds it is one of the most effective of plants; potted for greenhouse decoration it is invaluable, but it must not be overwatered. All the white Trumpet Lilies quickly lose their roots if soddened, therefore it is not desirable to over-pot them; a moderately damp condition at the root, a buoyant

A selection known as *giganteum* is the best for commercial and private growers, on account of the size and number of its flowers, and its vigorous healthy growth. It is not necessary to particularise all these forms, as there is little doubt but that they will give place to others in course of time. Three marked varieties, however, must be mentioned.

L. Takesim is a dwarfier plant, with longer, more linear foliage and stems, tinted with purple below, the flowers are more tubular than those of *longiflorum*, and they are also tinted with violet on the keels; the depth and extent of the colouring being dependent upon the amount of shade the flowers get. *L. Takesim* is the best of all longiflorums for all outside planting, as the bulbs do not perish in the first winter. They will not flower quite so well in the second year as in the first; the difference, however, will be but slight.

Another hardy and useful variety of *L.*

older types in its flowers, with leaves handsomely margined with white. The variegation is almost as good as that of *Dracena Godseffiana*; it makes a very useful decorative pot plant.

The var. *Harrisii*, as I have said before, is best left alone; it is not particularly wanted, for the improved forms of *L. longiflorum* fill its place to a nicety. Their flowers are of equal commercial value, and the bulbs of longiflorum improved are less costly than those of *L. l. Harrisii*; they may also be forced or retarded with every facility. In purchasing retarded bulbs of this or any Lily, I may here note that it is well to bear in mind the fact that small bulbs suffer considerably from the freezing process, and that good results cannot be obtained from them; in fact, they are almost useless. Under any conditions, the purchase of cheap, small bulbs of the trumpet Lilies is mistaken economy, larger bulbs costing twice

the money are cheaper in the end. Before leaving the true longiflorum Lilies, I would again impress upon growers the need for careful watering—a happy medium is the best state. Softened plants or plants that have been allowed to become dry at intervals flower badly, and invariably with a split perianth, and with numerous green blotches and other deformities on the petals.

Lilium Browni and *L. odorum*,* both of which are closely allied to *L. longiflorum*, have been subjects of much controversy amongst botanists as to their separate specific rank; and I do not think the matter is yet fully cleared up. For garden purposes, it is advisable to regard them as distinct plants. *Lilium Browni* is a slender growing plant, attaining a height of 2 feet or more; the leaves are

posure to sunshine the plants get. If grown under glass they should be placed outside a week before the plants flower, in order that the outer brown colour may be developed. Both *L. odorum* and *L. Browni* and its varieties grow as well as *L. longiflorum* under similar treatment, and they last several years under cultivation without deteriorating. They flower in July in the open, and may be forced to flower as early as May with ease. A warm situation, and a rich, moist soil brings out their best qualities; they rarely fail to flower, and may be regarded as most accommodating Lilies.

Lilium neilgherrense (see p. 53, July 29), is a moderately strong growing Lily, with fragrant, narrowly funnel-shaped, pale yellow flowers, widely spreading in the upper third in the manner of the flowers of *Nicotiana glauca*. It is

side of the three. It has widely funnel-shaped flowers, coloured a warm rosy-brown on the outside, the throat being of a rich creamy-yellow tint. It grows 5 or more feet in height, and bears numerous bulbils on the mature stems. The bulbils are easily distinguished by their black-purple colour.

L. nepalense grows to about 3 feet in height, and bears drooping, funnel-shaped flowers about 5 inches long, of a pale yellow colour, whitest at the entrance to the throat. The upper third of the perianth limb is much recurved, and the petals have a wax-like texture—a most beautiful flower.

Three rare Lilies, most suitable for greenhouse culture, are *L. polyphyllum*, *L. Lowi*, and *L. philippinense*. They are all slender-growing plants of rather delicate constitution.

FIG. 17.—FIELD OF *LILIAM LONGIFLORUM* VAR. *EXIMA* CULTIVATED IN JAPAN BY MESSRS. BOHMER AND CO., OF YOKOHAMA.

linear-lanceolate, arching, and of a deep green colour (the leaves of the var. *leucanthum* are completely rolled at the tips). One flower is produced on each stem (rarely two or three), coloured a uniform violet tint outside the tube; the inside of the flower is pure white, and the petals recurve to the tips to the fullest extent. It is narrower in the tube, and longer in the entire flower than in *L. odorum*. *L. odorum* (see supplementary illustration, July 29), flowers a fortnight earlier, has pale green, rigid, oblanceolate leaves, and one or two, occasionally three massive flowers coloured creamy-white when it first opens, changing to pure white on the fourth or fifth day. The outside of the flower is flushed a warm brown, the extent of the colouring in this plant and in *L. Browni* being dependent upon the ex-

not sufficiently hardy to grow in the open in most parts of Britain, but planted at the foot of a south wall, and abounded plenty of moisture, it is likely to thrive.

Both this species, *L. sulphureum*, and *L. nepalense*, do not make much growth till very late in the first season of planting outside, unless the bulbils are potted and started into growth by plunging them in a warm propagating bed of tan as soon as received. Even then they will not flower well the first season. They grow well enough the second year, getting away very early, inasmuch that the young growths often need no protection from frosts. They are most satisfactory in pots for greenhouse decoration, but do not last longer than three years in good health. It is possible to establish them outside if they last much longer, whilst the ideal spot for them is a border under glass, where they can grow when they will.

L. sulphureum is the best Lily to grow out-

They succeed under such treatment as would be given to greenhouse Begonias, both as regards soil and atmosphere.

L. polyphyllum has bottle-shaped buds, and half reflexing flowers of elegant shape, coloured whitish cream; the inside of the flower is covered with a multitude of linear, unvariegated spots, most dense near the middle of the petal. The outside of the perianth is green, or greyish-green.

L. Lowi is a very distinct plant with white flowers, prominently keeled green outside, the inside being heavily spotted purple. Two or three flowers are borne on each stem.

L. philippinense is the aristocrat among trumpet Lilies. It has very slender stems, linear-lanceolate leaves, and a pure white, long-tubed flower, longer than any longiflorum, the tips of the petals alone reflexing.

Geo. B. Mallett.

(To be continued.)

* *L. odorum* is also known as *L. spicatum* Colchesterensis, and is given to it by the late Dr. Wallace, of Colchester, but now superseded.

REMARKS ON THE CONDITION OF
THE FRUIT CROPS.

(See Tables, ante, pp. 88-91.)

(Continued from p. 129.)

5. SOUTHERN COUNTIES.

BERKSHIRE.—Apples and Pears bloomed abundantly, but set badly. Plums have been much blighted. Peaches, Nectarines, and Apricots on open walls have a fair crop of fruits. Small fruits, especially Gooseberries, Raspberries, and Currants, have yielded well, and are good in quality. Strawberries, on the other hand, suffered severely from the exceptional drought, early sorts being the best, and later varieties all but a failure. Walnuts are very plentiful, and Filberts a good crop. *Thos. Plumb, Holme Park Gardens, Sonning.*

—As a rule, Apples are a failure. I have a nice sprinkling of Wellingtons, but my Payne-Rent takes the lead, as usual, for cropping. It is a capital, all-round Apple. Mr. Veitch has got it, but I do not think he will ever be bold enough to exhibit it in a modern bloated collection. *Robt. Fenn, Sulhamstead.*

—The fruit crops are fairly satisfactory, with the exception of Apples, which have failed. On bush and pyramidal trees, however, we have some fruits of Ecklinville, Stirling Castle, Frogmore Prolific, and Margil. Small fruits have been exceptionally plentiful and good. Plums have been disappointing, for although appearing to set well, many dropped at an early stage. *W. Pope, Highclere Gardens, Newbury.*

—The crops are heavy generally, but the fruit, Apples in particular, will be small. The total rainfall from May 11 to June 28 was only 4.9 inches. The following varieties are carrying heavy crops, and in some instances will be thinned considerably. *Apples*—Allington Pippin Red Astrachan, Beauty of Bath, Duke of Devonshire, Beauty of Stoke, Bismarck, Chelmsford Wonder, Christmas Pearmain, Claygate Pearmain, Cox's Orange Pippin, Dutch Mignonne, Ecklinville Seedling, Golden Noble, Frogmore Prolific, Gold Medal, James Grieve, Lane's Prince Albert, Lord Derby, Lord Suffield, Newton Wonder, Peasgood's Nonsuch, Ribston Pippin, Pott's Seedling, Rosemary Russet, Royal Jubilee, Wealthy, Duke of York, Malcolm Dunn, and Williams' Favourite. *Pears*—Beacon, Beurré Baltet, Beurré Clairgeau, B. d'Amansis, B. Gifford, B. Superfin, Clapp's Favourite, Citron des Carmes, Durondeau, Doyenné Bussoch, D. du Comice, Fondante d'Automne, Le Lectier, Marguerite Marillat, Marie Louise, Louis Bonne of Jersey, Thompson's, Olivier de Serres, Petite Margaret, Vicar of Winkfield, Pitmaston Duchess, and Winter Nelis. *Peaches*—Premier, Prince of Wales, and Stirling Castle, are fine here outside. *Strawberries*—The earliest was Noble, picking commenced outside June 16, and being a dry season, the quality and flavour were good. Royal Sovereign was about a week later. Leader was very large, and of moderate flavour. It should make a good market variety. Aromatic is very prolific, and one of the best for travelling; Coatsness is distinct and good; and Waterloo, best for late crop, of which I am now (July 17) gathering very fine berries. *Owen Thomas, Royal Gardens, Windsor.*

DORSETSHIRE.—Several varieties of Apples are cropping well. The best are the following: Cox's Orange Pippin, Duke of Devonshire, King of Pippins, Irish Peach, Lord Suffield, Margil, Ribston Pippin, Northern Spy, Koswick Codlin, King of Tomkin's County, and Worcester Pearmain. Pears are very scarce, the best are Beurré Diel, B. Rancee, and Glout Moreau. Czar is the only well-cropped Plum. Damsons

are a failure. Cherries have been a very good crop. Gooseberries, and Red and White Currants are good, Black Currants moderate. Strawberries were good, but the season was a short one. *Thos. Denny, Down House Gardens, Blandford.*

—The Apple crop is the worst for many years past. On orchard standards, some few trees only which failed to crop last year are carrying a light crop this season. Free bearing kinds on bush trees in the kitchen garden are carrying an average crop. Pears also are a light crop, many trees not bearing a fourth of a crop. Plums are an average crop on walls, but almost a failure on bush and standard trees. Sweet Cherries have been excellent, and Morellos equally good. Peaches, Nectarines, and Apricots are good average crops, and the trees are very healthy. Of small fruits, Red, White, and Black Currants have been specially fine and clean. Raspberries are also very fine and abundant, so were Strawberries. Cobnuts are nearly a failure. *T. Turton, Castle Gardens, Sherborne, Dorset.*

—Apples are an average crop; but some of the trees in grass orchards have very few fruits. Bush and espalier-trees are heavily cropped. The cold rains and hail during setting time spoiled a promising Pear bloom. Plums are good, but under average. Cherries are one of the poorest crops I remember. Apricots, Peaches, and Nectarines are good. Strawberries have borne a heavy crop, and the quality was excellent. *Ben Campbell, The Gardens, Kingston House, Dorchester.*

HAMPSHIRE.—Big fruits in this district are very scarce, excepting in very sheltered places; most bush fruits are plentiful. Strawberries were a good crop, but did not last long; Royal Sovereign, Leader, Monarch, Trafalgar, and Latest-of-All were grand. *Arthur Lee, Palace House Gardens, Bantley.*

—Apple-trees are variable, one tree has a full crop, its neighbour of the same sort none. The trees are healthy, and free from insect pests. The buds, too, are plumping up for next season. Lord Grosvenor, as usual, is one of the best of early sorts, and Cox's Orange Pippin has a fair crop of healthy fruits. Plums and Cherries are especially a heavy crop. Strawberries, in spite of the dry weather, have been plentiful; Leader, Royal Sovereign, and Sir J. Paxton have been the principal sorts. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

—Apples on young bush-trees are carrying excellent crops of good, clear fruits. Old trees that bore heavily last season have scarcely any fruits. Pears are thin. Plums are a good average crop, and clean. Small fruits are abundant, but Gooseberries have suffered much from the ravages of the caterpillar. Strawberries have been good, but were soon over. *A. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.*

KENT.—Of Apples there is a fair crop of early sorts, but all store fruits will be scarce. Of Plums, Victoria, Pond's Seedling, and Diamond are best cropped. Apples and Plums were over-cropped in 1900. Pears on walls are good, and there is a crop of market sorts on standards. *George Bangard, Maidstone.*

—The Apple crop is irregular. Some varieties, as Cox's Orange Pippin, Duchess' Favourite, Worcester Pearmain, Warner's King, Lane's Prince Albert, The Queen, Lady Sudeley, Ecklinville Seedling, Lord Suffield, Koswick Codlin, and Stirling Castle, are carrying heavy crops. *George Hutt, Lullingstone Castle Gardens.*

—Varieties of Apples vary greatly, some kinds, such as Blenheim Orange, being heavily

laden, while many others have no fruits. Strawberries were splendid. *Geo. Fennell, the Gardens, Fairbairn, Tonbridge.*

—Apples, Pears, and Plums are decidedly short in this district; they will be good in quality where well cultivated. Cherries have been splendid. Strawberries were too much forced by the weather to pay well. Nuts are the worst failure we have known for many years, if they do not constitute a record. *B. Champion, Merecroft, Maidstone.*

—Apples in this district are scarcer than they have been for years past. Large standard trees of Blenheim Orange, of which there is a number around here, are very heavily cropped. Some years ago, when mildew almost ruined trees of the variety Lord Suffield, I had almost condemned this variety, but I am glad now that I did not do so; for the last two or three years it has been perfect in its growth and development of fruit. I know there are growers who prefer Lord Grosvenor to Suffield, but why I cannot quite understand, as the latter is a much better and stronger grower, and the shape of the fruit is better and it is more solid. "Stone's" is the most reliable variety we grow. It has not failed for several years past, and amongst mid-season culinary sorts it is one of our very best when grown on the Paradise stock. Lane's Prince Albert is another good sort, but owing to its heavy cropping propensities, this should be on the Crab stock, and even then it requires to be heavily thinned. Most varieties of Pears are carrying good crops. Durondeau, Emile d'Heyst, Doyenné du Comice, Beurré Hardy, Triomphe de Vienne, Passe Crassane, are exceptionally good. The Cherry crop has been prodigious and good. It might be feared that owing to the large crop the fruits would be small, but this is not the case. I may mention that one acre of fruit in this parish sold for £41 by auction. This is all profit, as the grass pays the rent, and the grower has no picking to do, and no trouble whatever. I have seen the new Cherry "Noble" again this year, and its qualities confirm my early opinion, that for market purposes it has a great future before it. Its two most distinctive qualities are firmness in texture, which will enable it to travel well, and its beautiful appearance. A new Black Currant that I have fruited for the first time this year is named "Boskoop." It is a much stronger grower than any sort we grow, and very much larger in berry and bunch. I would advise anyone requiring Black Currants to give this sort a trial. I believe Messrs. Bunyard, of Maidstone, are distributing it. *G. Woodward, Bisham Court Gardens, Maidstone.*

MIDDLESEX.—Of Apples and Pears we have a very thin crop; fortunately the later kinds are giving the best results this year; and a few of the best Apples, such as Cox's Orange, are our heaviest croppers this season. Pears were a heavy crop, but the drought caused many fruits to drop early. Small fruits have been abundant and good; but the Strawberry crop was a short one. Peaches and Apricots are good, and the trees look well. Plums are a very poor crop. *Geo. Wythes, Syon House, Brentford.*

—The Strawberry crop was the best for a number of years, especially on young plants put out a year ago. Pears are especially good in quantity and quality. Apples and Plums look remarkably well, and promise excellent crops. Bush fruits have been very good. Peaches and Nectarines are not quite an average crop. With the exception of aphid on Peaches and Nectarines, insect pests have not been very troublesome. *S. T. Wright, R.H.S. Gardens, Chiswick.*

MIDDLESEX.—The fruit crop is somewhat light, and especially Apples; the trees which bore heavily last year have little or no fruit this season. Pears are much below the average—perhaps due to the long spell of cold, wet weather experienced during the flowering period. Morollo Cherries are plentiful, and soft fruits were splendid. *H. Mackham, Wrotham Park Gardens, Boreet.*

All fruit crops promised well with us at the flowering period; all were, however, unusually backward in arriving at that stage. Peaches, Nectarines, and Plums phenomenally so. I think the warm weather that was for a time experienced in April hastened the Peaches and Nectarines too much, hence they failed

SURREY.—The present season has not only given a capital crop of Strawberries that needed only more rain to have made it a record one; but other soft fruits, such as Gooseberries, Currants, and Raspberries have been remarkably abundant and fine. Cherries have been very plentiful also. Apples seem likely to be abundant enough to make of them a profitable crop, and with more rain should prove a fine sample. Pears are sufficiently abundant, and although here and there thin, especially Williams' Bon Chrétien, yet there will probably be a satisfactory crop. Plums and Damsons promise in many places to be a good crop. Walnuts are plentiful, but small Nuts are scarce. *Alex. Dean, Kingston.*

is wonderful, considering the marvellous crops of last year. All bush fruits are heavily cropped. The Logan-berry and Strawberries have been perfectly phenomenal, and very good. *W. Wilks, Slitely.*

— Apples, with the exception of Benheim Orange, Bismarck, and King Harry, are above the average crop. Tyler's Kernel, Flower of Kent, Ecklinville Seedling, Lord Southill, Lord Grosvenor, and Ribston Pippin, bear splendid crops, and are free from disease. *J. F. McLeod, Dover House Gardens, Rochester.*

— Small fruits have been exceptionally good, especially Raspberries and Strawberries. Apples and Pears set an average crop of fruits, but have since suffered from the drought. *W. Haines, Cobham Park Gardens, Cobham.*

WILTSHIRE.—The Apple crop is the smallest I have seen in this neighbourhood for the last thirty years. Bush fruits are plentiful, excepting Black Currants. Strawberries have been abundant, but the season short. *Jos. Trollope, Loughat Gardens, Warrminster.*

— The Apple and Plum crops are exceptionally light, due partly to the heavy crops last year, and partly to the continued low temperature during the period that the trees were in blossom. *T. Challis, Wilton House Gardens, Salisbury.*

7. ENGLAND, N.W.

LANASHIRE. All kinds of Apples grown here are carrying a good crop. We have the best crop of Marie Louise and Williams' Bon Chrétien Pears (on trees 30 to 40 feet high), that we have had for twenty years. Co's Golden Drop Plum on a west wall has a better crop than usual. The soil in this garden is very holding, and in some parts not too well drained, so that we have not suffered from drought. *W. P. Roberts, The Gardens, Cae'don Hall, Preston.*

WESTMORLAND. Owing to bullinches, &c., most Apple and Plum buds in orchard were taken. On wall-trees the crops are light. Strawberries were good; but bush fruits are slight crop. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

(To be continued.)

PELARGONIUM ENDLICHERIANUM.

THAT a Pelargonium should be found in Cilicia, is one of those facts that set speculative botanists thinking how a solitary species should be found so far away from South African headquarters. There is a vast number of species of the genus in South Africa, and some few in Abyssinia. Of more immediate consequence to the gardener, is the fact that this perennial species is all but hardy in Sir Trevor Lawrence's garden at Barford, near Dorking, very slight protection being needed. The root-stock is fleshy, producing long-stalked condole, reniform, crenate, pubescent lower leaves; whilst those on the stem are more or less deeply three to five-lobed. The flower-stalks, 1 to 2 ft. in height, bear a tuft of five to fifteen flowers each, with two petals only of a glowing pink colour, the reticulate veins being of a darker purple. It is not necessary to go further into botanical detail, as the plant is well described in the books cited in the footnote; and our illustration (fig. 18), from a drawing by Mr. Worthington Smith, taken from a plant exhibited recently by Sir Trevor

FIG. 18.—PELARGONIUM ENDLICHERIANUM; HARDY PERENNIAL; FLOWERS ROSE-COLOURED.
(From the garden of Sir Trevor Lawrence, Bart.)

to set well. The various forms of aphides have been more troublesome than usual, and worst upon wall trees. Relative thereto I am more convinced than ever of the importance of winter dressings, when the application of insecticides, owing to the greater strength at which they can be used, are far more effective. Owing to the prolonged drought, the watering of all crops has been imperative, but good results have been achieved. The two best Strawberries are Royal Sovereign and Latest-of-All; these will require a deal of heating on a light loam on gravelly soil. Alpine Strawberries have been, and promise to be, far away into October, a heavy and remunerative crop for private consumption; they should be grown more than they have been—the conservative tendency of some of us has not favoured their extended culture. *James Hudson, Gunnersbury House Gardens, Acton, W.*

— Some varieties of Apples have a good crop, others none. Altogether they are about average. The trees are in very good order. Strawberries and bush fruit were very plentiful and good. *W. E. Humphreys, The Grange Gardens, Hackbridge.*

— The Apple crop is light this year, owing to the very heavy crops the trees carried last year. Pears are thin, owing to cold east winds and frost while the trees were in bloom. Stone fruits are good. Small fruits are very heavily cropped, particularly black and red Currants; while Raspberries are the finest crop I have ever seen. *W. C. Leach, Albury Park Gardens, Guildford.*

— Apples-trees which are bearing at all are fully cropped; but many trees have no fruits to speak of. Pears are a fair average crop all round. Plums are a fair crop, which

* PELARGONIUM ENDLICHERIANUM, FENZL - Pugliese, n. 16; Boissier, *Flora Orientalis*, t. 1867, p. 87, Hook. f., *Bot. Beech.*, t. 190, Nicholson, *Dictionary of Gardening*, iii. (1875), p. 61, fig. 63.

Lawrence, will serve to give a sufficient idea of the general appearance of the plant. While strongly recommending it to the notice of lovers of herbaceous plants, we have no doubt it would respond to the persuasions of the forcing-house, and that it would be useful for hybridising purposes. By its means it seems likely that we could get a hardy variety of the Ivy-leaved section of the genus.

"NATURE-STUDY."*

(Continued from p. 126.)

"WHAT better subject can be taken for our purpose than the insect world, which is full of object lessons? KIBBY, in his introductory letter to his book on *Entomology*, wrote: 'Insects have forestalled us in our inventions, and we ought to pay a closer attention to them and their ways than we have hitherto done, since it is not at all improbable that the result would be many useful hints for the improvement of our arts and manufactures, and perhaps for some beneficial discoveries. The instruments also with which they are provided are no less wonderful and various than the operations themselves. They have their saws and files and augers and gimlets and knives and lancets and scissors and forceps, with many other similar implements, several of which act in more than one capacity, and with a complex and alternate motion to which we have not yet attained in the use of our tools. If we attend to the history and manners of insects they will furnish us with many useful lessons in ethics, and from them we may learn to improve ourselves in various virtues. If we value diligence and indefatigable industry, judgment, prudence, and foresight, economy and frugality; if we look upon modesty and diffidence as female ornaments; if we revere parental affection; if of all these and many more virtues, insects in their various instincts exhibit several striking examples.' In another part of the same work in speaking of the value of a study of entomology in the education of the youth, KIBBY writes: 'All modern writers on this study of entomology in the education of the youth, unite in recommending natural history; and if the quality of accurate discrimination, the ready perception of resemblances among diversities, and still more the quick and accurate perception of diversity in the midst of resemblances, constitutes one of the most important operations of the understanding; if it be indeed the foundation of clear ideas and the acquisition of whatever can be truly called knowledge, depends most materially on the possession of it; if 'the best logic be that which teaches us to suspend our judgments;' and 'the art of seeing, so useful, so universal, and yet so uncommon, be one of the most valuable a man can possess,' there can be no doubt of the judiciousness of their advice. Of all the branches of natural history, entomology is unquestionably the best fitted for this disciplining the mind of youth; and simply from these circumstances, that its objects have life, are gifted with surprising instincts admirably calculated to attract youthful attention, and are to be met with everywhere.'

"It is not necessary to confine the examination of plants to the spring of the year, for a very great deal may be done by indoor work in copying Nature. In one of the American schools, where much is done in Nature-study, a very simple contrivance provided interest and instruction for a whole winter. It consisted of an old crate which was converted into a glass-sided box to form a terrarium (terra-earth, just as aquarium from aqua—

water). The bottom of the box was covered with a layer of soil. In one corner a mossy pile, and in another a mass of Thistles and Clover, one or two small plants and some twigs, completed the vegetable world. The crystals and larvae of some common insects were put into the case with some lady-birds, grasshoppers, spiders, and small toads. Such an object provided during the winter months an endless interest for the pupils, and undoubtedly roused such interest in their minds that with the return of spring the interest taken in outside objects was most marked. This perhaps is the simplest form of Nature-study, and should be the starting-point. The next step would be of a little deeper character, and along with actual observation there should be a noting of facts. In all things it is well to encourage among pupils this recording of what is seen; it is of great assistance to the memory and useful for reference. As an example of what I mean, take for instance such a branch as the natural history of the plant. The points that would be noted would be:—First, the kind of plant, the characters which mark it off from others surrounding it; secondly, where found; on the side of the road, grassfield, cornfield, &c.; thirdly, whether sheltered or not, and its relation to other plants; fourthly, the nature of the root, flower, leaf, if any fruit, the kind and form; fifthly, the time of flowering and the general character of the flower; how the flowers are fertilised, if by insects, the kind of insect. With the older pupils a few more details may be noted, as the common and scientific manner. After the initial work has been done, Nature-study may become the teaching of useful knowledge relating to farm work. I do not advocate the teaching of what is known as agriculture, but I believe that a great deal of useful and valuable information may be put before the pupils in elementary schools which will help to arouse an intelligent interest in the varied operations of the farm. After all, the aim of the authorities in advocating Nature-study is to so educate the labouring class of the country that they will remain on the land and not drift into the towns to swell the number of the unemployed.

(To be continued.)

The Week's Work.

THE ORCHID HOUSES.

By H. I. CHAPMAN, Gardener to R. I. MEASURES, Esq., Cambridge Lodge, Floddon Road, Camberwell.

Stanhopeas would probably become extinct in gardens were it not that the old-established places, that make no pretension to special Orchid culture, continue to cultivate them, suspended in baskets from the roof of the stoves. The excuse is made that the flowers are so short-lived, and the perfume is so overpowering, that the plants are not worth anything. These are probably mere excuses, for the plants are generally found in a very indifferent state of health in an Orchid-collection, and to see them really happy we must go to some old-fashioned garden, as it was my pleasure to do a few days ago, in the West of England. The results prove that the conditions provided in an ordinary plant-stove are what *Stanhopeas* require; and further, that they should be rarely disturbed at the roots, except to take a little of the old material away and afford a top-dressing, which may be done annually. I saw a plant of a variety of *S. Wardi* that had no fewer than nine spikes, with three and four flower-buds each, nearly ready to expand, and it had not been repotted for years. The best time in which to repot or top-dress *Stanhopeas* is almost immediately after they have flowered. Do not repot the plants unless the potting material has become decomposed, or the decay of the basket necessitates it. Provide

liberal, clean drainage; but as the *Stanhopeas* usually produce their flower-scapes from the base, they penetrate through the compost, and must be afforded the means of exit through the drainage. The crooks at the bottom should be so arranged that they may do this. The potting compost must be of an open nature, consisting of two parts peat, one of sphagnum-moss, and a liberal sprinkling of moderately coarse charcoal. Press this compost moderately firm about the base of the plant; water the plants directly after the operation, and encourage the roots to get hold of and establish themselves in the new compost. Shade from direct rays of the sunshine until the plants are re-established.

Peristeria elata generally succeeds in the plant-stove. I remember to have seen some huge specimens in charge of the foreman of the general plant houses in one of the greatest Orchid establishments. I have never seen their equals since. The man in charge of these afterwards became the Orchid specialist, but although he continued to cultivate the *Peristerias*, they have sadly deteriorated. I saw plants producing flower-scapes freely in a garden near Exeter, recently, where they have grown for many years, the whole stock having been obtained from one small plant. These plants are potted in the autumn each year in a compost of good fibrous strong loam, rough peat, a little leaf-soil, and a liberal sprinkling of rough sand. Plants now advancing their flower-scapes, if root-bound, should be afforded occasional applications of weak liquid cow-manure.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HUSSEY PACE, Esq., Prestwood Hall, Loughborough.

Cyclamens.—Prepare the requisite number of seed-pans for the purpose of sowing seeds of *Cyclamens* during this month, or not later than the first week in September. Cover the drainage material in each pan with moss, and use a compost of loam and leaf-soil in about equal proportions, adding a little fine mortar-rubble and sand. Make the soil firm, and the surface even, then distribute the seed, pressing it into the soil with the fingers; cover to the depth of $\frac{1}{2}$ -inch, and water with a fine rose-can. Place pieces of glass over the pans, and put the latter in a cold frame for a month or six weeks until the seedlings appear. As soon as the seed-leaf appears, lift the pans as closely to the glass as possible. Do not let the soil become dry. Continue to afford abundance of ventilation to plants approaching the flowering stage, removing the lights at night during the next two or three weeks.

Bulbs.—As the catalogues are now coming to hand, selection of varieties will be necessary that the order may be sent for them at once. The named varieties of *Hyacinths* and *Daffodils* to bloom during January should be potted by the beginning of September. Having already referred to early varieties of bulbs for forcing, the following remarks deal with bulbs for giving a display of flowers from January onwards.

Hyacinths.—The following varieties can be depended upon to give good results. Single reds: Charles Dickens, "Ornament Rose," Macaulay, Koh-i-noor, Garibaldi, Mrs. Becher Stowe, King of the Belgians, Princess Clothilde, Queen of *Hyacinths*, Comtesse of Rosebery, Vuurbaak, Von Schiller. Double reds: Novelty, Princess Louise, Empress of India, Lord Wellington, Susanna Maria, and Venus de Medici. Single whites: Avalanche, Alba super-bissima, Miss Nightingale, Mont Blanc, Grandeur à Merveille, La Franchise, La Grandesse, Mr. Plimsoll, Princess of Wales, Queen of the Netherlands, Snowball, and Finnoecia. Double whites: Edison, La Grandesse, Prince of Waterloo, Bonquet Royal, Florence Nightingale, Globosa, and La Tour d'Auvergne. Single blues: Marie, Queen of the Blues, Grand Lilas, Baron Van Tuyll, Challenger, Charles Dickens, Leonidas, Lord Derby, King of the Blues, Prince of Wales, General Havelock, Czar Peter, Sir J. Lawrence, and Grand Maître. Double blues: Perfection, Garrick, Charles

* Addressed by Mr. P. Hedworth Foulkes, F.R.S., F.E.S., at the Harper Adams Agricultural College, August 1.

Dickens, Blocksberg, Crown Prince of Sweden, and Van Speyk. Single yellows; King of Yellows, Obelisk, Ida, John Stuart Mill, Bird of Paradise, and L'Or d'Australia. All the foregoing are recommended for single pots and glasses. For making a display of flowers, bulbs to pot three in a pot may be obtained at a cheaper rate. Good varieties for that purpose are, whites; The Bride, Rosa Bonheur, and Elaine; blues; Her Majesty, Royal Blue, and Madame Lesseps; pinks; Coquette, Delicate, Gertrude, and Venus; yellows; Yellow Prince, and La Pluie d'Or.

Polyanthus Narvissi.—I name those in the order in which they will flower; Gloriosa, Soleil d'Or, Bazaar-han Major, Grand Monarque, Grand Primo, and Grand Saltana.

Tulips.—Early varieties of Due Van Thoe—crimson, scarlet, vermilion, white, and yellow—are all good for early forcing. Of later varieties may be named Canary Bird, Chrysolora, King of the Yellows, La Belle Alliance, Bride of Haarlem, Cottage Maid, Crimson King, Pottelbakker, scarlet, white, and yellow; Keizer's Kroon, Proserpine, Thomas Moore, and Vermilion Brilliant. Of double varieties; La Candeur, Prince of Wales, Rex rubrorum, Tournesol, Tournesol Yellow, and Imperator rubrorum.

Daffodils or Narcissus.—For pots the following are amongst the best varieties, viz., N. Ard-Righ, N. Golden Spur, N. Henry Irving, N. bicolor Empress, N. bicolor Horsfield, N. Emperor, N. maximum, N. rugulosus, N. Talmont's plume, N. princeps; the two last-named varieties should be grown in quantity for cutting purposes. The selection from the medium-crowned section of Daffodils should include Cynosure, Stella, Orange-Phoenix, Sulphur Phoenix, Incarnapink, single and double, Leedsii, and Sir Watkin. N. postions ornatus and single sweet-scented Jonquills will afford sweet-scented flowers for decorative purposes, and should be grown in quantity.

Miscellaneous.—For furnishing front row plants in the greenhouse or conservatory, *Seilla sibirica*, *Crocus* in variety, and *Chionodoxa Lucifera* are desirable. But several bulbs in a pot to give a good display of bloom. The cultural requirements of bulbs will be referred to next week.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Brighton, East Huddleigh, Devonshire.

Coleworts.—Get out later sowings of these while the ground remains moist; a distance of 9 to 12 inches each way will be sufficient. A narrow border that has yielded such crops as Lettuce, Turnips, or Carrots, will be suitable.

Lettuce and Endive.—Plant good breadths on an open piece of ground, and afford a space of 12 to 15 inches each way between the plants; dust them with lime and soot late in the evening or early in the morning, to keep away slugs.

Broad Beans sown at the end of May are now yielding good crops. Clear the ground of exhausted crops, that it may be planted with Colewort, borecole, and Kail, or sown with a late crop of Turnips. These would supply a remunerative crop of greens in the spring, should they fail to form roots of a serviceable size.

French or Kidney Beans.—The latest-sown crop of these should be kept well supplied with water when in flower, or the blooms will fail to set. We have given Veitch's Hybrid a trial this season, and it has proved a thoroughly good main crop variety, being a strong grower and very prolific. It requires to be sown thinly, and 3 feet space should be allowed between the rows. A sowing should soon be made that can be given glass protection later when frost threatens. Those who have pits heated with hot-water usually devote part of them to this vegetable. The soil should be fairly rich and light, and 2 feet or more below the leaders or raters. Sow in drills 2½ inches deep and 18 inches asunder. Another method

is to sow in boxes, or pots 8 inches in diameter, placing them out-doors for the present, where the pots can be plunged, and shading them with a few mats until the seeds have germinated. *Sion House*, *Filmer's* Forcing, and *Veitch's Superb Early Forcing*, are suitable varieties.

Peas.—As much of the spring sowing as can be spared should be cut back fairly hard to encourage new growth before cold nights occur, this will keep a supply up to the new year, or even later, providing the weather be not too severe. Keep the surface soil well stirred between the rows of the last sowing and those planted out for mid-winter use.

Miscellaneous.—Weeds are best removed by the hand, then use the flat hoe wherever it can be worked. Keep the walks clean, and roll them occasionally while damp. If the walks are of turf, cut the grass every ten days or so, finishing off with a heavy hand-roller the week after cutting.

THE HARDY FRUIT GARDEN.

By C. HERAS.

Wasps are becoming very numerous and troublesome, especially among Plums and late Cherries. All nests should be searched out and destroyed. Where the nests are in the ground, a very easy method of destroying them is by pouring in gas-tar by means of an old watering-pot. This may be done at any time of the day, as the absent wasps are sure to entrap themselves in the tar on their return, and it should be used liberally around the entrance to the nest. The old method of destruction with gunpowder and sulphur, and then digging out the nest, is very effective, but must be done at night, when all the wasps are at home. If the garden labourers be offered a premium upon each nest destroyed, most of the nests are likely to be discovered and destroyed at night. A lump of wadding soaked in a solution of cyanide of potassium and pushed into the entrance of the nest on a pointed stick, is another means of destroying them; but the cyanide being a very deadly poison, extreme care must be used, and the poison must not be brought at all near to the nose or mouth of the workman.

Earwigs are very troublesome among wall fruits, especially where the walls are old and contain old nail and other holes. They may be trapped in large numbers by placing 9-inch lengths of dry Broad Bean-stalks among the branches close to the wall. These should be examined every morning and emptied of the earwigs, a bottle partially filled with water being carried round for their reception.

The Fruit Store. As the storing of some varieties of early fruits will shortly be necessary, the fruit-store should be thoroughly cleansed at once; the woodwork and shelves washed down with soap and water, and rinsed with clear water afterwards. Where there are brick walls, these should be lime-washed. When finished, throw open the doors and ventilators until the inside is dry. If the floor is paved this should be washed also, but if of hard, trodden earth, the surface should be scraped off and freshened. An equable temperature is not always possible in fruit-rooms covered with tiles or slates, neither of which for this purpose is equal to a thatch of good straw or heather.

THE FLOWER GARDEN.

By T. H. STAVE, Gardener to Lord Poltmore, Poltmore Park, Exeter.

Fibrous-rooted Begonia flower profusely in the beds, and are suitable for forming masses of bloom, but they are seen to best advantage when planted sparingly over a carpet of some dwarf plant, and taller plants mixed with them. Three good sorts among the fibrous-rooted kinds are *Abundance*, colour coral-pink; *Fairy Queen*, or *Crimson Boddler*, useful as an edging; and *Carriker*, colour white. In propagating these *Begonias* from cuttings, care should be taken to preserve all the buds in the axils of the leaves, even leaving the one at the

bottom of the cutting. Where possible, select only such cuttings that have wood-buds, for although the tops of the plants will strike, such cuttings only form one straight shoot as plants, and therefore do not show the natural growth of the plants. Propagate at once, if cuttings can be obtained without destroying the appearance of the plants. If not, the old plants may be lifted later, and divided up or held as stock. Two or three cuttings placed now in small pots, or inserted in shallow pans in light sandy soil, will succeed. Place them in a frame, and do not keep the atmosphere too close or wet.

Annuals.—If a display of these is wished to follow the bulbs in late spring, a sowing should now be made, especially in cooler districts. *Larkspurs*, *Scabious*, *Coleus*, *Calliopsis*, *Clarkias*, &c., are all very useful for this purpose, and may be sown where they are to flower, or for transplanting later to the ground as it becomes available. *Larkspurs* are not so good to the ordinary bud this season. Seeds bought in, and sown saved, have scarcely a light shade amongst them. Last season the light shades predominated, and were very beautiful.

General Remarks.—Remove all decaying flower-spikes and lower-trusses from the beds; continue to pinch such plants as *Althæa*, *Therax*, *Coleus*, *Pyrethrum*, &c. Afford supports to tall-growing plants. Remove the flower-stems from *Cannas* as they pass out of bloom, and afford the plants copious supplies of water if the weather is dry. Tie up *Dahlia* growths, and afford the plants plenty of water, and a mulch; thin the blooms. Remove dead flower-stems from *Carnations*; continue to layer for young plants—the earlier the layers are rooted the better. Mow the lawns frequently; the grass may not grow much in the very hot weather, but weeds will. Trim the edges of beds and walks, and maintain a tidy appearance generally.

FRUITS UNDER GLASS.

By MALCOLM McKEIVIE, Gardener to SIR CHAS. TENNANT, The Glen, Inverhunting, Peeblesshire.

Lifting Wood-vines.—In too many private gardens Vines are preserved long after they have ceased to be profitable. In the case of exhausted borders, in which the roots are too deep, and the berries shank, the present is a good time to lift them. The old soil should be carefully removed with a fork, beginning at the outside, taking care not to injure the Vine-roots, and as the work proceeds lay them in damp mats and keep them moist. Take special care of all fibrous roots, and if necessary, re-make the border all through, adding new drainage and drain-pipes, so as to keep the drainage in a sweet condition. Cut back any old, decayed roots to a live part, spreading out the small fibrous roots carefully, and keeping all near to the surface. Make the new compost firm, but take care that in ramming it you do not injure the roots. When complete, spread a mulching of fresh stable-mannure over the surface, and saturate the border with water. Syringe the Vines several times daily, and shade them from the sun. In most cases a restricted border is best, adding soil as required in after years. The most important part in lifting is to get the roots re-covered without long exposure, and to keep the air close and moist. The compost should consist of good turfy loam, old mortar rubble, crushed bones, charcoal, and a sprinkling of Thomson's Vine Manure. Do not use any decayed manure, as when used in quantity, or there is a deficiency of root action, it causes the new soil to sour before the roots can take hold of it. It is surprising how soon such old Vines take to their new conditions, if kept moist by syringing and damping all parts of the house. This work should be done in the autumn, as there is then the certainty of success. Crop lightly the first season afterwards, and do not force the Vines, but permit them to grow freely, and the terminals to extend themselves, stopping the laterals when they touch each other.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER. Special Notice to Correspondents.—The Editor does not undertake to return to correspondents the original articles, but will return the proofs, if possible, by special arrangement.

Illustrations.—The Editor will accept illustrations and photographs of a suitable quality, but no reproduction of gardens, or of ornamental plants, flowers, trees, and so forth, cannot be responsible for illustrations.

Letters for Publication, as well as specimens and plants for examination, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London, W.C. Contributions should be written on ONE SIDE ONLY OF THE PAPER, and sent in the usual way, sealed, and duly signed by the writer. If desired, the contributions will not be printed, but kept in a drawer to edit at leisure.

Newspapers.—Correspondents sending newspapers should be careful to send the papers which they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUG. 24.—Strathearn Horticultural Society's Show.

TUESDAY, AUG. 27.—Royal Horticultural Society's Committee meet.

WEDNESDAY, AUG. 28.—Exhibition of Pot Plants and Flowers at Glasgow, by the Glasgow and West of Scotland Horticultural Societies, in connection with the Glasgow Exhibition authorities, 2 days.

THURSDAY, AUG. 29.—Barnenden Horticultural Society's Show.

FRIDAY, AUG. 30.—Barnenden Horticultural Society's Show, 2 days.

SALES.

MONDAY, AUG. 26.—Great Trade Sale of Dutch Bulbs, at Portico and Morris Rooms.

TUESDAY, AUG. 27.—Great Trade Sale of Dutch Bulbs, at Portico and Morris Rooms.

FRIDAY, AUG. 30.—Great Trade Sale of Dutch Bulbs, and Imported and Established Orchids, at Portico and Morris Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at CLYDEWICK.—60.7.

ACTUAL TEMPERATURES.—

LONDON.—Aug. 24, 6 P.M. Max 76. Min 56.1.
 August 25.—Fine, warm.
 PROVINCES.—August 21, 6 P.M. Max 67. Min 46.
 Counties.—Min. 59, Scotland.

It is always a matter of great interest to rosarians to know to whom and for what the Gold Medals for the new seedling Roses are awarded. A tribunal which decides what are to be commended and what left on one side is composed of the best leading rosarians, both amateur and professional, and consequently commands and receives the confidence of all Rose-growers. It is true that this jury, as the French call all such tribunals, may, like other juries, sometimes make mistakes, but they are mistakes which are few and far between, and not more than are inevitable by fallible men.

As will be seen, not only exhibition Roses, but a garden Rose has been decorated. And it is also interesting to notice that two firms which have never before received such an honour, have won the Medals this year. Two have been obtained by Messrs. B. R. CANT & CO., one by Messrs. JAMES VEITCH & SONS, and one by Messrs. ALEXANDER DICKSON & SONS, Newtownards.

It was at the Richmond Show that Messrs. B. R. CANT & SONS obtained the Gold Medal for their new H.P. Ben Cant (figured at p. 13, July 6), and around it there is a little history. About four years ago Mr. B. CANT (the younger of the two brothers who now so diligently carry on the business of the firm) began

the cross-breeding of Roses, believing that there was much to be done in this line; and the success which has attended his efforts, obtaining two Gold Medals the first year that any of his products were exhibited, shows the skill and intelligence with which his operations were carried out. "Ben Cant" is named after the old veteran, who was regarded as the very prince of Rose exhibitors; it was raised during his lifetime, though he did not live to see it exhibited in its full beauty. It is the product of Victor Hugo crossed with Susanne-Marie Rodocanachi, and clearly shows that it is a true cross, exhibiting the qualities of both parents. It is a fine sturdy grower, making shoots 3 feet 6 inches to 4 feet in height—some are even higher; the foliage is large and pointed, similar to that of Victor Hugo, but much finer, and more leathery. The flowers are a brilliant deep crimson, slightly veined and shaded darker; the outer petals are rounded after the Rodocanachi type, very firm and leathery; the centre is well defined, pointed, and very high, and when in its best phase, has a very bold and striking appearance, sometimes measuring as much as six inches across, and even when fully expanded the flowers retain their colour, and last extremely well. It is, we are informed, thoroughly perpetual, throwing out a large number of laterals, all of which bloom in the autumn. It is destined to stay, and will long keep before the minds of the rosarians of the future the name of one whose memory we of the present generation always cherish; probably had it been raised in France they would have called it Souvenir de Ben Cant, but our shorter name is more convenient and just as efficient.

Mrs. B. R. Cant is the name given to a second Gold Medal Rose raised by this firm. It seems likely to be a very valuable addition to our Tea-scented Roses, being very vigorous in habit, flowering continuously all through the season, which is evidenced by its obtaining an Award of Merit at the show of the Royal Horticultural Society of September 25. We have never known a Rose obtain such an honour at so late a period of the season; its colour is a beautiful rose on the outer petals, sometimes even quite a rich red; while the inner petals are soft, silvery-rose, suffused with buff at the base of the petals. The foliage is a very attractive deep rich blue-green, the young growth being a bronze-red. The blooms are compact, full, and symmetrical, and the flower-lust well when out.

Queen Alexandra.—The qualities of Crimson Rambler are so fully recognised by all lovers of a garden that it is certain that it will be much used by the hybridiser, and Messrs. JAMES VEITCH & SONS have succeeded in producing a seedling which will no doubt be a great acquisition as a pillar Rose. It is a seedling from Crimson Rambler crossed with Rosa multiflora simplex; the flowers are in large clusters like Crimson Rambler, but of a rich rose colour (see p. 27, July 13). A Gold Medal was awarded to it at the Temple Show, where the QUEEN was present, and the bouquet presented to HER MAJESTY consisted of this Rose and the late Mr. BENNETT's well known "Her Majesty."

Edith Dombrowski.—Rosarians have for a long time said, "I wish we could get a white Rose with the shape of A. K. Williams."

The well-known firm of Messrs. ALEX. DICKSON & SONS, of Newtownards, seem on the way to accomplish this, if they have not actually succeeded. The Rose at present under notice is described by them as white, with a faint flush of pink in the bud; the blooms are said to be of the form of A. K. Williams, and are produced singly on very firm, erect footstalks, qualities which all exhibitors of Roses will appreciate; it is an excellent cut-back Rose, every shoot carrying a bloom.

It will thus be seen that the present season has been prolific in Gold Medal Roses. We do not know when those flowers will be distributed to the Rose-loving public, but one of them at least will be for sale (Queen Alexandra) this autumn, and Mrs. B. R. Cant in June next.

WISTARIAS.—We are accustomed to see these very beautiful plants grown as climbers or trailers, but under certain conditions it is desirable to grow them in a limited space, or to arrange them in groups as part of a decorative design, and for this purpose they can be grown as standards. Our supplementary illustration was taken from some plants exhibited at the last Temple Show by Messrs. J. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held on Tuesday, August 27, in the Drill Hall, Buckingham Gate, Westminster, when a lecture on "Garden Manures" will be given by Mr. F. J. BAKER, A.R.C.S., at 3 o'clock.

—At a general meeting held on Tuesday, August 13, eighteen new Fellows were elected, making 706 since the beginning of the present year.

LONICERA HILDEBRANDIANA.—Owing to a mischance, for which we are not responsible, we stated in our last report of the Royal Horticultural Society that this had been grown out of doors in Devonshire, the fact being that it was grown and flowered in the garden of the Rev. H. EWANK, St. John's, Ryde, Isle of Wight.

A LARGE VINE.—The Daily News says that "Lord BREADALBANE is the owner of the finest Vine in Europe. It was planted at Auchmore House, in Scotland, more than half a century ago, and is quite double the size of its rival at Hampton Court. It produced 4000 bunches of Grapes, not long ago, in one season alone."

PRESENTATION TO MR. T. H. COOK.—There was a very large gathering at Gosford, Haddingtonshire, on Saturday evening, to do honour to Mr. T. H. COOK, Gosford, previous to his leaving the district to fill the important post of head gardener to his Majesty the KING at Sandringham. Mr. CONNOR, Craigielaw, presided, and previous to making Mr. COOK the recipient of several handsome presents, gave a brief sketch of his successful career as a gardener, and mentioned how highly his services had been appreciated by Lord WEMYSS and all others during his ten years' stay at Gosford. He then handed over to Mr. COOK, in name of many subscribers, a handsome mounted oak tea-tray, bearing the following inscription:—"Presented to Mr. THOMAS COOK by his fellow-servants, on his leaving Gosford for Sandringham, August, 1901." This gift was accompanied by a hot-water jug, cake-basket, and ten volumes of Chambers' Encyclopaedia, from the same donors. Mr. SCLATER, Edinburgh, afterwards handed over

a beautifully chased solid silver salver and purse of sovereigns, in name of Aberlady and other subscribers, bearing the following inscription:—"Presented to Mr. T. H. Cook by his Aberlady and other friends, on the occasion of his appointment to be chief gardener at Sandringham to His Majesty the KING, August, 1901." On Monday, Lord WEMYSS personally presented Mr. Cook with a handsome inlaid ringpiece, with the inscription:—"Presented by the Earl of WEMYSS to Mr. THOMAS COOK, on his leaving Gosford for Sandringham, August, 1901."

ROYAL APPOINTMENTS.—We have received so many intimations of late that such-and-such a firm has been honoured by a Royal appointment, that our printers have been confused with them. It is necessary to point out that a paragraph which appeared on p. 131 of our last issue should have read something as follows:—Messrs. LITTLE & BALLANTYNE, Carlisle, have been appointed nurserymen and seedsmen to the KING, having previously held similar appointments to Queen VICTORIA and the Prince of WALES. We have also to announce that Messrs. JAS. VEITCH & SONS, Ltd., Royal Exotic Nurseries, King's Road, Chelsea, S.W., have been appointed nurserymen and seedsmen to the KING.

THE NATIONAL DAHLIA SOCIETY.—We would remind our readers that the annual show of the National Dahlia Society will be held at the Crystal Palace on Sept. 6 and 7. The schedule of prizes includes forty-nine classes; and that for four Cactus Dahlias in pots, that made a poor display last year, has been retained, in the hope that exhibitors, being better able a second time to get their plants into the best condition at a certain date, a better result will be obtained. The society will also meet at the Drill Hall, on Sept. 24, for the purpose of inspecting late-flowering varieties submitted for certificate.

GLUT OF MUSHROOMS.—A correspondent notes that there appears to be a glut of Mushrooms in various parts of the country. In the early part of the week there were good samples achieving a ready sale at 3*d.* and 4*d.* per lb.; and from Carlisle it is stated that prices were as low as 1*d.* per quart, and farmers were complaining of the havoc caused by those engaged in gathering the fungi. The crop of the edible sorts in Cumberland last week was unprecedented; last Friday night 1000 baskets were sent off to one town in the north, and so large has the supply been, that much had to be refused by dealers—they could not find baskets for packing to send by rail. Some people have stated that so thick in several places was the crop, that a scythe could have been used with advantage.

CARPET-BEDDING. The third edition of a handbook on this subject, entitled *La Mosaïque Culture Pratique*, has just been issued by M. ALBERT MAUMENE (Librairie et Imprimerie Horticoles, 81 bis, Rue de Grenelle, Paris). The author devotes his chapters to: the history of Carpet-bedding, illustrated by numerous plans and pictures; Decorative Considerations; Uses of Carpet-bedding; Various Kinds of Carpet-bedding; Colour and its Uses; Plants and their Values in Bedding; Study of Styles and Patterns; Arrangement and Planting; Application of Plants to the Ground; After-care of a Plantation; Plants Suitable to the Work; Raising and Growing Plants for the Purpose; Carpet-bedding abroad; Specimens of Designs; and an Index. Thus it will be seen that the scope of the book is fairly comprehensive. M. MAUMENE by no means confines himself to plants with ornamental foliage

and flowers of primary colours, with which elaborate geometrical patterns can be wrought out; these, it is true, receive their due share of attention, but there is also much said about alpinas and other dwarf or taller plants which are to be grown for a less particular, more general effect. This makes the book interesting, not merely to the comparatively few who still favour "mosaic" bedding, but to all who like select plants of proportions suitable to the places in which they are to be grown.

DOUBLE DAHLIA.—MESSRS. CANNEL send us a flower-head of a Dahlia, in which the ray-florets bear at their base, where they join the ovary, one or more strap-shaped petals, which are sometimes confluent, and form a second imperfect corolla. As the colour of the rays was a deep maroon, a striking contrast was produced. MESSRS. CANNEL would do well to endeavour to develop and fix this peculiarity.

CENTENARY FRENCH BEAN.—Mr. Wood, of Penrith, submits a sample of his golden French Bean "Centenary," a dwarf Butter-Bean, with yellowish, fleshy pods destitute of parchment. Having submitted them to the test of cooking, we can say that they are excellent. Mr. Wood claims that they are early, and come into bearing quickly.

PUBLICATIONS RECEIVED.—*Proceedings of the Agri-Horticultural Society of Madras, October-November, 1900.* Contents: Citron, Natmogs on the Plain, Xow tamin (*Cesalpinia digyna*), Paspalum dilatatum, and notes on other subjects. *The Agri-Horticultural Society of Madras: The Annual Meeting, March 25, 1901.* "The year has been one of progress in several directions, Mr. Cavanagh, who arrived on January 17, has already effected considerable improvements in the gardens, and has extended the work of the Society in various ways."—*Bulletin of the Botanical Department, Jamaica, July, 1901.* Contents: Curing and Packing Produce, Imperfect Coco-Nut, Foot-rot and varieties of Cocoa.

NURSERY NOTES.

DICKSON & ROBINSON, MANCHESTER.

THE Manchester horticulturists were recently invited to view the trial-grounds of Messrs. Dickson & Robinson. These trial-grounds are between 4 and 5 acres in extent, and are situate at Northenden, a pretty little suburb. The soil is of fair quality, and representative of the Manchester district generally.

Sweet Peas and culinary Peas are very largely grown here for the purpose of comparison. Of the former, some of the best varieties noticed were Sidopian, Gorgeous, Emily Henderson, Mont Blanc (a very fine white), Americus, Mars, Stanley, Oriental, and Duke of Westminster; in all about eighty distinct varieties. One hundred distinct varieties of culinary Peas were growing side by side. Mr. Robinson pointed out the characters and utility of the various sorts. A new seedling, unnamed, is now in its second or third year of trial at these grounds; it is also at Chiswick this year to be reported upon. It has a very fine habit, splendid pods, and deliciously-flavoured Peas, and is a good cropper. Gradus and Alderman are two excellent varieties succeeding well. Triumph was pointed out as a good late variety.

Of Lettuces there were thirty varieties, Beet fifty, Carrots forty, Kidney Beans fifty, Scarlet Runners twenty, and of Potatoes seventy varieties.

There was seen also a very large collection of hardy annuals, notable among which was a

very good assortment of Tropaeolums, all dwarfs, one or two of which were of great beauty; Ruby King is of a very distinct colour, and worth growing, as is also Carmine King and Empress of India. Godetias were well represented, and about a hundred useful annuals.

In the agricultural department there were represented all the useful grasses, clovers, and fodder plants; some of the latter quite new to this country, and, I believe, not yet in commerce.

The party had a pleasant and instructive day's outing. P. W.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISPUM PITTIANUM.

ON May 8, 1900, H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), exhibited at the Royal Horticultural Society this fine blotched variety of *Odontoglossum crispum*, and it was unanimously accorded a First-class Certificate, its beauty being very much admired. On June 1 this year it was again exhibited, and good cultivation had greatly improved the flower, not only in size and substance, but in the richness of the colouring, and experts pronounced it to be the very best blotched *Odontoglossum crispum* seen up to that date. The title of "the best" is often bestowed on an exceptionally fine form of a favourite species, and probably on each occasion the owners of allied varieties would contest the right to the honour for one of their favourites. But in the case of *Odontoglossum crispum Pittianum* there is evidence that the experts were ready to back their opinions, for had Mr. Pitt been inclined to part with the plant he might have obtained 500 guineas for it; or from another source, 500 guineas for half the plant—a very substantial profit on the 300 guineas for which he purchased it from Mr. Thos. Rochford when it first flowered. But the owner of the Rosslyn collection, so rich in fine *Odontoglossums*, was not to be tempted to part with the best or any of his favourites. At the same time it should be stated that the giving of hundreds for exceptionally fine spotted *Odontoglossums*, or for any unique Orchid, is not such a wild proceeding as the inexperienced imagine. In the early days of *Odontoglossum* growing, when rare plants used to be regarded with fear and trembling lest they should depart this life in the hasty manner they were in the habit of doing before their culture got to be understood, things were different, and to give "a long price" was a very risky transaction. Then growers thought themselves lucky to preserve the plant alive and in fair condition. Of late years the case has altered, and by propagation the hundred or two paid for a plant may be well provided for, and with a reasonable margin of profit, and at the same time the owner is relieved of the anxiety which must always be felt so long as the stock is represented by a single plant. Now *Odontoglossums* are increased slowly but surely, and as each of these fine spotted *Odontoglossums* or other distinct Orchids is unique, there is a property in the stock which even wealthy amateurs are comforted to know. As a case in point, it may be stated that in Mr. Norman C. Cookson's collection at Oakwood, Wylam, the fine *Odontoglossum crispum* Cooksonii has been increased into a small stock, and other rare blotched varieties are now represented by several plants each.

Our illustration (fig. 49), from a photograph by Mr. H. J. Chapman, represents *O. crispum Pittianum* exactly of the real size. The flowers

are white, slightly tinged with rose, the sepals and petals being heavily blotched with red-brown the reverse side heavily tinged with purple. The labellum has a yellow crest marked with reddish lines, in front of which are brown spots on a white ground.

HOME CORRESPONDENCE.

BASIC SLAG.—My experience is as follows:—For light, gravelly soils, sow in autumn, at the end of September or October, at the rate of 4 to 5 cwt. per acre. If it be sown in spring, and drought follows, there will be very little return for the money. If the weather be showery after sowing in spring, there will be a fair return, but not so good as if the basic slag had been sown in autumn. I have applied it to corn, gardens, and lawns, also to pasture land; but I find we get much better results from an application of kainit and Damaraland guano, applying about 2 cwt. of guano and 1 of kainit [to acre?]. I may mention that basic slag varies much in quality. *G. Fulford, Presdales Lodge Gardens, Ware, Herts.*

— In answer to "Enquirer," last week, p. 140, the manual value of basic slag, which has within the past few years come into such general use, consists in the large proportion of phosphoric acid which it contains, this element ranging from 11 to 20 per cent. As a fertilising agent it is very essential that the slag be in the form of an impalpable powder, because in this condition the phosphoric acid is easily assimilated by plants, and is attacked without difficulty by carbonic acid and other vegetable acids produced by the decomposition of organic matter in the soil. One ton weight will contain about 226 lb. of phosphoric acid, and 1,120 lb. of lime; the latter substance will be of a caustic character, and will act on the nitrogen of the soil probably more quickly than the lime in superphosphate. The phosphoric acid in basic slag acts more slowly and over a longer period than the same element in superphosphate. It is a suitable manure for providing the soil with a lasting supply of phosphoric acid, especially in the lower layers of the soil, such as Vine-borders; this fertiliser will ensure the healthy development of fruit-trees, Vines, ornamental trees and shrubs. It also provides a good dressing for lawns, cricket-grounds, and paddocks, as it encourages the growth of Clovers and the finer quality of grasses. Basic slag may be used in preference to superphosphate on all wet, peaty, and rich garden soils, on account of it containing free caustic lime, which neutralises the organic acids of the soil. But it must not be used in combination with sulphate of ammonia, because it sets the ammonia free, and causes a loss of plant-food. Nitrate of soda may be mixed with it. When applied to grass and Clover, basic slag frequently produces very striking results, not only in the increased yield, but in the permanent improvement in the quality of the herbage, and the development of the White Clover, which had previously, in many cases, been hardly noticeable. In some cases where the application of basic phosphates has not seemed to produce any marked effect, we think it probable, from results obtained in the grass experiments at Rothamsted, that the soil is deficient in potash. For example, on a plot of permanent grass to which no manure of any kind has been applied for forty-five years, the average yield of hay is about 1 ton per acre; the plot to which basic slag alone is applied gives an increase of but 1 or 2 hundred-weights per acre over the unmanured; while the plot to which a mixture of basic slag, and 1 cwt. sulphate of potash, is applied each year, yields an average weight of over 2 tons of hay per acre; and the quantity of Clovers and vetchlings in the mixed herbage is, under the influence of the potash, more than trebled. The phosphate of lime contained in basic slag is not so soluble as that in superphosphate, and should, therefore, be applied

somewhat earlier. On pasture and meadow-lands autumn or winter applications at the rate of 5 to 10 cwt. per acre are usually the most economical, but the full effect of this will not be by any means exhausted in the first year—indeed, the effect has often proved more apparent the second year than the first. On arable land and in gardens, the most suitable time for the application will generally be previous to ploughing or digging, thus giving time for the decomposition of the material, and the liberation of the phosphoric acid for the use of the growing plants. *J. J. Willis, Harpenden.*

MEALY-BUG.—I have a vine of ripe Grapes, Hamburgs, Muscats, and Frontignans, which are attacked with mealy-bug. When the

twenty-three years, and will chiefly be remembered for the *Lapageria* which he grew so well, the variety *Lapageria rosea superba* (Nash Court variety) having been introduced by him some years ago. The magnificent fernery, designed and arranged by Mr. Humphrey, still remains a grand example of his work at Nash Court. *Wilmot H. Yates, The Gardens, Rotherfield Park, Alton, Hants.*

PHYLLOSTACHYS NIGRA IN FLOWER.—Several plants are in full flower here, but at present there is a considerable number that show no sign of flowering. It will be of interest to observe if all plants of this species in England flower this year, according to tradition. *Charles Ellis, Frousham Hall, Shottonmill, Haslemere, August 17.*

FIG. 49.—*ODONTOGLOSSUM CRISPUM* VAR. *PITHANA*. (SEE P. 153.)

(From a photograph by Mr. H. J. Chapman.)

Vines were dormant, I had them washed with hot water taken at boiling-point to the vineery; after that the Vines were scraped of all loose bark, and thoroughly washed with Bentley's Soluble Paraffin Oil at double strength. The house and glass were washed with hot water and the insecticide mentioned above, in the hopes that the pest might be got rid of; but now the Grapes are ripe, the pest is showing again, and getting into the bunches. I am painting every visible sign of it with methylated spirits. Can I do any more in the way of evaporising, or in any other way, without doing any injury? *Anxious One.*

MR. GEORGE HUMPHREY is shortly relinquishing the charge of the gardens at Nash Court, Faversham. Will all the old Nash Court "boys" who wish to show some mark of appreciation to their old chief on his approaching retirement, kindly communicate at once with Mr. G. Burrows, The Dell Gardens, King's Norton, Birmingham; or the undersigned. Mr. Humphrey has had charge of the gardens at Nash Court for the past

FRUITLESS PURSUIT OF MELONS.—I have often noticed the comments and criticisms of the *Gardeners' Chronicle* upon English and foreign trade, and send the following note as showing that there is at least some room for improvement. On the morning of July 29, at 9.30 A.M., my employer, Col. A. F., said he and his friends would lunch on the lawn at 1 o'clock (a lovely day with outside temperature about 72°), and would like a nice English Melon. I was asked to go into the town (Bournemouth), and get one at any price. At 10 o'clock I saw my neighbour, Lord P.'s gardener. "Have you got a good Melon to spare?" "No, I shall not have one ripe for another fortnight." I next went to our greengrocer, A. B. "A nice Melon, please." "Sorry I have not such a thing; the last one I sold was last Wednesday, to a young lady who rode in from Christchurch." I next tried George Day & Co., wholesale fruiterers, with van out in the street. "Hi! any English Melons?" "No! there is not one in Bournemouth." I then tried another first-class greengrocer (Mr. L.). "A nice Melon, please."

"I am very sorry. Melons are so dear I cannot do anything with them. They are 4s. 6d. first hand in Covent Garden Market, and there is no sale for them in Bournemouth at the price we have to charge." The next shop I tried was Mr. G. L. S., the largest and most influential firm, having three shops in the town. "A nice Melon, please." "Very sorry we cannot oblige you, there is not such a thing to be had in Bournemouth." Becoming desperate at 11 o'clock, I went to L. T. & Co., saw the manager, and explained the matter. He said, "Have you tried Lord C.'s gardener?" and kindly telephoned to him. "No," he replied, "I have not one; they have failed me this season." At 11.30 I went to Slaymaker's wholesale depot. "I want a nice Melon, please, and do not mind what I pay for it." "Very sorry, but you will not get one anywhere in Bournemouth. I have not had one in

English one to compete with them. On July 26 there was not a dish of green Figs to be bought in Bournemouth for any price I offered for them. *William Gosling, Lisle House Gardens, Bournemouth.*

BOUSSINGAULTIA BASELLOIDES.—In reply to the inquiry by "A. J. L." on p. 110, I have found this rapid-growing climber flower and succeed best generally when grown in quite a cold house. If subjected to even a moderate amount of fire-heat it becomes very weedy, and will not flower. "A. J. L." does not give the age of his plant, but he must not expect it to flower much until five or six years old. I have not seen the plant growing out-of-doors in this neighbourhood, but am growing on a young plant, which I intend planting in a warm corner next spring. *A. C. Bartlett, Penarrow Gardens, Cornwall.*

have published illustrations of such a wealth of beauty and interest in gardens all over the country, many must, like myself, have longed to be allowed a glimpse at places which would do so much to improve the taste and knowledge in gardening. It seems to me within the range of practical politics that a general scheme should be devised, by which garden-owners would admit the public to view their gardens against payment, for the benefit of the Gardeners' Benevolent Fund. A charge of, say, half-a-crown a head would exclude the rough element, and would not be considered too high by garden-lovers, who are attracted, not by eriosity, but by real interest. Would it not be possible to form an association of owners of gardens, who would join to bestow by these means upon those interested in beautiful gardens a great pleasure, a valuable instruction in taste and knowledge, and pos-

FIG. 50.—GROUP OF WATER-LILIES, AS EXHIBITED BY MR. HUDSON, GR., TO LORD OF ROTHSCHILD, ESQ., AT THE BRILL HALL, WESTMINSTER, AUGUST 13, AND REPEATED AT SHREWSBURY, AT JUNE 21 AND 22, (SEE PP. 141, 160.)

my place for a long time." "Is it any good to cry D., of the Triangle?" I went there at 11.15, more than a mile from home, saw a personal friend, a member of the Gardeners' Mutual Improvement Society, explained matters, and he kindly telephoned to some different market-growers, at a radius of more than 3 miles out, but not one of these had an English Melon. I got home at 12.40, and as a last hope sent my son to Hales, Dancy & Co.'s depot, to ask if any English Melons had come down by train today. "There are no Melons for love or money," was the reply. At 1.20 P.M. my employer saw me on the lawn. "Gosling, where is the Melon?" said he; and much disappointed I was to tell him that his money would not buy one, and returned to him the 21, as time would not permit me to send to Gloucester Road, South Kensington, London, as I have done before in like emergencies. Yet I am sure I saw tons of Water-Melons in Bournemouth, and not an

RECORD WEIGHT FOR STRAWBERRIES. In the *Gardeners' Chronicle*, August 17, p. 126, Mr. Snell asks, "What is the record weight for ten Strawberry 10's?" I have never heard the record, but I may tell him I exhibited a dish at the Dudley Spring Show of 1900, twelve fruits of which weighed 20½ oz.; one weighed 2½ oz. I thought such fruits would surely call forth some special commendation from either the judges or the executive; they, however, did not, so evidently the record was not reached. *W. R. Jennings, Caledon Park Gardens, co. Tyrone, Ireland.*

GARDENS AND THE GARDENERS' BENEVOLENT. In the *Gardeners' Chronicle* for August 3, I read that the Right Hon. J. T. S. Foljambe had thrown open his gardens to the public at a charge of 1s. per head, for the benefit of the Gardeners' Royal Benevolent Institution. Since your own journal, and, especially latterly, *County Life*,

sibly a considerable revenue to an excellent charity? *Hortulans.* We think many more owners would gladly throw open their grounds for the benefit of the garden charities if the suggestion was made to them. *Ed.*

YARROW ON LAWNS.—I must confess my surprise at the crusade against Yarrow on lawns, see note on p. 138. Here at Kew I not merely encourage it, but intend sowing it extensively. It frequently mown, it forms a soft and elastic turf, and is singularly resistant to wear and tear on lawns much trodden upon. But its great merit is its tolerance of drought. Years ago I remember a lawn in Gloucestershire where, during a dry summer, the grass was burnt up to a sickly brown, while the patches of Yarrow stood out in emerald-green in vivid contrast. Of course, those who are the happy possessors of a deep and fertile soil can please themselves; but beggars cannot be choosers, and I am convinced that

o light, gravelly and calcareous soils, Yarrow in dry summers is a splendid stand-by. Chamomile is perhaps equally good, but more difficult to establish. After all, the question is one which will settle itself. In old turf on a poor soil, I doubt the possibility of eradicating the Yarrow; and I do not envy the man who is bold enough to try to start afresh. W. T. Thiselton-Dyer.

THE SEASON OF WASPS (see ante, pp. 114, 138).—Last year we were swarming with wasps, and as your correspondents say, taking their nests made little or no appreciable difference in their numbers. Having suffered so much we made war on the queens when they first came out from winter quarters, and killed a large number; in the last three weeks of May alone we killed over 150, with the result that, at present, there is scarcely a wasp to be seen. On warm, sunny days, from the latter part of February to the middle of April, the queens are easily killed, as then they are not strong on the wing. A little observation will soon reveal the best hunting grounds, but the queens invariably show a marked preference for the flowers of Angelica. Our County Council Bee Expert told me that last season, in the west of Cornwall, the plague of wasps assumed a serious aspect; and a gentleman offered a £d. for every queen brought to him, and to his astonishment over 300 were brought in a single day. A. C. Bartlett, *Pencarrow Gardens, Cornwall*.

—Since my last note was written to the *Gard. Chron.*, stating that I had taken 127 nests from July 10 to August 1, I have destroyed forty-nine others, and still they come. Mr. Wilkins, on p. 138, recommends turp or tar; the former I have not tried, but the latter is an old and tried friend of mine. The only objection I have to tar is, that the sun must have set before it can be used, which makes it very troublesome and most inconvenient, especially in our case where most of the nests are amongst reeds and rubbish in the banks of "Bocks" and of the river, where they are so difficult to find at night. Cyanide can be used when the nest is found. I prefer it. By dissolving the cyanide, and soaking a piece of cotton-wool in it, and pushing it well into the hole, the danger of poisoning is reduced to a minimum. Mr. Roberts' plan (see p. 138), of poisoning I have also tried with advertised wasp poisons, but do not think it worth the time it takes. I have found more dead wasps in one nest taken by the cyanide, than in a whole season with poisons. I prefer a tempting mixture hung about in bottles, to poisoning. Honey and water, for instance, with a dash of sour beer and vinegar, which they prefer to any fish or carrion, although I am well aware they like the e. It is quite evident Mr. Roberts has not the number of wasps to bother him that we have, or he would be glad to adopt the more practical method of killing them at home. I think Mr. Roberts will do well to hesitate before undertaking to keep them down in any garden, by commencing in time. We begin with the advent of the queens, which I think is as early as possible. This year the men in the garden were paid for seventy-two queens. C. Simpson, *Nechy Hall Gardens, Ripon*.

WALL GARDENS.—I thank Mr. Jenkins for the reply to my enquiries respecting a wall-top garden. The following particulars will help further to describe my case:—(1). The heavy flat coping-stones on the wall-top cannot be removed or altered. (2). Only one row of bricks will be put on edge on each outer edge of the wall; they can be bedded and pointed in mortar, so that the rain will be retained in the shallow layer of soil a little longer than if the joints were quite open. (3). The wall-top is fully exposed to the sun all day. (4). The wall on one side is 2 feet above the garden-level, so that the flowering surface of the plants would be easily looked down upon, and there would be 2 feet of the face of the wall for the plants to hang down. On the other (the N.E.) side of the wall the ground is 6 feet lower than the top of the wall. (5). In asking

for plants suitable for "such a position," I mean, such as would thrive and flower well in 4 inches deep of soil, on a base of hard stone, and with full exposure to sun and wind. I thought there would be at least a score of beautiful hardy rock or alpine plants capable of enduring such conditions. The Houseleek, for instance, seems able to live on house-roofs with little or no soil; but I desire much more decorative, floriferous plants more after the type of *Sedum acre aureum*, *Aubrietia Leichtlinii*, *Phlox setacea*. As for the appearance of the bricks, I calculated on the plants spreading over their tops, and covering at least their outer face, even if not hanging down to the ground. By dividing the space between the bricks into separate compartments a yard long, one might supply each with just the kind of soil required. *Stouecrip*.

THE RIPENING OF FRUITS AND THE WOOD.—Having read with much interest your extracts from the *Comptes Rendus*, from a paper by M. F. Kévessé (p. 114), on the proportion of water in relation to the ripening of woody plants, the writer seems to think that a fruitful year follows a year of drought, or deficient rainfall. My own opinion is, that a deficient autumnal rainfall is a potent factor in an unfruitful year. Our rainfall in September, 1899, was 1.79 ins.; in October, 1.98 ins.; in November, 3.70 ins.; and the year 1900 was a year of general abundance of all kinds of fruits, berries, and nuts. The rainfall of September, 1900, was 0.50 in.; October, 1.59 ins.; November, 1.65 ins.—a difference in the three months' rainfall of nearly 1 inch; and the fruit crop of 1901 is nearly a failure, and the only cause I can assign for it is the want of rain at a critical period of the year, when fruit-bearing trees are making the final effort to store the requisite nourishment to produce a crop of fruit. R. M., *Newbury, August 20, 1901*.

GOOSEBERRY "GUNNER," ALIAS COBHAM.—As prominence has been given to the Gooseberry shown at the Drill Hall on July 20 as "Cobham," and given provisionally an Award of Merit, it should now be equally well known that the question of its identity was again raised at the last meeting of the Fruit Committee on the 13th, and ample evidence was then forthcoming that the variety was, after all, the old yellow hardy "Gunner." I had, prior to the meeting of the committee on the 20th ult., looked over the remarkable collection of one hundred varieties shown by Messrs. Veitch & Sons, and found Gunner as being exactly like Cobham, but the fruits were not quite so large as were those from Cobham. Because of that similarity, the award made was provisional, other members (including the Chairman, Mr. G. Bunyard), undertaking to compare "Cobham" with Gunner of their own stock. The result has been to satisfy the committee that Cobham is the same as Gunner. In consequence of that knowledge, the award will appear henceforth as being made to Gunner. Possibly it will be said, why not have withdrawn the award altogether? That is a fair question to put, but the award was made to the variety irrespective of correctness of name or otherwise, because of its excellent flavour, the committee recommending it for such reason. Dr. Hogg in the *Fruit Manual* describes the flavour of Gunner as "first-rate." It cannot be too well known that whilst a heavy cropper, it has much excellent fitness for the dessert. It is also of good size and handsome appearance. Certainly, like Howard's Lancer, it is a good thing too long overlooked. A. D. [As there was no indication on the list of awards supplied by the Society that the award to this Gooseberry was made provisionally, the presumption was that the committee considered it to be distinct. Ed.]

ENQUIRY.

"MANCHESTER MANURE."—Where can this be obtained? P.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

AUGUST 13.—*Present*: Dr. M. C. Cooke, in the Chair. Rev. W. Wilks, Prof. Hartog, Messrs. Gordon, Odell, Chapman, Hudson, Worsley, Bowles, Drury, Saunders, and Dr. Masters.

Iris Leucos Discolor.—Mr. WILKS brought leaves of a German Iris thickly beset with brown spots, which become confluent, and eventually bring about the death of the plant. Dr. Cooke identifies the fungus as *Heterosporium gracile*, and recommends spraying with sulphide of potassium or ammoniacal solution or copper. All diseased leaves should be forthwith burnt.

Banana Disease in Egypt.—Mr. LIOSEL SAUNDERS made some enquiries about this, but, in the absence of specimens, the Committee could not pronounce an opinion.

Cereopogon debilis.—Mr. ODELL exhibited specimens of this curious stove climber from the Zambesi.

Lycoris squarrellosa, and other flowers.—Mr. WORSLEY showed flowers of this species which turn of a slaty blue when exposed to the light. He also showed flowers of a *Hippeastrum* with rosy, acute, perianth segments, traversed by veins of a deeper colour. The leaves are produced some months after the flower is expanded. The filaments are more exsert than in *H. stylissum*, to which it is nearly allied. From the same gentleman came flowers of the single and double varieties of *Zinnia Haageana*, and of *Tagetes patula* nana. Seeds from this latter form, known as Cloth of Gold, produced pure yellow flowers, and some had, except in their dwarf habit, reverted to the large African Marigold. Both single and double forms were observed. Mr. Worsley also alluded to the variation in the *Dahlia*. Seeds of a white-tipped variety produced 70 per cent. of self-coloured flowers, and 30 per cent. of flowers varying in colour from red and yellow to white.

Dioscorea Crocota (Crocus).—Mr. BOWLES showed diseased crocus, which were referred to Dr. Cooke for examination.

Profilaria Aconite.—Mr. BOWLES also showed flowers of an *Aconite*, in which the stamens and carpels were absent, and in their place were secondary flower-buds, each with five green sepals, no petals, numerous stamens, and generally no carpels.

Phadanga major.—Mr. BOWLES exhibited fine specimens of the so-called Rose Plantain, in which the bracts are replaced by tufts of large leaves.

Mandragora officinalis.—The egg shaped fruits of this species were also shown by Mr. BOWLES.

Osmunda regalis.—Mr. DRURY exhibited fronds of an entirely new type of *Osmunda regalis* recently found in Co. Kerry by M. M. A. Cowan, of Penicuik, and W. Boyd, of Melrose. Nine plants in all were found, six of which were fertile, and three barren, the latter being more finely cut than the former, and apparently forming the plumose type of the species. In both forms the usually simple pinnales, with quite smooth edges, are deeply lobed on the edges on the lower and larger divisions, which, towards the upper part of the frond, merges into a distinct and thorough tertiary pinnation, rendering the frond extremely handsome. The fertile spores consist also of rows of bead-like sporangia, while normally these are only slightly lobed. Mr. Drury has named Mr. Cowan's form *O. r. decomposita*, reserving the naming of Mr. Boyd's form until its distinct character is confirmed.

THE CO-OPERATIVE FLOWER SHOW.

THE National Co-operative Festival and its allied agencies require a whole week at the Crystal Palace to carry out the full details of this great industrial gathering, for there is an exhibition of trade productions, meetings of various bodies, and such-like. The sixteenth One and All Flower Show occupied, as usual, two days, and on this occasion, owing to the interior of the Palace being occupied by a Military Exhibition, a huge tent was erected on the terrace, which was an eighth of a mile in extent, and right along the length of it there was width enough for six rows of tables arranged longitudinally. The exhibits were seen to better advantage under the white canvas than in the glass-roofed nave of the building; but the somewhat coarse shingle on the surface made walking about the tent a trying and exhausting process.

The entries in many of the classes were less numerous than usual; but this can be accounted for on two

grounds—first, the incidence of the season, which showed itself in some districts in a prolonged drought, followed by heavy storms, immediately preceding the show, which in many places, to materially damage not a few subjects which would otherwise have appeared on the exhibition-table; and, secondly, through the withdrawal by the railway authorities of those cheap facilities for travelling to London afforded in previous years. But even with these drawbacks, the flower show maintained its reputation for extent and interest, the mighty, myriad samples of vegetables which were seen at the earlier exhibitions, before the working-men cooperators had been taught by a series of object-lessons the particular lines of quality to which the judges gave their preference, have almost entirely disappeared, and the work of the judges now being to select the best from good average character, than in the old-time practice of eliminating the worst as a preparatory process.

From the gentlemen's gardeners and amateurs of means, the bulk of whose productions make up the first day's exhibition, good general quality may be expected, and it was abundantly forthcoming. The fact that the specimen plants have to be placed on tables, instead of in their beds, is, however, to be feared. Ferns, Fuchsias, Begonias, Pelargoniums, and others of ordinary greenhouse culture were all in good character. Then there was good fruit, as represented by Grapes, Peaches, Nectarines, Melons, &c., and also ordinary and dessert Apples and Pears, though the latter were fewer than usual. Vegetables were numerous and of good quality, the quality of the Potatoes recalled the days of the series of International Potato Shows formerly held at the Crystal Palace, when Potato cultivation for exhibition purposes was elevated almost to a fine art. In the cut flower classes good quality was generally apparent, and of those to subjects in which the florists takes a keen interest, the general quality displayed had about the most approved.

On the second day of the Flower Festival came the rush of the working men Co-operators from all parts, with the productions of their gardens. Cut flowers and vegetables largely preponderated, of the plants which are brought with great care from long distances, few, in all probability, found their way back again. Annuals in pots were both numerous and varied, and in the class for the outdoors, Carter's Brilliant Saturnia was a very desirable addition. *Coccoloba laterifolia* among yellow annuals, *Larrea grandiflora rubra* among the red-stemmed one as among the best for pot-culture. Some, such as *Coccoloba Drummondii*, *Salpiglossis*, *Nicotiana glauca*, &c., are too tall in growth to be effective, but, in all probability, many other green and/or conditions calculated to induce a display of growth.

Sweet Peas abounded, as represented by numbers it was the most popular flower in the entire exhibition. Indian Pinks were a charming feature, and it says something for the seed distributed by the Agricultural and Horticultural Association that the quality was good all round.

Few exhibitions entail more exhausting labours upon the judges than the one and all Flower Show. The Educational Flower Show, inaugurated by the Comtesse of Warwick, was somewhat confusing and disappointing. It was the first attempt, and the details must not be too severely criticised in consequence. There seemed to be a lack of sequence in the arrangement of the classes, and this made it difficult for an ordinary visitor to grasp the full unaidedness of the subject. Then of the production class, the general effect was marred by lack of intelligent arrangement. Added to this the quality of the exhibits was not high. Reorganisation of this department of the show is needed. No one appeared to be in special charge of it, so that those interested in this special feature found it difficult to institute comparisons. The idea is a good one, but only when the one and all Flower Show will grow in the future. It was, no doubt, gratifying to the Comtesse of Warwick to see the Hotel at Reading, and individual members of it, so successfully engaged in it in connection with this department.

THE ROYAL SCOTTISH ARBORICULTURAL.

AVL BURNS' COTTAGE THE BANKS AND BRACKS OF BONNIE DOON, ARCHDEACON CALZEAN CASTLE.

The twenty-fourth annual excursion took place last week to the land of Burns, the headquarters being in the old town of Ayr. On Monday afternoon about sixty of the party left Edinburgh for Ayr via Glasgow, on reaching Ayr the number had increased to over 100, several having joined the train by the way. Late in the evening the party all dined together in the Ayr Arms Hotel, Mr. D. P. Laird, of R. B. Laird & Son, nurserymen, Edinburgh, in the chair. A pleasant evening was spent.

During the night a considerable amount of rain had fallen, but regardless of the appearance of the weather, and the heavy day's work in front of them, the party mustered in full force at 8.30 A.M. on Tuesday morning. Their first stop was made in four or five drakes, the first one being occupied by the Earl of Mansfield,

the President, R. C. Munro Ferguson, M.P. Hon. Secs., Dr. Farquharson, M.P., of Torquay, Eugene Wason, M.P., of Hereford, Mr. Edward P. Tottenham, of The Glen, Mr. John Methuen, Edinburgh, Mr. Robert Galloway, the Secretary, and the joint leader of the party, D. P. Laird, Esq. The first stop was made at Alloway Adm. haunted kirk, and the birthplace and monument of Robert Burns, on the banks and bracks of Bonnie Doon; and after carefully examining the cottage where Burns was born, and other relics which are stored in the museum and monument, the banks of the Doon, and the Auld Brig over which Tam o' Shanter sped on his grey mare Meg, after he had looked at the witches in the haunted kirk, were visited; and while a great number of the excursionists were on the Auld Brig, Mr. Brown from Bathgate led off with "Ye Banks and Braces of Bonnie Doon," which was sung by the whole party with a considerable amount of pathos.

When the time came for crossing the Doon, a move was made for Archdeacon's, the residential estate of Miss Cathcart, and as the party passed along the avenue, all admired the woodland beauty they were surrounded with. Conferees of the finest order, intermixed with fruit-trees, their oever and grass well kept, offered Mr. D. P. Laird, Esq. Silver, and Scots Fir. The largest Silver Firs were planted in 1707 by Mr. John Maun, the first member for the Ayr burgis in the British Parliament, to commemorate the union of Scotland with England, and on this account is known to this day as the Union Avenue. Some of the Silvers girth 5 feet 9 inches 3 feet up the stem, and the good Larches are 4 feet 6 inches to 5 feet 6 inches tall. One of the oldest Scots Firs is known to be over 200 years old.

In front of the mansion-house are some very large old Yew Trees, and a very fine specimen of Betula alba, planted 1520, and now 200 ft. or less than 100 ft. tall. A very fine tree of the Scotchian tulip-tree was in flower on the lawn, and a number of other good things by far too numerous to mention. After thanking Miss Galloway for the hospitable reception, Mr. Galloway, who is factor in the estate, and who received the party, the drakes were remounted, and in due time arrived at Calzean Castle, the residence of the Marquis of Ailsa.

The party was welcomed by the noble lord of the mansion himself, and entertained to a sumptuous lunch. The exploration of gardens and grounds took place after lunch, first and foremost among the grounds being the arboretum, which is situated in the garden. Mr. Page, the estate manager, Mr. Dalziel, forester, and our old friend, Mr. Murray, the gardener, with such a grand selection of guides, and a place like Calzean to wander about, the best possible use was made of the time at the disposal of the party. Some wonderfully well grown stems of Beech were seen. Silver and Scots Fir were in great evidence. Some grand old trees, one of the Silvers girthing 11 feet 2 inches 2 feet up the stem. A peculiarity about the old Larch was that most of them had from three to six stems from about 4 feet up, and a considerable amount of good timber is thus got off one tree. But why it should be so is hard to say, unless the tops had been nipped off at the young trees when about 2 feet high. This forming a small trunk at each end of the main trunk, it would seem to have done well in this particular instance. Yet I hardly think that in practice it could be followed. There are also some very fine old yew trees about Calzean.

After wandering about the woods and dells for some time, the gardens and pleasure grounds were next in speed, and one of the most striking features about the place, and most all other places in Ayrshire, is that the system of soil-draining is almost a thing of the past. All borders and beds are filled as naturally as possible, hardy perennials and the best Conifers being very much in use.

In the terrace gardens, Hollyhocks were in abundance, with no sign of disease about them, Heathcote's candelabras is very largely used, and with good effect, indeed, hardy herbaceous plants and bulbs of all kinds are brought into use, and groups of all hardy and tender plants and annuals, and the effect is simply charming.

Fruit outdoors, and under glass are always good at Calzean, but if anything, they are better than usual this year, grapes being uncommonly good. Doubtless we shall see some of them a considerable distance from home in a few weeks' time with a red bucket on them.

The pond with its aquatic plants and fish, and surrounding well gardens containing fine shrubs and conifers, Tree Ferns, and hardy herbaceous plants, though hardly in the line of arboriculturalists, amply rewarded the visitors for the time spent in traversing the delightful scene.

A very large area of land is under plantation at Calzean, and a well-stocked nursery from which a considerable amount of planting is done every year. A surrounding well-arranged wood yard with no lack of machinery, where a great amount of the timber grown on the estate is manufactured for different purposes, brought a most enjoyable and profitable day at Calzean to a close. A chair was given by the Marquis of Ailsa and those who helped to entertain the party.

The drive from Calzean to Ayr along the stone road was very delightful, and the weather throughout the day was charming.

The party dined in the King's Arms Hotel at 8 P.M., and immediately after the dinner the general meeting of the Society took place.

(To be continued.)

BISHOP'S STORTFORD HORTICULTURAL.

AT FIRST IT. The thirty-second summer exhibition was held at The Grange, Bishop's Stortford, the residence of J. Barker, Esq., an ideal spot for a flower show. The increasing success of the Society is owing to the indefatigable Secretary, Mr. W. Smith, and a committee of workers. Not only are cottagers induced to grow produce well for exhibition, but the Society rents allotments for them, and offers good prizes.

One large tent was almost devoted to the ladies' exhibits, the table decorations, no fewer than thirty tables being laid out.

Groups for effect were not very numerous, but those that were successful were of good merit. Sir J. RIVIN, Bart. and Mr. Richardson, was 1st with a beautifully arranged group in which Orleans figured largely. Mr. C. GORDON, Mr. Clark was a good 2nd.

At this show there is good competition with groups of tuberosus-rooted Begonias. Mr. W. SMITH was a good 1st, with splendid blooms, and variety. Mr. A. TAYLOR was 2nd. For groups of early flowering Chrysanthemums, Mrs. MESER, gr., Mr. Lodge was 1st. The classes for stove and greenhouse plants were not strongly represented, though some nice plants were staged. Mr. C. GORDON was 1st, and Mr. J. BARKER (gr.) Mr. G. Booth, 2nd.

For hanging baskets, a feature at this show, Mrs. A. TAYLOR and Mr. Smith were the leading exhibitors. For dinner-table decorations seven prizes were awarded, the 1st going to Miss F. C. KNORR, Sadron Walden, who had Begonias, grasses, and Eleocharis, but we certainly thought the 2nd prize exhibit equally good. This was shown by Miss H. CLAYDON, Sadron Walden.

For twenty four varieties of Early flowers, Messrs. PAPE & SON, Chesham, were 1st. In the smaller classes, twelve, there was a strong competition. Here Messrs. MESSES, SMITH and WADE were the principal winners. Messrs. SMITH and WADE being best in the class for 12 varieties.

TABLET.

There were excellent grapes and good Peaches. The collections of eight dishes of fruit were very good. Col. ARCHER HOLLIES, gr., Mr. HARRISON was 1st, having beautifully colored Grapes, and good Peas and Peaches. The 2nd prize going to BAKER, Esq., M.P. (gr.), E. Hoobick.

For baskets of fruit of ten varieties, Col. A. HOOBICK and Sir J. RIVIN were the winners. Black Hamburg Grapes were excellent, Mr. J. BARKER being 1st. For white grapes, Mr. R. C. GOSLING had fine Muscats of Alexandria. For the best flavoured Melons, Mrs. MESER, gr., Mr. Lodge was 1st, with Syon Perfection. Col. A. HOOBICK, Messrs. SAPE & SONS, had the best Peaches. Sir J. RIVIN, and Messrs. BARKER and HOBBINS, best Nectarines.

VEGETABLES.

For a collection of eighteen varieties, Mr. J. BARKER was 1st, having grand produce, Mrs. A. TAYLOR, 2nd. For nine dishes, Messrs. WALLIS, CLAYDON, and GALE were the winners.

MISCELLANEOUS.

Messrs. PAPE, CHELSEA, and CLEMENTS Highgate, N., staged the banks of herbaceous flowers, Mr. MORTIMER, knowledge, Fulham, had Dahlias, the Messrs. RIVERS, Sawbridgegorth, a large collection of fruit-trees in pots laden with fruit, Mr. RIMSEY, Waltham Cross, had Roses, and Mr. AMOS PERKY, Wincbamore Hill, good Water Lilies.

THE ENGLISH ARBORICULTURAL SOCIETY.

REHBY MILTON PARK ETON CASTLE THE CONIFERS AT OGDON, BRAYOR CASTLE THE DINNAGE.

August 14, 15, 16. The Society held its annual excursion on the above dates, in the neighbourhood of Peterborough, under the presidency of Professor Somerville, Cambridge University.

On the first day a visit was paid to the historic mansion and park of Burglady, the magnificent seat of the Marquis of Exeter. The park of Exeter contains some splendid Oaks, Spanish Chestnuts, and Wyeh some splendid Oaks, Spanish Chestnuts, and Wyeh Elm; the latter being one of the small-leaved varieties of this puzzling genus, several trees were measured with an iron level of timber, the King Oak being a remarkable tree, with a clean stem of over 20 feet, and a girth of 10 feet at 5 feet up. The chief features of Burglady, at the present day, from an arboricultural point of view, however, are probably its Lime avenues and Spanish Chestnuts. The avenue facing the main entrance terminates in a handsome gate, leaving a clear path of considerable extent in front of the house. The Spanish Chestnuts are of vast sizes, many of them being over 20 feet in circumference. Fortunately, in some respects, perhaps, their ornamental is greater than their commercial value, as was indicated by one specimen tree which had blown down, and been sold for 121, which sum was recomputed by the buyer rather than meet the expense of removal and re-plantation.

Of great historic interest is the Lime Tree near the house, planted by Queen Elizabeth, which was 100 ft

ASTERS were represented by the Victoria variety, the best twenty-four blooms come from Messrs. CHAPMAN & SON, BOLDING, LEADS.

The best twenty-four bunches of hardy flowers, as not fewer than twelve varieties, were from Messrs. HARKNESS & SONS, Messrs. KING, Duffries, were 2nd, and LOB WALKER-WINSLAND.

S. J. PARS were shown in several classes, and some very fine blooms for the season were shown. Mr. W. L. CRAW, Market Harborough, got 1st with *Reddy, Wonder*, & Mr. W. STRONG-SMITH, Cheswilde, 2nd. The Eekford Challenge Cup for thirty-six varieties was not awarded the judges did not think the flowers good enough. The best eighteen varieties of *Eckford's Sweet Peas* were staged by Mr. R. L. KENNON, Oswestry, and Mr. W. L. CRAW won Mr. Sydenhams prize for twelve.

VEGETABLES.

Whilst in some respects there was a falling off in the number of competitors in some of these classes, in others three former and able growers being absent, there was still to be seen superiority in many of the dishes, in spite of the summer having been one of exceptional difficulty to vegetable growers. Lord ALDENHAM stable gardener from Elmstree, Herts., was again the champion exhibitor, the three collections with which he took the 1st prizes amounted to twenty-three dishes, and were about as fine and perfect as vegetables well could be.

In Messrs. Sutton & Sons's competition for nine kinds, Mr. BECKETT's group comprised very fine Ailsa Craig Onions, Early Giant Cauliflowers, Prizetaker Leeks, Perfection Tomatoes, Tender and True Parsnips, Windsor Castle Potatoes, Autumn Peas, New Improved Giant Carrots, and Old White Celery. Cauliflowers were the weaker article, but the season, like in most instances, was unfavourable for these vegetables. A very choice 2nd was another first-class grower, Mr. CRAW, gr. to W. HUDSON, Esq., Marlow, Bucks.—some day no doubt we shall see this good gardener turning the tables on Mr. BECKETT. Just now it is a case of 'look meeting Greek.' This exhibitor had very fine Leeks, Solid White Celery, Supreme Potatoes, Duke of Albany Peas, Perfection Tomatoes, Tender and True Parsnips, Early Craig Onions, and Cauliflowers. Mr. W. BLOW, gr. to the Earl of CAPEMARE, Highlee, Castle, was 3rd, having capital samples. Mr. ASHTON, gr. to the Earl of LATHOKE, Okeokk, was 4th; and Mr. L. BARRING, gr. to A. HENDERSON, Esq., M.P., Buscot Park, Berks., was 5th. There were seven collections.

Messrs. Jno. Calder & Co.'s Prizes.—These were offered for collections of six kinds, but only four were competitive. Mr. BECKETT, again 1st, had fine Ailsa Craig Onions, Supreme Potatoes, Striped Runner Beans, White Celery, and Early Autumn Cauliflowers. Mr. BASTIN was 2nd, having Onions, Celery, Runner Beans, Potatoes, Cauliflowers, and Tomatoes. Mr. ASHTON was 3rd; and Mr. REARD, gr. to Lord CAPEMARE, Bredley Park, 4th.

Messrs. Webb & Sons's Prizes.—These were offered for collections of eight kinds of vegetables. Mr. BECKETT with this performing what may for the purpose be called the 'hot trick,' as this made three 1st prizes for collections. In his group were seen very fine samples of Exhibition Runner Beans, Mastfield Court Grand White Celery, Jubilee Tomatoes, Meteor Potatoes, Grand Exhibition Runner Beans, Mastfield Court Grand White Celery, and good Carrots. Mr. ASHTON was 2nd with fine exhibits, especially Progress Potatoes and Exhibition Peas. Mr. BASTIN was 3rd, and Mr. REARD 4th.

There were but two dishes of Tomatoes shown in the EHC's class for any sample of their own sending out, the best coming from Highlee Castle.

There were but one dish sent of the Firm's Golden Butter Beans, Mr. SELLER, gr. to Col HUDKINSON, Ross, having the best.

Messrs. March & Co.'s Class.—But two competitors entered in the class for twelve dishes of vegetables arranged by these local seeds-men. Mr. E. WALKER, gr. to Sir W. HONYMAN, Bart., Chestel Church, was 1st; and Mr. J. BULL, gr. to Captain B. F. G. Shenbury, was 2nd. There were four collections of six dishes, the best coming from Keepling, gr. to the Hon. M. C. HERBERT, Wellington, and No. Pine Elm, Mr. E. WALKER had the finest dish of Runner Beans. Mr. LEITH coming 2nd. Mr. HOESPOOL, and Mr. BEARD, were again 1st and 2nd with three Cauliflowers, the 1st one being exceptionally good. Again they took the same places out of seven exhibits, with six Carrots; but with six Parsnips Mr. S. COLE, gr. to Lord SAUNDERS, Althorp, was 1st. Mr. ASHTON coming 2nd. Mr. LEITH had the best Onions, Messrs. March & Co. got the best long, best places with White Turnips, and also with Tomatoes, the former having Fulgiate and the latter had Royal Leigh Green. With Celery, Mr. GRINDROD, gr. to T. BALES, Esq., Herford, was 1st, having good Bibba's White Dolans. Mr. COLE coming 2nd with Standard

Beetor. There were eight potato dishes of Potatos, Mr. REARD coming 1st, with very handsome samples of Windsor Castle and Ideal. Mr. COLE coming 2nd with the same varieties.

The *Sally* class was—For each smaller prize there were three collections of six dishes, the best coming from Mr. W. POPE, who was very strong with fine examples of Mammoth Cauliflowers, Ideal Potato, Ailsa Craig Onions, Inferno Gigan Carrots, Autumn Peas, Striped Turnips, and White Celery. Hollow Crown Parsnips, Ever-true Cucumbers, Perfection Tomatoes, Best-of-All Runner Beans, and Blood Red Beet. Mr. HOESPOOL was 2nd, and Mr. ASHTON 3rd.

There was a big competition in the collectors' vegetable classes, the exhibit generally being of great excellence. It is very satisfactory to find at this, the greatest of the province of its kind, where so many lavish prizes are offered for so many things, that vegetables are so well encouraged, that their economic value is fully understood, the work is never undervalued, and
H. P. P.

The fruit classes at Stratbury are invariably well filled, and no portion of the show excites greater interest than among the fruit. This section does, and it has done during the past years, again stand out prominently viz. those for degenerated sweet table fruits and flowers combined, for a collection of twenty dishes of fruit, too many to all save a few growers, who may be counted on the fingers of one hand, and to twelve large and small. Each of the last two classes have also to be decorated with flowers, and foliage.

COLLECTIONS OF FRUIT.

Under this head one of the decorated dessert tables, in which the competition has been keen as usual. The stipulations are that to be in, which is to be by a foot or inches, shall be decorated with fruits, our flowers, plants in pots and foliage. The fruit to be limited to those which are of genuine, but as to foliage the use of the relative value and to be in one kind or fruit being possible. In the selection of prizes, length of exhibit, and the points are those nearly equal. The premier prize in this class was awarded to Mr. G. MULLIN, gr. to Lady HENRY MOUNTFORD, Easton to the Earl of Devon, and a fine and a remarkably even exhibit were shown. The Grapes were M. Muscat of Alexandria, the superior bunches were well matched, and in the form of bunches, the fine bunch, clear in berry, and of ripeness, Black Hambro on bunch, to the large and of colour good, Black Albion, a medium bunch, of colour good; four dishes of Peaches, Belgic good, of colour good and large; Barrington rather large, but not so good in colour. Staying a table, which was a collection of fruit, a fine bush and two stems, which were in size, but well coloured; four dishes of Neectarines, Pine Apple extra good in colour, Pitt on Orange likewise so, Stanwick Elms very fine, the best of the lot, and a good dish of Lord Napier of Melons there were splendid fruits of Heron Lockinge, and a seedling presumably a scotch fish variety, after Sutton's seedling, and appearance of Black Currants, of a fine red in every respect. The total number of points awarded to this table was 115. This table lacked variety, some what, it certainly should have had a dish of Peas.

The 2nd prize was taken by Mr. McDougall, gr. to Sir J. W. PEASE, M.P., Hutton Hall, Gushborough, who was very strong, having greater variety. The Grapes were Black Hambro, and Cape Guillaume, both finely coloured bunches, and of better quality than in these, but weaker in the white class, which were Foster's seedling and Black-bud seedling; two extra fine Melons were put up here, better than on the 1st prize table, these were Yorkshire Beauty and II W. VIMPT, both being grand fruits; a superb dish of Somerset Congress Peas, the fruit being well ripened; four dishes of Peaches, of which the best are these were extra large fruits of Sun Eagle, Golden Early, and Princess of Wales, with a good dish also of Violetta Huxley, the Neectarines were Pine Apple, Lord Sapper, and Spencer, the latter were indeed; the other dish was one of large early Apples, which lost points against its antagonists Peas. The total points awarded were 112, which denotes the best competition.

The 3rd prize was taken by Mr. Goodacre, gr. to the Earl of HERTFORD, Elyton, Castle, who had a good look of grapes, four varieties, in each of which quality preponderated over size, the varieties shown were of white kind, Canon Hall Muscat, Muscat of Alexandria, and of Black, Madrasfield Court, finely coloured, and an excellent bunch of Muscat Hambro, moderately set. Two splendid and well set Muscat were also shown large large fruits of Sun Eagle, Golden Early, and Princess of Wales, with a good dish of early of Violetta Huxley, the Neectarines were staged on the table, these were grand examples of Elms, a remarkable dish, Spencer especially so, and Pine Apple, and so fine. Fig, were represented by a fine dish of Brown Turkey; Peaches by Royal George; Peas by Jules Gogot; Plums by Kirkes; and Apples by Lord Napier, and Early Scorching both good. Total number of points, 103.

The 4th prize went to Mr. Tulliet, gr. to Lord Bernard, Babo Castle, Burbank.
The floral decorations and general arrangement in the preceding class was valued by the judges, as follows:—1st prize, 12 points; 2nd prize, 10 points; 3rd prize, 10 points; 4th prize, 12 points.

The 5th prize for the 1st prize table with 11 points was comprised of arrangement, and especially so in the blend arranged together with others, the material used being Manilla, and Franco ranosa, both arranged with well coloured sprays of Ampelopsis. Whilst finding amongst the grapes and pines too thick with too good a proportion of Apples.

The twenty dishes of fruit staged within a space of 8 feet by 1 foot 6 inches, divisions included. Fruit, it should be noted, are excluded from this and the following classes, so also are strawberries. Although the pines, Bananas, the grape mill, and the Montey, all of these are put out from a large class to some what straggled. In this case Mr. MULLIN was again 1st and that, too, in a highly creditable manner. The 2nd prize was awarded to Mr. Jones, who was a strong pro-Muscat of Alexandria in grand condition, four bunches, well coloured, heavily shouldered bunches of Black Hambro, Black Albion and Gros Maron, both well finished; Best-of-All Melons, four dishes, well ripened variety, however, would have been better; Peaches, five dishes, consisted of Barrington, Suning Castle, and Bellemeade; and Neectarines of three dishes of Stanwick Elms, extra fine. Total points 121. Here it should be noted that there was a splendid look of variety, Grapes, Melons, Peaches, and Neectarines only being represented, the object in view evidently being to gain the greatest number of points, irrespective of variety. No dinner table would be complete with such a selection of twenty dishes. The 2nd prize was won by Mr. GARDNER, who was not so strong with grapes; his last year of Canon Hall Muscat and Muscat of Alexandria, several dishes, and Black Hambro, and Black Albion in each class. Neectarines here were again first class, these being Pine Apple, Spencer, and Lord Sapper, all of large size and fine colour; Peaches of Royal George, Warburton, Admirable, Raymakers, and Bellemeade; Melons of Frogmore Orange and Sutton's A1, and a fine dish of Somerset Congress Peas. Total points awarded 125.

The 2nd prize was awarded to Mr. Jones, gr. to Mrs. F. NICHOL, York House, Great Malvern, who was a strong pro Grapes, pointing out more than his opponent, Mr. GARDNER. These consisted of Gros Maron, extra fine in berry and bunch, two bunches; the same number of Madrasfield Court, grand bunches, but lacking colour; two Muscat of Alexandria, moderate only; and two more of Black Hambro, extra fine in bunch and berry; Peaches here six dishes consisted of the old and the new class ones, Royal George, Striking Castle, and Violetta Huxley, all of first class quality. Neectarines were represented by two dishes of Stanwick Elms and Melons by Heron Lockinge and No. Plus Ultra. Total points, 121, or one less than in the preceding.

The 4th prize went to Scotland, the Scots must look to their laurels in this class and to Mr. R. CURRIE, gr. to JAS. MAULES WHITE, Esq., Bahndridge, Dundee, the Grapes here pointed slightly less than the preceding, but they were grand, both in berry and bunch, especially so, but they were grand, both in berry and bunch, especially so, but they were grand, both in berry and bunch, especially so, but they were grand, both in berry and bunch, especially so, but they were grand, both in berry and bunch, especially so.

Two or three dishes of fruit in twelve distinct varieties and in not fewer than nine kinds, being an easier class for many growers than the preceding, should have produced a better competition. It was in this instance done by the best grower; this allows more room relative to the preceding class.

Three Mr. P. JORDAN, gr. to the Executors of the late F. COURTNEY, Esq., Impney Hall, Droitwich, was placed first with fine dishes of Madrasfield Court (grand in berry); Muscat of Alexandria and Gros Maron (grapes); two fine Melons, Phinaston (Pine Fig); large but 1st green; good and first-rate examples of Kirke's Plums, and Neectarines. The 2nd prize was awarded to Mr. Thomas, Barmston, gr. to Lord RAY, Rithfield, Rugeley; the grapes were Madrasfield very good, Muscat of Alexandria good and large berries, and Gros Maron, here was the first dish of Maule's Cherries we noted, also excellent Peaches and Neectarines.

Some dishes of fruit open to the county of St. (only) under the same conditions as the preceding, except as regards the number of plants, viz. 11, 6 in, which is rather too small, four lot at least should have been allowed. Mr. LANGLEY, gr. to the Rev. T. M. BUCKLEY OWEN, Tedstone Hall, West Felton, was a good 1st, the grapes here lacked quality for this season of the year, but Black Hambro and Sun Eagle, seedling, both fine in bunch and in berry; Frogmore Peas, Pine Hale's Golden Gate Plums, and Shipley's Anjouet were also noteworthy.

The 2nd prize went to Mr. Phillips, gr. to S. F. KENNEDY, Esq., Eighnton Hall, Tomblad.

GRAPES.

Collections of Grapes, twelve bunches, in four or more distinct varieties, but not more than four bunches of

any one variety, is a popular class at Shrewsbury, and invariably brings another one, even to the novice.

On this occasion Mr. CAIRNS, Balrindley, Dundee, was the winner, and that in splendid fashion, totalling 96½ points out of a possible 112. The Muscat of Alexandria here were the finest in the show, and might fairly have been pointed at least three points higher, they were extra fine in bunch, grand in berry, and with one exception finely coloured. Of these there were four bunches. Madrasfield Court, two bunches, were extra weighty, grand in bunch and berry, but a little deficient in colour. Gros Maroc were noteworthy for the huge berries, large bunches, and high finish; Black Hamburghs left nothing to be desired, being fine in berry, bunch and colour; the remaining two bunches were of Alwinck Seedling, huge double bunches well finished. This was the finest exhibit of grapes in the Show, and it is tolerably safe to say that no two other exhibits, if combined could have beaten them. The 2nd prize was sent north of the border, and to Messrs D. & W. BUCHANAN, Kippin, Stirling, the bunches here were also of high-class finish, being possibly heavier on the scale than in the 1st prize lot; these comprised two grand bunches of Alicante, the largest of which was fairly worth the maximum given, and 1st companion nearly as much. Two smaller Alicante were also staged, but also of Cooper's Black, which, in spite of all that may be said to the contrary, is, in our opinion, so close to Gros Maroc as to deceive all but those who may be growing the two kinds. Four grand bunches of Black Hamburgh were also staged, better in bunch and finer in berry. The two remaining bunches were of Madrasfield Court, a little deficient in colour; and a finely finished example of Alwinck seedling. (What was wanting in the preceding exhibit was a couple of bunches of Muscat.) The 3rd prize was taken by Mr. Shingler, 3rd, to Lord HASTINGS, Melton Constable. The points allotted to this exhibit were 51, as compared with 83 to the 2nd prize exhibit. The 4th prize, with 75½ points, went to Mr. MELLISS.

In the last four classes, additional prizes are offered for the twenty dishes of fruit, the chief of these were awarded as follows.—1st to Mr. NEED in the class for twenty dishes of fruit, the chief features being lightness, the material used being long, trailing shoots of *Lycopodium casimii*, with the bronzy tints upon it; a few *Cypripedium* and *Carnation* blooms, lightly set up with *Gypsophila* moderately used. The 2nd to Mr. MELLISS in the class for twenty bunches of grapes; the material used here was *Eshala japonica variegata* plants, trailing shoots of *Asparagus plumosus* and *A. Sprengeri*, and as floral accompaniments, *Montbretia* and *Dracenas*. 3rd to Messrs. BUCHANAN in the same class with well coloured small plants of *Crotoms*, *Asparagus*, and Maidenhair Ferns, with cut foliage of variegated *Ivy* and *Ampelopsis Verticillata* being the chief features. 4th to Mr. McINDOE in the class for twenty dishes of fruit; the chief here as indicated by *Anthurium Scherzerianum*, *Kalanchoe flammula*, and *Hebeche sanguinea*, *Clerodendron fallax*, with *Panacium fragrans*, and a backing of pretty plants, made a bright display. 5th to Mr. JORDAN in the class for twelve dishes of fruit, who had pretty light plants of *Crotoms* and *Eulalias*, with *Crocus salina* beautiful, and a light touch of *Montbretia* and cut *Asparagus deflexus*.

For four bunches of Grapes, Mr. BANNERMAN was 1st, with excellent, well-finished examples of Muscat of Alexandria and Gros Maroc, Mr. Ball, ex to J. C. WATERHOUSE, Esq., Prestbury, Macclesfield, with two superb bunches of Madrasfield Court and two also of Muscat of Alexandria, not so good, was placed 2nd, and Mr. Lambert, ex to Lord HASTINGS, Broxton, Glasgow, 3rd.

For Black Hamburgh, three bunches, Mr. W. DAVES, ex to Lord TREVOR, Brynkinald, Cork, was a worthy 1st, with grand bunches of the finest colour and finish. 2nd to Mr. J. LANGLEY, with large bunches, scarcely inferior to the preceding.

For Muscat of Alexandria, three bunches, the 1st prize was awarded to Mr. W. NEED, Holmes Chapel, Cheshire, with heavy, compact bunches, fine in berry and finish; the 2nd to Mr. COATES, ex to Col. PLATT, Gooding, Lambeth, who had long tapering bunches.

Ten other classes were provided for Grapes, some for three, and others for two bunches.

The classes for separate kinds of fruit were also well filled. This was specially notable in those for Peaches, Seedlings, Melons, and Potatoes. Prizes also were quite up to the average, although it is yet quite early enough for the best dessert kinds.

MISCELLANEOUS EXHIBITS

were numerous, and it was extremely difficult to gather up a list of the awards actually made, but so far as can be learned, Gold Medals were awarded to Messrs. F. RIVERS & SONS, nurserymen, for orchid house trees, 4 in pots, *Pentstemon*, *Nepenthes*, *Platanus*, *Chelidonium*, and bunches of Grapes; to Messrs. B. R. DAVIS & SONS, Yeovil, for a very fine collection of Begonias in pots; to Messrs. DOBBIE & CO., nurserymen, Rothsay, for a superb collection of Pen-stemon, from their nurseries at Orpington; to Messrs. R. HARDY AND CO., Long Nurseries, Cork, for *Cladonia*, and other cut

flowers, a fine and varied collection; and to Mr. JOHN GREEN (Hobbs) Co., for a large and representative collection of Cactus Dahlias, including several promising novelties.

Small Gold Medals were awarded to Messrs. DICKSONS, LTD., Chester, for a collection of cut flowers of a varied and interesting character; to Mr. A. MYERS, Sutton Lane Nurseries, for floral decorations, with zonal Pelargoniums, &c.; to Messrs. JONES & SONS, Shrewsbury, for a collection of Sweet Peas and other flowers; to Messrs. J. PEED & SONS, Russell Park Nurseries, London, for a fine group of Calliandras in variety; to Mr. HENRY ECKFORD, Sweet Pea merchant, Wem, for a very fine collection of Sweet Peas, including some new varieties of promise; to Messrs. HUNTS BROS., nurserymen, Warwick, for a large and varied collection of Sweet Peas, and to Messrs. J. JALMAN & CO., seedsmen, Chard, for a bank of varied cut flowers, and a table of their specialities in vegetables.

Silver-gilt Medals were awarded to Messrs. J. H. WHITE & SONS, nurserymen, Worcester, for a collection of cut flowers; to Messrs. R. SMITH & CO., St John's Nurseries, Chester, for a large and interesting collection of plants and cut flowers; to Mr. S. MORTIMER, Swiss Nurseries, Farnham, for show, Fancy, and Cactus Dahlias in great variety; to Messrs. WEBB & SONS, seed merchants, Worsley, for cut flowers of various kinds, including a good strain of *Gloxinas*; to Mr. E. MURRELL, Portland Nursery, Shrewsbury, who had a varied collection; and to Mr. J. CHUNG, nurseryman, Pogy Hill, Enfield, who had a large group of Ferns.

Silver Medals were awarded to Mr. H. DICKSON, Bury, for a collection of cut flowers; to Messrs. T. GUNN & CO., nurserymen, Olton, for hardy flowers in variety; and to Mr. W. PATTERSON, Shrewsbury, for a collection of sprays and vases of *Vivida*.

Mr. J. HUDSON, The Gardens, Gunnersbury House, Acton, exhibited blooms of *Nymphaea gigantea*, *Anaryllis Belladonna major*, *Sagittaria japonica*, *Il. pl.*, and *Selambium spectabile*, Mr. S. COLE, The Gardens, Althorp, Northampton, had blooms of his new Sweet Pea Countess Spencer. A collection of stunted Japanese trees were shown by Messrs. M. PIERRE HARR & SONS, Shrewsbury.

Certificates of Merit were awarded to Cactus Dahlia Fire King, from Mr. S. MORTIMER, very bright in colour, and to Miss Grace Cook, a charming rose-pink variety from Mr. J. GREEN, Dereham.

BECH: Sandridge. It is not a fungus, but an insect allied to *Oecus*, and to the American-blight which affects the Apple. It is very injurious; petroleum emulsion may be tried, but we have little faith in your being able to apply it sufficiently to all parts of the tree.

BOOKS: *T. D. R.*, The standard book is *A Manual of Forestry*, by William Schlich, C.I.E., Ph.D., in four volumes, published by Bradbury, Agnew & Co., Ltd., 8, 9, 10, Bonville Street, London.

CYANIDE OF POTASSIUM: Wasps. You can obtain this from a chemist, and the best mode of applying it was described on p. 111, in our issue for August 10.

GOAT BARKING APPLE TREES: *H. B.* Mix a white-glassful of spirits of tar in 2 gallons of white-wash and clay and cow-dung, making the whole with water of the consistency of thick paint; and with this coat the stems to a height of 5 feet.

GRAPES, &c.: *G. C.* Your berries are suffering from "shanking." This arises from a variety of causes, all the result of faulty management. The Tomato is imperfectly ripened. The hard patches are due to excess, and consequent granulation of one of the constituents caused by lack of potash in the soil. Use sulphate of potash to remedy the evil, and do not kainit. There is no fungus. The names of the Ferns will be given next week.

IVY-LEAVES: *Index.* The leaves are swarming with an *Acarus*, the so-called red-spider. Syringe the leaves with 1 oz. of kerosene-oil to a gallon of soap-suds, keeping the mixture well stirred. Burn the affected leaves as far as you can.

LIVE CATERPILLAR: *J. M.* The caterpillar of the Death-head Moth. It generally feeds on Potato banha.

MELON-LEAVES: *Dyswell.* There is nothing wrong with the leaves. Examination of

roots and stems are necessary, to enable a statement as to the cause with certainty. *G. M.*

NAMES OF FRUITS: *G. W.* Your Apple is the true type of Keswick Collin. We have gathered fruits of this variety as early as the middle of July in a similar district to that you name. In some places it can be gathered still earlier.—*A. B.* The fruits were damaged in transit, and all except two were too smashed to be recognisable; these are, 1, Nectarine Hardwicke; 4, Apricot, Large Early.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*T. N.* *Burlingtonia pubescens*.—*X. no name*, 1, *Selaginella denticulata*; 2, *S. Mertensii*; 3, *S. Viticlosa*; 4, *Adiantum trapeziforme*; 5, *A. Paotii*; 6, *A. capillus-veneris*; 7, *A. decurram*; 8, *Pteris hastata*; 9, *Lastrea filix-mas*; 10, *Nephrodium molle*; 11, *Athyrium filix-femina*. The ordinary garden names are given. Most of the Ferns were immature barren fronds, or portions of fronds, very difficult to determine. Where possible, mature, fertile, and barren fronds of each should be sent.—*R. R.* 1, *Pteris Wimsettii*; 2, *Pteris cretica albolineata*; 3, *Pteris cretica Mayii*; 4, *Adiantum pubescens*; 5, *Adiantum hispidulum*; 6, *Pteris serrulata cristata*. The *Odontoglossum* × *Ruckeriana* is a remarkably handsome and finely-coloured fern.—*A. W.* *Phillyrea decora*, *Quercus cerris*.—*Saegroya*, *Tecoma radicans*.—*W. E. D.* *Hibiscus* *Griacum*, commonly called *Althea frutescens*.—*G. R. C.* *Eucromocarpus scabra*.—*G. R.* 1, *Inula Helenium*; 2, *Atronia belladonna*; 3, *Saponaria officinalis*; 4, *Pyrethrum uliginosum*; 5, *Lupinus*; 6, *Sclera telephium* var.—*Auroras*. 1, *Podaocarpus*; 2, *Veronica Traversii*; 3, *Veronica spicata*; 4, *Antennaria margaritifera*; 5, *Tanacetum vulgare*, if the flowers are yellow; 7, *Bocconia cordata*.—*Kyle*. 1, *Silphium laciniatum*; 2, *Helianthus rigidus*; 3, *Impatiens Roylei*; 4, *Spiraea Douglasii*; 5, *Sedum telephium* variety; 6, *Eucryphia pinnatifolia*.—*G. Austin*. *Koeleria paniculata*, *Label nasturtium*; scarlet flower, *Zauschneria californica*.

PEACHES: *J. B. W.* Your fruits are affected with a fungus, the ordinary Peach mildew. Dusting with sulphur is the best plan to follow, but it is too late now. Burn the fruits.

PONY ON LAWN: *W. H. Y.* A simple remedy would be to immediately throw over the grass affected a bucketful of water, thus diluting the ammonia contained in the urine.

SHRUB: *W. Sharpe*. Can you give particulars of the shrub sent? We cannot trace it.

VINES: *Vine*. The trouble is at the roots of the Vines, which are suffocated for want of air, the soil being too compact and water-logged. When these defects are remedied, the foliage and roots will develop vigorously. *G. M.*

VIOLETS: *Dongdale*. The injury is caused by a fungus—*Phyllostictia violae*. The leaves should be sprayed with an ammoniacal solution of carbonate of copper. This acts best when done early in the season. Diseased leaves should be collected and burned, otherwise spraying next spring will be almost useless. *G. M.*

COMMUNICATIONS RECEIVED.—*W. B. J.*, many thanks, but it is too late for the present season.—*A. J. L.*, the writing was insufficiently legible.—*S. A. E.*—*E. C. O.B.*, Secretary Derbyshire Agric. and Hort. Soc.—*T. S. Ware*, Ltd.—*G. Smith*—*G. W.*—*Dr. B.*—*H. T. M.*—*J. Snel-H. G. C.*, Secretary Glasgow and West of Scotland Hort. Soc. (with thanks)—*J. W. GARDENERS'
CHRONICLE

GROUP OF STANDARD WISTARIA, GROWN BY MESSRS. J. VEITCH AND SONS

ORCHID NOTES AND GLEANINGS.

SELENIPEDIUM GRANDE.

A VERY remarkable flower of this hybrid, between *S. caudatum* and *S. longifolium*, kindly sent by Messrs. Charlesworth & Co., Beaton, Bradford, Yorks, shows abnormal characteristics. The upper and lower sepals are united into one blade with a concave base. At right angles is a narrow purple-tinted petal of the normal form, and about 5 inches in

plants of the orange-scarlet *D. sublaevisum*, imported by Messrs. Jas. Veitch & Sons, has been identified with the above-named species at the Kew Herbarium. The plant is of slender growth, and bears short racemes of rose-purple flowers, three or four on an inflorescence, and in colour and appearance to a casual observer rather like *D. glomeratum*. The structure, however, is very peculiar, and totally different from that species. The sepals and petals are short and not conspicuously displayed, but the lower sepals are continued into a thick spur.

The Royal Infirmary, Liverpool, who remarks:— "It grows with me in an ordinary greenhouse, better than in the warmer Dendrobium-house, and produces slender pseudo-bulbs about 2 feet in length, bearing racemes of several flowers at the extremities. The roots seem to be pubescent or rough, and adhere closely to the wood of the basket." The flowers are white tinged with rose, and with a yellow crest to the labellum. These remarks may be useful, as the plant is often found in a declining and unsatisfactory state in warm houses. It is by

FIG. 51.—VIEW IN THE BOTANIC GARDEN, BRISBANE. (SEE P. 161.)

length. The labellum, instead of forming a pouch, is formed into a large tolerably flat blade, round the wavy margin of which the other purplish petal is attached like a riband frill, looking very singular surrounding the whitish, rose-freckled blade. The column juts out straight from the ovary, with the stigmatic plate at the apex, the anthers appearing on short filaments beside it.

DENDROBIUM CORNUUM.

A very pretty and extremely rare Dendrobium appears in the collection of Major Joicey at Sunningdale Park, and which Mr. Fred, J. Thorne, his gardener, states was received with

which closely follows the under side of the flower-stalk and ovary, so that they appear to be almost united; and both ovary and spur being of the same bright rose-purple colour, they form a very showy and striking feature. The short labellum is also peculiar in shape, the front forming a pouch with up-turned apex, above which the column appears. It lasts a long time in perfection, and the rose-purple flowers being darkest over the veining, variety in the colouring is given.

DENDROBIUM MUTABLE (HIBADENDUM).

Flowers of this pretty though not large Dendrobium are sent by Francis H. Moore, Esq.,

no means a common plant, although it has been imported frequently, and probably the practice of growing it in too high a temperature may account for its scarcity.

NATURE-STUDY.*

(Continued from p. 150.)

"The natural interest in a living thing (be it an animal or a plant) which is possessed by almost every child, should be taken advantage of. Companionship with plants and animals means a great deal. There is something real
* Address by Mr. P. Holsworth Parfitt, B.Sc., F.F.S., at the Harper Adams Agricultural College, August 1.

and genuine about it—something suggestive. Very much could be done by teachers in encouraging the pupils to grow for him or herself, be it only a single plant. It does not matter much what the plant is, only let it be grown from the beginning. A grain of Wheat or Barley, a Pea or any weed even, will serve for a beginning. Something that grows and matures quickly is perhaps more interesting and attractive. The next step may be the growing of something which is useful—a

there will be something new to speak of, and to demonstrate. The comparison of common well-known plants in their early stages will be most useful and interesting.

"Another direction in which very useful work may be done, among mere especially the older pupils, is in teaching the elements of 'germ' life; to call it bacteriology would be misleading, and perhaps bring down the undesired criticism of scientists.

"There is, however, a good deal of the

individual realised what the danger of the practice of spitting in public meant. But before perhaps such an ideal state of affairs could be reached, the humblest individual must be taught wherein the danger lies. With milk as the object, much useful teaching can be done in showing how the organisms in the first place are present in the air, and on entering the milk bring about a change in its composition and cause the milk to turn sour. Further, it could be shown that at times such a state of

FIG. 52. VIEW IN THE ROYAL GARDENS, BRISBANE, (AUSTR.) (P. 141.)

Radish, Pot-herb or Strawberry. Single plants will serve the purpose. I do not suggest this for teaching gardening, but simply and solely to encourage among the youngest pupils a pleasurable interest in a living, growing thing.

"Pot-cultivations are of great use, and serve as objects for a number of lessons. Take for example a grain of Wheat, a Pea, or Bean, &c., may be induced to germinate on a damp cloth. The conditions that are necessary for germination, moisture, air, warmth, can very easily be demonstrated. Next will come the root and stem, and seed leaves, and soon. Day by day, during the life of the plant

science of organic life, which can be taught to pupils in elementary schools. Micro organisms play such a part in our daily life that it is most essential for everyone to know something of the rudiments of the laws which govern these minute forms of life. During the recent Tuberculosis Congress in London, a great deal was said about the spread of this deadly disease, and much stress has been laid upon the question of prevention of spitting as a precautionary measure against the spread of the disease. In New York city it is a misdemeanour to spit in a public place, and the punishment may be as much as one year's imprisonment or a fine of 500 dollars. Such a law would not be required if the

affairs can be made use of, and is even necessary. From milk other branches may be touched upon which, while perfectly simple, and above all free from technicalities, will be helpful to the pupil in understanding those subjects to be met with in every-day life.

"The one danger that perhaps we should be on guard against, above all others, is that of making Nature study a dry lifeless lesson. Vitality of interest is the secret of success.

"Finally, let me say, cultivate enthusiasm in yourselves, and from yourselves it will spread to your pupils. Let spontaneity be a ruling feature, and with a devotion that inspires an abiding faith in boundless possibilities your work will be crowned with success."

LILIES AND THEIR CULTURE.

(Continued from p. 147.)

LILIUM HUMBERTI AND L. WASHINGTONIANUM.—These two Lilies, with their garden varieties and *L. columbianum*, comprise a group which falls mid-way between border Lilies and the Marsh Lilies of Western America. They produce a few serviceable stem-roots, but depend mainly upon their basal roots for support. They all require a well-drained soil, not necessarily peaty, so long as it is fairly open, and copious supplies of water when growing. The rainfall of Great Britain is scarcely enough for them, and they must therefore be watered by hand. The bulbs are of loose build, and are easily fractured; they all grow in an oblique direction, yet are not capsitose, or strictly rhizomatous, as in *L. parvum* and *L. pardalinum*; those of *L. Humboldtii* are a dull pink or red, whilst those of *L. Washingtonianum* are white in colour; their leaves are whorled, as in the Martagon group.

L. Humboldtii grows to a height of 5 feet, and bears twenty or more large orange-red flowers, reflexed and pendulous, each 3 to 4 inches across, and spotted on the inside with large purple spots (see fig. 37, p. 144, Jan. 31, 1874).

The var. *Bloomeriana* differs from the type in its paler flowers, and in having a purplish shading throughout, densest near the tips.

L. columbianum may be described as a very small *Humboldtii*; it has small, whorled leaves, more or less bronzed, and two or three flowers, about an inch across, coloured bright orange, and spotted throughout with black and purple. The petals are much reflexed, forming a complete roll; its ovary is also spotted. It likes a light, open soil, and plenty of water, which must pass away quickly, or the plants soon discolour and ultimately wither.

L. Washingtonianum, a grand trumpet Lily, 4 or 5 feet high, bears fifteen to twenty flowers, each 3 inches across, white in colour, tinted purple on the inside, where also a few spots occur on the margins. Its leaves are whorled, broadest and longest below. It is a very graceful Lily, of tolerably easy cultivation, succeeding with *Humboldtii* (see fig. 29, p. 59, July 20, 1901).

Its var. *purpurea* is a slender-growing plant, 18 inches high, the leaves of which are curved and undulating. Two or three flowers are produced by each plant, they are large in proportion to the size of the plant, are white in colour, 3 inches long, and are minutely spotted pale purple or lilac about the middle. A delicate flush of lilac suffuses the whole flower a few days after opening.

A still smaller var., *rubescens*, has much reflexed flowers, in shape like *Lilium columbianum*, coloured white when it first opens, shading to a rosy-lilac on the second or third day. The flower is also heavily spotted a similar colour. The scent of these Washington Lilies is very sweet and refreshing, resembling that of a *Hymenocallis*. The flowers are very delicately tinted, and possess a grace peculiarly their own. All these Lilies are very liable to "sunstroke," and it is best to plant them where they may be shaded, but in such a position that the drip of trees cannot reach them.

LILIUM GIGANTEUM AND L. CORDIFOLIUM.

These two Lilies are woodland plants, delighting in rather dense shade, a damp, not dark, situation, and a root-run of dead leaves and vegetable debris; they cannot be cultivated with any measure of success in the open border. *L. giganteum*, the biggest known Lily, is a grand plant when well grown. Large bulbs, though so frequently planted, are practically useless, for they push their flower-

spikes before the plants have had time to establish themselves, and the inflorescence rarely develops properly. Small three or four-year-old bulbs, about the size of a small cocoa-nut, are more satisfactory, for they have a few years in which to establish themselves before the flower-spikes ascend. It is, however, only those plants that have originated as offsets from previous bulbs, and which have grown away undisturbed, that produce the finest spikes. The stem averages 8 feet in height, and bears upwards of a dozen greenish-white, fragrant flowers, each a foot across, and tinted purple on the inside. The flowering-stem not only exhausts the bulb and reduces it to a moist mass of pulp and fibre; it also emits a large number of extremely thick roots from its base, which pierce the tough scales of the bulb in all directions, feeding on the decaying tissues as it passes through to the outside soil. The destruction of the bulb is so complete that only a mass of tough fibre and a few offsets are left on the old basal disc. These offsets quickly get away into growth, and in order that these may not be disturbed whilst they have no roots, the stems should be cut down, not uprooted. An annual top-dressing of rich soil and leaves, and copious waterings in dry weather, should be given to every colony of these plants, or they will wear out in the course of time. Imported bulbs or large bulbs newly planted that have attempted to flower soon after planting should not be uprooted as failures, but allowed to grow as much as they will; the offsets they always produce will, if left undisturbed, prove far more successful than their parents, it is merely a case of hope deferred. A clump of this fine Lily in flower is a grand sight, and worth every effort that can be made to obtain it.

Lilium cordifolium is a rarer plant than *L. giganteum*. It has a stem about 3 feet high, and bears six long, erect-growing, tubular, white flowers, spotted purple on the inside, and drooping, heart-shaped leaves, which are whorled in the lower portion of the stem. For garden purposes it may be described as a small *giganteum*, with erect, more tubular flowers, and drooping leaves. Where *L. giganteum* grows, this plant is likely to succeed, but it is rather difficult to keep it thriving (see *Gard. Chron.*, July 20, 1901, p. 51). *Geo. B. Mallett*.

(To be continued.)

ROSE - STOCKS AND BUDDING.

As the budding season is still with us, I wish to make a few remarks which may be followed to advantage by amateur gardeners or others. I am dealing now with the Standard Briar-stock. The hot weather of late has not been very favourable for the Briar pushing out shoots unless the surface of the ground had been heavily mulched during winter and spring, which, maintaining the moisture near the roots, would prevent evaporation; even now, or immediately after budding, a good mulching of manure would be beneficial to the plants, and as a consequence to the buds. Briar-stocks sometimes break irregularly, but the three strongest and best placed shoots should be selected, and as near the top of the stock as possible, which, when budded, are usually sufficient to form a good head for the ensuing season. [Many gardeners are satisfied with one bud. *Et c.*] In case of a miss, two extra shoots can be left as a reserve to work in August, but if not required, they can be removed. The shoots, when ready for budding, should be about the thickness of a lead-pencil, and mature. I prefer making a parallel cut, and slipping the scion in the opened bark

without the right angled T or cross-cut, as a much better union is effected, and the shoot is not so liable to be broken off by the wind, or from other causes, only it requires an expert hand to do it. It is best to choose scions with good prominent buds. It is often a vexed question whether the wood from the scion should be removed in all cases or not. If the woody part does not leave the bark freely, the better plan is to leave it in, but if it comes away easily, well and good. In new or choice varieties, where it is desirable to use all the available wood, the former plan can be used to the best advantage.

There is sometimes a difficulty in finding early scions sufficiently developed when the stocks are ready; this I have met by taking well-ripened wood from plants gently forced under glass. Tying in the bud is an important matter, which should be done neatly in the form of a bandage, finishing off with the two ends at the top, and well covering the incision. The best material I have found is cotton waste; this has an advantage over raffia in being more elastic, and not so liable to cut into the rind when the bud begins to swell. I have known cases where, through neglect to sever the ligature, the bud has been ruined by raffia. The ends of the shoots should be kept in a can of water or damp moss, while the budding is proceeding. At first some stocks will not run. I usually shorten these back a few inches, and leave them for the last working, or what is generally called "filling up," as by that time they will have pushed a few lateral shoots, which, bringing up the sap, causes them to run right enough. Under favourable conditions the ligatures can be removed three weeks from the time of budding, but this will depend on the character of the weather, which might cause it to be a week or so later. *J. D. Golewin*, 29, Cleveland Road, Southsea.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables, ante, pp. 88-94.)

(Continued from p. 149.)

8. ENGLAND, S. W.

CORNWALL.—I have not seen Peach-trees looking so badly for a number of years. The cold winds that we had in the months of March, April, and May blistered the leaves very much, and killed in some cases last year's growth. Small fruits are very good, especially Strawberries. *W. H. Bennett, Membilly, Par.*

— Early and maincrop Strawberries were gigantic in size and of very good flavour. There are next to no Apples, although in a few places I hear of very good crops. Small fruits are abundant, Raspberries especially so. Filberts are a complete failure. Medlars bear an average crop, and Figs are very fine. *A. C. Bartlett, Penarrow Gardens.*

DEVONSHIRE.—Dry east winds, occasional sharp frosts, and a low temperature by night at the time of blossoming, had a bad effect on wall fruits, causing the trees to set badly. A great improvement in the weather came in time to save Apples and Pears. Caterpillars were more abundant than usual on Gooseberries and Currants. *Andrew Hope, Prospect Park, Exeter.*

— Apples are much below the average, and small in size. Pears are a partial crop. Peaches and Nectarines are very good, but the trees were blistered early in the season. Small fruits are very plentiful, but small. *Geo. Baker, Membilly Gardens, Plymouth.*

— The Apple crop will again be good. Plums against walls are a heavy crop, and I do not remember seeing the trees so free from

red-spider. Apricots and Peaches are looking well. Pears, as a rule, do not carry very heavy crops, except Williams' Bon Chrétien, which is laden. Small fruits have been abundant and good. *James Mayne, Birtou, East Budleigh.*

DEVONSHIRE.—The fruit crop in this neighbourhood is generally good, but Apples are not so plentiful as last year. Walnuts and Colnuts, Peaches and Nectarines, are excellent. *C. W. Bloye, The Gardens, Pinhoe, Lyme Regis.*

— The Apple crop in these gardens is the lightest for some years, although there was abundance of bloom. Pears in the open are a very light crop. Peaches and Nectarines gave promise when in flower of very heavy crops, and appeared to set well, but the north and north-east winds caused the fruits to drop; while for some years past I have not seen the trees so badly affected by leaf-blisters. Plums are a heavy crop again this season, especially Kirke's. *T. H. Slade, Pottimore Gardens, Exeter.*

GLOUCESTERSHIRE.—During the thirteen years that I have lived in this locality, I never remember seeing the fruit crops so good, although reports reach me from the Pershore and Evesham district that the crop there is somewhat partial. *Geo. W. Marsh, St. George's Nursery, Cheltenham.*

— The Apple and Pear crops vary very much this season; the best Apples are Blenheim Orange, Bramley's Seedling, Flanders Pippin, Ecklinville, White French, Warner's King, Pott's Seedling, Worcester Pearmain, King of the Pippins, Duchess of Gloster, and Early Margaret. The best Pears are Beurré d'Amanlis, Beurré Diel, Duchesse d'Angoulême, Chaumontel, Huxley's Prince of Wales, Uvedale St. Germain, Catillac, &c. *Alfred James, Woolstone Rectory Gardens, Cheltenham.*

HEREFORDSHIRE.—The fruit crops generally are looking well, and the trees are clean and healthy. Plums are a full crop, both on walls and bush trees. Strawberries were the best we have had for years. *Thos. Spencer, Goodrich Court Gardens, Ross.*

— The Apple crops are good, and look promising. The great pest, the Pear-midge, has reduced the Pear crop to very small proportions, and has done so for the last few years. *John Watkins, Pomona Farm, Withington, Hereford.*

MONMOUTHSHIRE.—Apples will be below the average in this district, and not at all clean. Some varieties have again proved their superiority. Calville, Blanche d'Hiver, Merc de Ménage, Hawthornden, and Golden Pippin, in particular, are carrying immense crops; while young pyramid trees of Cox's Orange Pippin have a few nice fruits on them. Pears are an average crop, Madame Treve, Marie Louise, Doyenné du Commerce, Durondeau, and Louise Bonne of Jersey being the best. Peaches and Nectarines set well, and required much thinning. Gooseberries and Currants are most abundant. Strawberries have been plentiful, and of good flavour. *W. F. Woods, Blansfords Grange Gardens, Cardleon.*

— Apples and Pears collectively are a good crop, and promise to be of good quality. Insect pests have not been very troublesome, where the customary winter and summer sprayings have been carried out. Cherries are excellent in quality, and abundant; while Peaches and Apricots are good in every respect. Plums, although they blossomed freely, are not so plentiful as last year, after the heavy crops of the past two years. Strawberries were plentiful and good, as are also all bush fruits. *Thos. Coomber, The Hendre Gardens, Monmouth.*

SOMERSETSHIRE.—Small fruits have been abundant, and of capital quality. Apples are under average, but of very good size. Some Apple and Pear Orchards have plenty, and in another one near by there are no fruits at all. *Thos. Wilkins, The Gardens, Linwood House, Henstridge.*

— Poor as are the crops of Apples, Pears, and Plums, they are better than I expected after last year's exhaustive crops. The fruits are clean and good, and the trees are very clean. Cox's Orange, Ribston Pippin, Scarlet Pearmain, Domino, and Lane's Prince Albert, are our best Apples. *John Crook, Forde Abbey Gardens, Chard.*

WORCESTERSHIRE.—Excepting Apples on orchard standards, which were heavily cropped last year, the fruit crop is remarkably good, and of excellent quality. Apples on

periods of drought without serious check, whilst those crops growing on shallow land and hard, unbroken subsoil have quite failed. Insect attacks have been numerous and persistent. It is only by a policy of "war to the knife" with proper insecticides that their attacks have been repelled. The Strawberry season was short, but exceptionally high flavour was secured. Apples are clean, and a fairly good crop. Apricots also have been very good in quality and size. *W. Crump, Mulresfield Court Gardens, Malvern.*

(To be continued.)

HERBACEOUS BORDER.

LATHYRUS MAGELLANICUS.

A YEARAGO I sent to the *Gardeners' Chronicle* a note concerning the history of this rather famous blue everlasting Pea. The name was adopted by me on the authority of Don in Sweet's *British Flower Garden*, Series II., tab. 241; and is that by which Lord Anson's Pea is generally known amongst amateurs. But it appears that this Pea, which was first described in Miller's *Dictionnaire* as *Pisum americanum*, was called in Lamarek's *Dictionnaire* *Lathyrus nervosus*; and another Pea, with dull, magenta-coloured flowers, was named *L. magellanicus*. In *Index Kewensis*, the priority is rightly given to the name *L. nervosus* (Lamarek), and this is the name by which Lord Anson's Pea is known at Kew. Mr. Bailey tells me that he has the true *L. magellanicus* (Lamarek), and that it has just been verified for him at Kew. As for Lord Anson's Pea, which I rightly described last year as a disappointing flower, I have, by the help of seeds and cuttings, managed to keep it alive; and one plant flowered rather freely last June, having lived on a south wall through winter without dying down; but the colour is rather dull blue, and by no means like the colouring of Sweet's portrait, though the plant agrees with it in all other characters. *C. Wolley Dod, Edge Hall, Malpas, August 22.*

FOREIGN CORRESPONDENCE.

PERENNIAL ASTERS.

THE Asters unquestionably form one of the finest groups of native American plants. The number of species is unusually large, they present a great variety of colour and habit, and they are nearly all hardy and useful in cultivation. Most of them take to the garden very kindly. They thrive and spread in the hardy border, and grow large and lusty under the gardener's care. Some of them are at home in the shade, while others prefer the sun. Some will endure severe drought, though others do best in a rather moist situation.

It cannot fairly be said that the native Asters have become thoroughly popular in American gardens. The common gardener's mind turns always to something exotic. And then we have not yet learned in this country the lesson of how to grow hardy plants in a border. Occasionally you may see a good one, showing that our climate and conditions are not unsuitable to it; but for the most part we have not passed the flower-bed stage of gardening yet. We are making progress, though. The most popular, and probably the best, of all is the New England Aster, *A. Nova-Engliæ*. This has large, showy, blue flowers, which are borne in large trusses on a very stately plant. The plant, when well cultivated, reaches a height of 1 foot, or even more. The flowers appear late in the summer, or in early fall, about September 1 in this

PHILIP MACMAHON,
(Director of the Royal Botanic Gardens,
Liverpool.)

garden bushes and pyramids set very heavy crops, and have been thinned severely. As garden trees are more under the control of the cultivator, the crop can be thinned, and a crop obtained again the succeeding season. Pears are excellent in quality. All fruit-trees are healthy, and free from insect pests. *A. Young, Willey Court Gardens, Stourport.*

— There was a grand show of bloom on all kinds of fruit-trees in this district, and there are good crops of fruit. Strawberries were very fine, Royal Sovereign, Leader, and Waterloo being our best varieties. All bush fruits have been heavily cropped, and the fruits are of good quality. The Apple-maggot is very destructive, and American-blight seems worse than ever this year. *F. Jordan, Inipney Gardens, Droitwich.*

— This has been a remarkable season of extremes in temperature and moisture, varying from periods of cold and wet to intense heat and aridity. This has affected the fruit-crops in various degrees, according to local conditions. The immense advantages of deep and thoroughly good cultivation with a free, open subsoil have been remarkable this season. It has enabled the crops to withstand

latitude, and last for a considerable time. There is a beautiful variety of this species, the rose-flowering sort, which should be given almost equal praise with the "True Blue." This is really the only one of the native Asters which is well-known, and which may be had from all nurserymen.

Aster hevis seems to me to be the next best species in cultivation. This species is common along old fences and in woodland borders, but is not well known in gardens. It responds well to cultivation, however, and is a fine, stately plant, somewhat smoother of foliage and tidier of habit than most of its congeners. It has sky-blue flowers, borne in great abundance.

Aster cordifolius is a beautiful plant along woodland borders, where it often grows in large masses. It must be seen in fairly large masses to give the best effect. Though the plant is graceful, with a large and well-set inflorescence, the individual flowers are so small that they do not make much show till they are properly aggregated. They are white or pale blue.

Other good species are *Aster patens*, *A. spectabilis*, *A. ericoides*, *A. multiflorus*, *A. diffusus*, *A. paniculatus*, *A. Novi-Boelgii*, and *A. panicus*. There are several besides these which are well worthy of cultivation; and I can think of no genus of common plants which one might make a collection of with greater satisfaction. There are a few nurserymen who are beginning to see the value of them, and to list them in their catalogues. I feel confident that the demand for them will increase as gardeners learn their value, and doubtless most of the common species will come into cultivation one after another. *F. A. Waugh.*

FUNGI ATTACKING CUCUMBER ROOTS.

It was with the greatest interest I read your article on the supposed origin of Potato-tubers. There have been several good articles in the *Gardeners' Chronicle* about fungi, and they have helped me to find out the origin of a plant disease that before was hidden in the greatest darkness for me.

Here I have a great house containing Cucumbers. They are nursed in the same manner that is customary in English gardens. For several years they have behaved to my satisfaction, but this year they have nearly failed. The roots of the Cucumbers have swollen considerably, and consequently have given a small amount of fruit. For a long time I was not able to decide the origin of the disease. The plants have been given the best management possible, and have been nursed as other years. In one point only is there a change. This season I have used Bamboo sticks across the trellises as support for the young plants. They are what the Germans call "Tonkin-stäbe," and are directly imported from Tonkin. After having read the above-named article, I am apt to think that the Bamboos must have been infested with spores of a fungi, closely related to the smut of Oats, and this is the cause of the swollen succulent stems of *Zizania latifolia*. Having considered the facts, I am convinced that the swellings of my Cucumbers roots may be traced to this origin. Moreover, two months after planting, the sticks were covered all over with a black, sooty powder—mature spores, as I think. Apparently this powder has fallen to the ground and attacked the roots, causing the swellings. These are not large; some are as great as a common Pea, the biggest are as Walnuts. They resemble in colour and structure a Turnip, though not so irregular in shape.

I think it is singular, and proves that plant-roots respond to the irritation of a fungus. *Sweden.* [Are not our correspondent's Cucumber-roots attacked by col-worms? Ed.]

The Week's Work.

THE FLOWER GARDEN.

By T. H. SLADE, Gardener to Lord Pollimore, Pollimore Park, Exeter.

Lilium cavatum.—This chaste Lily is useful for a variety of purposes, whether planted in the mixed flower borders or among Azaleas, and has a good effect as large clumps. In order to extend the flowering season, bulbs should be planted in different aspects, and always in sheltered spots where the wind will not damage the blooms. The bulbs should be obtained forthwith, and planted without delay. Any clumps existing in the garden may, if strong, be taken up before growth recommences, and replanted. The re-planting may be done at a later date, but progress is then almost at a standstill for a year. The species thrives in almost any kind of garden soil, but the best results are obtained in loamy soils. Manure should not be applied when planting, but a mulch of half-rotted manure will be beneficial afterwards, and some of this may then be forked into the soil so that the roots may find it as they extend.

Lilium tigrinum.—Plants of this species are now in bloom, and, like the preceding one, they are excellent for sunny positions. A light or sandy soil is best suited to their needs, and in it fine large flower-spikes are formed. There are many other species of Lilies, some requiring special attention in regard to soil and treatment, that are well worth growing where their requirements can be met. Among them is *Lilium giganteum*, established bulbs of which carry a large, massive spike, but it is not a free bloomer. A sheltered position, a well-drained and fairly rich soil, appear to suit this species.

Dutch Bulbs.—Catalogues have begun to arrive, and the list of the quantities required will demand attention, for nothing is gained by delay in posting the bulb order. Where bulbs will be planted in the open ground, wherever this is possible, should be got in readiness, but where spring and summer bedding is the rule, the bulbs cannot be planted for some time yet.

Annual Asters.—These flowers are very fine this season, the showery weather during the past two or three weeks having greatly aided the plants. The gardener is amply repaid in fine blooms for a liberal treatment of the plants, whether in the mixed border or in beds by themselves. Asters have not been so good with us for several years as is the case this year. The plants were pricked out into their permanent quarters when of quite small size, and therefore they received very little check. The Comet strain is an exceedingly useful one, few plants lifting better when in bud, or their flowers just expanding. The new variety named "Ostrich Plume," or "Feather," is a decided acquisition amongst white Asters, the blooms measuring over 6 inches across, resembling a white Chrysanthemum, while a strong point in their favour is the length of stem the blooms possess.

THE ORCHID HOUSES.

By H. J. CHAPMAN, Gardener to R. I. MEYERS, Esq., Cambridge Lodge, Flordon Road, Cambridge.

Orchids of the Coolhouse.—During the next few weeks, particular attention must be paid to the plants in this house. There exists amongst cultivators, differences of opinion in regard to the most suitable season in which to re-pot the plants. I may say, that I find the autumn months the most suitable, as then the plants become established without the drawbacks entailed by potting in the spring. The more robust growing *Masdevallias*, such as *Ignea*, *Veitchi*, *Harryana*, &c., should be re-potted at the present season, and that without delay. It is not necessary that these species of *Masdevallia* should be re-potted annually, but rather that consideration be given to the size of the pots used, and such sizes afforded as will hold the required quantity of compost, and afford

root space for a longer term than one year. This is the more desirable when dealing with specimens of large size. *Masdevallias*, for a great portion of the year, require a considerable quantity of water, therefore the drainage materials must be ample. In dealing with large specimens, an inverted pot should be placed at the bottom of the pot or pan, and the remaining space filled to the desired depth with clean crocks. I have tried bracken roots after thoroughly drying them; but care must be taken to use none in which any sap remains, or it will quickly turn sour, and probably breed fungus. The plants have succeeded well here with this material, but I cannot see any marked difference in the case of those plants as compared with others that have been afforded the ordinary materials; and the same has also been found to be the case with *Odontoglossums*. If bracken roots are made use of, potting must be very lightly done; and the compost should contain a larger quantity of sphagnum-moss. Affording water is a critical operation, for if too much be applied the tips of the leaves soon decay. The most suitable compost is one of chopped sphagnum-moss two parts, and one of turfy peat, together with a liberal use of clean coarse sand or finely broken crocks. Having turned out the plants, remove all dead matter about the bottom, which will improve their appearance, and do away with the risk of moisture accumulating about the base at undesirable seasons, i.e., during the winter months.

Odontoglossums.—The cultivation of *Odontoglossums* has engaged the attention of growers during recent years to a greater extent than formerly, and much progress has taken place in the management of *O. crispum*. A few years ago, we were largely dependent on Continental cultivators to supply the demand for the cut flowers; but now we have growers for market who make a speciality of *Odontoglossums*, and who have supplied the foreign grower. The *Odontoglossums* are at the present day better liked and more valued than ever. This success must be attributed to a better knowledge of the requirements of the plants, especially in the matter of ventilation, the dispensing with the use of crocks and the use of chopped-up bracken-roots, and to more careful methods of affording water. Any re-potting or top-dressing that may be deemed necessary should now receive attention, affording a compost of sphagnum-moss two parts to one of peat, and pressing it tightly about the base of the plants. Repotted plants should be thoroughly watered as soon as re-potted, carefully shaded from the direct rays of the sun, and the house kept slightly closer for a few weeks.

THE HARDY FRUIT GARDEN.

By C. HERRIN.

Gathering fruit.—Early varieties of Pears should be inspected, and the more forward fruits gathered and stored in the fruit-room. Of these, it may be mentioned that Jargonelle keeps but two or three days after being gathered, and is often found to be "sleepy" at the core, whilst ordinarily it is still sound. The best all-round early Pear is Williams' Bon Chretien, which, by having trees of it on walls having south, east, and west aspects, and also in standard form, may have its season considerably lengthened. By gathering the largest forward specimens, the remainder attain a larger size than would be the case if all were left and gathered together. Fruits from bush-trees and standards have usually the best flavour. The ground being now very dry, a heavy application of water will have a very beneficial effect on Pear-trees in general, in developing the fruits. Some of our Congress succeedees Williams' Bon Chretien, and grows to a larger size than that variety. The variety is excellent on bushes and pyramids. [A few Pears of merit ripening in September besides those our contributor names are: *Beurre d'Amanlis*, *B. Superfin*, and *B. de Beignines*. Those who have the space for a standard-tree, should plant the autumn or common Bergamot.

It is an abundant bearer in the south, and the fruit is melting, juicy, and richly flavoured. (Etc.)

Apples.—Early varieties of Apples of the type of Mr. Gladstone, Beauty of Bath, and Irish Peach, which are now in use, should be eaten direct from the trees. The same remark applies to the fruit-coloured variety Lady Sudeley, whose fruit's best flavour when stored, and are best eaten direct from the tree. Devonshire Quarrenden is an old favourite variety, and may be kept in the fruit-room for several weeks. This is seen in the best condition in the county from whence it takes its name, and where the pulp and rind attain a rich red colour, and the flavour is finer than I have remarked in other districts. In the midlands it does best when grown as a bush on the paradise stock, and given an open sunny position.

FRUITS UNDER GLASS.

By MALCOLM MCINTYRE, Gardener to Sir CHAS. TESSNAR, The Glen, Innerleithen, Peebles-shire.

Strawberries for Forcing.—After the runners are thoroughly well rooted in pots, they derive but little further advantage from being left longer connected with the old plants. Those in small pots especially should be at once separated from the old plants, stand them on a hard substance for a few days before they are shifted into 6-inch pots to fruit. Those layered into 6-inch pots may also shortly be severed from the parent plants, and arranged thinly in a sunny place on a bed of ashes. This has been a favourable season for procuring young plants, there being large numbers of well-rooted runners that have not been layered. These may be lifted and potted up, and it will look after will grow to a serviceable size, either for late forcing or for planting-out. A moderately rich loam, with an 8-inch potful of wood-ashes to a barrow load of soil, covering the drainage with a layer of half inch of bones, suits Strawberries well. The ball of soil and roots should be in a moist state when the potting is done, and the soil should be firmly rammed down, a good space being left for holding water. Afford water very carefully at first, but when the pots are full of roots the plants will need a great deal. All runners must be pinched off, and the plants kept clear of weeds.

Pines—Potting Rooted Suckers.—Suckers obtained from the summer-fruiting plants will soon be ready for potting. It is well to divide the plants, the strongest Cayennes being shifted into 11-inch pots as soon as they are ready, and the Queens into 10-inch ones. Afford the plants a position near the glass in a light, airy house, and keep them growing gently now and through the winter months. There ought to be strong suckers available on the plants of the Smooth Cayennes and Charlotte Rothschilds, and these should be left till they have become 2 ft. long. When the suckers are taken, employ 7-inch pots for potting the larger suckers, and smaller ones for the weaker ones. Let these pots be clean or new, and well drained; use light turfy loam, roughly broken up, and a small quantity of bone-meal only, pot firmly, and plunge the pots in a bed having a bottom-heat of 85° or 90°. Keep close, or lightly shade them from bright sunshine for about a fortnight, and afford only just enough water as will keep the soil moist in a slight degree. When rooted, increase the amount of air and water; never allow the soil to become quite dry. Those plants of Queen Pines intended to fruit early next year should now be rested by gradually applying less water, less leaf, and rather more air. Only as much water should be afforded as will prevent the leaves from shrivelling; and by the end of the month they ought to be in a dormant state, and kept so by means of a lower temperature, the night heat not exceeding 65°, with a slight increase in the day time. Succession plants must be kept growing for another month, a moist atmosphere and a moderately strong heat being maintained.

Re-arranging the Plants.—A re-arrangement of the Pine plants should now be made, in

order to separate the fruiting from the non-fruiting ones, as many of those that were started from suckers of last summer's fruiting plants will have swelling fruit. Those plants that are not fruiting will have completed their growth, and should have air very liberally for the next six weeks, whenever the temperature exceeds 80°, maintaining the bottom heat steadily at 80°; and all plants well established, that is, well rooted, should have a bottom heat of 80 to 85, but recently-potted suckers, or those not having roots well established in the fresh compost, should have a bottom heat of 90° steadily maintained to insure speedy rooting.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HESSEY PARK, Esq., Prestwold Hall, Leicestershire.

Hyaacinths in Pots and Glasses.—As soon as these bulbs arrive they should be unpacked, and without delay stood in a cool place till the potting can be performed. Before commencing to pot, let a selection of the earliest-flowering bulbs of Hyaacinths, Polyanthus, Narcissus, and Daffodils be made, and pot these within the first two weeks of September for forcing early. Later batches of all varieties may be potted up to the end of October, and after that date Dutch bulbs begin to deteriorate. The most important point in bulb-growing, particularly the Hyaacinth, is the potting compost, which should consist of turfy loam, dry cow-manure rubbed small, leaf-soil, and coarse, clean sand. These ingredients should be well mixed before-hand, and placed in a heap for a fortnight before proceeding to use them. For single bulbs of Hyaacinths, use a pot having a diameter of 5 inches, and if it be deeper than the ordinary flower-pot, so much the better. Having cracked the pot, fill it loosely with the compost, making a hole with the hand for the reception of the bulb, placing a handful of sand in the cavity; on this place the bulb, and press down the compost and bulb together, and make the soil firm with the fingers, with the crown of the bulb well above the surface. For miniature Hyaacinths, or varieties grown for making a good display of bloom, it is usual to put three bulbs in a 6-inch pot. The potting finished, afford enough water to permeate the entire mass, and place the pots on a bed of coal-ashes outdoors, and cover to the depth of 6 inches, as previously advised for Roman Hyaacinths. Here they should remain undisturbed for five to six weeks, when the pots will be found to be filled with roots and growth begun, and the bulbs in a suitable condition for bringing into cold frames and gradually inuring to the sunlight, and later into the forcing-house. Hyaacinths to flower in glasses should consist solely of the single-flowered varieties, which may be put in the glasses forthwith if wanted very early. Nearly fill the glasses with rain-water, in which place some small bits of charcoal, and arrange the bulbs in the glasses so that the bases barely touch the water, and place in a cool, dry, dark situation till the roots of the bulbs nearly fill the glasses, when they should be set in a moderately light position, free from cold draughts. If the water should become foul, or evaporate, the fresh water afforded should be of the same temperature as that of the room in which the Hyaacinths are growing. Hyaacinths which have been grown in flower-pots may have the soil carefully washed away with water applied with a syringe, and be placed in glasses.

Polyanthus, Narcissus, Daffodils, and late Tulips, require much the same kind of treatment as Hyaacinths, but the potting-soil need not contain so much manure, but rather more leaf-soil and loam. The bulbs should be potted rather deeper than Hyaacinths. The treatment after potting is the same as for the last named. It is usual to put Polyanthus, Narcissus to the number of three or five in a 7-inch pot; Daffodils to the number of five in a pot 6 inches in diameter, and Tulips five in pots of that size. It is better to err on the side of having too many in a pot than too few.

Mulmison's Cow Slips.—The season of bloom being over, potting will require immediate attention. Any two-year-old plants that are worth retaining should be transferred to 10-inch pots, each shoot being secured to a neat stake. For the next four or five weeks the plants should be well ventilated, but protection against heavy rain should be afforded. Succession plants which have given one spike of bloom, which are growing in 7-inch pots, should now be potted into 9-inch pots; and they will afford flowers after the larger plants are over next year. The earlier layers being in a condition to be severed from the old plants, may be potted in large 60's or 31-inch pots in a compost of turfy loam two parts, leaf-soil one part, and some fine mortar-rubble and charcoal. To the larger plants we add one part of turfy peat. Pot the plants firmly, but do not use the potting-stick or rammer, more especially in re-potting plants in pots up to 9 inches; and be sparing in the use of the watering-pot after re-potting. Afford plenty of air, and apply shade during bright intervals for a month or six weeks after re-potting.

THE KITCHEN GARDEN.

By J. MANSIE, Gardener to the Hon. MARK KOFFE, Breton, East-Devonshire, Devonshire.

Cabbage.—The earlier sowings being fit for transplanting may be put out in nursery lines at 4 inches apart, as may also the later sowings when fit. Some gardeners prefer to plant direct into the permanent quarters, considering the plants grow away more kindly if subjected to but one removal. There is no doubt that pricking-out does give a check, but it is beneficial rather than otherwise, as transplanted plants are furnished with numerous fibrous roots and a ball of soil if the operation be carefully performed with a trowel. There is then no check of any consequence; and the plants being of good size are less liable to be devoured by slugs, and they are more under the eye of the gardener, and remedies are easily applied.

Onions.—In most gardens the Onion crop will be ready for lifting, and should fine weather continue the bulbs can remain on the ground to get dry after clearing off weeds and rubbish. In the event of showery weather setting in, the bulbs must be laid on boards, hurdles, &c., or in an open shed or under-glass, turning them a few times, so as to thoroughly dry them. Onions should be stored in a cool place. The bulbs with the longest necks should be set aside for present use, or when the Tripolis are finished. If any of the latter are out-of-doors they should now be got under cover.

Late Peas.—In gardens where crossbills and other birds devour the Peas, and I am sorry to say they are a great worry here, netting, having a 1-inch mesh, must be placed over the rows, and pegged down to the soil, in order to keep these depredators from the crops. If the soil is still dry, afford water copiously, and a mulch if possible. Runner Beans claim the same attention in this respect.

Spinach sown towards the middle of the present month will need to be thinned to 5 or 6 inches apart, and the soil well stirred between the plants. Given a mild autumn, Spinach sown seed in the first week of September often proves remunerative in Devonshire gardens.

Lettuces and Endive.—A sowing should be made of the hardier varieties of Lettuce named in an earlier issue to stand the winter. Thin and transplant the stronger plants of sowings made early in August into an open position. During dry weather it is wise to plant in drills 1 inches in depth and 1 foot asunder each way, affording water to the same a few hours before putting in the plants. Tie up the forwardest of the Cos Lettuces once a week, and when the leaves are quite dry. Endive is not much in request, so long as good Lettuce can be had. To blanch them, they should be tied up similarly to Cos Lettuces, a flat tile or inverted pot placed over each, so as to exclude the light.

APPOINTMENTS FOR SEPTEMBER.

EXHIBITIONS.

	Preston and Fulford Horticult'ral Show (2 days).
WEDNESDAY, SEPT. 4	Glasgow International Exhibition, in conjunction with Glasgow and W. of Scotland Horticultural Society (2 days).
	Berwickshire Horticultural Society's show at Duns.
	Royal Caledonian Horticultural Society Exhibition, Waverley Market, Edinburgh (2 days).
WEDNESDAY, SEPT. 11	Derbyshire Agri-Horticultural Society's Show at Derby (2 days).
	Arundel, Littlehampton and District Agri-Horticultural and Poultry Show in the grounds of Arundel Castle.
SATURDAY, SEPT. 14	Central Horticultural Society of Nancy (France) great Horticultural Exhibition.

MEETINGS.

SATURDAY, SEPT. 7	Société Française d'Horticulture Meeting.
MONDAY, SEPT. 9	United Horticultural Benefit & Provident Society Meeting.
FRIDAY, SEPT. 10	Royal Horticultural Society Comm. Meeting at Drill Hall, Westminster.
TUESDAY, SEPT. 21	Royal Horticultural Society's Committees at the Drill Hall, Westminster.

SALES FOR THE ENSUING WEEK.

MONDAY, SEPT. 2	Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY, SEPT. 3	Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY, SEPT. 4	Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY, SEPT. 5	Dutch Bulbs, at Protheroe & Morris' Rooms—Clearance Sale of Greenhouse Plants, Glass Erections, Piping, &c. at Smith's Nursery, St. Mary's Gardens, St. Mary's Road, Lower Edmonton, at Protheroe & Morris, at 1 o'clock.
FRIDAY, SEPT. 6	Dutch Bulbs and Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE FOR THE ENSUING WEEK, deduced from Observations of Forty-three Years at Chiswick—59°.

ACTUAL TEMPERATURES:—

LONDON.—August 28 (6 P.M.): Max 64°; Min 48°.

August 29—Fine, chilly.

PROVINCES.—August 28 (6 P.M.): Max 61°; Scilly: Min 48; Orkneys.

The Selection of Root Crops for Seed

We are pleased to see that length growers are beginning to recognise the truth of what has been often pointed out.

VIZ., that the mere size of roots is not the point to be aimed at, inasmuch as these monster Mangels contain infinitely more water than nutritive matter—a very wasteful way of supplying water truly. Messrs. JAS. CARTER & Co. now issue the following remarks, which we heartily commend to all growers:—

"Previous methods of root selection have all had for their primary object increase in the weight and volume of the crop.

Agricultural chemistry has been applied to artificial manures and feeding stuffs, but the food-producing powers of roots have been neglected.

TOTAL SOLIDS.

The solids in a root contain all the nutriment. These solids are not uniformly nutritive.

All roots are (very largely) made up of water. The variations in the quantity of water and of the digestible solids represent enormous differences in money value to the farmer.

Five tons of one crop may contain as much solid food as ten tons of another.

The food value and digestibility or otherwise of the solids is determined by analysis.

SUGAR AND ALKALI COMPONENTS ARE OF FIRST IMPORTANCE.

Historical parallels to a degree are found in the great achievements by continental sugar-beet growers who have increased the saccharine matter in beets no less than four-fold.

The sugar and feeding qualities of Turnips, Swedes, Mangels, &c., can be increased and multiplied.

A small increase of sugar and its allied compounds adds enormously to the net feeding value of the roots.

SPECIFIC GRAVITY OF THE ENTIRE ROOT.

It is demonstrable that the higher the density of a root, the better the keeping quality.

A small deviation in the percentage of water alters materially the value of the crop in keeping properties.

SPECIFIC GRAVITY OF THE JUICE.

The higher the specific gravity of the juice, the better the feeding quality (albumen and carbohydrates).

The new method is to analyse each root planted for seed purposes, and reject all which do not reveal a strong combination of the above qualities.

Examination of roots and valuation of root-crops on these analytical principles bring to light their true and only value for feeding.

Scientific appliances are devised so as to test each root in a manner to a mathematical exactness, and yet not to destroy it for seeding purposes.

Roots which stand these crucial tests provide for the next year a hardier race and more generous food products.

Contrast this method with that of the 'seed beds' of the nineteenth century.

The new method, while not neglecting weight and size, uses them only as an instrument to convey the greatest net feeding value which is the only value either to the farmer or his live stock."

DRACÆNA, SYN. (ALETRIS), DRACÆNA FRAGRANS VAR. LINDENI (SYN. ALETRIS FRAGRANS).

(Supplementary Illustration).—In this handsome, green-leaved species from the coast of New Guinea we have a Palm-like shrub growing to a height of 10 feet under liberal cultivation. The head is composed of a comose fasciole of leaves arranged in several ranks, horizontally diverging, recurved, strap-shaped, lanceolate, and slightly channelled; the flowers are white, very numerous, and arranged in glomerate umbels. The plant flowers in the stove at various seasons, and the flowers have the scent of newly made hay. It is a good decorative plant, and can be used in the summer months in beds of sub-tropical plants if previously inured to sunshine. We are indebted for the opportunity of figuring the plant to MR. L. G. WALKER, gardener to Sir H. B. BURY, Bart., Barton Hall, Bury St. Edmunds.

MR. OWEN THOMAS.—A sympathetic address, handsomely engrossed, with views of Mr. THOMAS' residence at Frogmore, was presented (on the 23rd inst.) by the garden staff to Mr. THOMAS on the occasion of his retirement from his position as Superintendent of the Royal Gardens, Frogmore. The gardeners at the Private Gardens, Hampton Court; White Lodge, Richmond; and at the Royal Pavilion, Aldershot, were also associated in this interesting ceremony. The address, which was presented on behalf of the subscribers by Mr. EDWARDS, is creditable to all concerned, and must be very gratifying to the recipient. We subjoin a copy of the document:—

"ROYAL GARDENS, WINDSOR.

TO OWEN THOMAS, Esq., V.M.H.

We, the Staff, Young Gardeners, and Employés of the Royal Gardens, Windsor, have learned with deep regret that you are retiring from the position you have so ably filled for the last ten years as Superintendent of the Royal Gardens.

It has been the privilege of most of us to have worked under your direction the whole of that time, and we desire to place on record our grateful acknowledgment of the courtesy and kindness we have invariably received from you; also to bear testimony to the earnest and energetic manner in which you have carried out the responsible duties of your office, which has been an example to all.

We ask your acceptance of this Address as a slight token of our esteem and regard, and

pray that Almighty God will bless you with health, happiness, and prosperity for very many years.

Signed, on behalf of 130 subscribers, June 29, 1901:—

THOS. EDWARDS, Chairman; JOHN DUNN, Treasurer; EDW. HARRIS, Secretary; W. BARKER, JAMES BROWN, J. CHENNELL, JAMES GREEN, G. HAMPTON, J. TACK, J. S. LINDSAY."

MR. THOMAS, in his reply, bore testimony to the loyal support he had always had from the staff, and presented each member with a portrait of Mrs. THOMAS and himself.

FLOWERS IN SEASON.—Messrs. KELWAY send us a selection of magnificent Gladioli, robust in habit, large in flower, perfect in shape, rich and varied in colour. To be sure, the flowers all face one way; but that is esteemed a special virtue in Gladioli. The most noteworthy varieties are Nilus, with magenta-coloured flowers; Taunton Dean, salmon-pink, with white at the base of the segments; Lord Roberts, of a similar colour, but with less white; Mrs. Wood, rich crimson; Sir Evelyn Wood, reddish-crimson; Governor Cleveland, rich rose, with white stripe; Regalia, pale magenta; Lady Llangattock, salmon-pink, with white stripe; and Kenwyn, pale buff, tinted with pink.

"GUIDE TO THE GLASGOW BOTANIC GARDENS."—This guide to the gardens and the conservatories and greenhouses is by Mr. C. SHERRY, and appears at an opportune moment, when the exhibition at Glasgow is drawing many visitors to the city. The garden has a famous history, for it was here that Dr., afterwards Sir, WILLIAM HOOKER succeeded in introducing so many novelties and interesting plants, the Professor availing himself of the opportunities furnished by his influence with Glasgow merchants and shippers. There is first in the book before us an introduction, giving a brief history of the gardens, then accounts of the glasshouses and descriptions of the more notable plants therein, which should enable the most unlearned to recognise the specimens. Next is given an account of the hardy herbaraceous plants, arranged according to their natural orders; and, after this, lists are published of the principal Musci, and Hepaticæ, and fungi, and of the birds to be found in the gardens. Among the birds, it is curious to find the singularly sparrow-hawk named first, and as a "too-frequent visitor." The Guide has many illustrations, and should prove useful to non-botanical admirers of the Gardens who wish to understand a little about the collections around them. The book is published by DAVID BRYCE & SON, Glasgow.

HANDBOOKS FOR THE HOLIDAYS.—Many attractive handbooks written for intending holiday-makers, have reached us. Among these is vol. 12 of the Homeland Handbooks, "Dulverton and the District; the Country of the Wild Red Deer" (second edition), by F. J. SNEEL (St. Bride's Press, Ltd., 21, Bride Lane, Fleet Street). This volume treats of How to get to Dulverton; Dulverton, its scenery and story; Exmoor sheep and ponies; for fishermen; stag, fox, hare, otter, and badger-hunting; flowers and Ferns, and pleasant places on the Exmoor border. This addition to the series is quite equal to its forerunners; it is lightly written, and plentifully illustrated.

"Views of Hastings and St. Leonards, the popular Health and Pleasure Resort," is the name given to an attractive album of pictures, giving a good idea of the watering-places under discussion. There is a preface, dealing with the historical and other attractions of the town, and the little album is a pleasant variation from many similar books because it has no

advertisements to distract the reader from his chief subjects of interest. The publishers are F. T. PARSONS, LTD., 11, Claremont, Robertson Street, Hastings.

The Great Eastern Railway Company sends us some "annotated time-tables" concerning the Cromer and Mundesley expresses. There is a brief commentary on the objects of interest along the line, and some pretty pictures, which should still more attract visitors.

THE JERSEY POTATO CROP.—A Jersey correspondent kindly forwards us some interesting statistics relating to the yield and value of the Potato crop from May 1 to July 20:—

Date of Sample.	Tons.	Average Weekly Price.	Weekly Totals.
1901.		£ s. d.	£ s. d.
From May 1 to May 15	1,215	27 1 8	1,656 10 0
From May 15 to May 22	1,275	27 1 8	1,647 11 8
From May 22 to June 1	1,215	27 1 8	2,922 11 8
From June 1 to June 8	1,260	25 8 4	6,504 18 4
From June 8 to June 15	1,260	25 8 4	6,168 0 8
From June 15 to June 22	1,260	25 8 4	6,256 0 8
From June 22 to June 29	1,260	25 8 4	7,068 0 8
From July 1 to July 6	1,260	25 8 4	4,200 0 0
From July 6 to July 13	1,260	25 8 4	4,780 0 0
From July 13 to July 20	1,260	25 8 4	3,214 4 4
Total.	13,170		58,913 13 8

From this statement it will be seen that the amount exported was approximately 51,750 tons. This is the lowest tonnage since 1887, when just over 50,000 tons were exported. This of course points to a poor crop, but it must also be remembered that less land was in Potatoes this year than for some considerable time past. The monetary return for these 51,750 tons was £320,901 15s., the smallest result since 1890, and almost £125,000 less than last year. In 1887, when the tonnage was less, the amount received was just over £100,000 in excess of this year. From May 1 to May 18 the average was 52 18s. 8d. per ton, while for the last six days, that is from July 15 to July 20, the price was but 25 8s. 4d. per ton. The heaviest days were from June 10 to June 15, when 214,155 packages, representing 11,900 tons, were exported. From May 27 to June 1, £13 2s. was the average price. After this latter date, however, there was a big drop, and the next six days' average was only per ton, and the next six days' show but an average price of 25 8s. 4d. The following table shows the amount and value of the Potato-crop each year from 1883 to 1901, both inclusive.

Year.	Tons.	Value.
1883	39,468	262,472
1884	53,655	375,841
1885	18,224	139,074
1886	64,529	369,155
1887	59,674	423,588
1888	69,988	212,169
1889	52,590	264,417
1890	54,199	255,681
1891	66,410	457,942
1892	66,292	376,265
1893	57,762	327,366
1894	69,695	462,995
1895	54,280	259,989
1896	64,583	435,392
1897	53,555	362,274
1898	56,227	398,299
1899	65,040	439,424
1900	54,942	435,572
1901	51,750	326,904

MR. MARTIN SUTTON.—In the absence of his Excellency M. CAMBON, the French Ambassador, M. REY, Officier d'Academie, yesterday, at the Abbey Hall, Reading, in the presence of a large assembly, presented to Mr. MARTIN J. SUTTON, head of the firm of SUTTON & SONS, the insignia of the Ordre du Merite Agricole, as a further recognition by the French Government of Mr. SUTTON's successful efforts in the improvement of grass and arable husbandry in France and England, and especially in the advancement of agricultural education in both countries. Mr. SUTTON was decorated with the Cross of the Legion of Honour by the President of the French Republic in 1878, for international services rendered to agriculture.

LILIAM SULPHUREUM.—Messes. T. WARE sends us a flower of this species, sometimes erroneously called L. Wallichianum var. subpernum, and sometimes L. ochroleucum. It has long, funnel-shaped flowers, 6 to 7 inches long, with narrow, oblong, acute segments, recurved at the tips, the inner ones broader than the outer; all white externally, flushed with primrose-yellow, and marked with a central line of pale purple internally; deep yellow in the centre. The anthers are golden-brown, the stigmas 3-lobed, club-shaped. The flower emits a powerful fragrance. A coloured figure is given in the *Botanical Magazine*, tab. 7257.

THE SOCIETY OF LANDED ESTATE AGENTS.—We have pleasure in announcing the inauguration of the Society of Landed Estate Agents, the principal objects of which are: (1) To promote and protect the interests of the profession. (2) To advise by mutual conference on all matters of practice relating to the management of landed estates. (3) To disseminate information by means of publications, correspondence, &c. (4) To watch legislation on matters affecting the interests of agriculture and land generally; and (5) To provide a centre in London for members. The provisional Council consists of the following gentlemen: Colonel Halifax Wyatt, for many years agent to the late Earl of Sefton, K.G., President, *pro tem.*; E. F. Chamber, Esq., agent for the Rolle estates, North and South Devon; Dudley W. Drummond, Esq., D.L., J.P., agent for the estates of the Right Hon. Earl Gwendor, Sir James Drummond, Bart., and others in South Wales; Reginald C. Glamville, Esq., agent for the Antony and other estates in Cornwall; Godfrey Lipscomb, Esq., agent for the Margam estates, South Wales; E. G. Wheeler, Esq., Chief Commissioner to His Grace the Duke of Northumberland; and the Secretary (*pro tem.*) is Mr. William Broomhall, 16, Cockspur Street, Pall Mall, S.W. Membership is restricted to landed estate agents, their pupils and assistants.

HOME CORRESPONDENCE.

THE LATE MR. JOSEPH MEREDITH.—I should like to add one small tribute to the kindly disposition of the late Mr. Meredith, as what little I learnt about the special sort of cultivation needed by the Madresfield Court Grape was given me by him. He was really the man who first brought to light the wonderful capacity of this grand Grape. The first exhibition bunches of this Grape I saw were those he staged in Liverpool twenty-four years since. They were not monstrous bunches as we now see them, but they had extremely fine berries, even in size, and covered with that dense bloom which makes all the difference in examples of this Grape. Mr. Meredith at that time had one Vine growing near the partition of a small vinery, and seeing how suitable the variety was for extension, he removed the partition and gave the Vine much greater space. It was, however, specially in the cul-

ture of that prince of Grapes Black Hamburg that Mr. Meredith became famous—and certainly the existing conditions were none too favourable. The small lean-to vinery from which he cut his grand examples of this Grape had an eastern aspect; but, as Mr. Miller says, health of foliage was his leading feature. When showing me, with pardonable pride, these Vines, along with the Madresfield Court above alluded to, he endeavoured in his kindly and forcible manner to show the absolute necessity of obtaining and maintaining perfect foliage, as without this, he said, "you cannot have satisfactory grapes." All practical Grape-growers know that this is quite true, and experience shows this to be true, and true also of the opposite, *E. Molgineux*, [Mr. Meredith showed, at the Royal Botanic, Regent's Park, on July 5, 1865, the biggest bunch of Black Hamburg Grapes of which we have any record, viz., 9 lb. It had six shoulders, each as large as an ordinary bunch, and the fruit was jet black, and had a beautiful bloom. Ed.]

GOOSEBERRY GUNNER, ALIAS COBHAM.—I notice you refer to Gunner as the old yellow hardy variety. My experience of Gunner is that it is a dark green both inside and out, more round than oval, large, very hairy, an excellent cropper, and one of the best early dessert Gooseberries grown. In east Kent it goes by the name of Greengage or Guiner. With reference to Howard's Lancer, it is one of the finest flavoured late Gooseberries, similar in appearance to White Lion, quite as large, but more oval. I have seen bushes 5 to 6 feet through the centre, and nearly as high, carrying a bushel of fruit. Although it is a very late Gooseberry to pick ripe, it is ready as one of the first to pick green. I quite agree with the editor's remarks, that they are two good things too long overlooked, W. H.

BOUSSINGAULTIA BASELLOIDES (p. 155).—This luxuriant-growing plant is quite hardy here, having been planted at the foot of a south wall ten years ago, and it has received no protection at any time. The shoots get killed down by the first autumn frost, but throw up strong young growths again towards the end of May, which reach the top of the wall (12 feet) by the end of July, producing its small, white, fragrant flowers early in August. Our only trouble with it is to keep it from encroaching on other creepers, too much, *Charles Dixon, The Gardens, Holland House, Kensington.*

There can be no doubt of the complete hardiness of this plant. I have grown it here, out-of-doors, for certainly over twenty years, and I do not think any winter would hurt it, though its roots are absolutely on the surface. It dies down every winter, but by the middle of June it finds its unassisted way up a wall, and grows 10 feet or more in that time. *H. N. Ellacombe, Bilton Vicarage.*

PELAGONIUM ENDLICHERIANUM (p. 119).—You suggest that this might be used for hybridising purposes, to get a hardy variety. Would not *P. australe* do better? It is more hardy, and the flower, though small, is perfect. It seeds freely, and the seedlings come up everywhere; in fact it is almost a weed. I enclose flowers. *Henry N. Ellacombe, Bilton Vicarage.*

SOME EXCELLENT PEACHES.—On Monday, August 19, I had the pleasure of paying a visit to Moor Park, the beautiful residence of H. Williams, Esq., near Harrogate; and amongst the many things of interest, I noticed what I may say was the finest lot of Peaches I have seen for many years. The variety which took my attention most was a variety which the gardener, Mr. G. C. Warrior, informed me was "Exquisite." It is a young tree, and carried about forty very fine fruits of a very high colour, and excellent vinous flavour. It is a variety worthy of more extensive cultivation. My friend has also a very promising lot of *Chrysanthemums*. *Geo. Snelh, Barnley Gardens, Olney.*

SWEET-FRUITED STRAWBERRIES.—Just a word in appraisement of some of the well remembered varieties of bygone years. The

are many persons to whom the acidity of some of our fine, large, new varieties of Strawberries are distasteful, and who would gladly go back to the popular varieties of fifty years ago, which had not the rather doubtful property of briskness and sprightliness to the extent of setting one's teeth on edge. I may instance the Hawthorn in several forms, Trollope's Victoria, the plant a great bearer, and a fruit round and pinkish, of not quite the largest size, and that was not good for travelling; but as it was not then the custom for a private family to sell its garden produce, that was of no account. Then there was Keen's Seedling, which few will grow now because it is not big; but it is very sweet and nice flavoured, and hard to beat. British Queen was as highly prized then as now, and later there came out Dr. Hogg, which resembles it in most respects, but will grow in almost any soil, which is not the case with British Queen, and the fruit ripens to the tip; Myatt's Eliza, equal to either of these in flavour, is a good bearer and hardier; Carolina superba has fruits of a very large size, ovate, and regular; few surpass this variety for flavour, although many do so in fruitfulness. The writer has had it growing in a grass orchard, where it received no more attention than an occasional dressing of dung; the variety bears well under the shade of trees. Frogmore Late Pine is a variety that should not be omitted, for the flesh is tender, juicy, red throughout, and richly flavoured when quite ripe; it is late, and a free bearer. Those who are not captivated by mere size may grow that very early Strawberry Black Prince, which has small obovate-fruits of a dark red colour, and prominent seeds. Along with these old varieties, which I fear are in too many gardens being elbowed out by the more showy Nobles, Royal Sovereigns, Waterloo, and Trafalgars, mention should be made, I think, of the richly-flavoured novelty Veitch's Perfection, a cross between British Queen and Waterloo. It has great sweetness, and a flavour markedly resembling that of British Queen. There are other old varieties having a sweet, pleasant flavour, but their inclusion would make my note unduly long, and I refrain therefrom; and the names and descriptions of the new, are they not to be found in all present-day fruit nursery-men's lists? *Meator*.

BASIC SLAG.—For the last five years I have used basic slag largely—many tons per year—on various crops, and have found it very successful in all instances save one. This curiously happened in two fields, but with the same crop, viz., yellow Turnips; with 2 cwt. superphosphate of lime, I used the same quantity of basic slag per acre when drilling the Turnips in July. The Turnips grew away freely at the first, but in the autumn they commenced to rot, and before Christmas nearly all had disappeared. In one of the fields I used 1 cwt. superphosphate per acre alone on 3 acres as an experiment, alongside the basic slag. In this instance not a single Turnip was lost, although every other condition was the same. Since then I have not employed basic slag for roots, but intend to give it an extensive trial for the next season's Swede crop, as an experiment against the growth of "finger-and-toe" in this root. I have employed this manure, too, in Apple culture, but I cannot say the results have been at all satisfactory, certainly not to the same extent as farmyard manure. It is with grass that my experiments with basic slag have been the most extensive and satisfactory. Having over 100 acres of grass-land in hand, and this not satisfactory, I endeavour to improve a certain number of acres annually. As early in November or December as possible, I mix 8 cwt. basic slag and 1 cwt. kainit together, and spread this evenly over an acre, using one of Ben Reid's Basic Slag Distributors, which does the work so much better in every way than can be done by hand. Some persons may think this is an enormous quantity to sow over an acre; well, it is a good dressing, but I find it lasts with striking results for four years, and perhaps longer. Certainly the results justify

the outlay. The grass is so much thicker, the "herbage," as it is termed here, is so much improved; many sorts of Clover grow where not any was to be seen before. Even if nothing was added to the pasture in weight of grass, the addition of the Clover is well worth the outlay, as these plants make all the difference to the pasture, whether it is intended for hay or feeding. When grazing the flock, the shepherd can point out the spots where basic slag was used, even if he did not know where it was applied, as he finds a difficulty in keeping the sheep away from those portions, for they evidently find the grass so much sweeter there. It is said to be an excellent stimulant for Wheat crops; in that case it should be applied when sowing the Wheat in October. I may say that the soil here is somewhat heavy in character, although not wet, owing to the presence of so many flints. Not far from here excellent results have been obtained on grass-land which is of a gravelly nature. *E. Molyneux, South Hants.*

HELIENUM PUMILUM MAGNIFICUM.—It, as Mr. Perry says, this plant is a cross between *H. autumnale* and *H. pumilum*, it is unfortunate that it was not given another name, as the present one would lead anyone to think that it is simply a large-flowered form of *H. pumilum*. It does partake much of the character of that useful border flower, but it is a much superior plant. As it is growing in my garden it proves one of the best of the yellow Composites, which are now so plentifully in bloom. It has proved, also, a good dry weather plant, and is thus acceptable in a garden where summer droughts tell badly on flowers which do not like to be dry at the root. It is also of a good, erect habit, and in a rather sheltered corner has stood erect without stake or tie—a circumstance which has added much to its beauty. In my light soil it grows about three feet high, and bears a number of solitary soft yellow flowers nearly three inches across. The forms in which it was referred to in the *Gardeners' Chronicle* of July 28th, 1898, were not too complimentary, and one is grateful for thus having been introduced to so good a plant. *H. Arnott*.

PRUNUS PISSARDI FRUITING.—Some little time ago a correspondent in the *Gardeners' Chronicle* doubted if *Prunus Pissardi* ripened its fruit in this country. I enclose one taken from a bush that is growing here—the only fruit I can see on it. The severe frost that occurred while the tree was in flower is no doubt the cause of the poor crop. Two years ago this and another bush carried several fruits which ripened nicely; but I cannot say I appreciate the flavour of them. *James Mayne, Bilton Garden, Devonshire.*

HEMEROCALLIS AURANTIACA MAJOR.—I have been waiting patiently for three years to see a bloom of this plant, and was rewarded by seeing my first bloom on August 10. It was of a beautiful soft orange colour, larger than the double form of *H. fulva*, with broader foliage, but not so tall, about 15 inches. It is far and away the best of the race I know, and one of the best large herbaceous plants I have seen for many a day. I have never seen the fact of its blooming mentioned in your paper, and not long since a correspondent wrote and suggested that England was not hot enough. This looks as if it did not bloom freely. It seems to increase slowly, and I take it that it wants age. Mine is a very poor sandy soil, *W. R. Fryer, Verwood Manor, Wiltshire.* [This is, by no means the first time this handsome variety has flowered in this country. One of the earliest blooms exhibited was that figured in the *Gardeners' Chronicle*, July 20, 1895. Ed.]

LILIUM CANDIDUM.—It may interest some of the readers of the *Gardeners' Chronicle* to know of our success in sulphuring the bulbs of *Lilium candidum*. In 1898 we had in these gardens a very fine border of *Lilium candidum*, such plants as are seldom seen. In 1899 they were so badly attacked by disease that not a single flower opened. We at once adopted the remedy of sulphuring the bulbs, which was

described in the *Gardeners' Chronicle* at the time, and carried it out to the very letter, with the result that in 1900 they flowered well, although, on account of the lifting, they were not so fine, for they greatly resent this. This year there is still a great improvement. A photograph shows how well the Lilies have done. We hope next year that our Lilies will quite come up to the standard of 1898. *C. Cupp, Gardener, Satis House, Gosford, Suffolk.*

CRASSULA RUBICUNDA.—I have been desirous of acquiring the above plant for some few years. I cannot ascertain where it can be got. I had a plant resembling it sent me under that name, but it proved to be wrong. *C. rubicunda* is a strong-growing plant, has channelled leaves, finely speckled with a dark colour. The leaves are 3 or 4 inches long, stems stout, about the size of one's little finger, and producing in autumn a large head of Roehia-like flowers, but darker in colour. Height about 1 foot or more, according to conditions. A plant was received from the Royal Gardens, Kew, under that name many years ago. I should highly esteem any information of its whereabouts. Surely it must be in someone's keeping, such a beautiful plant as it is. *J. C., care of Editor.*

CULTURAL MEMORANDA.

CUCUMBERS.

LARGE, handsome Cucumbers may suit some people, but those of medium size are better, especially when space is limited. A variety which will grow to the length of 4 inches is large enough for family consumption; and the variety which gives a large number of these is better for the gardener than the long, sparse-fruited ones. In order to cut Cucumbers continuously for a long period of time, the bine must be kept thin, the old barren parts removed, and young bine laid in; and besides this, dressings of suitable materials should be applied when the roots reach the surface of the bed. Dryness at the roots must never occur, neither should the soil be afforded an excess of water. Liquid manure may be applied occasionally, and for this purpose nothing is better than the drainings from a cow-stall. *H. Markham, Wrotham Park Gardens, Barnet.*

SAGITTARIA JAPONICA.

(DOUBLE FLOWERED VARIETY.)

OUR illustration (fig. 51) was taken from a drawing by Mr. Worthington Smith, of a specimen exhibited before the Royal Horticultural Society, on August 13, by Mr. Hudson, gr. to Leopold de Rothschild, Esq., Gunnersbury. It is very similar to our common Arrow-head, but the flowers are much larger and very double. We presume the plant is nearly, if not quite, hardy, and if so it will be a most desirable addition to our "water-garden."

SOCIETIES.

ROYAL HORTICULTURAL.

AGUST 25.—The Dudd Hall on this occasion presented an unusual appearance, exhibits being comparatively few, and the proceedings scarce ample.

The chief features of the meeting were cut flowers of hardy bellflowers plants, a few rhodone hybrids, *Gladious craniavensis*, *Caladiums*, and *Aloesias*; and two excellent collections of fruits, one of them indicative of early varieties of Peas and Apples. Owing to the absence of Fellows and others from London, visitors to the Hall were but few.

Floral Committee.

Pres.—W. Marshall, Esq., in the Chair, and Messrs. C. T. Drucey, Jas. Walker, H. B. May, Geo. Nicholson, R. Dean, G. Reuther, J. Jennings, J. Hudson, W. Bain, W. Howe, C. R. Fielder, C. Dixon, E. T. Cook, W. P. Thomson, E. H. Jenkins, J. W. Barr, G. Paul, and R. C. Nottell.

Messrs. HARRISON & SONS, nurserymen, Leicester, showed a collection of *Pianthus diadematis flore pleno*

and *D. diadematus*, the type with single flowers. The double forms appeared valuable for variety's sake, but in regard to effectiveness, the single-flowered forms are to be preferred, all the fruits occurring in the latter appearing in the former. Alongside of these were bunches of blooms of *D. Heddlewigii*, *D. chinensis flore pleno*, and *D. laematis*. The firm showed about a score of modern varieties of Sweet Peas of good quality for the present date.

Messrs. MAURICE YOUNG & SONS, Milford Nurseries, Milford, W. Saluting, showed an interesting collection

splendens, somewhat larger than the type, and *L. rubrum*. The eighteen bunches of Sweet Peas which he showed in separate colours, were excellent for the time of year (Silver Bank-san Medal).

MR. MAURICE PIERCE, The Nurseries, Christchurch, Hants, showed a very stately and herbaceous perennial, *Gladolius*, bulbous plants, &c. Amongst the *Gladolius* were, besides those whose names are found in our list of Awards of Merit, *G. Minstre* Pichon, rosy-purple with white blotch and streaked with rosy-erimson, a pretty variety; and several of *G. Lemoni*, as Baron

flower *Phloxes*, *Eupatorium purpureum*, *Apera arua dimaeca*, with awns of silvery brown—a graceful subject for bouquet making (Silver Flora Medal).

Messrs. BARR & SONS, 12 and 13, King Street, Covent Garden, W.C., had a small exhibit of hardy herbaceous perennials, Water-Lilies, &c. We remarked *Heliopsis mollis*, *Kuhphoda corallina* superba, a fine, brightly coloured bloom; *C. Patzeri*, several *Monibetrias*, flowerspikes of the old Lobelia cardinalis, *Abstermeria fistulicoma*, many bright-looking *Phloxes*, Tiger Lily, &c. This firm likewise made a great show with cut spikes of *Gladolius gandavensis*, many of them of great beauty, but none received any special award. The bank of bloom, which consisted of about ten bunches, in as many varieties, was faced with cut *Pentstemon* and *Pompon* and other *Dolichus* a Silver gilt Banksian Medal.

A BENSON, Esq., Upper Gifford Park, Surrey, showed flowers of *Lapageria rosea* var. *Bensoni*, which were of a lighter tint than those of *L. rosea*, especially in the interior of the flower; and some of *L. rosea* var. *gattonensis*, which did not appear to differ greatly from the type.

Messrs. CANNELL & SONS, Swanley, Kent, exhibited a plant of *Koehia scoparia*, a plant with linear leaves of a light green colour, 2 to 3 inches in length, and of an exceedingly dense, bushy habit of growth, and forming a pyramid 3 feet in height.

DR. E. BAYNE, Worthing, showed two blooms of *Datura Knightii*.

Messrs. H. & L. CO., NURSERY, Bush Hill Park, Epsom, showed two blooms of *Hippastrum procumbens*.

A plant of *Pteris Betheli* was shown by Mr. G. BETHEL, Hayes Nursery, Uxbridge—a species of a bold spreading habit.

Messrs. JOHN LAING & SONS, The Nurseries, Forest Hill, arranged a semicircular floor group of *Chalcidiums*, 2000 in its longest diameter, and consisting of small plants of the more showy modern varieties (Silver Flora Medal).

MR. JOHN RUSSELL, Richmond Nurseries, Richmond, Surrey, made a capital display with a floor group of *Veronica*s, including the species and varieties *argentea*, *2-riducosus*, *Sanderiana*, *macrorhiza*, *Watsoniana* (very large leaf), *Lowi grandis*, *Martin Calyciae*, *metallica*, *Johnstoni*, *Marcelhanemensis*, and others. The plants were excellently grown, and faultless in foliage (a Silver gilt Flora Medal).

A few *Dolichus*, a few varieties, were shown by Mr. G. S. S. PEEKER HAYDON, Orpington, Kent. They were of good bloom in nice condition.

A variety of *Abernuthera amoena spectabilis*, with a beautiful name *grandiflora*, was shown by Messrs. CANNELL & SONS, Swanley. It is an effective plant, with foliage mostly of a bright red tint.

SIR THOMAS LAWRENCE, Bart., & Mr. FOUN, showed a variety of *Gladolius* known as *Nance*, a flower of blue and purple tints, and a variety of *G. Nanceianus* (sp. *Bicolor*), of a scarlet colour, and having a crimson or red-tinted web with white on the lower segments.

FIRST CLASS CESTRUMS.

Asclepias speciosa *peruviana* *plum*. A fine, well-grown specimen, 6 inches in diameter, shown by LORD ROBERT DE ROTHSCHILD, Esq., Gunpowder House, Apsley Ter., Mr. J. Hudson.

Asclepias speciosa *albina* *plum*. A large, opaque white bloom. Shown by LORD ROBERT DE ROTHSCHILD, Esq., Mr. J. Hudson.

AWARDS OF MERIT.

Chalcidius Leonardii *Lalage*. A flower having a white ground with a blotch of dark crimson on the lower segments. Shown by Mr. MAURICE PIERCE, Christchurch, Hants.

Chalcidius Colchidicus *Callist. Herb.* A scarlet self, with blue splashes of a deeper tint, and some of white on the lower segment. The flower in its widest part measured 1 1/2 inches. Shown by Mr. MAURICE PIERCE, Christchurch.

Chalcidius Callist. Ligea. A climbing variety, with a flower of a rich rose purple tint, and about 3 inches in diameter. Shown by Messrs. BARR & SONS, King Street, Covent Garden.

Chalcidius Callist. Bicolor. A variety of which the foliage is more yellow than green. Shown by Mr. L. KROEMER, Rorania Nursery, Randon Hill, Croydon.

Gladolius Hybridus *Peliceps*. A variety apparently of the *Chalcidius* strain, very large, being 6 inches wide, and all round with white feathering on the lower segments. Shown by SIR THOMAS LAWRENCE, Bart., Bedford Lodge Park.

FIG. 54. SAGITTARIA JAPONICA; HARDY WATER PLANT; FIG. FRS WHITE, (SILE P. 170.)

of *Chalcidius*, *Eupatorium purpureum*, *Apera arua dimaeca*, with awns of silvery brown—a graceful subject for bouquet making (Silver Flora Medal).

MR. ARTHUR W. WARD, Riverside Nurseries, Colchester, showed a small collection of hardy perennials and Sweet Peas, including *Monibetria* *superba*, *Papilion*, *M. Goble* *double*, a large coloured flower, not much expanded, *M. Botton* *grandiflora*, *Lobelia* *lignata* and

Joseph Hudd. Sals. Flamm. speciosa, *Polemonium* *Gold-channema* were shown. The white flowers are very minute, and arranged in branching terminal and axillary panicles. *Stachys amoena* *Chelone glabra* with a pretty tint of blue; *Lespedeza innoxiosa* *ensis*, *Statice* *Boul. de la Haye*, having yellow flowers; *Helianthus mollis*, a fine Japanese species with downy stems, leaves, and calyx, disc and ray of a yellow colour. The blooms have a width of 3/4 in., and the plant a height of 5 feet. We noted *Monibetria* *Golden Sheet*, *Hedysarum multigratum*, *Helenium autumnale* *superbum*, larger than the type, *Verbena longifolia* *subsessilis*, with fine flower spikes of a dark blue colour; *Quadrifida* *speciosa* *rosea*, *Heliopsis* *serotiflora*, a fine big

Orchid Committee.

Present: H. Vetch, Esq., in the Chair; and Messrs. de B. Crawshaw, E. Hill, J. G. Fowler, T. W. Bond, H. T. Pitt, F. J. Thorne, H. A. Tracy, and H. J. Chapman.

Messrs. J. VETCH & SONS, Ltd., sent a most interesting group of hybrid Cattleyas and Laelias, the most attractive among them being the remarkable *Laelio-Cattleya* × *Digbyano-Mendeli*, the flower being much larger and more highly coloured than the typical introductions of M. Mason; L. C. × *Anderiana* (*dicolor* × *elegans*), showing the intermediate characters of the parents; L. C. × *Wellsiana superba* (*Trianae purpurata*), has larger flowers than the type, the petals and sepals rosy-lilac, the broad front lobe of the lip rich crimson, shading to yellow in the throat; L. C. × *Rohm Mesures var. Ena* (*xanthina* × *Schofieldiana*), has bright golden-yellow sepals and petals, and a rich rosy-purple lip; *Laelia* × *Pavonia* (*dendrosa* × *purpurata*), rosy-purple sepals and petals, and crimson lip, lined at the base with darker markings; it has the intermediate characteristics of the parents from which it was derived, and L. *Stella* (*crispata* × *elegans*) one of the most useful of the older hybrids, flowering during a season when Orchid flowers are scarce.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), sent a very meritorious group, considering the advanced season of the year, and was awarded a Silver Banksian Medal. The most prominent subjects in the group were *Cypripedium* × *Chapmanii* (*dellatulum* × *Curtisii*), the dorsal sepal creamy-white, spotted and lined with purple at the base, the unusually long petals richly suffused with crimson, and covered with minute brown spots; the lip purple, shading to white; *Laelio-Cattleya* × *Callistoglossa ignea* (C. *Warszewiczii* × L. *purpurata*), with two flowers; L. C. × *Broomfieldensis* (C. *Dowiana* × L. *pumila* *Bayana*) has the distinct purple longitudinal lines through the lip; *Cattleya* × *Atalanta* (C. *guttata* × C. *Warszewiczii*); *Vanda* *corallina*, *Odontoglossum*, *Oncidiums*, and *Miltonias*, were well represented.

J. J. COLEMAN, Esq., Gatton Park, Reigate (gr. Mr. Boudin), sent a pretty variety of *Odontoglossum* (*trifidians*), and the natural hybrid *Miltonia* *Travassosiana*, a distinct variety of the M. *Regnolii* section, with yellow sepals and petals.

D. B. CRAWSHAW, Esq., Rosefield, Sevenoaks, also sent interesting plants of natural hybrid *Miltonias*, and varieties of M. *Regnolii*.

REGINALD YOUNG, Esq., Sefton Park, Liverpool, showed the interesting *Cypripedium* hybrid C. × *Kuhle* (*canthium superbum* × *Youngianum*).

DREWETT DREWETT, Esq., Kiding Mill-on-Tyne, sent *Cypripedium* × *Bryan* × C. *tonsum* × C. *Levigatum*, and C. *Miss Fanny Wilson*, C. *Standerianum* × C. *Argus*, but the flowers were past their best.

Mr. W. M. APPLETON, Weston-super-Mare, showed *Cypripedium* × *Massalinum* = *superbe* and *Rothschildianum*; C. × *gigas* = C. *Lawrenceanum* and C. *Harrisiana*, C. × *Transvaal* = C. *Chamberlainianum* and C. *Rothschildianum*, showing its origin by the intermediate characteristics of the flower.

LORD ROTHSCHILD, Tring Park (gr. Mr. Hill), sent a fine cut specimen of the rarely-seen *Schomburgkia* *Lyonsii*.

SIR F. WIGAN, Bart., Clare Lawn, East Sheen (gr. Mr. W. H. Young), sent a pretty variety of *Laelio-Cattleya* *Violetta* = C. *Gaskelliana* × L. *purpurata*.

FIRST-CLASS CERTIFICATE.

Laelio-Cattleya Digbyano (C. *Mendeli* (Vetch's variety), derived from the parentage indicated by the name. The flowers are much larger than those of the typical kinds. The flowers wholly of rosy lilac excepting the yellow spot at the base of the lip. It is certainly one of the finest of the Digbyano section of hybrids. Exhibited by Messrs. J. VETCH & SONS, Ltd., King's Road, Chelsea.

AWARDS OF MERIT.

Laelio-Cattleya Robbia Mesures, var. *Ena* (L. *xanthina* × *Schofieldiana*).—The sepals and petals clear yellow, the lip white, suffused and margined with white; petals green on the basal halves, becoming suffused with purple on the margin and at the apex, the whole covered with dark brown spots; the lip deep brown, shading to green. From R. I. MEASURES, Esq., Cambridge Lodge, Floddon Road, Camberwell (gr. Mr. Chapman).

Laelio-Cattleya × *Haroldium* (*dendrosa* × *Hardyana*).—The sepals pale yellow, with slight rose markings; the petals yellow, deeply suffused with rose; the basal lip rosy-purple, shading to crimson at the base and throughout the throat. It has the intermediate characteristics of the parent species. From R. TUNSTALL, Esq., Monkholm, Brierfield, Burnley.

Cypripedium Robbia (*dellatulum* × *Rothschildianum*).—The dorsal sepal greenish-white, lined with broad bands of dark purple. The long petals greenish-white, lined and spotted with dark purple. The lip white, covered with bright rose-purple markings. From the collection of W. M. APPLETON, Esq., Tyn-y-Coed.

Cypripedium Utahi superba (*Harrisiana superba* × *Lawrencei*).—A fine, bold flower, the dorsal sepal green, suffused with deep purple in the central area, the outer halves rose-purple. Shown by R. I. MEASURES, Esq., Cambridge Lodge, Floddon Road, Camberwell.

Fruit and Vegetable Committee.

Present: G. Buryard, Esq., in the Chair; and Messrs. H. Esling, W. Farr, W. Bates, A. Dean, G. Kell, F. Q. Lane, G. Norman, J. Smith, W. Pompat, A. H. Pearson, and W. Wilks.

An extensive collection of heavy fruit was shown by Messrs. S. STONE & SONS, Bonmoss Nurseries, Middlesex. Of Plums we noted Demington's Superb, Bryantonie Gage, Pond's Seedling, Gishorn's Early Transparent, Belle de Louvaine, and Victoria. Apples were shown in baskets piled up into pyramids, with wood-work as the foundation. Very fine were the varieties *Lady Sudeley*, Worcester Pearmain, Royal Jubilee, Grenacher, Williams' Favourite, Red Quarenden, Goodenough's Nonsuch, Beauty of Bath, and Ecklinville Seedling. A few varieties of Pears were shown (Silver Knightian Medal).

A large exhibit of Early Apples, Pears, Plums, &c., was made by Messrs. J. VETCH & SONS, Ltd., Royal Exotic Nurseries, Chelsea, and the various lots were shown in pyramidal form in baskets, as in the other exhibit. All were particularly clean-looking, unblemished examples, and for this early date, of good size. The Demington's Superb Plums and Nectarine Plums were very good, as were the samples of La Constantine (red), and White Dutch Currants. There were nice specimens of Pears—Jargonelle, Beacon, and Williams' Bon Chretien. The finest baskets of Apples were Worcester Pearmain, *Lady Sudeley*, Peter the Great, Bunches' Favourite, Langley Pippin, Early Julian, Beauty of Bath, Early Strawberry, Duchess of Oldenburgh, and Irish Peach (Silver Knightian Medal).

Mr. H. W. BROWN, Esq., Penbald, Mold, Flintshire (gr. Mr. W. Taylor), showed red-fruited Tomato *Klondyke*, seemingly a prolific variety, having slightly corrugated fruit.

A seedling Apple from Mr. C. ROSS, gr. Welford Park, two varieties of Plums, one of Neclaires, two Melons, and a few Damsons, completed the list of fruits shown.

The Lecture.

At the three o'clock Meeting, at which Mr. A. H. Pearson presided, Mr. Baker read an excellent paper on the theory and practice of manuring. He urged the importance of tillage, and of the employment of suitable manures in sufficient quantities, at the proper time; dwelling on the fact that the requirements of the living plant needed more careful study than the analysis of the dead soil. This information was to be obtained by careful comparative experiment, which every gardener could carry out for himself. The necessity for the application of lime under suitable circumstances was insisted on, and the action of nitrate of potash, phosphates, and other fertilisers duly explained.

GLASGOW & WEST OF SCOTLAND HORTICULTURAL.

SHOW OF POT PLANTS AND CUT FLOWERS IN GLASGOW INTERNATIONAL EXHIBITION.

AUGUST 27, 28.—The first of the shows arranged under the joint management of the Glasgow and West of Scotland International Horticultural Society and the authorities of the Glasgow International Exhibition was opened on Wednesday last. The exhibition was one of plants and cut flowers exclusively, a fruit and vegetable exhibition having been arranged for Wednesday and Thursday in the following week.

The show just held was certainly a success, as it ought to be, considering its association with so successful an institution as the Glasgow International Exhibition has proved itself to be.

Groups of miscellaneous plants arranged for effect were very good, but it is worthy of record that the best of these was shown by a "single-handed" gardener. Readers of the *Gardener's Chronicle* will know what that means!

Then the cut flowers were glorious; the Dahlias, the Gladioli, the Roses, the Pentstemons, the hardy herbaceous species, or what are known as "border" flowers, were above praise; and they were shown in profusion. It was exceedingly evident that the Scotsman's forte is

his hardy flowers. He grows them well, and his climate and his soil make this possible. At the same time, it may be pointed out that Mr. MORFHEU, of the Rowledge Nurseries, Surrey, is proud that he has now for the first time beaten the Scots growers in Scotland in a class for Dahlias, having won that for forty-eight show and fancy varieties.

A very weak feature of the show was the section for stove and greenhouse plants. These were very inferior, and this failure is probably due to the fact that of late years Glasgow has not held the large horticultural shows it might do, therefore, specimen plants, that take years to attain an appreciable size, are not forthcoming.

The total area of the tents was 25,000 square feet, and it was well filled. Mr. Hugh M. Mackie and his committee are entitled to congratulation.

GROUPS OF PLANTS AND SPECIMENS.

The "Group" class, a feature nowadays at almost every horticultural show, was represented at Glasgow. In this case the exhibits were upon spaces of 30 feet by 10 feet, and prizes to the value of £10 were offered in this "open" class. The 1st prize was won by Mr. J. G. Gault, gr. to MOKIAS CAWSELL, Esq., Murcia House, Pollok-shields, with an exhibit of much excellence. The best plants in the group were *Codiums*, some of which ranged from 2 feet to 3 feet high, and were of grand colour, not inferior to plants exhibited in the South of England. The exhibit was provided with a background of a steep cork-covered wall of varying height, and its relation to the exhibit itself was not sufficiently close to afford the best effect. The arrangement generally was not so satisfactory as the quality of the plants shown, which included *Panacraus*, *Lilium speciosum*, *Odontoglossum*, *Palmis*, *Cordylines*, *Dendrobiums*, &c. Mr. HUGH DUNSON, Belmont Nurseries, Belfast, won the 2nd prize, and showed a group that in arrangement was commendable in design, but too heavy in execution. This exhibit had not such finely-cultivated and coloured *Codiums*, and it was probably principally due to this fact that the prizes were awarded as described above. In the centre of this group was a fine lot of varieties of *Lilium lancifolium* and *L. auratum*, and at each corner a group of tuberous-rooted *Begonias*. 3rd, Messrs. R. B. LAIRD & SONS, Ltd., Murrayfield, Edinburgh, who introduced into the groundwork a few nettles to represent water. There were nice *Codiums*, *Lilium*, and *Eupatris* in the group. There was one unsuccessful exhibitor.

A smaller class was one for a group of miscellaneous plants to be shown exclusively by gardeners and amateurs, the exhibits to be arranged on circular spaces of 10 feet each. The 1st prize of a Memorial Medal and £5, presented by the Trustees of the Vetch Memorial Fund, was won by Mr. THOS. HALL, gr. to Mr. CAMPBELL, Williamwood, Kemi-hedge; 2nd, Mr. ADAM KNIGHT, gr. to Mr. WOODIE, Millersneuk.

The principal "open" class for specimen plants called for twelve stove or greenhouse plants, not fewer than eight of which were required to be shown in bloom. The 1st prize was gained by Mr. ALEX JACK, gr. to W. CONNELL, Esq., Roselle, Partick, the individual specimens shown by whom were not of striking merit. They lacked size, and were not choice, for the inclusion of *Madame Desgraves* *Chrysanthemum* could not be said to add greatly to the value of a collection of "stove and greenhouse plants." There was a large well-flowered plant of *Vallota purpurea*, carrying seven flower-spikes with five or six blooms each. *Lilium speciosum*, several *Palmis*, a *Yucca*, and two *Begonias*, were also included. The 2nd prize went to Mr. JNO. NEIL, gr. to A. B. MURRAY, Esq., 35, Crawford Street, Partick.

The class for collection of six plants was won by Mr. J. BISHOP, gr. to A. DENTON, Esq., Craigdarroch, Cove, his plants being *Vallota purpurea*, *Statiche*, *Lilium speciosum* var. *alba*, *Sedum spectabile* of very poor colour, and two tuberous-rooted *Begonias*; 2nd, Mr. JNO. NEIL.

Ferns were shown in classes for six and for four specimens. The 1st prize for six specimens was won by Mr. JNO. O'NEIL, gr. to H. B. MURRAY, Esq., 35, Crawford Street, Partick; and the 1st prize for four specimens by Mr. LAND-BOUGH, gr. to Mrs. MUIR, Beechwood, Beuchden.

In a class for two exotic *Ferns*, Mr. MICHAEL RAE, Ferniecha, Biggar, staged large specimens of *Adiantum emarginatum* and *A. gracillimum*.

British Ferns were exhibited better than the exotic species, and the 1st prize collection for nine specimens, shown by Mr. WILLIAM BAILEY, Stewart Street, Milngavie, was praiseworthy, consisting of plants in 12-inch pots, or larger, and of the following species and varieties: *Las-trea crispata*, *Polystichum longe-*

pinna, *Athyrium coronatum*, *Scolopendrium vulgare crispum robustum*, *Polypodium Canbriacum*, *Scolopendrium vulgare crispum* var. *Miss Kilsou*, *Athyrium gemmatum*, and *Lastrea cristata "stem"*.

The best collection of four British Ferns was shown by Mr. Jno. Lyon, gr. to Ma or MOORE, Greenhill, Blandyre.

Early-flowering Chrysanthemums were allotted a class for twelve plants, but the specimens exhibited were not nearly in full flower, and therefore do not call for comment in detail.

There were some very finely grown *Cordylines* (*Dracenas*). The 1st prize for four specimens was won by Mr. Adam Knight, gr. to PETER WOODIE, Esq., Millersneek House. The varieties Lindeni, anandite, terminalis, &c., were about 4 feet high; 2nd, Mr. W. Lansborough, gr. to Mrs. MITCH, Beechwood, Bearsden. The prize in the class for six specimens was won by the same exhibitors, who won in the same order as they did in the smaller class.

Calceolus strebosus in the class reserved for them were capital. Mr. John Gault, gr. to MARGARET CARSWELL, Esq., Mirena House, Pollok-Highly, who won 1st prize for four specimens, had plants 5 and 6 feet high, of good form and colour, with leaves averaging the surface of the pots; 2nd, Mr. WILLIAM LANSBOROUGH.

Tuber plants, or plants suitable for the adornment of the dinner-table, were shown very well, and seemed to indicate that the Scottish gardeners have to make the provision of such plants a matter of the first consideration. The 1st prizes for twelve plants and for eighteen plants respectively were won by Mr. Adam Knight, gr. to PETER WOODIE, Esq., Millersneek. The plants were pretty specimens of *C. cadmeus* and *Cordylines*, with an *Aralia*, *Palm*, &c. The *Calceolus* were splendid, and the only fault that could be urged against the collection was that it lacked variety. The 2nd prize was taken by Mr. W. LANSBOROUGH, and the 3rd by Mr. A. WARD, gr. to M. ALEXANDER KASHLEY, Milliken Park. There were numerous exhibits in this class. Mr. MITCH took the 2nd prize in the class for twelve plants.

The 1st prize for six specimens was won by Mr. A. KELLOCK, Sawmill Fold, Partick, and Mr. JAS. JARVIS, Bala Beva House, West-Bridge, Falkirk, took the 2nd prize.

CUT FLOWERS.

*Dahlia*s constituted quite a feature of the cut flower section of the exhibition. The 1st prize for twelve blooms of *Cactus* varieties was won by Mr. JAS. ROBERTSON, Redcliffe, Johnston, who showed very bright blooms of fine size and quality, 2nd, Mr. J. W. TAY, ELPHIN, 7, Ardenne Street, Kilmarnock, and 3rd, Mr. B. MAINDALE, Sunshill, Cultulloch. The larger class for twenty-four blooms was won by Mr. Peter McGowan, gr. to J. COLVILLE, Esq., Arngowney, Kippen, and amongst a large number of competitors the most successful for the 2nd prize was Mr. JAS. HAITE, gr. to JAMES ABAM (?), Esq., Orchard House, Carluke, 2nd, Mr. GEO. COLE, gr. to Col. HAIRDENSON, Stuart Terrace, East Kilbride.

The show and fancy varieties were shown in extremely large blooms, and the best collection of twenty-four specimens were shown by Mr. JAS. HAITE, Mr. ROBERT SUTHERLAND, Avild Aisle, Kirkcubrick, was 2nd; and Mr. THOS. ROBERTSON, Eastwood, Thordiebuck, was 3rd.

A wonderful display was made by the class for the display of *Balbia* blooms upon a space of 10 ft. by 1 ft., there being as many as eight competitors in the class. Though some of the exhibits ran pretty closely to each other in point of merit, the 1st prize was well won by Messrs. CAMPBELL & SONS, Blandyre, who had very large flowers of the stiff show blooms, also a good selection of varieties for Pompons and *Cactus*, and very few single-flowered. It was a capital exhibit, and the arrangement effective. Apparently there is need for more white varieties among *Cactus* *Dahlia*s. Mr. S. MORIMER, Kowledge Nursery, Farnham, who was 2nd, exhibited a very representative collection; 2nd, Messrs. ALEX. LISTER & SONS, Rothiesay.

For forty-eight blooms of show and fancy *Dahlia*s, the 1st prize was won by flowers from STRAY, shown by Mr. S. MORIMER, Kowledge Nurseries, Farnham. The exhibit contained excellent blooms, and won against a large number of exhibitors, 2nd, Mr. JAS. SMELLIE, Pansy Gardens, Busby, N.B.; 3rd, Messrs. CAMPBELL & SONS, High Blandyre, N.B.

*Cactus Dahlia*s, shown in jasper vases, were very pretty; the best came from Mr. W. GOLD, nurseryman, Durlanbank, Wishaw; 2nd, Mr. JOHN SMELLIE, who however won 1st prize for forty-eight blooms of *Cactus Dahlia*s shown in boxes. This was a very large class, containing numerous exhibits, and the 2nd prize was

won by Messrs. ALEX. LISTER & SONS, Rothiesay; the 3rd, by Mr. W. GOLD, Wishaw.

Pompon *Dahlia*s in vases were best shown by Mr. W. TIESSEDER, Cardiff, and Mr. JOHN IRELAND, Bridgeend Terrace, Kilmarnock, was 2nd.

Ternell were shown in considerable quantities, and consisted of very strong flower-spikes, and large brilliantly coloured flowers. The best collection of forty-eight spikes, in not fewer than thirty-six varieties, was shown by Mr. GEO. MAHER, nurseryman, Prestwick, N.B. Some of the varieties in this collection which showed to best advantage were *Balbia* de Mirbule, *Sultana*, *Grand Vainqueur* an excellent late one, *Fornosa*, and *Thais*. The 2nd prize went to Messrs. HARKNESS & SONS, Bedale, Yorks, who also showed very fine flowers in the freshest condition possible. 3rd, Mr. J. W. CARNEGIE, gr. to M. SMITH, Esq., Rosedale, Prestwick.

The best exhibit of twenty-four spikes of *Glaboli* in the Amateurs' class was shown by Mr. J. W. CARNEGIE, and the flowers were capital, 2nd, Mr. JAS. FORSYTH, 26, Wilson Street, Alexandria, 3rd, Mr. Jas. Bishop, gr. to AICHI DUNLOP, Esq., Craigdoonock, Cove.

The only collection of twelve spikes came from Mr. ADAM BRIDSON, Tweedbank, Innerleithen.

Balbia ones were capital, the varieties having extra large flowers, and the stems were erect in habit. The best exhibit of twenty-four varieties came from Mr. JAMES ROWAT, Glasgow, while the 2nd and 3rd prizes were won by Mr. J. STEWART, Lennoxton, and Mr. ALFRED BROWN, Blandyre, respectively.

The Amateurs' class for twelve varieties was won by Miss GEMMELL, Oneyard House, Kilmanning.

Pinus *Piceas* were of good size, and generally the quality was of average merit. The best collection of twenty-four blooms came from Mr. ALEX. O'BRIAN, Campbellton, and Mr. CHAS. KAY, Gargunnoch, was 2nd. Of the other exhibitors the most successful for 2nd prize was Mr. JAMES PATR, Drumbig, Kilmory.

Orchids. There were six exhibits of collections of twelve spikes, all of which were shown in vessels of twelve to eight handfuls. Excellent flowers were shown by Mr. ALEX. O'BRIAN, Campbellton, the size of them being much larger than we see them in the south. The varieties were *Doris* of Argyle, *Duchess*, *Argyle*, *Belton*, *Nellie* (var. *Battle*), *W. P. A. Sneyth*, *Magnie*, *Corn*, *Sunshine*, *Sutton*, *J. P. E. King*, *Baldie*, and *Lark*; 2nd, Mr. ALFRED MITCHELL, jr., Craigcarrick, Campbellton; and 3rd, Mr. JAS. PATER, Drumbig, Kilmory.

Sweet Peas were shown in two classes. The best collection of twelve glasses of *Sweet Pea*s was shown by Mr. Robertson, gr. to the Earl of LINDSAY, Lomdon Castle, who showed the varieties *Gorgeous*, *Comtes*, *Cardigan*, *Grey Gordon*, *Lady M.*, *Ormsby Gore*, *Greenway*, *Grey Blue*, *Sadie*, *Burpee*, *Comtes* of Paris, *Lady Grey*, *Hamilton*, *Orchard*, *Salopian*, *Lady Mary Curzon*, and *Galypto*. The 2nd prize was won by Mr. ADAM BRYDEN, Tweedbank, Innerleithen, and these also were very good flowers. Altogether, there were seven exhibitors.

The last collection of *Sweet Pea*s, upon a space of 8 feet by 1 foot, came from Mr. COLIN MUIR, gr. to S. STRANOE, Esq., Westwood, Busby, who had very fine flowers shown in Bamboo stands and glasses of varying heights, all stood upon a white ground. Messrs. JONES & SONS, Shrewsbury, were 2nd, and Messrs. KEAR BIOS, Dumfries, 3rd.

Carnations were shown in glasses containing six blooms each, and relieved with natural foliage. The 1st prize for twelve glasses of *Carnations* or *Peonies* was won by Mr. DAVID WALKER, Kilmarnock, some of the best border varieties were contained in this exhibit, and a number of seedlings.

Messrs. M. CAMPBELL & SONS, Blandyre, made a grand display of flowers of *Carnations* and *Peonies* upon a space of 8 feet by 6 feet; they were arranged in Bamboo stands and in glasses, and a great variety of *Carnations* was included in those shown, generally, too, the quality of the flowers left nothing to be desired. 2nd, Mr. THOS. WHITEHEAD, Selkirk; and 3rd, Mr. CHAS. FREEDLAND, Luskhall.

Roses were exhibited in several classes, and were of good size and quality considering the late period of the season. The 1st prize for twenty-four blooms (namely of *H. P.* and *H. T.* varieties) was won by Mr. A. GRAY, jr. Middleton; and the 2nd by COLIN MUIR, gr. to S. H. STRANOE, Esq., Westwood, Busby. The varieties best shown included Maidme Joseph Combe, pale lemon colour, Alfred Colomb, Dupuy-Jamain, Clara Watson, Duke of Wellington, Gustave Digneaux, Crown Prince, Chas. Lefevre, &c.

But in the open classes the quality was very much better than that that already noticed. Messrs. D & W. CROFT, nurserymen, Dundee, who won 1st prize for forty-eight blooms of *H. P.* and *H. T.* varieties, showed capital blooms of surprisingly fine size, good form, and high colour. Particularly noticeable were *Chas. Lefevre*, *Ulrich Brunner*, *Victor Verdier*, *Maidme José Chateaux*, *Capt. Hayward*, *Comtes* of Carillon, *Comte Planchon*, *Horace Vermet*, and *Caroline Testout*, 2nd, Messrs. A. DICKSON & SONS, Newtownards, Ireland; 3rd, Messrs. DAVID ROBERTSON & CO., Mossend Nursery, Helensburgh.

The best collection of twenty-four blooms of *Teas* or *Noisettes* was shown by Messrs. ABAM & CRABHILL, Fernfield, Ribblesdale, Aberdeen, and they staged a very pretty exhibit of moderate-sized, fresh-looking blooms of good colour. Mrs. Ed. Maxley, Inverke, Mevha, 2nd other new varieties were included. Mr. GEORGE PERKINS, ONYOND, the excellent grower of this section of *Roses* in the South, had to take 2nd place; but by the best two other exhibitors, namely, Messrs. D & W. CROFT, Dundee, who were 3rd; and Mr. HENRI DICKSON Belfast.

The best display of *Roses*, on space of 8 ft. by 4 ft., was shown by Messrs. JAS. COCKER & SONS, Aberdeen. Messrs. CROFT, Dundee, were 2nd, and Mr. HENRI DICKSON, Belfast, and Mr. GEO. PRINCE gained no prize against the Northern in this class.

Early-Flowering P. P. The best twenty-four bunches of hardy herbaceous flowers were shown by Messrs. JAS. COCKER & SONS, Aberdeen, and they were against a number of exhibitors who staged collections of much merit, conspicuous in Messrs. COCKER'S exhibit were *Laluna speciosa*, *Paeonia*, *Calceolus grandiflorus*, &c. Early, a bright scarlet variety, *Pala*, *Le S. S. H.*, *Paeonia crancestra*, *Pala*, *Sylphide* white, *Montbrun*, *Golden Star*, *Lythrum*, *Rose Queen*, *Vermore* longer *Pala*, *Le S. S. H.*, &c. 2nd, Mr. W. W. Young, gr. to Mrs. THOMAS, HAMILTON, Craighall, Kilmarnock. Amongst other *Gallonia canadensis*, *Chelone barbata*, &c. were included in the exhibit, 3rd, Mr. W. STRONACH, Glasgow.

In this class, for twelve bunches was won by Mr. ABAM BRYDEN, Tweedbank, Innerleithen, who had fine field variety of flowers of *Telchira* *cardinalis*, *Lathyrus splendens* *alba*, *Erysimum regin.*, &c.; 2nd, Mr. LINDSAY M. KIMMOR, gr. to CAMPBELL MARRIN, Esq., Drumcree Gardens, 3rd, Mr. WILLIAM YOUNG.

The class for twelve bunches of any sorts of cut flowers from the open border was won by Mr. ABAM BRYDEN, but the selection of varieties in this competition was similar to that in the case of hardy flowers generally. Mr. COLIN MUIR was 2nd.

Spaces of 12 feet by 6 feet were devoted to collections of flowers and foliage from the open border, and the exhibits in this class were grand. The 1st prize was won by Messrs. HARKNESS & SONS, Bedale, who made a splendid show, in which *Glaboli*, *Penstemonis*, *Helianthus*, *Gallonia canadensis*, and *Bedlamium* were conspicuous; 2nd, Messrs. JAS. COCKER & SONS, Aberdeen; and 3rd, Mr. M. O'BRIENSON, Rothiesay. There were four exhibits in this class.

FLORAL DESIGNS, BOUQUETS, &c.

The principal class for cut flowers was one for floral designs (bouquets and baskets) exhibited to occupy a space of 8 feet by 6 feet. There were four exhibits, and the best of these, exhibiting most variety and greatest excellence, was adjudged to be one from Messrs. PERKINS & SONS, Coventry, the remarkable display we meet of almost every large show south of the Tweed. The principal item in this exhibit was a very large floral harp, with strings formed of *Lily* of the Valley blossoms, and the framework of choice flowers in great variety, but including very few *Orchids*. There were floral cushions, alliums, wreath crosses, &c., which, from the florist's point of view, left little to be desired. 2nd, Messrs. W. HADLEY & SONS, 369, Sichelus Hill Street, Glasgow.

A class for six bouquets and six baskets of cut flowers made a great display, there being four exhibitors. The best collection came from M. ALFRED CAMPBELL, Ltd., Boustons, 13, Gordon Street, Glasgow, and the 2nd prize was awarded to Messrs. JONES & SONS, Shrewsbury; but the 1st prizewinner led by a considerable distance, and showed some charming bouquets of *Orchids*; 2nd, Mr. John Gault, gr. to MORRIS CARSWELL, Esq., Mirena House, Pollok-Highly.

A class for two flower bouquets was won by Messrs. PERKINS & SONS, who showed bouquets composed almost exclusively of *Orchids*, *Bananas*, *Lily* of the Valley, and suitable *herb.* 2nd, Mr. M. CAMPBELL, Ltd.; and 3rd, Miss M. SMITH, 112, Ralston Row, Glasgow.

The best bouquets of *Roses* had travelled all the way

from Cardiff, and the 1st prize went to the Welsh nursery of Mr. Wm. TIESSEKER. The flowers were shown in a very fresh condition.

NON-COMPETITIVE EXHIBITS.

Messrs. ASKIN & McASKIN, 84, Mitchell Street, Glasgow, showed a collection of stove and greenhouse plants, in which we noticed good *Codiaeums*, well-grown plants of *Ficus benjamina*, *grandiflora*, *Cordylines*, early-flowering *Chrysanthemums*, Palms, &c.

Mr THOS. S. WARE, Hale Farm Nurseries, Feltham, London, exhibited a very large group of tuber-rooted Begonias in flower, the varieties and cultivation evidenced being of the firm's usual first-class quality.

Messrs. J. HILL & SON, Barronfield Nurseries, Lower Edmonton, Middlesex, exhibited an immense group of Ferns in much variety also some fine plants of *Pteridaceae* variegata, which will answer the purpose in cold houses that the old *Panicum* serves in the hot-houses.

Messrs. SMITH & SIMONS, 35 and 38, West George Street, Glasgow, exhibited a group of stove and greenhouse plants, in which Palms and Pandanus were a principal feature.

Messrs. HIGH LOW & CO., Bush Hill Park, Enfield, exhibited a group of plants made up mainly of choice *Codiaeums*, *Phytolium variegatum*, *Præcoxia Sandersonii*, *Xanthoxis Rothemannii*, *Adianta*, *Erica Marnockiana*, now less seldom seen in the south, but well worth retaining in cultivation. Also *Cattleya gigas*, *C. Leopoldi*, *C. Harrisoni*, and *Oncidium x Mantini*. The *Codiaeums* were of moderate size, but excellent colour.

A collection of Japanese dwarfed trees was shown by Lord HAMILTON, of Dalzellier, Mr. Angus, there being about two dozen specimens.

Messrs. WALLACE & CO., Kilnfield Gardens, Colchester, exhibited a group of flowers of Lilies and Gladioli in variety, giving to one of the tents quite a familiar appearance, suggestive of the Drill Hall, Westminster.

Messrs. STEART & MEIN (Laing & Mathew, Kelso, N.B.), exhibited Golden Pines, also *Etiopium radicans* variegata, *Carnations*, &c.

Messrs. BROWN BROS., U. Clington, showed *Violas* and early-flowering *Chrysanthemums*.

Mr. JOHN THOMAS, Hawick, exhibited a grand lot of Carnation blooms over 200 all on paper collars; *Dahlia*s, *Phloxes* in variety, and a batch of plants of the new Begonia *Caledonia*, and the white *Glorie de Lorraine*.

Mr. H. ECKHARD, Wem, Salop, showed a collection of about a variety of Sweet Peas.

Mr. ANOS PERRY, Windchore Hill, London, N., exhibited early flowers in which some very fine *Tritomas* were a grand feature, also choice *Water-Lilies*, &c.

Mr. CHAS. HAVINE, nurseryman, Jedburgh, N.B., showed collections of shrubby *Phloxes* and *Pentstemons*, both in great variety, and well.

To a very fine plants of *Sarracenia purpuracea* were shown by J. B. MURPHY, Esq., Redlands, Kilmarnock, Mr. Geo. Russell, and from the same garden came an excellent specimen of *Lycopodium scariosum*, but which was a little faded and showed it.

Messrs. LISTER & SONS, Bothesay, exhibited a capital collection of *Dahlia*s, *Ericas*, Sweet Peas, &c.

Messrs. HOLLIS, Ltd., Dereham, Norfolk, made a great display with *Cactus* *Dahlia*s, arranged in 144 pyramids, and in other ways, interspersed with *Asplenium* fronds.

Messrs. DOBIE & CO., Bothesay, and at Orpington, Kent, exhibited *Dahlia*s largely, and in another part of the general exhibition have a permanent stand of cut flowers, *Tritomas*, &c.

Messrs. JAS. VITCH & SONS, Ltd., Royal Exotic Nurseries, King's Road, London, S.W., exhibited a group of ornamental foliage plants, composed of very choice specimens showing excellent cultivation. The *Pteris* and *Crotons* were grand, the colours of particularly varieties being highly developed. These included *Ficus* a few one, with twisted, rather narrow leaves, and other a combination; *Prime* of *Wals*, *Princess* in *Wals*, *Mortoniensis*, *Golden King*, *Albino* (of *W.*); also *Maria* in *Nepenthes*, including the *Variegata* of *N. Mastersiana*, and *N. Dicksonii*. Ferns, including *Platycaulium Vetchii* (new), *Bovillia fibrosa* (robusta), and several varieties of *Asplenium*, &c. *Cordylines* (*laucensis* in considerable variety), including *The Queen* and *Exquisite* (all of very fine colour), *Alseodora*, *Anthurium*, many very large specimens of *Acaulium Macraeana*, *fil.*, *fil.*, *Caladium*s, including the varieties *Mrs. MacLeod* and *Mrs. Payne*; *Dahlia*s, *Ficus radicans* variegata, and some flowering specimens of Messrs. Vetch's *Leucostemum Rhodioides* (new), *laucoides*, *laucoides*,

retarded *Lily* of the *Valley* flowers, &c. The whole were arranged over a groundwork of *Eubolia japonica* variegata and *Adiantum* Ferns.

Messrs. JAS. COCKER & SONS, Aberdeen, showed a collection of hardy flowers and herbaceous and bulbous flowers in great variety.

Messrs. SKINNER, BOARD & CO., Bristol, exhibited Board's patent greenhouse (wire-tension), with plants in it; and the West of Scotland Agricultural College showed a series of pots containing vegetables and cereals, illustrating the effects produced by artificial manures on farm crops.

Awards.

The awards made to non-competitive exhibits were as follows:—

SPECIAL AWARD OF MERIT.

Messrs. JAS. VITCH & SONS, Ltd.
Messrs. HILL & SON.
Mr. T. S. WARE.
Lord Hamilton.

HIGHLY COMMENDED.

Messrs. High Low & Co.
Messrs. ASKIN & McASKIN.
Messrs. Smith & Simons.

CERTIFICATE OF MERIT.

To *Lycopodium scariosum*, from Mr. Russell.
No medals were awarded, but Diplomas (mounted) will be issued in accordance with the above scale of merit.

TAUNTON DEAN HORTICULTURAL.

AUGUST 15.—There were, as usual, seven tents for the various exhibits, and in the two largest of these, where the open class and gardeners' productions were staged, the exhibits were inconspicuously crowded, so great was the increase in the entries over those of last year. The show arrangements made by Mr. J. S. Winsor were excellent; they should be studied by some other societies, for they were perfect, and all the work of making the Awards went smoothly and expeditiously. There was, as usual, a very large attendance.

As is usual at Taunton, specimen plants made a very fine feature. Mr. JAMES CYBER was first from *Cedrus*, and took the 1st prize; Mr. WILLIAM MARSHALL, the President of the Society (Mr. Thomas, gr.), was 2nd.

In the class for specimens there was a stiff fight between Mr. W. FINCH of Coventry, and Mr. CYBER, the prizes going in the order of their names.

With eight fine foliaged plants Mr. CYBER staged magnificent Palms, and the four following *Crotons* in fine character—*Flambean*, *Angustifolius*, *Queen Victoria*, and one other. Mr. W. FINCH was 2nd.

The eight exotic Ferns, Mr. GEO. TUCKER was 1st, he had nicely developed even specimens of *Epiphyllum siphonophora*, *Chelidonium elegans*, *Adiantum Williamsii*, *A. Ledyense*, &c. Mr. H. B. BAILEY, Glastonbury W. Merritt, gr. was 2nd.

The best foliaged plant recently introduced was *Croton Bredii* (improved), from Mr. W. FINCH, but its variation from the type is scarcely perceptible. The best flowering plant recently introduced was *Begonia Chelidonia* (from Mr. J. CYBER, but somewhat disappointing as a show).

The best specimen stove plants were *Asplenium bipinnatum* (Mr. W. MARSHALL) and *Botrychium* (Coker Court variety, which appears to be identical with *R. secundatum*, from Mr. W. A. SANDFORD, Northwood S. Kelly, gr. these two being placed equal. Mr. G. TUCKER had the best specimen greenhouse plants, having a fine *Statis*. Messrs. NEAL had the best *Lycopodium*, having a good example of *Selaginella cocinea*. There were specimen Ferns, *Peltandrium*, *Begonia*, &c.

With four orchids, Mr. W. MARSHALL was 1st with equal examples of *Cattleya Leopoldi*, *C. Edwardi*, *epiphylla*, *C. Sandersoniana*, and *Cypripedium Rothschildii*. Mr. CYBER was 2nd.

Begonia in collections of eight varieties were finely shown by Messrs. W. MARSHALL and G. TUCKER, the prizes being awarded in the order of their names. There were 200 specimens of single and double zonal *Peltandrium*, *Fuchsia* in four forms in the form of *double*, *double*, *double*, and *double* were single specimens also; good *Cockscombs*, which, though rather small, were of good quality.

In the Amateur Division, which includes gentlemanly gardeners, there were also some excellent specimen plants and here the exhibits were as inconspicuously crowded as in the open class tent. With two stove and greenhouse plants Mr. W. MARSHALL was the only exhibitor, and he had 1st prize also for six orchids, Mr. W. A. SANDFORD was 2nd. Mr. H. S. BAILEY had the best four plants in flower, and also the best six exotic Ferns. Mr. W. MARSHALL was 1st with four orchids, staging in this division good examples of *Cattleya Warneri* and *egias*, *Dendrobium*, *D. Devoniana*, and *Cypripedium Rothschildii*.

*Fuchsia*s, *Begonia*s, single and double zonal *Peltandrium*, *Gloxinia*s, *Adiantum*s, *Potamois*, *Colerata*, *Catalpa*s, *Cockscombs*, &c., were all well shown.

There were two classes for groups of plants arranged for effect. In the open division Mr. W. FINCH was the only exhibitor; while Mr. W. A. SANDFORD was 1st in the Gardeners' Division.

OPEN CLASSES FOR CUT FLOWERS.

Messrs. J. TOWNSEND & SONS, Worcester, took the 1st prizes in the principal classes; Messrs. J. CARR & SONS, Frome, were equally fortunate in all the *Dahlia* classes, showing good blooms throughout. Mr. G. HEMPHREYS, Chippenham, was 1st with twelve spikes of herbaceous *Phloxes*; while Mr. A. A. WALTERS, Kensington Nurseries, Bath, won for German and French *Asters*. The Rev. J. D. PRING, North Curry, was 1st with the *Conet* type, and he had the best *Phlox Drummondii*. Mr. S. DORRIS, Wellington, won, as is usual, the 1st prize for spikes of *Gladioli*. *Carnations*, *scilla*, and *Lilies* were shown in good character by Mr. A. R. BROWN, Handsworth; stove and greenhouse cut flowers in bud bunches came from Messrs. W. MARSHALL and G. TUCKER; double and single *Begonia* were finely shown by the Rev. J. D. PRING; highly Perennials by Messrs. W. J. STOKES & SON, Trowbridge; and A. A. WALTERS, Bath; while Sweet Peas were abundantly shown in two classes, the Rev. P. W. BRANCKEN taking the 1st prizes.

A tent was set apart for floral decorations in the class for an amateur exhibitor. Messrs. E. S. COLE & SONS, Bath, were placed 1st, and Mr. J. CYBER, 2nd; both used choice orchids with excellent effect. With an *epique*, Mr. CYBER took the 1st prize. Some excellent hand bouquets were shown by Mr. COLES and Mrs. CUTL.

FRUITS AND VEGETABLES.

were generally good, and with eight dishes, Mr. J. LOCK, gr. to E. SWINNEY, Bath, K. C., Weybridge, was 1st, with excellent *Madresfield*, *Connet* and *Muscot* of *Alexandria* Grapes, *Sea Eagle* Peaches, *Early Rivers* *Nectarines*, *Plums*, *Figs*, &c. Mr. Geo. Hall, gr. to Lady ASHBURTON, Romsey, was 2nd; he had *Black Hamburgh* and *Muscot* of *Alexandria* Grapes, *Royal George* Peaches, *Pineapple*, *Nectarine*, &c. With four dishes, Mr. W. MITCHELL, Romsey, was 1st; he had *Madresfield* and *Connet* Grapes, *Sea Eagle* Peaches, *Pineapple* *Nectarines*, and *Moore Park* Apples. Mr. W. A. SANDFORD was 2nd.

Mr. MITCHELL was 1st with two bunches of *Black Hamburgh* Grapes, also with two bunches of any other black, having *Grass Marie*. Mr. LOCK came in 1st with two excellent bunches of *Muscot* of *Alexandria*; while Mr. Alderman W. H. DAVIES came 1st with any other white, having well finished bunches of *Blackland Sweetwater*; the 2nd prize going to three wonderful bunches of *Foster's* seedling from the Rev. F. STERRY. Old *Cree*, which lacked finish, though very fine in bunch and berry. *Melons*, *Nectarines*, *Apples*, *dessert* *Apples* and *Pears*, *culinary* *Apples*, *Plums*, &c., were all shown, but the pressure of the crowd was too great to admit of the details being gathered.

The open class vegetable tent, as well as that for cottagers, were filled to overflowing with exhibits of a very high order of merit. The special prizes offered by Messrs. SUTTON & SONS, Messrs. JAS. CARTER & CO., Messrs. WEBB & SONS, Messrs. DUNN & BROS., and others, contributed to a large number of exhibits. It would perhaps be difficult to show such a collection of cottagers' produce as that seen at Taunton; the soil of the district appears to suit the various vegetables, and they were seen in very fine character.

NON-COMPETITIVE EXHIBITS.

Miscellaneous collections of plants and cut flowers were furnished by Messrs. R. VITCH & SONS, Exeter; KEW & SON, Lancaster; WHITE, and BARR & SON, London; JARVIS & CO., Chard, DAVIS, Stare, &c.

SWANSEA HORTICULTURAL AND GARDENERS'.

AUGUST 17.—This Society held a very successful show in Swansea Market, and the energetic Secretary and his committee may be congratulated on the result of their efforts. The exhibits generally were of considerable merit, and the vegetables, fruit, chief classes of cut flowers, wreaths, and bouquets, together with a large collection of *Gloxinia*s, exhibited by Messrs. PARSONS & CO. of Swansea, were especially noteworthy.

GROUPS OF PLANTS.

For a group, arranged in a space of 2 ft. by 10 ft., Mr. Carpenter, gr. to Mr. R. KYLE, Llanelly, was 1st; Mr. Hughes, gr. to Mr. RICHARDS, Hill House, Sketty, 2nd.

The twelve-stove and greenhouse plants, Mr. CARPENTER won with nice, fresh-looking plants, including *Croton* *Baron A. de Rothschild*, *Kenia* *Belmoreana*, *scillanotis* *floribunda*, *Rosa* *cochina* *superba*, &c. 2nd, Mr. Hawkins, gr. to Mrs. TREVILLE, Hendre-Idolau.

The class for a collection of eight dishes was won by Mr. J. DUNN, gr., of Mill Hill, THOMAS, Swanage, and Mr. J. HAWKINS, who was 2nd, and had large quantities.

Prizes for six and eight dishes were given to Messrs. HAWKINS, gr., of Swanage, and Mr. J. DUNN, gr., of Mill Hill. Mr. J. HAWKINS, gr., of Swanage, was awarded a silver cup, valued at £20, for his collection of eight dishes, which was a most successful one. Messrs. J. DUNN, gr., of Mill Hill, and Mr. W. ALCOCK, gr., of Swanage, were 2nd and 3rd respectively.

The best exhibition of Sweet Peas was shown by Mr. A. H. BROWN, gr., of Swanage, who was 1st in the district of Swanage. He had a splendid set of four. Mr. A. H. BROWN, gr., of Swanage, was a good 2nd.

For a collection of Peas, arranged for exhibition in a space 20 ft. by 10 ft., 1st prize was a silver cup, valued at £20, given by the President of the Society, Col. W. L. MOORE. The four best exhibitors, who made an admirable display, were Mr. J. TOMES, gr., of Swanage, who was 1st; Mr. W. ALCOCK, gr., of Swanage, who was 2nd; Mr. W. ALCOCK, gr., of Swanage, who was 3rd; and Mr. J. TOMES, gr., of Swanage, who was 4th.

For a collection of Dahlias in a space 20 ft. by 10 ft., a similar cup to the above was given by the President and won by Mr. W. THREBHER, Godalming, who appears to be the most successful in this district.

In a class for a collection of Carnations, in a space 10 ft. by 10 ft., Mr. W. THREBHER, Godalming, secured a cup offered by Mr. H. S. EVANS, of Swanage, with a fine lot of blooms.

FRUIT.

The class for a collection of eight dishes was won by Mr. HAWKINS, with good Grapes, Madresfield, Court and Muscat of Alexandria, Figs, Nocturnes, Peaches, &c. Mr. MITCHELL, gr., of P. TRENTHAM, Ewington, following.

For six bunches of grapes, in three distinct varieties, Mr. MITCHELL was 1st with good Muscat of Alexandria, Boywood Muscat, and Albatros. Mr. CRAFTS, gr., of Mr. VANDER, KILDEA, North, was 1st for Black Hamburgh Grapes; and Mr. T. PILLER, gr., to Miss TAYLOR, Penrice Castle Gardens, for Muscats. There were good exhibits of Peaches, Nocturnes, and Melons.

VEGETABLES.

These were numerous and well shown. In an open class for nine varieties, Mr. PILLER was awarded the 1st prize for a grand collection, every dish being remarkably good.

TWO LABOURS.

A Silver Medal was awarded to Messrs. PARSONS & Co. for a group of Gloxinias, including 1st and 2nd variety but rarely seen with two rows of petals, and to come true from seeds.

Mr. HARRIS, Black Hill Nurseries, was awarded a Certificate of Merit for a collection of miscellaneous plants and flowers.

NATIONAL CHRYSANTHEMUM.

The executive committee met at Carr's Restaurant, Strand, on Monday evening last, after a long interval. Mr. Thomas Hill presiding, there being a good attendance of members and delegates from affiliated societies. It will be remembered that at the last annual general meeting an alternate address was voted to the late chairman of the executive committee. It was on this occasion submitted to the committee previous to presentation, and the execution of the address by Mr. W. B. Pratt, Newgate street, was greatly admired. It set forth that the presentation made by Mr. Waterer "in grateful recognition of his services to the Society as the vice-chairman of the executive committee in 1897-1898, and as chairman of the executive committee in 1898-1899." It bears the signatures of the late Sir Ed. W. Sandford, Bart., and of Mr. Richard Dean as Secretary. A small deputation was appointed from the committee to make the presentation to Mr. Waterer. A good deal of routine business was got through. A suggestion thrown out by Mr. Norman Davis that some form of memorial of the late President should be provided, was considered, and action postponed until the next meeting of the Committee. Resolutions to convey thanks to A. Tate, Esq., and Mr. Tate for their generous offers to the members to visit the gardens of Downside on the occasion of the annual outing on July 5, and for their generous hospitality; and to A. Dixon, Esq., for the privilege of visiting Checkley Court on that occasion, were passed by acclamation; and the Secretary was instructed to convey the Society's acknowledgments to the gentlemen named.

The subject of appointing a new President in succession to the late Sir E. Sandford was mentioned, and preliminary action taken. It was resolved that the annual dinner should be held as usual at the end of November, and a small committee was appointed to deal with the same and to report. Nineteen candidates for membership were duly elected, and the following societies admitted to affiliation: The Stoke Newington, Stamford Hill, and Clapton Chrysanthemum Society; the Gainsborough and District Chrysanthemum Society; and the Olveston Olds Chrysanthemum Society.

READING HORTICULTURAL.

By MR. J. T. COLEMAN, Secretary.

Mr. P. BISHOP, gardener, was the first exhibitor in the class for a collection of eight dishes. He had a splendid set of four. Mr. J. TOMES, gr., of Swanage, was a good 2nd. Mr. W. ALCOCK, gr., of Swanage, was 3rd. Mr. J. TOMES, gr., of Swanage, was 4th.

The best exhibition of Sweet Peas was shown by Mr. A. H. BROWN, gr., of Swanage, who was 1st in the district of Swanage. He had a splendid set of four. Mr. A. H. BROWN, gr., of Swanage, was a good 2nd. Mr. W. ALCOCK, gr., of Swanage, was 3rd. Mr. J. TOMES, gr., of Swanage, was 4th.

For a collection of Dahlias in a space 20 ft. by 10 ft., a similar cup to the above was given by the President and won by Mr. W. THREBHER, Godalming, who appears to be the most successful in this district.

In a class for a collection of Carnations, in a space 10 ft. by 10 ft., Mr. W. THREBHER, Godalming, secured a cup offered by Mr. H. S. EVANS, of Swanage, with a fine lot of blooms.

FRUIT.

The class for a collection of eight dishes was won by Mr. HAWKINS, with good Grapes, Madresfield, Court and Muscat of Alexandria, Figs, Nocturnes, Peaches, &c. Mr. MITCHELL, gr., of P. TRENTHAM, Ewington, following.

For six bunches of grapes, in three distinct varieties, Mr. MITCHELL was 1st with good Muscat of Alexandria, Boywood Muscat, and Albatros. Mr. CRAFTS, gr., of Mr. VANDER, KILDEA, North, was 1st for Black Hamburgh Grapes; and Mr. T. PILLER, gr., to Miss TAYLOR, Penrice Castle Gardens, for Muscats. There were good exhibits of Peaches, Nocturnes, and Melons.

VEGETABLES.

These were numerous and well shown. In an open class for nine varieties, Mr. PILLER was awarded the 1st prize for a grand collection, every dish being remarkably good.

TWO LABOURS.

A Silver Medal was awarded to Messrs. PARSONS & Co. for a group of Gloxinias, including 1st and 2nd variety but rarely seen with two rows of petals, and to come true from seeds.

Mr. HARRIS, Black Hill Nurseries, was awarded a Certificate of Merit for a collection of miscellaneous plants and flowers.

THREBHER, Godalming, secured a cup offered by Mr. H. S. EVANS, of Swanage, with a fine lot of blooms.

ENQUIRY.

RETARDING IRIS ROOTS.—Will some of our readers kindly state if it be possible to retard or freeze iris bulbs in the manner Lilies of the Valley, Spiraes, &c., have been retarded during the last few years?

APPLE: A. W. G. The insect is the grub of the Leopard Moth, Zenzera aestiva. Hook the grub down with a curved wire, or thrust a piece of cotton-wool steeped in a solution of cyanide of potassium into the hole made by the insect; but remember, you are dealing with a most powerful poison.

APPLES: King Hedley. The Apples submitted are undoubtedly infested with the grubs of the Codlin Moth—no other grub was present with them. They are about two-thirds grown, and are very probably a second brood, which, if exclusively proved, is of much economic importance, as so far the species is believed to be single-brooded in this country. You are wrong, however, in supposing the grub "has not entered from the eye of the fruit." In all the examples but one the entrance passage from the eye could be distinctly traced, and in two examples the anterior portion of the fruit was badly eaten, indicating that the grub had fed there for some considerable time. Externally, however, there was very little evidence of their presence; the characteristic pile of frass usually found in the eye of infested fruit was barely traceable in two examples. It is not unusual to find the grub infesting Pears, and they also attack stone-fruit, and have been found in Walnuts and Chestnuts. The smallness of the grubs is due to immaturity. It would be interesting to ascertain how long the grubs remain in the fruit before pupation takes place, and whether the moths from them hatch at blossoming-time or later in the

LETTUCE.

The exhibits of fruit were in general of good quality. The 1st prize for a collection of eight dishes was won by Mr. HAWKINS, gr., of Swanage, who was 2nd, and had large quantities. Prizes for six and eight dishes were given to Messrs. HAWKINS, gr., of Swanage, and Mr. J. DUNN, gr., of Mill Hill. Mr. J. HAWKINS, gr., of Swanage, was awarded a silver cup, valued at £20, for his collection of eight dishes, which was a most successful one. Messrs. J. DUNN, gr., of Mill Hill, and Mr. W. ALCOCK, gr., of Swanage, were 2nd and 3rd respectively.

year; this could be ascertained by rearing the grubs, and if you would care to send about fifty or more diseased fruit to R. Newstead, Grosvenor Museum, Chester, he would be pleased to carry out the investigation and report later through us.

BOOKS: B. W. *The Art of Budding and Grafting*, by Charles Baltet (W. Robinson, 37, Southampton Street, Covent Garden, W.C.).

FERTILISATIONS OUT OF DOORS: *Alpha*. A sandy-loam moderately enriched with well decayed stable-dung and leaf-mould, and not of less depth than 1½ ft. thrown up a few inches above the surrounding soil, unless it be on a natural slope.

ATTILEVA WARSCEWICZI (GIGAS) FAILING TO FLOWER: W. L. *Atton*. Probably your plants were kept too close (not sufficient air admitted) and too heavily shaded during the time the flower-spikes were developing. If they had been suspended near the glass of the roof the flowers would have been more likely to develop satisfactorily.

CORRECTION: Mr. John Kirk, of the Wellington Nursery, Ileanon Chapel, Stockport, was the only Kirk who exhibited in the bouquet classes at the recent Shrewsbury Show, and was awarded two 1st, two 2nd prizes, and one 3rd prize. Our report notwithstanding.

DATE SEEDS: M. A. H. File the seeds at the suture, and stratify them in Coccaut-fibre refuse, sand, or leaf-mould, in the dark in a warm house, and when they have begun to germinate, put them into pots or shallow boxes in heat of 65° to 80°. Report before the roots get entangled or pot-bound.

DECAYED PINE NEEDLES: J. Jackson. If thoroughly decayed, it is as good as any other for garden purposes. It should be screened, or passed through a half-inch mesh sieve, and sweetened by turning the heap several times before it is made use of in potting plants.

FRUIT-ROOM: T. R. Have ground for the floor, which you can coat with sand or fine gravel annually. Have double or rather hollow walls, and let the room stand 3 to 4 feet below the ground-level. Fit it with a double door 1 foot wide, and a small window at each end or in the roof for ventilation; and let there be one or two larger windows provided with wooden outer shutters, as fruit keeps plump for a longer time in a dark place than a light one, and we imagine there are fungus attacking fruits that like not the darkness. If the racks, tables, shelves, and drawers can be made of Willow, Poplar, Beech, Sycamore, or other wood not containing turpentine, all the better for the fruit. Never use hay or straw in the room—it gives a musty flavour to any fruit lying on it. Let the sharp edges of battens used for shelves be bevelled slightly. Above all, use reed or heather thatch, not slates or tiles. If thatch of this kind be employed, and it is 1½ ft. thick, no ceiling will be required. A fruit-room built in the manner described would need no heating apparatus—at least, not south of the Tweed.

ROBE ARTICHOKE: *Enquirer*. We are unable, in the absence of any information regarding the method of culture pursued, to give a reason for the plants not flowering. Are they seedlings, or are they stools of great age?

"ICE APPLE:" W. J. G. Kindly say what is intended by this term; it is unknown to us.

INSECT: J. Hughes. The insect on *Pentstemon speciosus* is the greenhouse *Orthesia* (*O. insignis*), the only coecid of the genus occurring under glass in this country. It is a comparatively recent introduction, and unfortunately a very destructive insect. You should destroy the infected plant, or so cut it down that it may be thoroughly cleaned, using either the paraffin emulsion in common use or Gishurst Compound Soap.

INSECTS ON FERNS: *Scott Elliot*. 1. The curled fronds are pseudo-galls of a species of *Cecidomyia*, commonly met with on bracken.

Collect and burn them as soon as they appear. 2. "Aphids." No. 1. A species of plant-bug. Collect them by beating the fronds over a net or farred tray. 3. "Scale insect." No. Excreta of an insect, possibly of the plant-bug. Fronds undoubtedly in an unhealthy condition. Cultivation probably wrong.

LIME FOR LAWN DRESSING: J. Jackson. Slaked stone or chalk-lime.

NAMES OF FRUITS: D. McIntyre. 1. Royal George, the fruit arrived in bad condition; 2. Emmerton's White (white) Nectarine, but the example was not in character; 3. Pitmanston Orange Nectarine.—A. W. Crismon Galande (large flowers) is probably *Grosse Mignonne*; the *Crismon Galande* (small flowers) is correctly named; and the other variety of the same name (small flowers) we cannot identify with certainty. One needs leaves and young shoots in naming these fruits.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Gurley Wilson*. Aira pulchella.—G. Coon. 1. *Vitis heterophylla variegata*; 2. *Polystichum angulare*; 3. *Davallia hirta cristata*; 4. *Pteris Ouyerdii*.—A. C. T. *Lycium sinense*, so-called Tea-tree.—J. K. *Blechnum boreale*, also called *Lomaria spicant*.—T. R. *Wantage*. *Blechnum boreale* (*Lomaria spicant*).—E. S. R. 1. *Blechnum boreale* (*Lomaria spicant*); 2. *Asplenium trichomanes*; 3. *Lastrea rigida*; 4. *Polystichum angulare*; 5. *Sedum spurius*; 6. *Sedum Telesium* var.—T. R. *Helium autumnale* var. *striatum*. *Lithospermum prostratum*.—W. H. 1. *Rudbeckia speciosa* (Neumann); 2. not recognised; 3. *Helium autumnale*; 4. *Echinops Ritro*; 5. *Eryngium alpinum*; 6. *Lythrum salicaria* var.—S. R. *Worcester*. 1. *Dactylis glomerata* var.; 2. *Tanacetum vulgare*; 3. *Arabis albidula*; 4. *Ceanothus azureus*; 5. *Pseudo-tsuga Douglasii*; 6. *Cryptomeria japonica*; 7. *Artemisia Draunculus*, *Tarragon*; 8. *Origanum vulgare*. Another time do not send more than six.—R. W. 1. *Angreum falcatum*, a Japanese species, growing well in a cool-house; 2. *Xylobium squalens*, figured in *Botanical Magazine*, t. 2955, as *Maxillaria squalens*; 3. *Catasetum viridiflavum*.—A Reader. 1. *Sedum Sieboldi*; 2. *Ophiopogon japonicus* var.; 3. *Diosma alba*; 4. *Soucheus laciniatus*; 5. *Cestrum elegans*; 6. *Achillea Millefolium*, red var.; 7. *Achillea aurea*.—M. C. *Saponaria officinalis*, Soap Wort, double-flowered variety.

OVER-WINTERING ANTIRRHINUMS THAT HAVE FLOWERED: A. W. H. In a sheltered warm spot the *Antirrhinum* is hardy enough to stand the winter in your county (Warwick), provided the land is well drained. In many parts of the south, east, and west, especially near the sea, the plant is really a perennial.

PEACH: W. J. S. Peach Mildew. Too late to do anything now; another season try dusting with sulphur.

PENZANCE SWEET BRIARS: Half-penny. My be struck from cuttings of *Alphitonia* shoots on a slight bottom heat towards the end of the summer, using small pots with one cutting in a pot. The cuttings must have a thin heel of older wood, be under 6 inches in length, have their leaves reduced in size somewhat, and not be inserted deeper than an inch. The proper sort of soil is one consisting of sifted loam ¾, leaf-soil ½, and enough sand to make it very porous. Press this firmly, and insert the cuttings with the aid of a dibber. Sprinkle the frame night and morning, give close, except for about fifteen minutes, and keep close, from 6 and 7 A.M., when the lights may be drawn off. Cuttings 8 to 9 inches long, also with a heel, may be inserted in a bed of sandy soil in a sheltered spot out of doors early in October. These should be arranged at 2 inches apart in trenches having an upright side, and 6 inches

in depth. Before putting soil into the trench, sprinkle coarse sand at the bottom. The soil should be made firm round about the cuttings. The loss will probably amount to 20 per cent. You might try present budding or winter grafting.

PICOETES: *Alpha*. The flower is a purple-edged *Picoete*. We cannot name varieties, and you should send it to a specialist or large grower.

ROSE-LEAVES: C. C., *Blackthorn Hall*. A fungus, which looks like a species of *Puccinia*. Superficially it closely resembles immature specimens of the *Rose-scale* (*Aulacaspis rosae*), but the mimicry must be accidental. Collect the leaves and burn them. Spray in early spring with Bordeaux-Mixture, R. N.

SHEEP-DROPPINGS AND SHOT FOR AN 18-GALLON CASK OF MANURE-WATER: M. J. H. Soot, a peck placed in a canvas bag, and swirled about occasionally. The bag should be hung in the cask free from the bottom. Sheep-dung, if used, should be stirred thoroughly, occasionally, and allowed to stand till it becomes clear, or at any rate less turbid. For the plants you name, 1 to 8 or 10 of water would be strong enough, and once a week is quite as often as it should be given. If the manure ferments much, this can be stopped by using a little white vitriol.

"STICK" INSECT: B. T. Unless you send the specimen we shall be unable to identify the species.

SUPERPHOSPHATE OF LIME AND SULPHATE OF AMMONIA: T. R. Good dressings of quick lime, or superphosphate, would benefit your light sandy soil by making it more compact and retentive of moisture, and be better therefore than sulphate of ammonia; besides, the sulphate is the more expensive artificial. Laves and Gilbert used the following mixed manure for pasture-land:—500 lb. potassium sulphate per acre, 100 lb. sodium sulphate per acre, 100 lb. magnesium sulphate per acre, 800 lb. ammonia salts per acre, 400 lb. sodium silicate per acre. 3½ cwt. superphosphates per acre. This manure produced 4½ cwt. of hay (first crop) per acre during the twenty-fifth session of using artificial. Griffiths, in *Treatise on Manures*. You would find this small book of much usefulness in your work. The publishers are George Bell & Sons, York Street, Covent Garden, W.C.

THIRPS IN A VINERY IN WHICH THE GRAPES ARE NEARLY RIPE: *Oakfield*. We cannot recommend anything better than XL-All, giving no stronger vaporisation than the cubical contents of the vinery demand. Afford plenty of air afterwards.

TOMATO: Vine. The so-called "sleepy disease." We fear there is no cure. Turn out the plants and burn them.

VIOLET: C. Jugs. See last week's *Gardeners' Chronicle*. The balance between the amount of food supplied and growth has been upset; then comes fungus, and completes the disaster.

A MIDLAND GARDEN.

IT is an admirable testimony to the progress of good social feeling that during the last twenty years many wealthy men who delight in their magnificent gardens throw them open to the general public during certain seasons of the year. Thousands of persons of all classes take advantage of this kindly privilege, and gain from it health, enjoyment, and education. We have several such gardens around Leicester. One of them, belonging to W. H. Walker, Esq., is celebrated for its display of Rhododendrons. These splendid shrubs are arranged in a curved bank about a hundred yards long and 4 or 5 yards deep, with the back row about 10 feet high. Behind them is a belt of fine trees, chiefly well-grown Camifers in great variety. At one point the bank is broken by a small excavation, which is filled with hardy Azaleas. When all this mass is in flower, during about three weeks of June, the combination of harmonious colours and lovely forms is enchanting to the cultured eye, and makes a useful impression even on the dulllest.

These grand Rhododendrons have only been introduced during the last half century, from the Himalayas, China, Java, and various parts of North America. When I was a boy, we had nothing but Ponticum and Catawbiens. Now there are a hundred species, besides hybrids.

Mr. Walker's residence, called Birstall Holt, is a picturesque modern mansion,

built of that pleasant Elizabethan mixture of red brick and white stone, and harmonised with its surroundings by creeping Ivies, Jasmines, Roses, and Clematis, that drape the walls and windows with many-coloured blooms. It stands upon a green slope with beautiful distant prospects between the grand old trees that stud the park. With one of its present residents, now an old man like myself, I used to go botanising sixty years ago, and as we toiled homeward along the dull high road he would recite with excellent humour "The Jacklaw of Rheims," which was to me a never-failing stimulant. In a sheltered angle of this house there is a fine specimen of that handsome Chilian shrub *Buddleia globosa* nearly 20 feet high, bearing in profusion its orange-coloured balls of flowers.

It is an interesting study to watch the unfolding of the flowers of the yellow Evening Primrose, *Oenothera biennis*. They open here between 6 and 8.30 p.m. The four large yellow petals are coiled up spirally within the four long narrow lobes of the calyx, and when ready to open they endeavour to unroll themselves, thus exerting pressure upon the calyx, the lobes of which adhere slightly, and will not easily separate. Small slits open between them which gradually lengthen, and at last they give way with a slight jerk, dividing into two sections of two lobes each which rapidly with a visible motion bend backwards. The struggling petals are then free to expand, and in a few minutes the flower is wide open. Each flower lasts only about twenty-four hours, fresh ones opening each evening as the spike lengthens. The anthers discharge their pollen before the flower opens, but they do not fertilise their own pistil, as they are generally too short to reach the stigma, which moreover does not ripen or expand its four arms till several hours after the opening of the flower.

In a previous article I said that I knew of no recent book on sweet-scented flowers. The Editor named two such, and I have met with another, *Sweet-scented Flowers and Fragrant Leaves*, by D. McDonald, 1895, a catalogue of more than a thousand species, with interesting remarks upon most of them. In the *Journal of the Royal Horticultural Society for October, 1898*, there are several important papers by E. W. Burdidge on the same subject. It seems that fragrant odours are now considered to be generally healthful, cooling, and antiseptic, producing ozone and absorbing heat. It is desirable, therefore, that scented flowers and leaves should be freely used in our homes, and in all public meeting places. Scented leaves seem to be more useful than flowers for permanent odour. Their essential oils are less volatile, and their fragrance lasts longer.

I think this has not been a good season for spring-sown Lettuces; it has been too dry and hot. I sowed a mixture of Brown and White Cos the last week in April; by July 10 the White was in fair condition for use, but every plant of the Brown Cos had run to seed. The bed had been thinned, and the best of the thinnings planted out, but with the same result. I conclude that the white variety is the safer to grow, at least in a dry season. On the whole, however, the Chibbage-Lettuces have stood the dry weather better than the Cos. They have been crispier, and have shown less tendency to run.

For tying up flowering plants that require stakes I have been using short pieces of thin wire instead of string or radia, and have found them very effective. My right hand being partially paralysed, it is difficult for me to tie a knot, but by making a hook at each end of the wire I can easily pass it round, join the two hooks, and pinch them close, and I think it takes less time than tying. If the wire is passed twice round, it will hold without hooking. The wire I use is rather thicker than that which florists use for wiring short-stalked flowers.

Among half-hardy annuals, the *Zinnias* take an important position. They are handsome, varied, and very lasting, and they seem to do best in the most sunny places. Partial shade retards them considerably. They come from the sunny land of Mexico, and nothing but the brightest sunshine that England can afford them will satisfy their longing for the light. At the same time they must have plenty of water and good food, or they will be unable to weave their showiest dresses. Those who grow *Zinnias* for the first time are often disappointed with the first blooms, which come out small and poor; but they have the habit, common to many Composites, of growing after the flowers appear to be fully expanded, so that the flowers which look poor at first become in a few days of normal size and colour. On examining a number of flowers with reference to this point, I find that there is much variation. In some plants which are not Composites, the corolla grows after the flower opens, in others it does not. I am not prepared at present to say which is the rule of the majority. *F. T. Mott, F.R.C.S., Birstall Hill, Leicestershire.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

ARCTOTIS GUMBELTONI (*J. D. Hooker in Bot. Mag., September, 1901, tab. 7739b*).

THIS is one of the finest in flower of all the species of *Arctotis*. The diameter of the flower-head is quite 1 inch, and the ray flowers are of the most brilliant orange colour. There is besides a handsome ring around the disc, of dark brown-red colour, formed by a blotch nearly at the base of each ray-flower. The upper portion of the plant is well shown by the accompanying illustration (fig. 55, p. 178), but in the case of the Cambridge plant, kindly contributed by the introducer, the ring has been narrower, and with less uneven margin. It is practically seedless, flowering first without any evident stem, though afterwards producing very fine flowers from branches which bear a few leaves at the base. These branches, however, are not very persistent; they appear to be the last effort of a plant which seems scarcely perennial, and, at last, after flowering, having but slight attachment with a partially decayed stem, they readily break off, and unfortunately are not easy to strike. The plant I have has nearly exhausted itself by flowering, and my only hope of saving it rests in one small shoot which remains upon it.

This fine species has been dedicated by Sir Joseph Hooker to Mr. W. E. Gumbelton, of Belgrove, near Queensdown, Ireland, whose interest in good Composites of this and similar genera is well known. A figure is to appear in the *Botanical Magazine* this year, and I am greatly indebted to Sir Joseph Hooker for his kind information of the name which he pro-

poses to adopt; he remarks, "in tardy recognition of Mr. Gumbleton's services as a raiser and flowerer of many fine new plants."

Sir Joseph Hooker has satisfied himself on the point of novelty, and he has very kindly placed his own MS. description at my disposal. I am able, therefore, to benefit by his diagnosis, and in order to distinguish this new species from all others in cultivation, and from no doubt the great majority of species, but omitting the finer details, which would not be of general interest, it may thus be described:—

Stemless; the entire plant, with the exception of the flower-heads, clothed with their white felt of hair, notable as strongly present and permanent on the upper surface of the leaf; leaves 6 to 10 inches long, narrowed into a long petiole, pinnatifid or pinnatisect, with a large terminal lobe which is crenate or lobulate, lower lobes either wanting in upper leaves, or varying to an inch long with rounded apex, entire; peduncle stout and hollow, much longer than the leaves; flower-heads distinctly variable in size, but about 4 inches in diameter, with ray-florets $\frac{1}{2}$ inch long, and about 2 inches across the middle, of deep orange colour, with brown-red blotch near the base composed apparently of confluent lines. A native of Namsaphaland.

Some time ago I made a note that this plant must be near *A. levis* (*A. grandiflora*, Jacquin), but from that species, as described in DeCandolle's *Prodromus*, it differs in not being fruticose, and in having a decided clothing of felted hair, as well as in having, I think, no semi-amplexicaul leaf bases. From many species it differs in being quite without trace of the stiff hairs which are not uncommon in the genus; from a number it differs in not being distinctly caulescent; and among those with flowers of a yellow kind of colour, it belongs to the much more limited number which have flowers of deep orange, with a ring. In the examination of this plant I have made an interesting observation. The disc-florets, of course, are male in function, and the stigmas exist only as piston-like heads for the purpose of driving out the pollen from the anther cylinder, in order to bear it aloft, for insects to carry away.

This is quite usual, but I find, in the case of *Aretotis*, that the styles project to their fullest extent only in full sunshine, and retract when light is dull. This alone is curious, but I find, further, that when the styles are fully projected, they are acutely sensitive. The slightest touch serves to cause a sharp bending over to the side of the impact, the style immediately reversing its inclination when touched on the other side. The projection of the style appears to be due, mechanically, to its thinning out, and its retraction to the reverse process of thickening. This I thought was new, and the phenomena are, I believe, unknown to the present day physiologist; but, on looking up the descriptions of the species of *Aretotis*, I found the whole matter referred to in the Latin description of *A. aureola*, in the first volume of the *Botanical Register*. R. Irwin Lynch, *Botanic Garden, Cambridge*.

NEONICHOLSONIA, DAMMER.*

A NEW GENUS OF PALMS FROM CENTRAL AMERICA.

AMONGST a collection of Palms which I received from Central America, I found two species hitherto unknown to me, but worthy

* *Neonicholsonia*, Dammer.—Flores monoici; ♂ calyce parvo trifido; corolla 3-petala calyce plus duplo majore; staminibus 6-linea basi tantum connatis, filamentis subulatis; antheris sagittatis staminibus duplo longioribus; pistilli rudimento conico, stylis tribus ima basi connatis; ♀ immaturi ad destitutionem non suppetunt. Baccæ.

Palme aculeis foliis pinnatis; inflorescentia spicata, spatulis? floribus leviter numeris, ternis?

N. Georgii, Dammer, n. sp. Inflorescentia pedunculata, sine pedunculo ad 55 cm. longa; foliis pinnatis vagina ad 20 cm. longa, petiolo glabro quadrangulato, ad 18 cm. longo, rachidi glabra basi quadrangulata

FIG. 55.—*ARETOTIS GUMBLETONI*, Hook. f.: FLOWERS ORANGE WITH A BLACK CENTRE. (SEE P. 177.)

of cultivation, as they form stemless Palms with pinnated fronds of 4 to 6 feet in length. Fortunately I received also some good fresh seeds of one of them, from which I raised some good strong seedlings. The seedlings of *Palms* show generic characters often at an early stage, if not always, which afterwards disappear for a long time. A close study of *Palms* seedlings is therefore of the highest systematic value. The seedlings of one of these species have a character which is very striking. The first leaf is not bilid as in other species of that affinity, but bears four pinnules, two on each side of the rachis.

A closer inspection of the flowers showed that the plants belong to that little group of Central American Palms which is formed by *Asterogyne*, *Calyptrogyne*, and *Pholidostachys*. Of the latter I saw no flowers, so I was obliged to look for *Asterogyne* and *Calyptrogyne*. *Asterogyne*, Wol. (see fig. 56, A), has stamens which are united at the base into a stipitate column; the filaments are short, and bear two free half-anthers, which are united by a broad connective, which covers over the anther as a flat incurved rostellum. The first leaf of the seedling has an elongated blade, which is incised at the apex only to about one-third of its length. *Calyptrogyne*, Wol. (see fig. 56, B), has stamens, which also are united at the base into a stipitate column; but the short filaments bear a bilocellate anther of more or less sagittate form. The connective is short, more or less swollen, and does not reach the apex of the anther. The first leaf of the seedling has a blade which is cleft down near to the base.

The plants which I received from Central America have male flowers, the long stamens of which are united at the base only in a short not stipitate ring, the anthers are long, sagittate, and have a thin subulate connective, which runs out beyond the apex of the anther into a fine mucro. In the centre of the male flower is a short conical rudimentary ovary, with three styles, united somewhat at the base. The first leaf of the seedling is pinnated, with two pinnules at each side of the rachis.

I have named this new genus of Palms *Neonicholsonia*, in compliment to Mr. George Nicholson, when retiring from the curatorship of Kew. A *Nicholsonia* has been already founded by De Candolle, but which now is considered a section of *Diosmodium*.

The species, which is in cultivation, may be named *Neonicholsonia Geopipi*, Dammer. The stemless plant has leaves with the blade about 4½ feet long, the blade being 8 inches long,

the glabrous quadrangular petiole 20 inches, and the rachis, which becomes triangular at the upper part, about 27 inches long. The rachis bears on each side ten or eleven pinnules, which are lanceolate, long, acuminate, with three primary nerves, one central and two marginal, and six to eight secondary nerves. They are 12 to 16 inches long, ½ to 2 inches broad, the first pair opposite, the others alternate, 2 to 4 inches distant each from another, the terminal pair confluent only at the base, 8 inches long, 1 inch broad.

The other species, which I hope to bring into cultivation in a short time, may be named in honour of Mr. Nicholson, and his successor Mr. Watson, for several years associated with him at Kew—*Neonicholsonia Watsoni*, Dammer. This differs in its longer leaves, viz., about 6 ft. long, of which come upon the blade about 6 to 7 inches, the quadrangular petiole 33 inches,

FIG. 56.

B, *Calyptrogyne glabra*, d, Male flower, e, Back of the stamen; f, Stamen from the side.
C, g, Male flower, h, Androecium, i, Stamen, j, Rudiment of pistil.

and the rachis 36 inches. The pinnules, nine to ten on each side of the rachis, are elongate lanceolate, cuneate, 13 to 18 inches long, 1 to 2 inches broad, more or less opposite, 2 to 5 inches distant one from another; the terminal pair being confluent only at the base, 10 inches long, 2 inches broad.

ORCHID NOTES AND GLEANINGS.

LELIO-CATTLEYA ELEGANS VAR.

A VERY remarkable variety of this showy natural hybrid between *Laelia purpurata* and *Cattleya Leopoldi* is flowering with Walter Cobb, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes). The variety, in the size and texture of its flowers, is the nearest to *L. purpurata* which has yet appeared. Its sepals and petals, which are white, tinged and veined with blue, closely imitating the same parts in *L. purpurata*; while the labellum, which is whitish on the tube outside, and yellow inside, has fine dark lines extending from the base to the front, exactly similar to those invariably seen in all forms of *L. purpurata*, the front lobe being purple, with a lighter area at the apex, as in *L. purpurata*. The form of the lip, with its narrow isthmus between the front

and side lobes, is of typical *L.-C.* elegance, though broader than usual. The fine plant bears a ten-flowered inflorescence.

LAELIA MONOPHYLLA.

Several pretty specimens of this neat, dwarf-growing *Laelia*, bearing showy orange-scarlet flowers, are now in bloom in Mr. H. A. Tracy's nursery, Anyand Park Road, Twickenham, where it thrives admirably in small *Orchid*-pans suspended in a cool house. The species is interesting on account of its wide difference in habit from the rest of the genus, and from the fact that it is the only *Laelia* that is not a native of the American continent. It is a native of Jamaica, where it grows on St. Andrew's Mountains at 3,500 to 5,000 feet elevation, in the region of Mosses and filmy Ferns. The earlier importations all perished through being placed in too high a temperature, Jamaica having the reputation of being a hot, moist country. Of late years the difference in temperature between low lands and mountain ranges, even in the same countries, is better understood, and consequently many species from high altitudes which used to be imported only to perish, are now grown satisfactorily in cool houses. *Laelia monophylla* makes a good companion plant to *Sophranitis grandiflora*, and it succeeds well under similar treatment. It is an evergreen species, requiring water at all seasons, but a more abundant supply when growing than when at rest.

ODONTOGLOSSUM ASPIDORHIZUM, Lelou.

In describing this elegant species in the *Gardeners' Chronicle*, September 28, 1895, its discoverer, Consul F. C. Lehmann, says:—"This is beyond any question the most floriferous *Odontoglossum* yet discovered. Not only does every pseudo-bulb produce two flower-spikes at one time, but they do so for two, and even three, years in succession, a character which, though common among *Mastdevallias*, has not been observed among *Odontoglossums*." Under cultivation the peculiarity has been well maintained, and in the few collections where the plant is found, the profusion of its elegant sprays arching all round the plant renders it highly ornamental. Several such in the gardens of T. F. Blackwell, Esq., the Cedars, Harrow Weald (gr., Mr. J. Dinsmore), are in great beauty, and form striking features in the floral arrangement in the *Orchid*-house. The individual flowers may be likened to those of *O. blandum*, but the large white crimped labellums, more or less spotted with purple, are larger than in that species. The sepals and petals are yellow, marked with purple-brown.

SCHOMBURGKIA LYONSII.

This handsome and rare *Schomburgkia* is again in flower in Lord Rothschild's gardens at Tring Park, where Mr. E. Hill, his gardener, succeeds in flowering it and other reputedly shy-flowering *Schomburgkias*, and the allied *Laelia superbiens*, regularly every year. *Schomburgkia Lyonsii* is a plant of noble habit, bearing tall flower-spikes, having on the upper portions handsome flowers, borne on stalks 2 or 3 inches in length, and having at the base of each a conspicuous bract, which falls away when the flowers mature. The flowers are white, beautifully marked with purple. The plants were imported from the hills of Jamaica, and are grown in a light intermediate-house.

Another fine *Schomburgkia*, which has been in great beauty, is *S. undulata*, "Tring Park variety," bearing dense heads of glossy dark purplish-red flowers, with undulated segments.

apicem versus triangulata, ad 6 cm. longa, pinnis utriusque 10-11, lanceolatis longeacuminatis, nervis primariis tribus, uno medio, duobus marginalibus, nervis secundariis parvis prominentibus utriusque 3-4, 30-36 cm. longis, 0.8-5 cm. latis, utrimque oppositis (an semper?) ceteris alternantibus, 5-6.5 cm. distansibus, pinnis terminalibus una basi tantum confluentibus 20 cm. longis, 3 cm. latis. Folium primum plantae juvenis utriusque pinnis binis linear lanceolatis. Habitat, America Centralis, Costa Rica.
A. Welford, *Flower*, p. 51. Inflorescentia pedunculata sine pedunculo, 10 cm. longa, vixle longiora quam species parentibus, lobis pinnatis, vagina, 6-17 cm. longa, petiolo glabro ad 85 cm. longo quadrangulari, rachidi glabro basi quadrangulato apicem versus triangulato ad 70 cm. longo, pinnis utriusque 6-10, elongato lanceolatis cuneatis, nervis primariis tribus, uno medio, duobus marginalibus, nervis secundariis parvis prominentibus 1-7, 31-36 cm. longis, 2-5 cm. latis, pinnis utrimque oppositis, cernis aliquid alternantibus 5-12 cm. distantibus, pinnis terminalibus una basi tantum confluentibus 25 cm. longis, 5 cm. latis. Floribus ♂ 6.5 mm. longis, calyce trilobo, membranae, lobis late ovatis, acuminatis, corolla 3 petala calyce plus duplo longiore, petalis lanceolatis acutis, striatis; staminibus 6 filamentis, antheris in corolla brevem comatis, subulatis, 2-5 mm. longis, antheris sagittatis, 1.5 mm. longis, dorso medio ovatis, connectivo tenui antheris adnatis superante, postilli rudimento comae styli tribus una basi comatis. Habitat, America Centralis, Costa Rica.

COLONIAL NOTES.

THE JAMAICA BANANA TRADE.

THERE are, as is well known, a great many varieties of Bananas. In the *Kea Bulletin*, 1894, pp. 229-311, an account is given of about 100 named varieties existing in various parts of the tropics. They are supposed to have had a primitive existence in tropical Asia, and to have been diffused at a period "contemporary with or even anterior to that of the human race." According to Oviedo, the edible Bananas were introduced to San Domingo, soon after the discovery of the New World, from the Canaries. It is believed they did not previously exist in any of the eastern parts of the American continent.

The Banana hitherto exported from Jamaica, and so largely consumed in the United States and Canada, is the best of the large Bananas, and is highly esteemed by Europeans throughout the West Indies. It was at first cultivated at Jamaica under the name of Martinique Banana; in Trinidad it is called Gros Michel, and in Dominica La Rose. It is now the established Banana of commerce, and over 20,000,000 bunches are annually imported into the United States, and consumed as a dessert fruit.

"There can be no question as to the Jamaica Banana being a first-class fruit. It is large, attractive in colour, and bears transport better than any other sort. When at its best—that is, gathered when fully developed and ripened slowly—it rivals "in lusciousness and delicacy the most delicious Pear." It is almost identical with the celebrated Champa and Ram Kela fruits of Bengal. It is probable that, so far, it has not reached England in the best condition. That, however, is only a question of time.

In the West Indies the Banana (*Musa sapientum*) and the Plantain (*M. sapientum*, var. *paradisica*) are closely allied, but distinct fruits. The former (or Sweet Plantain) is a dessert fruit, while the true Plantain is eaten cooked as a vegetable. In India and Ceylon both sorts are commonly known as Plantains, but they are used differently, as in the West Indies.

The Canary Banana is yielded by another species, originally from Southern China, hence called *Musa chinensis*. The plant is smaller than that yielding the Jamaica Banana, and it is often cultivated in this country under glass. The late E. W. Cooke, R.A., grow it with great success even in London. It is commonly to be seen in fruit at Kew, Syon House, and other gardens. In 1894, two plants were growing at Parkfield, near Worcester, "carrying clusters of fruit weighing between 80 and 100 lb. each." It is generally known in England as the Chinese or dwarf Banana. It is well adapted for cultivation in the Canary Islands, for it is suited to sub-tropical conditions, is easily protected from strong winds, and thrives under irrigation. It is well known in tropical countries, but is not largely cultivated in the West Indies, probably because it is not so productive on a large scale as the Jamaica Banana. It may be interesting to place on record that the introduction of the Chinese Banana from the Chatsworth gardens into the Polynesian Islands by John Williams, the Martyr of Erromanga, put a stop to the famines that previously had devastated some of these islands. The Chinese Banana was found to be much less affected by violent storms which caused considerable damage to the taller sorts.

It has been often suggested that the delicate and luscious Bananas known as "Fig Bananas"

and "Ladies' fingers" should be introduced to this country. They are undoubtedly superior to the Jamaica and Canary Bananas, but the skin is too tender to admit of their being handled for export purposes; besides, the bunches are so small that they would be acceptable only to a very small section of the community. These very choice and desirable fruits, which cannot be largely grown outside the tropics, will probably be unattainable elsewhere for some time. There would be no difficulty in growing Plantains in any quantity in Jamaica, but it is doubtful whether they would suit European taste, and there is the possible difficulty with the cook. A fruit to be eaten raw is easily dealt with, but an unknown vegetable presents difficulties that would take years to overcome. D. Morris, Imperial Commissioner of Agriculture for the West Indies, in the "Times."

WINTER SALADS.

LETUCES.—In order to furnish winter Lettuces, provision should be made some months in advance, and there must be heated pits, horse, &c. Lettuces of certain varieties are the chief ingredients of winter salads, and there is no better time than the present to sow for an early winter supply. Of course, it is now too late for obtaining large blanched heads. A note on winter salads would be incomplete if reference was not made to the useful practice of sowing Lettuce-seed in warmth at this date, and later in boxes or frames; but this can scarcely be termed a winter supply, still it may be had in time to eke out the late summer-sown or midwinter salads.

Let us take Lettuce for furnishing salad from the month of November to March, the month the most critical time of all, for if the Lettuce raised from seed sown at the present time or slightly earlier is much advanced, it will not keep if blanched, and if sown too late, unless the plants are of great strength, they will not pass through the winter safely. Give frame-protection from November. The August sowings will afford the best Lettuces if soil and situation are favourable. Late August sowings are not advisable in north-country gardens, and the sowings in that part of this island must be quite a fortnight, and in certain parts three weeks, earlier than what is deemed proper in the south. I have found it advisable to have a second supply upon which to fall back, and if a sowing be made in cold frames in August, and the thinnings pricked out when large enough, that will be sufficiently early to get a fair growth or root-hold; these plants will then turn in usefully should those in the open ground fail. The seedlings that are left in the seed-bed will afford a February or March supply. So far, we have found it useless at Syon to transplant seedlings in the open, no matter how protected, the damp being fatal to them; on the other hand, there is no great difficulty in maintaining a supply from August sowings up to Christmas; as if, say late in October, the plants are lifted with a ball of earth and the roots are intact, and planted in frames or fruit-cases free of damp, they will last till the time named. By covering with mats in the open, the larger grown plants afford Lettuces well into the month of November; and if quantities are needed, sowings should be made thinly in drills; but we have met with a fair amount of success by planting the thinnings on Celery ridges for a late autumn supply, and the plants are readily covered when frost threatens. By lifting and housing half-grown plants, affording plenty of air in favourable weather, and planting close to the glass, and keeping

a dry air, removing decaying leaves, and affording very little water, good Lettuces are obtained in winter. It is a good practice to strew dry wood-ashes on the surface as a remedy for mildew.

As regards varieties, there are differences in hardiness, and one of the best is Brown Bath Cos, with black seeds; and good Cabbage varieties are Stanstead Park, Hardy Hammer-smith, and Sutton's Intermediate, the latter a dwarf cross between the Brown Cos and a hardy Cabbage. It is never advisable to rely upon one variety, but to sow several, so that if one or more fail, there are others upon which to fall back. Sowing thinly is a most important matter, weak plants being useless for standing the winter. For sowing under glass in August and September, I prefer the Intermediate and the Cabbage types, and of these we sow large breadths in frames, thinning when ready, say, early in October. These are placed in boxes, and furnish Lettuces fit for salads as soon as the supply of lifted plants is over early in the new year, as the plants grown in boxes are afforded cultivation under glass from the start. The varieties grown in heat, seeds of which are sown in December, are Commodore Nutt and Golden Queen, and quite three months are needed for their growth, and they do well if a frame with a slight bottom-heat be afforded them. This method should not be overlooked, as the demand for Lettuce in the early spring is greater than at midwinter.

ENDIVES.

Endives are of a hardier nature than Lettuces, and more easily grown. At Syon, two varieties are grown, namely, the Green Curled and the large round-leaved Batavian. The Batavian should be grown in quantity for winter supply, it being more hardy than the other. August is a suitable time for making sowings for the latest supplies, as plants grown in rich soil, not blanched, and given ample space, are more hardy than those sown earlier, and which are blanched. For a supply from October to March, and later, sow early in July for providing Endive till Christmas, as with no lack of Lettuces, Endive should be saved till as late as possible. The Batavian winters fairly well in a sheltered warm spot in the open ground if the land be thoroughly drained. At Syon the Endive suffers greatly from the dampness of the district, so that frames are largely used to preserve it, the plants being lifted in October or November, and placed therein. I have wintered the latest-sown Batavian at the foot of a wall by covering the plants with dry tree-leaves in frosty weather, and exposing them freely in fine weather. I have made fine sloping banks against a wall, and planted Endive thereon, and by using frame-lights and mats in hard weather, the plants have passed through some very severe weather. The earlier-sown Endives will not need lifting, but merely covering so as to blanch the hearts. Flower-pots of 7 inches in diameter answering the purpose, the leaves being first tied up, and if dry leaves or long dry litter be placed between and over the pots, the Endive can be kept in a good condition for several weeks; but they must not be covered up if frozen, or when in a wet state.

CORN SALADS, &c.

Other plants useful as salads in this country are Corn Salad, not grown so much now as it deserves to be. It is very hardy, and if seed be sown in June and August thinly on well-manured land, it will give a lot of leaves for cutting (the Italian has the largest leaves). In the south, sowings made in September afford leaves in the following March.

Watercress is a valuable salad-plant, which may be grown in pots, boxes, or cold frames for winter use. I prefer to sow seeds for mid-winter supplies, pricking the young plants into boxes or cold frames. Chicory is a plant of such simple requirements that it need only be mentioned. If seed be sown in June, there will be strong roots for forcing in the winter; the Witloof is much the best variety. There are other aids for furnishing the salad-bowl. Dandelion forced is most useful, and the large-leaved French is the best; this needs much the same culture as Chicory. Sorrel and Celeriac should not be overlooked, both being useful, the former being lifted in October, planted in a cold frame, and the young growths cut as required; and the latter stored in the root-house in a bed of soil with heart leaves retained and exposed to the light, for unless it grows the roots wither or rot. Then there are Tarragon, Chives, and Mustard and Cress, *G. Wythes*.

[When are our growers going to copy their American brethren, and grow Lettuces in very large quantities under glass with the electric light? If it pays in the States it should do so here. *Ed.*]

THE AIR-ROOTS OF ORCHIDS.

The spongy covering of the roots of epiphytal Orchids is generally considered as affording a means of absorbing watery vapour. Moreover, they have been considered to have the power of condensing watery vapour, and thus supplying the plant with liquid water. M. Nabeikikh, a Russian naturalist, according to the *Revue Horticole* does not adopt this view, but considers that the spongy coat has the function of protecting the roots against the ill effects of too low a night temperature. Again, the reservoirs for air, "pneumatodes," which occur in the spongy tissue, supply the living tissues with air during the dampest portion of the year. Without the presence of these "pneumatodes," the roots would be suffocated by excess of water and deficiency of air.

Ferns require, as we see at Kew, an acre or so for the accommodation of their representative forms. With very many of these no exotic Fern can compare for delicacy of make and novelty of form; in fact, quite a number of our native types and some of the best, are altogether missing among exotic varieties, and our best plumose Lady Ferns, Shield Ferns, and frilled Hartstongues, stand unrivalled among the Ferns of the world. What then are the secretaries and organisers of our home shows about, that year after year this unique branch of horticulture is practically ignored, and little or no provision made in their schedules for the encouragement of this peculiarly British cult? In all probability the response would be disappointing at first, but a schedule defining exhibits on proper lines, i.e., instead of six or twelve British Ferns, "six or twelve plumose or crested ones, preference being given to the greater number of species," would

FIG. 27.—THE AIR-ROOTS OF ORCHIDS.

BRITISH FERNS AT FLOWER SHOWS.

If an audit were made of the various classes of plants scheduled for exhibition prizes at the innumerable flower shows held in Great Britain during the year, it is a lamentable fact that no class would be found to be so badly represented as British Fern varieties. As a rule, they do not figure at all, even in counties which have contributed most prizes to the Fern hunter; and when they do figure, it is in an insignificant fashion, and as we have noted on more than one occasion, is responded to in a style to fit, the exhibits often being merely huge bunch-grown specimens of little varietal merit and no novelty, and which have periodically carried off the prize year after year by virtue really of their size. No country in the world is capable of even remotely challenging Britain in this particular direction of beautiful and diverse and purely native productions. Several of our native species have varied so much and so widely that a large and beautiful collection can be formed of varieties of one species only; the writer, for instance, has forty distinct forms of our common Polypody, many of which are capable of easy culture in pans, and become magnificent feathery or tasselled specimens of great decorative value. A well-managed frame full of these is a sight for sore eyes. The same and much more, as regards diversity, may be said of the Hartstongue, a complete collection of which would fill a very large house; while the Lady Ferns, Buckler Ferns, and Shield

be a step in the right direction, always provided they were subsequently properly judged, and the award given not on the mere basis of bulk, but of proper and clean culture, and intrinsic merits of form.

The plants should also be named. At the present time British Ferns appear to be popularly appreciated only in the Midlands and the Lake District, where in many of the gardens we may see numerous varieties, and well-grown plants frequently deck the cottage windows, in which situation nothing so well repays a little care and attention as a thoroughbred form of a British Fern. Once established it will last the owner's lifetime, annually donning a new set of fronds, and only now and again requiring repotting and division, should it tend to form a crowd instead of an individual. Requiring as they do no heat in the winter, British Ferns, though worthy of posts of honour anywhere, are pre-eminently plants for folk of limited means, and in thousands of cases where unsightly, leggy Pelargoniums and similar window decorations (2) are used, the owner would get immensely more enjoyment out

of a fine frilled or tasselled Hartstongue, or feathery shield or Lady Fern, if only the horticultural powers that he would educate him or her up to the level of its acquisition. Now, however, when the prize batch of British Ferns at the local show is an eyesore, badly grown and badly chosen, a scarecrow rather than an attraction, the visitors are educated the wrong way about, and accepting these as full representatives, naturally abjure them. *Chas. T. Drury, F.L.S., V.M.H.*

LILIES AND THEIR CULTURE.

(Continued from p. 194.)

"SWAMP" or "BOG" LILIES.—A group of peaty and moisture-loving Lilies peculiar to Western America, having markedly rhizomatous bulbs, whorled leaves, and pendent flowers, which are contracted and tubular below; the apical and greater portion of whose petals are expanded widely or fully reflexed. The terms "bog" or "swamp" Lilies have been applied to them, but such terms require qualifying, as they are likely to mislead the cultivator. The plants revel in a peaty soil and an abundance of water, which must be allowed to pass away freely, or the peat will become sour and sterile, and the bulbs will speedily rot. A position somewhere near trees that would shade them most of the day is necessary for them. If no natural brook or rill exists on the banks of which a plantation of these Lilies could be made, a bed must be dug out 2 feet deep near a good water supply, and filled with spongy peat and leaves, adding a fair proportion of loose sand. If the peat is very light, such as would not hold water in suspension for more than a day or two, add some fibrous turf and mix well together, using the compost in a rough state for filling in. The bed must be drained if the subsoil is a retentive clay. The bed when finished should lie below the level of the surrounding soil to preserve it from the influence of drying winds, and to keep it cool. Plant the bulbs as soon as obtainable, for they lose much of their vitality out of the soil, having no fat scales to maintain them fresh and plump. They are best disposed in colonies at some distance from neighbouring species (some of the rhizomes travel an inch or two every year), enveloping each bulb, and charging the surrounding soil freely with sand, especially above the bulbs, for it is here that free drainage is needed, or the bulbs will rot whilst at rest in winter. Roots are emitted all over the bulb, and they travel in any direction where moisture is obtainable, and it is on this account that water should be withheld till the stem is well above ground, in order that the roots may be driven downwards in search of moisture. They are safe from summer droughts and great heat, whilst in winter they are not harmed by severe frosts. The bulbs keep safe and sound in a fairly moist medium, the roots in the wetter soil below them. This is practically the key to their successful culture, and the conditions under which many swamp plants thrive.

Lilies succeeding under these conditions are emaciated, a slender-growing plant with nodding yellow flowers, freely spotted black. A variety of this (*trubium*) has flowers coloured red externally. *L. emaciated* flowers do not expand to the fullest extent, and much of their beautifully-spotted interior is not seen from above.

L. superbum is a grand Lily, with larger, more reflexed flowers, coloured yellow or orange on the inside, the petals being heavily tipped with red; the inside of the flower is heavily spotted black. It is a tall, strong-growing Lily, of easy culture.

L. parvum, a dwarf, slender-growing Lily in the way of *canadense*, has reflexed petals flushed with reddish-orange on an orange ground colour. It is a very pretty little plant, flowering in the latter half of June. It is scarcely 18 inches in height, and bears but two flowers.

Others, such as *L. Rozzli*, which has brownish, reflexed flowers, spotted and flushed with crimson; and *L. Parryi*, which has buff-yellow flowers, more or less trumpet-shaped, and sparsely spotted with chocolate, represent the choicest of the slender-growing Lilies of this type. These two latter plants require very careful cultivation, as they are not easy to suit. Their flowers are among the most pleasing, though of small size compared with many.

L. Grayi (see fig. 21, p. 69, July 27, 1901), a plant resembling superbum in its manner of growth, but whose flowers are much less showy; and *L. pardalinum* in variety, which does well anywhere so long as it is moist enough, must close my list of Lilies requiring wet places. A new species, *L. Masseyi*, looks like a useful plant of easy culture. *Geo. B. Mallett*.

HYBRID VERONICAS.

I SEND herewith specimens in flower of new hybrid shrubby Veronicas, along with their parents, now in flower for the first time. They were raised about two years ago, and a good number are still to flower, but they appear to differ from each other in some respects. *R. Lindsay, Murrayfield, Midlothian*. [We have added within brackets some notes on the specimens sent by Mr. Lindsay, Esq.]

1. *Veronica Pioneer*.—The result of a cross between *V. Lindsayi*, itself a hybrid, figured in the *Gardeners' Chronicle*, p. 331, 1898, as seed-parent, and *V. pinelcooides*, Hook. f., as pollen-parent; the flowers of this hybrid are of a rich crimson colour, the general appearance like *V. pinelcooides*.

[Glabrescent. Leaves 15 mill.; lanceolate; broad at the base, acute at the apex, concave above. Flower-spikes 25 mill. long, stalked in the axils of the upper leaves, densely many-flowered. Bracts oblong-lanceolate. Sepals oblong-lanceolate, ciliate at the edges. Corolla white.]

2. *V. Forentiner*.—The same parentage as the former, but has light blue flowers. The habit of both plants is good, and they ought to prove quite hardy everywhere.

[Branches puberulous. Leaves somewhat compacted, sessile, spreading, 16 mill. by 12 mill., broadly oblong, rounded, sub-acute, spoon-shaped. Flower-spikes 30 mill., stalked from the axils of the upper leaves; conical. Sepals oblong, puberulous. Corolla white.]

3. *V. Ilacina*.—The result of a cross between *V. Balfouriana*, Hook. f., as seed-parent, and a species from New Zealand, whose name I do not know, as pollen-parent. This is a very pretty plant, but may be slightly tender.

[Branches spreading, puberulous, glabrescent. Leaves subsessile, 15 mill. by 6.7 mill.; oblong-acute, flat. Flower-spikes stalked, loosely panicle, many-flowered; 10 mill. long. Sepals oblong-obtuse. Corolla white.]

[*V. pinelcooides* (Hook. f.).—Shrubby young shoots, puberulous, afterwards glabrescent. Leaves decussate, sessile, spreading obovate, spoon-shaped, acute, 15 mill. by 7. Flower-spikes 13 mill. long, stalked, springing from the axils of the uppermost leaves; pyramidal, 4-sided, 4-angled, 4-tupered. Flowers white, flushed with lilac; half as long again as the bract. Sepals oblong, lanceolate, ciliate at the edges.]

[*V. Lindsayi*.—Branches scarcely puberulous. Leaves sessile, descending, oblong-rounded, spoon-shaped, 22 mill. long by 15 mill. lat. Flower-spikes 25 mill. long, stalked, arising from the axils of the upper leaves; conical, densely many-flowered, each flower half as long again as the bract. Sepals oblong, acute; corolla white, flushed with rose. Flower-buds oblong, pink-tipped.]

CULTURAL MEMORANDA.

AUTUMN PROPAGATION OF HARDY SHRUBS, &c.

THE time is at hand when the gardener may begin to put in cuttings of such plants as single and double-flowered Furzes, *Bupleurum fruticosum*, *Santolina incana*, *Chamaecyparissus* and *S. incana*, the more delicate small-leaved Ivies, the hardier New Zealand Veronicas, *Chamaepetea Casabone* and *C. diaantha*, *Hypericum* of species, *Cineraria maritima*, *Althea frutex* in many varieties, *Heris sempervirens*, *I. gibraltarica*, *I. sempervirens*, and *I. Tenoreana*, among many; *Paulownia imperialis*, ripe young wood; *Bignonia radicans*, *Lavandula* (Lavender) will all strike from cuttings inserted in clean sand, overlying fine-sifted loam and peat, under hand-lights and bell-glasses in partially shady spots.

The wood should in all cases be mature, and the cuttings removed with a heel, and be of a length of from 4 to 8 inches, according to the natural growth of the plants. They should be inserted at from 2 to 4 inches apart, with a little dibber, and abundantly watered in, and the glass tops put over them when the foliage is dry. Attention must be paid to shading during the hours when the sun strikes the glasses, but no longer. Air may be afforded once a week for 30 minutes, just to dissipate over-abundant moisture.

Usually, all the hardier subjects may remain where they are struck till April, or till growth begins, when they should be planted in nursery lines, or potted—pots being best for most of them for one or two years.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables, ante, pp. 88—91.)

(Concluded from p. 155.)

WALES.

GLAMORGANSHIRE.—The Apple and Pear-crops in the gardens here are very heavy, so much so that the trees have had to be propped to save the branches from breaking under the great weight of fruit. The trees are very free of blight, and the fruits are swelling rapidly. Apples and Pears in this district are a fair average crop. Strawberries were very good, but were soon over on account of the drought. *A. Pettigrew, Castle Gardens, Cardiff*.

Pembrokeshire.—Apples are more abundant in the valleys of this district this season than on higher ground, owing to high winds at the time of blooming. The trees were to a certain extent exhausted by a very heavy crop last year, when the orchards on the higher ground bore the heaviest crops; the valley orchards suffered then in more or less from spring frosts. We had no injurious frosts this season. Plums are a very thin crop. The trees were very much over-cropped last year. Cherries are a wonderful crop, some hedges of the wild Cherry here are a very pretty sight. There are more than the birds can keep down, and that is saying a deal. *Geo. Griffin, Slebeck Park Gardens, Pembroke*.

9. IRELAND.

GALWAY.—Owing to a hurricane that passed over this district on the last day of May, the Apples and Pears in unsheltered places suffered very much. The crop is short, and of inferior quality. Small fruits generally are a full crop and good, excepting Strawberries, that suffer very much on our limestone light soil in dry seasons like the present. *Thomas Dunne, Lough Culra Castle Gardens, Gort*.

—Apples promised exceedingly well, but the low temperature and stormy weather about the middle of May caused quantities of the fruit to drop. Young trees are carrying a heavy crop, being more sheltered. Pears did not suffer so much, as they were better set when the stormy weather came. The growths on fruit-trees in general look well for the next year, as we have had more sunshine than usual. All small fruits are heavy, and of fine quality. Strawberry Royal Sovereign gives size and weight, but lacks colour and flavour; Sensation and Guntan Park excels in all points but shape. *A. Porter, Woodlawn Gardens*.

LONDOND.—The fruit crops generally are exceedingly bad, the result, I believe, of an over-cropping last season. We had hail and frost also this season when the trees were in flower. Raspberries are good, but Strawberries were very poor. *J. Rafferty, Castle Forbes Gardens, Newtown Forbes*.

MAYO.—Apples, Plums, and Cherries were injured by winds and a slight frost early in May. Gooseberries, Currants, Strawberries, and Raspberries have borne an abundant crop. Pears, Peaches, Nectarines, in well-sheltered gardens, have done very well. *Patrick Connolly, Cranmore House Gardens, Ballinrobe*.

SLIGO.—Apples are a very poor crop, owing to late frosts in spring, and the birds were very troublesome to the buds. Small fruits are excellent. *J. E. Dawson, Lissadell Gardens*.

TYBENE.—Fruits of all kinds are plentiful. This is remarkable, as we had an exceptionally heavy crop last year. Apples would have been an enormous crop, but the hot, dry weather in May and June, combined with a rather severe attack of grub, caused many fruits to fall. *F. W. Walker, The Gardens, Slon House, Strabane*.

ATLENE.—In this garden Apples and Pears are above the average for the district, but in neighbouring gardens there are scarcely any. Our garden stands higher and drier than the others, consequently the wood is better ripened. In opposition to the above, our Strawberry crop has been much poorer than in neighbouring places. All other small fruits are plentiful. The failure of Strawberries I attribute to poor land and exhausted stock. *James Tivendale, Waterston Gardens*.

KILDARE.—The crop of Apples is far below the average, owing to the east winds. Pears are better, and Plums fairly good. *Frederick Bedford, Straffan House Gdns., Straffan Station*.

KING'S COUNTY.—The fruit crops here are good, although Apples are not nearly so heavy a crop as last year. Nuts and small fruits are abundant. *T. J. Hart, Bivv Castle Gardens, Pursonstown*.

LIMERICK.—The dull, wet, and almost sunless summer of last year partly accounts for the light crops of Apples, Pears, Plums, &c. The wood was not matured, and was killed back much during March by cold east winds. There were green leaves on the above fruit trees until well on into December. *W. A. Boates, Adare Manor Gardens*.

CHANNEL ISLANDS.

GUERNSEY.—The show of bloom was fairly good on trees that did not suffer severely from last summer's drought; but Pears generally were not very promising at the blooming time. The set was very fair, and the promise of quality is good where reasonable help by watering has been afforded. C. Smith & Son, Calvelonia Nursery, Guernsey.

JERSEY.—Apples and Pears showed abundance of blossom, which appeared to set but soon dropped, the effect, evidently, of cold east winds. All stone fruits suffered similarly. Strawberries made a brave show, but dry weather shortened both season and crop. Tomatos as a main crop out-of-doors are a leading feature here. There is scarcely a farm without a breadth of from 1,000 to 100,000 plants now showing a very promising crop, several growers now commencing to pack from the open. Markets should provide empties for very heavy shipping. H. Becker, Caesarian Nurseries, Jersey, July 22.

BOOK NOTICE.

MEMORIES OF THE MONTHS.

A NEW edition of this delightful volume has been published this year. It has been out of print for some years, but now that it is again available, it should be read by every lover of Nature who has not already made its acquaintance. Sir Herbert writes first as a sportsman and lover of animal life; secondly, perhaps, as an amateur historian; and thirdly as a keen observer of plant-life. It is in the last capacity I venture to bring him just now before the notice of the readers of the *Gardeners' Chronicle*. Referring to the extraordinary growth of the Canadian pond-weed in a certain lake, and the consequent loss of certain wild fowl, he proceeds to say:—

"The introduction of this weed (*Elodea canadensis*) into European waters is part of the romance of botany. It is said that a Cambridge professor, having received some specimens from a botanical friend in Canada, inadvertently left them in his washhand basin, whence they were emptied by an over-diligent housemaid into that bourn whence no specimen returns. A few years later, beds of a weed new to English botanists were found to have taken possession of certain reaches in the Cam, and great was the throwing up of scientific hats at this notable addition to the British flora, which received the name of *Anacharis albiustrum*. But in the fulness of time the *Anacharis* of the Cam came to be identified with the *Elodea* of Canadian lakes, and the murder was out; the sprigs thrown out of the professor's dressing-room had found a congenial home in an English river."

Sir Herbert proceeds to show that the weed soon spread from the Cam to the canal system, and threatened to bring traffic to a standstill. *Elodea canadensis*, he further explains, is a diocious plant, and there will be unpleasantness if any other professor imports its bride! The appearance of this weed in ornamental waters or reservoirs is a calamity.

Tussilago fragrans, the winter *Heliotrope*, though an exotic, is very hardy. Sir Herbert says, "Few gardeners know it or grow it; yet it is a herb of such exceeding merit that none ought to be without it. Nothing but severe frost prevents it flowering freely through the winter months, and a bunch of it scents a whole room with a perfume exactly like that of *Heliotrope*. One word of warning—plant

it not among choice things, but in a border by itself; for it spreads as quickly and is as hard to get rid of as any weed of them all. It will make itself a home on any sunny waste piece of ground, and once established it is a joy for ever. You and your children to the third and fourth generation will never cease to thank me for telling you about it." Like a true Scotchman, Sir Herbert shows his familiarity with his Bible and the Short Catechism frequently by his quotations. My experience of the winter *Heliotrope* confirms exactly what Sir Herbert says of it. I think it would do well on railway embankments; if it would make these places fragrant in winter, what a boon it would be! I frequently cut it here in Bate, where we have no railways but plenty of Nature's embankments, in December and January.

A list of rabbit-proof plants given at p. 75 should be useful to many a forester, head-gardener, and landowner. In a chapter devoted to spring flowers, reference is made to Mr. G. F. Wilson's garden at Wisley, near Weybridge, a garden in the strict sense the author says it can scarcely be termed; rather is it a *champ fleurie*—a field of flowers some 9 acres in extent, including a hillside, an Oak-wood at the foot, and a couple of level fields beyond. Here is how this chapter concludes:—

"One question must occur to everybody who visits this wilderness. How comes it, seeing there is abundant variety to choose from, that most gardens and shrubberies present such monotony in their furnishing? Here is one plant for instance, *Daphne Blagayana*, covered with ivory-white rosettes of exquisite fragrance, evergreen, shapely, and withal as hardy as a Box-bush, which one would expect to be a general favourite; yet you shall look for it in vain in nine hundred gardens out of a thousand. How many ladies who really take pains about their borders are acquainted with the lovely little ground Laurel (*Epigaea repens*), the chosen badge of Nova Scotia; or the quaint Oak-leaved Aven (*Dryas octopetala*), sheeting the banks with dark green foliage and gay white flowers? The Canadian "Pinecon" or Blood-root (*Sanguinaria canadensis*), far exceeds the Snow-drop in lustrous white, and is quite as easily naturalised; while for matchless blue consider the Himalayan [Chilian] *Tecophilaea cyanocrocea*."

Sir Herbert has a kick at the bedding-out system, which, no matter what a thousand Sir Herbert's may say, is still an indispensable and the best of all systems for many places. From bedding-out, he goes on in the same chapter to talk in a charming way of Forget-me-Nots, Pansies, School Boards, Canon Ellacombe, Saxifragas, Sweet Briars, and Daffodils. Further on, speaking of *Salvia*—the great blue *Salvia* (*Salvia patens*) he tells how for eighteen years, under the window of his bedroom, a plant has grown and flourished without the slightest protection; and then proceeds to point out just one of those things which should be pointed out to every young gardener—should be pointed out, I say, because if this is done, the said young gardener will never forget it: "This *Salvia* possesses a beautiful mechanism to secure cross-fertilisation. Insect a stem of grass, or a hair-pin between the lips of the flower, and push it gently down the throat, and you will see the long stamens moved down from the upper lobe of the corolla, so as to deposit ripe pollen on the back of the supposed insect-visitor. . . . Our bumble-bees find it very difficult to reach the honey, for they are corpulent, and the passage is narrow.

. . . But if our bumble-bees have no waists to speak of, they have brains; and they have discovered the trick of biting through the neck of the flower, opposite the honey-store, and sucking it without further trouble." Many of us knew all this before, but Sir Herbert tells it again in his own delightful way. He recommends the planting of *Stonescrops* plentifully near bee-hives, particularly the summer-flowering species, *Sedum spurium*, and concludes:—"Let anyone who desires to possess *Sedum spurium* and respectable be careful to get the bright-coloured varieties of each. All are equally hardy, grow like Chickweed, and are easily and quickly propagated by cuttings or 'pinchings'; but there are some worthless, dull-coloured varieties which should be avoided."

The volume ends with very practical instructions for planting Mistletoe berries.

I have still that young gardener in my eye, and I conclude with a quotation for his benefit from the preface of the book under consideration:—"No head is constructed to carry about an explanation of half the things noticed in the course of a single morning's walk; but if notes are made at the moment of what attracts the eye, be it a landscape, a ruin, a battle-field, a living creature, or a flower, recourse may be had at home to the information abundantly stored in books, and the significance of what seemed commonplace or trivial becomes evident at once." *William Cuthbertson, Rothsay.*

HERBACEOUS BORDER.

ZAUŠCHNERIA CALIFORNICA.

SOME sixty-two years ago a prominent horticultural writer, whose racy articles in the *Press* of the time are still worth perusal, wrote in glowing terms of two plants which had been introduced only a short time before. After speaking of the disappointments experienced by those who purchase new plants at a high figure, and often find them no better than, if as good as, older things, he ventured into the realm of prophecy, and said:—"I shall pledge my word, however, that no one who will buy the two plants that I shall name to-day will ever feel a disappointment respecting them." Unfortunately, many who have grown both will only know too well that Mr. Beaton was too optimistic when he wrote these words, at least, so far as outdoor culture is concerned, as the plants were *Ceratostigma plumbaginoides*, then known as *Plumbago Larpentei*, and *Zauschneria californica*. There are many who cannot induce the former to open its flower-buds before the frost comes to prevent them from expanding, and there are a good number who think they have a good right to make a similar complaint of the brilliant *Zauschneria californica* on similar grounds.

For several years I had a depressing experience with the *Zauschneria*, although I could flower the *Ceratostigma*; but a few years ago one discovered that there are really two plants in cultivation, both passing often under the same name, but quite unlike each other in their time of blooming and their usefulness as garden flowers. It seemed strange to read the warm eulogies of the plant by Beaton, and to hear now and again from others of their success with it, while one had to strive vainly to persuade it to flower, instead of seeing the bright scarlet blossoms of which one read and heard with envy, for such a plant is to be prized when the autumn days come in, and the garden grows dull so far as its rockeries are concerned. But the mystery was solved by comparing notes with others, so that one learned that there were "two *Richmonds* in

the field," and that the one was as satisfactory in its flowering properties as the other was the reverse. That one plant flowers here in July, and that the other will not bloom at all, though I have tried it in the warmest positions, is a fact beyond cavil; and thus that the one is of great service here while the other is valueless.

There is a considerable difference in the appearance of these plants under whatever names we may find them, and it must be said that the plant-dealers are rather erratic in this respect. I have received the free-flowering form as *Z. mexicana*, as well as *Z. californica*, but I take it that it is the typical *Z. californica*, and that the late-blooming *Zauschneria* is that called in Nicholson's *Dictionary of Gardening* *Z. c. latifolia*. At least, the characters answer to the descriptions in that excellent work. The leaves of the latter are distinctly broader and much more caespitose than those of the free-flowering form. When one sees a plant of the latter in bloom, one can well understand why that good plantsman of the forties praised it so much with its *Fuchsia-like* flowers, but with the mouth of the tubes turned up instead of down. It is, I think, slightly less hardy than the other form, but if grown in dry soil between the stones of a sunny rocky or between those of an old wall, it is quite hardy enough for our winters. So good a garden flower is welcome, especially in a dry season when other plants suffer, but this "Humming-bird's Trumpet" remains unscathed. *S. Arnott, Cursethorn by Dumfries, N.B.*

The Week's Work.

THE ORCHID HOUSES.

By H. J. CHAPMAN, Gardener to R. I. MEASURES, Esq., Cambridge Lodge, Floddon Road, Camberwell.

The Cool Intermediate-house.—The *Cypripediums* belonging to the cool section, which includes such fine species as *C. Charlesworthii*, as also the varieties of *C. insigne* which have appeared among the importations of the past few years, which flower earlier than the typical species, are commencing to push up their flower-scapes, and they will need every encouragement to induce them to flower satisfactorily. In the case of *C. Charlesworthii*, which will soon be expanding its flowers, I find it the plants are removed to a slightly warmer house a few days before the flowers expand, the latter come considerably larger than when they are allowed to expand in a cooler temperature, but they lose in intensity of colour under the warmer conditions. Some of the hybrids of this section will also be coming into flower, and the flower-scapes and younger growths should be closely observed daily, as the falling tree-leaves and high winds convey thrips through the ventilators on to the plants. I make it a practice to fumigate the houses at regular intervals, which certainly checks this pest.

Vanda Sanderiana.—It is a pity that one rarely meets with this grand species grown to perfection; indeed, many cultivators fail to keep it alive for any length of time. I find it does best when planted in suspended baskets, for whenever I have tried to grow the plant in a pot or in a basket on the stage, it has not been satisfactory. The plants at Cambridge Lodge formed, in some cases, part of the collection before I took charge of it. These grow in a satisfactory manner when planted in baskets. The plant will be showing its flower-spikes in most collections, and should be making roots freely. As the young tender buds of the flowers as well as the new roots offer particularly attractive baits to cockroaches, it is necessary for the welfare of the plants and to preserve the flowers, to place the plants out of the reach of these marauders. It is rarely that I experience trouble from this cause with

suspended plants. *Vanda Sanderiana* requires much heat and plenty of moisture at the roots and humidity in the air at this season; but after the plant has passed out of flower and the points of the roots are sealed over, little moisture at the roots is required, only as much as will keep the foliage plump during the winter months.

Seedling Cattleyas of one year's growth or upwards that may need to have potting compost afforded, may now receive attention, for the new growths on most of them will be at this date maturing, and roots arising from the base. This being so, great care is needed, for the least touch is sufficient to bruise and destroy the roots at this stage; but with careful handling the roots soon seize upon the compost, becoming re-established with but little apparent check. The size of the pots used will, of course, depend upon the strength of the plants, and it is never advisable to over-pot small seedling *Cattleyas*, it being then a difficult matter to ascertain in the winter season the condition of the materials as regards moisture. Allow the pots abundance of clean drainage materials, and avoid pressing the potting compost too firmly into the pots, but retain this as far as may be possible in a porous condition, with which intent a liberal sprinkling of rough sand or finely-broken crocks is of use. The smaller seedlings of the summer sowing that have become large enough to be successfully removed, may be transferred to small pots. It is desirable that each plant should be established separately as soon as possible, being then more easily cared for. Apply water thoroughly as soon as repotting has been done, keep the temperature slightly closer, and avoid direct sunshine until they have become established.

THE HARDY FRUIT GARDEN.

By C. HERRING.

Peaches and Nectarines.—The trees of the early-fruited varieties will have been cleared of fruit, and they should have the shoots that have borne fruits, where not required for extension, removed forthwith, together with other surplus shoots. Those of the present season's growth should then be laid in thin. By clearing away these old fruiting-growths early, the remaining ones obtain more sunlight, ripen well, and develop strong fruit and wood-buds. The trees should be afforded an occasional syringing in dry weather, and the borders clear water, sufficient in quantity to thoroughly moisten the soil down to the lowermost roots. Should there be traces of red-spider on the foliage, one or more applications of an insecticide should be made, thoroughly wetting both sides of the leaves, and afterwards a daily syringing with clear water until it is thoroughly cleansed of the pest. The past dry, hot weather has been very favourable to the increase of red-spider, especially when it has been accompanied by a scarcity of water.

Gathering the Fruits.—The mid-season varieties are now ripening fast, and maturing and ripening fruits that part easily from the shoots should be gathered and placed on wadding on the shelves of the fruit-room. With a very little practice, those fruits that are ready for gathering may be easily selected without any squeezing of the fruits, for great care must be taken not to bruise them. A shallow box, with a sheet of wadding and a sheet of soft paper in the bottom, should be taken to the trees in which to place the fruits, which is a better way than fixing up netting to catch the fruits; moreover, the flavour is usually superior to that of fruit allowed to fully ripen and drop off the tree, particularly *Peaches*.

Apples and Pears.—The protection of choice fruits is absolutely necessary in most country districts, blackbirds, thrushes, and the small tits being very troublesome among Apples and Pears, especially the latter. The small tits makes holes in the fruits near the stalk, and one bird will spoil many fruits in a day. Bags made of thin, stiff canvas are the best protectors, and

may be bought at a cheap rate, in quantity, of the sundriesmen. If the string is fixed to the branch, the fruit (should it part from the shoot) will be caught in the bag, and not drop with it to the ground. Round pieces of cardboard with a small hole in the centre, and from this a slit to the edge, will enable it to be slipped over the stalks of Pears and Apples, and prevent the birds pecking that part near the stalk which is usually the part damaged. If the cards are not stiff enough to keep in position, a pin will fix the edges together securely.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HESSEY PACEK, Esq., Prestwood Hall, Loughborough.

The Store.—The growth of specimen plants of *Codibeus*, *Bougainvilleas*, *Clerodendrons*, and the earlier *Allamandas*, &c., will be nearly over, and the flowering season at an end, and the gardener's endeavour should now be to bring about the ripening of the wood without injuring the plants. Much less shading will now be required, and by rearranging the plants, especially the hard-wooded ones, the growths will get properly matured. Manure in any form will not be required now, and water should be gradually lessened in quantity, but not withheld as yet, or it may cause the plants to flag. Syringe the plants twice a day, and damp the paths and stages at noon in bright weather. Pot on young plants of *Codibeus*, *Draecena*, *Aralia*, and *Dicoubaehia*, placing them in small span-roofed houses, and affording them abundance of light and a humid air. During the month and in October, propagate *Codibeus*, selecting the most highly coloured or most characteristic shoots from such plants as have become unsightly; insert them singly in thumbs and 60's, and place these in the propagating pit. Such small stock may be kept in the small pots in which they have been struck till the new year. They are of use during the winter in decorative work. Propagate *Oplismenus Burmanni*, *Fittonias*, *Lycopodiums*, *Pellionias*, *Colens*, &c.

Polargoniums.—Shake out and repot into smaller sized pots the earlier show *Polargoniums*, success depending upon an early and sturdy autumn growth being secured. Place the plants in a frame, and syringe them twice a day, affording water very sparingly at the root till growth has become pronounced. Later plants, when the shoots are well ripened, which is known by the wood becoming brown, should have the shoots pruned back to two or three buds, and be laid on their side and syringed. Pot rooted cuttings singly, and place them on a shelf or close frame for the time being. Propagate *Zonalas* to furnish plants for flowering in the spring months.

Fuchsias propagated at this season are much to be preferred to those struck in the spring. A good number should be forthwith made and inserted, and placed in a close, cool frame, where they will soon form roots.

Cinerarias and Calceolarias.—The more forward plants of *Cineraria stellata* should now be put into large 32's, in which they may flower. The right sort of compost will consist of loam two-thirds, leaf-soil and dry cow-manure one-third each, with a small quantity of steamed bone-meal and sand added. Let the plants stand on a bed of coal-ashes in a frame facing north. Syringe them often, and remove the lights at night. Pot off successions of the florist's *type* now standing in pans, using for these a less rich compost. Afford cold frame cultivation, and rear them hawily, or the leaves will become soft and flabby, and unable to endure the drier air of a house later on. Syringe the foliage occasionally with Calver's Carbolic soft soap, used at the rate of 1 oz. to 1 gallon of water, as a preventative of the ravages of the leaf-miner fly. Prick off *Calceolaria* seedlings, and put the more forward plants into thumbs, and treat similarly to the *Cineraria*.

Crassula coccinea (Kalanthes).—Cut back those shoots which have borne flowers, and

induce a new break by frequent syringing; and when new growths are about an inch long, repeat, and grow-on in the greenhouse.

THE FLOWER GARDEN.

By T. H. STADE, Gardener to Lord Poltmore, Poltmore Park, Exeter.

Budded Roses.—Standard Briars recently budded should be examined, and if the ligatures are too tight to allow of the wood swelling, strip off these and apply fresh ones. If the bud is growing freely, cut the shoot half way through above the bud, or give it a sharp bend, in order to divert the sap to the bud; but if there is no sign of growth in the bud, let well alone. If the soil is very dry, apply water, and in dry weather syringe the budded stock once daily.

Violas.—If the plants which flowered in early summer were cut over afterwards, there will now be plenty of young shoots fit for making cuttings, and many of these shoots will have formed roots. These rooted shoots may be detached from the mother plants with all their roots intact, and planted in a half shady place, and in such fashion that some solid frames can be placed over them; make the bottom firm, and on it place an inch-thick layer of spent Mushroom-bed dung, or similar materials, and above it another of 2 or 3 inches in thickness, consisting of sandy soil. In this insert the cuttings at 1 inches apart; keep the frame close and moist more or less, in proportion to the quantity of roots that the young shoots may have, and in about five weeks the plants will be fit for planting out in beds or rows. If Violas are much employed, there should be two batches of plants, the one to succeed the other. Fancies may be propagated in the same manner.

Anemones may be planted during the present month in beds or on vacant spaces in the borders of herbaceous perennials, which they will help to brighten in the spring. Prepare the ground by throwing out the soil 1 foot deep, and placing manure at the bottom; then put new soil to the depth of 1 to 6 inches over it, and plant the tubers so that they will be about 3 inches below the surface. When planting for cutting purposes, plant in beds or on small borders, at a distance of 6 inches apart, in soil which is in fairly good condition.

Fritillarias—*Crown Imperials*.—Of the several species, some are excellent for planting in shrubberies, and as margins to beds of shrubs. They are more curious than beautiful. Among the *Crown Imperials*, *Aurora*, *rubra maxima*, *lutea* are the best. *F. meleagris* (Snake's Head *Fritillary*) and its varieties are suitable for naturalising in grass, and being not particular as to soil, they may be grown where other kinds of bulbs would prove unsatisfactory. When planted on turf, it should be where no mowing is done until the flowering period is past. The next few weeks will be a suitable time for planting these bulbs.

Hedges.—The trimming of evergreen and deciduous hedges should now be finished, especially the latter, or they will present a stubby appearance throughout the autumn. Evergreen shrubs may now be propagated by planting cuttings in small trenches, placing the cuttings with or without a heel against the upright side of it, the cutting resting firmly on the bottom, then fill in and tread firmly.

Belladonna Lily (*Amaryllis belladonna*). The decayed leaves and the weeds growing among them should be removed, for the flower-spikes will soon begin to push forth, and though these present a somewhat naked appearance without leaves, they are pretty and useful flowers; there is sometimes an objection to their scent, but if it be not inhaled too closely, it is not overpowering. To flower them successfully, the bulbs should be planted in a warm, sunny place, in a well-drained soil of fair depth. Plant the bulbs singly and in rows, or plant several together in clumps. There has been a lively demand for flowering bulbs in the last two years, a sign that owners of gardens appreciate the plant.

Cleodendron trichotomum is a striking looking shrub, with flowers which in colour somewhat resemble those of *C. Balfourianum*. These are very sweet-scented, but the leaves when rubbed give off an unpleasant odour.

Penstemon.—The great improvement effected in recent years among *Penstemon*s almost does away with the need of growing named varieties for general purposes, neither does it appear necessary to treat those raised from seed as one would the perennial species. Sow early in the year, and at the present time the plants will be well in flower, and continue to produce flower, till late in the autumn they get nipped by frost. Seedlings produce massive spikes of bloom, and exhibit great diversity of colour, scarcely two being alike. They are useful for planting thinly among dwarfier plants, or for forming masses in beds or borders. I sow the seeds in mild heat, and as soon as the plants appear above the soil, they are transferred to a cold frame.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK ROUTE, Bacton, East Angles, Devonshire.

Carrots.—Thin the Carrots sown in the month of July to a distance of 3 inches apart, then ply the hoe between the rows. Carrots of the February or March sowings, if still in the ground, should be lifted and stored, and the ground otherwise made use of.

Turnips.—The last sown Turnips will now be ready for the first thinning, i.e., to 3 inches apart. Now that heavy dews and cooler nights are with us, Turnips are growing faster, and neither aphid nor flea will give much trouble, although an application of wood-ashes will certainly accelerate growth. Hoe the land so long as it is not covered with the tops.

Celery. I never saw Celery looking better than this year, and I also hear good accounts from gardeners around here. The plants appear to have escaped the leaf-miner in a marked degree. Earthing-up should be carried on piece-meal, as previously advised, making quite sure beforehand that the roots are in a proper condition as regards moisture, though the tops must be quite dry, or decay will soon set in. The earliest rows may be finally banked up if Celery is required early in October. It will be noted that I have not advocated the use of manure-water in any form for Celery, believing the use of such to be the cause of many a good crop of Celery rotting away during the winter. Should the plants seem to need any extra assistance, I prefer to scatter a safe quantity of artificial manure between them occasionally, and apply water soon afterwards. I find the so-called Ichthemic gaino to be followed by good results. The latest planted Celery should be allowed to grow without any mounding up.

Beans & Sprouts. If the plants lack vigour, and sprouts are expected to be ready about the end of the present month, well saturate the ground between the plants with manure-water of moderate strength at intervals of ten days; or, should showery weather prevail, a light application of nitrate of soda will quicken the growth, but the nitrate must be kept clear of the foliage and stems.

Mushrooms. Collect and prepare manure for making beds, and as the spawn runs well at this season, a bed should be made and spawned every three weeks under cover. About a week is necessary to get manure into a proper state for making a bed. The materials should not be too wet, nor too dry; the heap should be turned and mixed on alternate days, and two wheelbarrowsful of loam should be added to every six of manure, and when making the bed let it be made firmly. Spawn the bed when its temperature is 80 to 85, and declining, and in three days cover with finely-sifted loamy soil to the depth of 1 inch, and beat it regularly and evenly with the back of a spade. The lumps of spawn should be about the size of a hen's egg, and be put 2 inches deep and 9 inches apart.

FRUITS UNDER GLASS.

By MALCOLM MCINTYRE, Gardener to Sir CHAS. TENNANT, The Glen, Innerleithen, Peeblesshire.

Melons.—The weather in Scotland has been favourable for Melons, and good crops have been the rule in most places. Those planted out on ridges or beds of soil still require to have water applied very carefully, and none of the plants should get dust-dry at the roots. The discontinuance of fire-heat at this season is often fatal to the plants, and a brisk heat should be afforded from the first to the last, for the roots will perish in a cold or wet soil, as also in a very dry one, flagging occurring on the first bright day. Let the soil be kept in a uniformly moist state, and maintain a temperature at night of not less than 70, increasing the day temperature by 5, without, and 10, with sunshine. If the fruits crack, keep the soil and the air somewhat drier. Melons in pits and frames without fire-heat very often ripen badly. Those still in good condition and with crops still green upon them should have very little water applied at the roots, enough moisture being obtained by them from the heating material. The bottom-heat may be freshened up with linings of prepared stable-manure. Leave a small amount of ventilation at the back of the lights at night, keep the fruits raised above the soil at the least 6 inches, cut fruits which it is desired to keep for a time with a portion of the stem attached, and place in a dry, airy room, or if wanted quickly, in a warm house in the full sun; but the fruits should not be cut from the plants till of full size, and developed in every respect.

Cucumbers. Give attention to autumn-fruiting plants, affording tepid liquid-manure in abundance, removing superfluous growths, and stopping the shoots at short intervals of time, not allowing the fruits to hang on the plants after they become of a usable size. Maintain a genial atmosphere by damping all bare surfaces in the morning, afternoon, and evening, but not wetting the plants, excepting in the afternoon when the day has been bright. Let no more foliage be retained than can have full exposure to light; earth up just covering the plants advance in growth, only just covering them each time they show at the sides of the hillocks or ridges, the soil being placed in the house some time previously to get warmed. The water used should be of the same temperature as the air of the house. If strong plants are now ready for putting either in fruiting pots or on to ridges, the sooner they are planted now the better for them, for but one allow them to become much pot-bound and stunted, and no sort of treatment afterwards will be of much use. It is important that an early start be made, so that the plants may be of large size before they are allowed to bear fruits, as it is certain they will make but slow progress afterwards. Half-balls of decaying manure are scarcely to be recommended for winter Cucumbers, as they are apt to become merely masses of decaying vegetable matter, and unsuited to the needs of the plants. The winter Cucumber-plant should consist of coarse and light compost, chiefly of light turfy loam in large lumps, with some charcoal added. If the soil is heavy and close, leaf-soil may be added. They succeed well in large pots, but spare and loose brick pits formed, say, on a slate staging over hot-water pipes are less troublesome, and the plants do well in them. A great mass of compost is not needed at the outset, frequent small additions of lumps of turf serve to feed the roots that come to the surface. See that the balls of soil are in a moist state, and the new compost is quite warm at planting time. Cucumbers do not require large quantities of water during the winter, still they must not be allowed to become dry at the root. Train each plant to a clear stem till the trellis is reached. The night temperature should range from 60 to 70, the latter figure being reached when the weather outside is comparatively warm. Very little air is needed, and the syringing should not be heavy or frequent in dull, cool weather.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

EXHIBITIONS

WEDNESDAY, SEPT. 11. { Royal Caledonian Horticultural Society, Waverley Market, Edinburgh (2 days).
Arundel and Littlehampton Agricultural, in Arundel Castle grounds.

MEETINGS

SATURDAY, SEPT. 7. { Société Française d'Horticulture, Paris, London.

MONDAY, SEPT. 9. { United Horticultural Benefit & Provident Society Committee.

TUESDAY, SEPT. 10. { Royal Horticultural Society, at 11 o'clock, at a Drill Hall, Buckingham Gate, Westminster.

SALES.

MONDAY, SEPT. 9. Sixteenth Annual Trade Sale of Pot Plants at Dymond's Nursery, Upper Edmonton, by order of Mr. H. B. May, by Protheroe & Morris, at 11 o'clock. Dutch Bulbs at Protheroe & Morris' Rooms, at 11 o'clock. Dutch Bulbs at Pollexfen & Co.'s Rooms, 45, Pilgrim Street, E.C.

TUESDAY, SEPT. 10. Annual Trade Sale of winter blooming Heaths at Burnt Ash Road Nurseries, Lee, by order of Messrs. F. Miller & Son, by Protheroe & Morris, at 11 o'clock. Dutch Bulbs at Protheroe & Morris' Rooms, at 11 o'clock. Dutch Bulbs at Pollexfen & Co.'s Rooms, 45, Pilgrim St., E.C.

WEDNESDAY, SEPT. 11. Annual Trade Sale of winter flowering and other Plants at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11 o'clock. Dutch Bulbs, Lilium, Helleborus, Juglans, &c., at Protheroe & Morris' Rooms, at 11 o'clock. Dutch Bulbs at Pollexfen & Co.'s Rooms, 45, Pilgrim Street, E.C.

THURSDAY, SEPT. 12. Thirty-third Annual Trade Sale of Stove and Greenhouse Plants, &c., at the Brimsdown Nurseries, Green Street, Enfield Highway, by order of Mr. E. H. Thompson, Jun., by Protheroe & Morris, at 11 o'clock. Twentieth Annual Trade Sale of winter blooming Heaths at Longlands Nursery, Sidcup, N.E., by order of Messrs. Gregory & Evans, by Protheroe & Morris, at 11 o'clock. Dutch Bulbs at Protheroe & Morris' Rooms, at 11 o'clock. Palmus, Bays, Bulbs, &c., at Pollexfen & Co.'s Rooms, 45, Pilgrim Street, E.C.

FRIDAY, SEPT. 13. The Beneficial Interest in the Lease of the Royal Horticultural Society's Plants, at the Blechnet Nurseries, Granville Road, Child's Hill, by order of Mrs. Gay, by Protheroe & Morris, at 12.30 o'clock. Imported and Established Orchids, such as *Oncidium*, *Phajana*, *Protholobium*, *Protholobium*, *Phajana*, *Phajana*, *Phajana*, at 12.30 o'clock. Dutch Bulbs at Protheroe & Morris' Rooms, at 11 o'clock. Dutch Bulbs at Pollexfen & Co.'s Rooms, 45, Pilgrim Street, E.C.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick—58.5.

ACTUAL TEMPERATURES.—

LONDON.—September 6 (P.M.): Max. 65°; Min. 52°. September 7. Daily. PROVINCES.—September 4 (P.M.): Max. 61°; Southern Counties; Min. 52°. N. E. Scotland.

The following communication has been issued from the Board of Agriculture:—

"The Board of Agriculture, having received information of the appearance of an insect resembling the Colorado beetle (*Doryphora decemlineata*) among Potatoes on premises belonging to the London and India Dock Company at Tilbury Docks, submitted the beetle and larva to their technical advisers at the Natural History Museum at South Kensington, where they were identified as those of this pest, which has not previously been known to have bred in Great Britain, or to have been detected as imported in any but isolated instances.

Inspectors of the Board were immediately sent to Tilbury to make an examination and report on the circumstances of the attack. The inspectors found that a patch of Potatoes within a limited area on certain allotments occupied by men employed by the Dock Company was infested by the beetles, which were recognised as being present in various

stages of their existence. In pursuance of an order of the Board the immediate destruction of all the crops and grass within the area affected, which was fortunately isolated from other land, was promptly carried out.

Careful examination of the surrounding area has failed to detect any other case where the beetle has made its appearance, and it is confidently hoped that the attack has been successfully arrested. The Board, nevertheless, desire to advise growers of Potatoes of the danger which would threaten the Potato crop should this voracious insect become established and common in this country.

Provision was made for the contingency which has now arisen by the Destructive Insects Act, 1877; and the terms of the Colorado Beetle Order of 1877, issued under that statute, require all persons to give immediate notice to the police if any specimens of this insect are found, under a penalty not exceeding ten pounds. The police constable on receipt of such information must at once inform the local authority (the same as under the Diseases of Animals Acts), who are required to communicate by telegraph with the Board of Agriculture.

It may be borne in mind also that by this Order it is an offence, to which the same penalty is attached, to keep or sell any living specimen of the Colorado Beetle in any of the stages of its life.

The Colorado beetle (see Fig. 58) is from one-third to half-an-inch long, of a yellow colour, with ten longitudinal black lines down the wing-cases, and with reddish-yellow and black legs. The larva, when mature, is very thick in the middle, and of an orange or reddish-brown hue, with black spots on the lower portions. Long, oval, yellow eggs in clusters are laid by the female beetle on the under surface of the leaves of the Potato, and these may appear also in certain weeds in the vicinity. Both larvae and beetles feed voraciously on the Potato haulm, but they are also known to feed on other plants, such as Tomatoes and Poppies, while, failing more congenial food, they may possibly be found on rough grasses and other weeds."

The first notice in our columns of this destructive pest was in 1874, when we availed ourselves of an article from an American source, printed in *Hurdwicke's Science Gossip*, and evidently based on information supplied by the late Prof. RILEY.

"A man must witness," said the writer, "the myriad legions of this insect and the ravages of its never-tiring larvae in order to form an idea of the terrible danger with which Europe is threatened. . . . The devastations of the Colorado beetle are all the greater from the fact of its propagating itself with extraordinary rapidity, several broods following each other in the course of the year." The female lays from 700 to 1200 eggs on the under side of the leaf, the larvae are hatched in less than a week, feed voraciously for some seventeen days, and then retire beneath the soil to assume the pupal condition. After ten to fourteen days the perfect insect appears. "No description can do justice to the marvellous voracity of the insect, especially in the larval state."

The only remedy found useful is to dust the haulms with Paris green, or arsenite of copper, a terribly poisonous substance, demanding the most careful handling. In the *Gardeners' Chronicle*, April 18, 1874, is an

article from the late Prof. RILEY on the same subject. Our volumes for 1875, 1876, and 1877, also contain numerous notes on the subject, especially from Professor RILEY, who doubted if the insect was likely to be introduced with tubers; but the recent discovery at Tilbury Docks shows that this was too optimistic a forecast. A long article by the late ANDREW MURRAY, summing up the information to date, will be found in our columns March 17, 1877, and there is a leading article, probably from his pen, on June 30 of the same year.

On February 19, 1881, we recorded the infliction of a fine on a Devonshire man, who was proved to have some live beetles in his possession. After this time we heard nothing more of the Colorado beetle till the recent discovery at Tilbury. By far the most serious invasion we have had to record. People had come to look upon the Colorado beetle as a delusion, and it was made the subject of frivolous ridicule. The active measures taken by the Board of Agriculture are much more to the purpose, and now that attention is widely called to the danger, we may hope that the pest will not be allowed to gain a footing among us. We earnestly press upon our readers the urgent necessity of complying with the regulations, which require notice to be given of the occurrence of the beetle. A rural policeman is hardly likely, as a rule, to realise the importance of the matter, and therefore it is most desirable that cultivators and country residents should themselves notify any instance they may meet with to the Board of Agriculture or other authority.

GROUP OF FERNS SHOWN BY MESSRS. J. HILL & SON, EDMONTON (Supplementary Illustration).

—For several years past the show held by the Royal Horticultural Society at the Temple Gardens in May has been enriched by a well-grown collection of handsome, rare, and interesting exotic Ferns, exhibited by Messrs. J. Hill & Son, of Edmonton, who are renowned for the cultivation of exotic Ferns. We find, on referring to our report of the last Temple Show (*vide* issue for May 25), that the group depicted in our illustration contained examples of *Adiantum curvatum*, *peruvianum*, *Hendersonii*, *tinctum*, with its pretty tinted fronds, and the old and still rare *A. reniforme*; *Davallias*, including *assamica*, with spreading, scaly rhizomes and fronds of nearly equal width; *D. solida*, *D. filijensis* and *tenitifolia* Veitchii. Of *Pteris* there were remarked *Childsii*, a very beautiful species of the cretacea section; *P. scaberula*, *P. geaniifolia*, &c. Of *Platycremium* there were *athiopium*, *grande*, *Willinckii*, and *Alicorno* Hallii. *Leucostegia immersa*, a fine specimen, occupied the centre of the group most effectively. Other plants consisted of *Asochloa paleolata*, a tree Fern, with slender stems and spreading fronds; *Gleichenia semivestita*, *Lygodium scandens*, in fine form, showing it to be equal to *L. japonicum*, which is usually grown under the former name; *Lomaria attenuata*, *Oncidium auratum*, &c. The exhibit obtained a Silver-gilt Flora Medal.

"KEW BULLETIN."—We are glad to receive numbers of this publication, dated November and December, 1899, but which did not reach us till the end of August, 1901. The first article is one on the Jarrah and Karri timbers of West Australia, much used for paving roadways. Jarrah is the wood of *Eucalyptus marginata*; Karri that of *E. diversicolor*. The value of these timbers can hardly be over-

estimated. *E. diversicolor* is also noteworthy as an ornamental tree, and sometimes reaches a height of 200 feet. The colony of West Australia at present contains abundance of the trees, but it is satisfactory to learn that a system of forest conservancy has been established, so that reckless felling and prodigal waste may not accrue. The "Maromba" Vine disease of Portugal is stated by Mr. MASSEE to be due to the attack of a root fungus, allied to *Rosselinia necatrix*. Carbon bisulphide poured into holes in the soil is an efficacious

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society will be held on Tuesday, September 10, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 P.M. A lecture on "The Origin and Development of the Cactus Dahlia," will be given by Mr. C. G. WYATT at 3 o'clock. At a general meeting of the Royal Horticultural Society held on Tuesday, August 27, twenty-four new Fellows were elected, making 730 since the beginning of the present year.

Iris Tauri, Siehe, tab. 7793.—See *Gardeners' Chronicle*, 1901, vol. i., p. 190, fig. 71.

Oxalis dispar, N. S. Brown, tab. 7791.—A shrubby species with long-stalked, tri-foliolate leaves, and stalked clusters of yellow flowers. It is a native of British Guiana.

Impatiens Thomsoni, tab. 7795.—A Himalayan species, with loose racemes of small pink flowers.

Arctotis Gumbletoni, Hook. f., tab. 7796.—See *Gardeners' Chronicle*, present issue, p. 177, fig. 55.

FIG. 58.—THE COLORADO BEETLE, SHOWING THE EGGS, THE LARVAE, THE PUPA, AND THE PERFECT INSECT. (SEE P. 186.)

remedy. The holes should be 1 foot in depth, and 1 foot from the base of the Vine stump. One ounce of the carbon bisulphide is poured into each hole, and immediately covered with earth. As the fluid is very inflammable care must be taken not to manipulate it anywhere near a light. Chinese wood-blocks for engraving purposes are, it seems, derived from *Pyrus betulaefolia*, *Eucornia ulmoides*, *Buxus sempervirens*, a species of *Euonymus*, and *Zizyphus vulgaris*. The disuse of wood-engraving renders these details of less importance than would have been the case in former years. The personal details and the record of work done lose some of their interest from the delay in publication.

"BOTANICAL MAGAZINE."—The plants figured in the September number are the following:—

Epidendrum osmanthum, tab. 7792.—This is the *E. Godsellianum* of ROLFE in the *Gardeners' Chronicle*, 1892, i., p. 126, which it appears had been named by RODRIGUES ten years previously under the name here cited. It is a fine, loosely paniced species, with spongy-shaped segments, having reddish streaks on an olive-coloured ground; the lip projects beyond the segments and is three-lobed, the two lateral lobes are small, roundish, crenate, the anterior lobe stalked, dividing anteriorly into two roundish subdivisions like the lateral lobes; all are white with purplish nerves.

ROYAL SEEDSMEN.—MESSRS. TOOGOOD & SOSS, Royal Seedsmen, of Southampton, which old-established house enjoyed the unique honour of uninterruptedly supplying her late Majesty Queen VICTORIA for just fifty years, have been appointed by Royal Warrant seedsmen to the KING.

THE SOUTH-EASTERN AGRICULTURAL COLLEGE.—The summer course for teachers at the South-Eastern Agricultural College, Wye, concluded on August 30. It began on August 15, and was attended by thirty schoolmasters from the counties of Kent, Surrey, and Worcester. The object of the session was to develop a scheme of instruction suitable to

the children of a rural elementary school, and the course, which dealt with plants, air, water, and soil, had been previously put to a working test in the Wye Elementary School during the past two years. The lectures were followed up by practical work in the laboratory, garden, or field, so that the teachers could familiarise themselves with the construction of the necessary apparatus and the conduct of suitable experiments. Other instruction dealt with the management of school gardens, and the preservation of and mounting of specimens of grasses, weeds, injurious insects, &c., for use in school demonstrations. There were also classes dealing with the management of fruit-trees, bees, and poultry, the elements of land measuring; and on the evenings of one week a course of lectures was given to illustrate some of the recent advances in chemistry. Excursions were made to Canterbury, to Richborough, and the Stonor Marshes, to see both the Roman remains and the varied flora of that district; and again the series of interesting geological sections in the neighbourhood of Wye. Though a course of instruction in practical agriculture did not form part of the session, the teachers were conducted round the college farm and had its management and live-stock explained to them.

PLUMS AT MARKET.—Whatever may be the case in selected cases, the price of Plums at various local markets, and that charged by small retailers, appears to be reasonable, rising from 1½d. per lb. for fairly good qualities, the supply of which cannot surely be complained of. From some favoured spots the supplies are large—witness one instance in Cambridgeshire, where the harvest has been a notable one. From a local station on the G.N.R., one day 30 tons of Plums were despatched; two days later went a similar quantity; and in the week ensuing the 17th ult., the total was 90 tons; last week's total was 140 tons, nearly all sent to London. Good Greengages have been retailed at 1d. per lb., but it cannot be said of all that the quality was first-rate.

DAHLIA SHOW AT THE ROYAL AQUARIUM.—This exhibition, which will be held at the Royal Aquarium on September 17, 18, and 19, takes the place of the Dahlia show formerly held by the National Chrysanthemum Society. It is supported by the principal Dahlia cultivators and exhibitors on the grounds that it affords an opportunity for the Dahlia to be exhibited in central London, and supplies a convenient occasion for submitting the later flowering seedlings for inspection. The schedule of prizes has been extended, and classes for every type of Dahlia find a place in it. In connection with this show, Messrs. DOBBIE & Co., seed merchants, Rothsay, offer valuable special prizes for their pedigree Leeks and Onions, and it is certain that the display will be both numerous and very fine. Schedules of prizes can be obtained of the Superintendent, Mr. RICHARD DEAN, 12, Ranelagh Road, Ealing, W.

GALLS.—Messrs. HITCHINSON & Co., 24, Paternoster Row, announce the early publication of a work on *British Vegetable Galls*, by Mr. EDWARD T. COXNOLD, with 130 page illustrations. This should be very serviceable to gardeners.

GRAPES AT CHISWICK.—The large vine in the gardens of the Royal Horticultural Society at Chiswick is just now a perfect picture—indeed, it has been portrayed in these columns in previous years when in a similar condition. There is a full crop of black Grapes, which, at the time of writing,

were untouched, although so nearly ripe that the crop was expected to begin very shortly. Looking through the Grape-house, from one door to the other, we were inclined to echo the sentiment of one of the gardeners, that "it seems a pity to touch it." Other fruits now in season at Chiswick are Peaches and Nectarines; the Apples and Pears are as yet hardly ripe.

"JOURNAL DE LA SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.—The number of the transactions of the National Horticultural Society of France for July, 1901, is interesting as containing several not-worthy papers, among which we may note one by M. DUVAL on *Odontoglossum Adriane*, and those presented to the Horticultural Congress. Among these latter is a remarkable memoir on the species and varieties of *Syringa* (Lilacs), by M. HENRY, of the *Jardin des Plantes*, which of itself justifies the existence of the Congress. The species admitted are *S. pubescens*, *oblata*, *vulgaris*, *persica*, *dubia*, *Bretschneideri*, *Josikea*, and *Enodi*. M. DENAFFE contributes an elaborate memoir on the cultivated *Pea*, in which stress is laid on a useful "character." This consists in the determination of the number of sterile nodes on the haulm going from below till the first flowering node (maille) is reached. Thus in the "pois d'Avvergne," the majority of plants produce their first flowers at the twelfth node, while in Prince Albert the majority of flowers are first produced at the seventh node from the base. M. MOLLET contributes a monograph of the species of *Erenurus*, which will be serviceable to the cultivators of these noble plants.

METROPOLITAN LOCAL MARKETS.—The other day a flower vendor in an open street-market in the borough of St. Pancras was fined for obstructing the highway. The vendor must move on, as also the rest of the clan, for his was a test case. Not by many is this the first of such cases, nor probably will it be the last. Not the inhabitants, but the Borough Council, complained, and the costers are to become like so many "Poor Joes." If the various Councils object to such markets, why do not they first of all provide local market-places where vendors and purchasers may congregate and do business? It is years since the L.C.C. advocated the scheme, but if the Borough Councils wish to distinguish themselves, let them band together and provide the necessary schemes. In Paris they beat us; in every *arrondissement* there is a local market, which, we are assured, leaves little to be desired in the way of cleanliness or accommodation.

"A GUIDE TO CIRENCESTER."—Many intending holiday-makers might do worse than visit Cirencester, and we advise those whose inclinations incline them to that district to obtain this guide to the town and neighbourhood, which is edited by Mr. SCOTLAND HARMER. There are plenty of illustrations in this little book, and information concerning the history, antiquities, educational facilities, and other features of the town; excursions in the neighbourhood, sports, and natural history of the district.

BULLETIN OF THE ST. PETERSBURG BOTANIC GARDEN.—It has been decided by authorities of the Imperial Botanic Garden, St. Petersburg, to issue, at intervals, a Bulletin of Miscellaneous Information. The publication will contain brief articles only, comprising:—1, Original papers hitherto unpublished, and relating to all branches of botany; 2, Critical analyses; 3, Reports and communications

connected with the garden. Communications should be written in Russian, and be accompanied with an epitome in French or German. The editorial staff hope for the assistance of all botanists for their new publication, which they hope will prove of use. Each communication, adds Professor A. FISCHER DE WALDHEIM, should be addressed to the Imperial Botanic Garden, St. Petersburg, and should bear the name and address of the author.

ZURICH BOTANIC GARDEN: LIST OF PLANTS FOR EXCHANGE.—We have received from Zurich a list of plants offered for exchange by the Botanic Garden of the Zurich University. Applications should be addressed to the Director of the Botanic Garden and Museums of the University, Zurich, Switzerland.

THE SOCIETY OF AMERICAN FLORISTS held high festival lately at Buffalo. We have nothing in this country comparable to this association of commercial florists. The Society has recently received a charter from the Government, and enters upon a higher scale of development and usefulness. The party, numbering several hundreds, visited Niagara Falls.

"NATURE TEACHING."—The Imperial Department of Agriculture for the West Indies has issued a text-book, entitled *Nature Teaching*, based upon the general principles of agriculture. This is prepared for the use of schools by FRANCIS WALES, Government analytical and agricultural chemist, Leeward Islands. According to the preface, the book is an "attempt to place in the hands of teachers, both in elementary and secondary schools, a well selected but co-ordinate body of information suitable to West Indian conditions, to be supplemented in each case by numerous illustrations and experiments in which pupils themselves take an active part." *Nature Teaching* treats of the seed, the root, the stem, and the leaf, each separately; as regards their uses and structure both botanically and economically. There are also chapters upon the soil, plant-food and manures, flowers and fruits, weeds, and insects. The book is clearly written, but it is not intended to be read through, but to be used as a guide by the teacher in training pupils to observe for themselves, and in endeavouring to give them an intelligent interest in the everyday facts of rural life, and is very well suited for the purpose.

PUBLICATIONS RECEIVED.—*Agricultural Experiment Stations of the Louisiana State University and A. & M. College*. Report for 1900. Details the operations at three stations: At No. 1 (Audubon Park, New Orleans), with Sugar-cane, Alfalfa, Clover and Grasses, Forage Crops, Corn, Cotton, Orange-trees, and Tea-plants; at No. 2 (Baton Rouge), where farmwork generally is undertaken; No. 3 (Cahoon), with Tobacco, Onions, and Live Stock.—*From the Michigan State Agricultural College Experiment Station, Horticultural Department*: Bulletin 190, April, 1901. Vegetable Tests for 1900, by L. R. Taff and M. L. Dean. The experiments dealt with Beans, Cabbages, Sweet Corn, Cucumbers, Lettuce, Peas, Potatoes, Radishes, Squash, Pumpkins, and Tomatoes.—*The Agro-Flora of Yugoslavia*, by W. West, F.L.S., and G. S. West. Contents of third instalment (four sheets): Class Chlorophyceae, under Conjugate, to Class Bacillariaceae.—Department of Agriculture (Canada), *Central Experimental Farm, Report of the Horticulturist*, W. T. Macoun, 1900: "Owing to the favourable season this year, nearly everything made satisfactory progress in the horticultural department. The arboretum and botanic garden continue to increase in usefulness and improve in appearance every year. The collection of trees, shrubs, and herbaceous perennials is

FIG. 29.—FIRST PRIZE GRAPES SHOWN AT SHREWSBURY BY MR. CAIRNS, OCTOBER. Top Row: Beginning at the upper left-hand corner, and going to the right—1, Madresfield Court; 2, 3, 4, 5, Muscat of Alexandria, white; 6, and 7, Madresfield Court. Lower Row: going from left to right—1, Althwick Seedling; 2, Gros Maree; 3, 4, 5, Muscat of Alexandria, white; 6, and 7, Black Hamburgh; 8, Althwick Seedling. Photograph by Bartlett, Shrewsbury.

now very large, and in many genera few additional species and varieties can be procured." — *Agricultural Economist*, August 1, with articles on Agriculture in the Twentieth Century, Colonial Doings, &c. — *Twenty-sixth Annual Report of the Board of Commissioners, City of Boston, Department of Parks*, for the year ending January 31, 1901; Describes the progress made, and includes illustrations showing the beauty of many of the parks and public gardens. — *The Botanical Exchange Club of the British Isles*, Report for 1900; Satisfactory, but some members contribute fewer specimens than are required by the regulations. — *Proceedings and Journal of the Agricultural and Horticultural Society of India*, January-March. A record of good work, which was somewhat hampered by heavy rains. Experiments with *Paspalum dilatatum* were very satisfactory; the plant weathered the hot season and floods, and is now growing luxuriantly. The grass is soft, and readily eaten by horses and cattle. — *Rhodora*; Journal of the New England Botanical Club, July, 1901. Contents: Obituary notice of T. C. Porter, by Thomas Meehan; Notes on Ericaceae of New England, by W. Deane; *Scutellaria parvula* and *S. ambigua*, by M. L. Fernald; *Lysimachia punctata* in Eastern Massachusetts, by A. Clark; Embryology of New England Orchids, by R. G. Leavitt; Chloranthus in Anemoneella, by B. L. Robinson; Variations in *Alisma Plantago*, by M. L. Fernald; and Herbaria of New England, by M. A. Day. — *Annual Report on the Government Cinchona Plantation and Factory in Bengal, for the year 1899-1900*. The rainfall for the year 1899 was the heaviest recorded since the establishment of the Government Cinchona Plantation in Sikkim. A disastrous rain-storm in September did considerable damage. The continuous wet weather was unfavourable to the growth of Cinchonas; while, perhaps as a consequence of these otherwise unfavourable conditions, the damage done by *Helopeltis* has been considerable. *Annual Report of the Royal Botanic Garden, Calcutta, for the year 1900-1901*. The weather conditions during the first half of the year under review were normal. In the middle of September a period of excessive rainfall set in, which lasted till the 25th. The arrangements for the surface-drainage of the Gardens proved inadequate to meet the needs of precipitation so phenomenal. In the eastern section of the Garden little damage was done by the flood. In the western half, however, many losses have unfortunately to be recorded. Many trees fell, but the great damage has been the death of many species as they stood. *Agricultural Journal of the Cape of Good Hope*, July 18. This includes reports and prospects of various stations, and notes on Medic-stalk Sugar, Grass Fires, and other agricultural details.

PRIZE GRAPES.

We are able this week to lay before our readers an illustration of the Grapes shown in the class for a collection, in four or more distinct varieties, at the recent show at Shrewsbury, by Mr. Cairns, of Balfordery, Dundee (see p. 160 of our issue for August 21). The photograph was taken by Mr. Bartlett, and is excellent so far as form is concerned, but gives no idea of the colour, bloom, or "finish." The twelve bunches were shown in two rows. In the upper row the end bunches were of Madresfield Court; that to the left obtained 8 points, that to the extreme right 8½ points. The four central bunches were of Muscat of Alexandria, which obtained, going from left to right, 8, 8½, 7½, and 8 points respectively. In the lower row, the two end bunches were of Althwick Seedling, of which that to the left was awarded 8 points, that to the right 8½ points. Following the Althwick Seedling, going from the left to the right, were two bunches of Gros Maree, both of which were adjudged 8 points; next come two bunches of Black Hamburgh, the one to the left gaining 8, the other 7½ points. The total number of marks was 96½, out of a possible 112.

We congratulate Mr. Cairns on his success.

HOME CORRESPONDENCE.

THE SYLHET ORANGE.—This is the fine orange, grown solely from seed in the Khasia Hills of eastern Bengal, and sent in large numbers to Calcutta. It belongs to the Sontara group of loose-skinned Oranges. A writer in 1869 calculated that at Shalla, in those hills, there was an Orange-garden of about 1,000 acres, and that one might walk "for a good hour or two, always under the shade of Orange-trees, without reaching the limits of cultivation." I wanted to make an experiment, by obtaining some seeds of this fine Orange from Lucknow, where this variety is also grown. So I asked the Superintendent of the Lucknow Horticultural Gardens to send me two of these Oranges in a small box by parcel post. I conjectured that even if the Oranges reached me in a rotten condition, I might perhaps still be able to get their seeds to germinate. The two Oranges came in a quite rotten condition, and perfectly black. The seeds of one were discoloured, but those of the other were of a normal colour. I sowed the seeds of each Orange in a separate small pot, and placed them in heat. They all germinated! And now I have twenty-two healthy seedlings of the Sylhet Orange several inches high. So we now know that Orange-seeds of all kinds, I should say, can be sent from all parts in their fruit by parcel post; and Orange-growers in the West Indies should take note of this, and endeavour to introduce this fine Orange into those islands. In the Khasia Hills, as I said, the only mode of propagating this Orange-tree is by seed. The history of my little Orange-plants is somewhat interesting. This variety of Orange is grown in the Khasia Hills and sent to Calcutta. Many years ago the head gardener of the Lucknow Horticultural Garden had some Sylhet Oranges sent to him from Calcutta, he sowed the seeds in that garden, and now from Lucknow the seeds of those trees have come to Worthing, and the resulting plants may yet travel further. If planted in proper soil and a suitable climate, I should say the seedlings would fruit in five or six years. The Sylhet Orange is much like that of Magpore, but the habit of the two trees is different. The branches of the Magpore tree are spreading, while those of the Sylhet-tree are upright. *E. Bonavia, M.D., Worthing, July 23, 1901.*

SAGITTARIA JAPONICA, FL. PL.—Seeing the illustration of this plant and your note on p. 170, I can assure you that it is perfectly hardy, having planted it seven or eight years ago in the ponds here. The plant has increased to such an extent that I am obliged to clear it out by the wheelbarrow at times to keep it from choking the other water plants growing in the same pond. Although it will grow in water 2 feet deep, it delights in more shallow water, with a good depth of mud; here it has found its way into the banks round the ponds 2 and 3 feet from the water's edge. The flower-spikes are thrown up 1½ to 2 feet in height, and they carry four to six tiers of large, very double, pure white blooms, and have a noble appearance. It grows freely in moist or boggy ground. We have several other single-flowered Sagittarias which are hardy, but the most beautiful of all is *S. montevicensis*, which is not quite hardy, and must be wintered indoors. We place it in the open ponds in the last week in the month of May, and it soon begins to throw up its spikes of pretty creamy-white flowers, with dark chocolate centres. *W. J. Townsend, Sandhurst Lodge, Berks.*

ERICA STUARTI.—I enclose a specimen in fine flower of a charming Irish Heath, Erica Stuarti. This lovely Heath was discovered by Dr. Charles Stuart, of Chirnside, Derbyshire, in Connemara, during an excursion of the Scottish Alpine Botanical Club to that district in 1890. It was found growing along with Erica Mackaiana, to which it is perhaps related, but is nevertheless a most distinct and beautiful hardy Heath. *R. Lindsay, Kaimies*

Lodge, Murrayfield, Midlothian, July 4, 1901. [The specimen sent was to our thinking very like *E. tetralix*, of which *E. Mackaiana* is a form. *Ed.*]

GUNNERSBURY PARK GARDENS.—This is one of the most charming old gardens near London, and will bear comparison in many respects with the best in more favoured districts, where the air is purer and more favourable to vegetation. Those who remember the fine old Cedars there will regret to hear that they show unmistakable signs of decay. However, it is not intended to sweep these old monarchs of the pleasure-grounds entirely away; after trimming the dead branches back a little, Ivy and other climbing plants are being planted to cover the dead trunks, and again clothe the branches with life. In a few years what now appears unsightly will be pleasing to look at, and a remembrance to many who visit the gardens of what were once some of the finest trees in this country. Very recently the writer enjoyed a walk through the gardens with Mr. Reynolds. Everything under glass looked clean, healthy, and in good order. The practised eye delights to run over cultivation of this kind. Lately some improvements have been made in the pleasure-grounds, more herbaceous species have been planted for autumn flowering, and grouped beds have been arranged of different classes of plants. Here one comes across a whole bed of scented foliage plants, further on one containing all berried plants, which will look cheerful after Jack Frost has wiped out many of the other pictures on the lawn. On the terrace, Mr. Reynolds has arranged a wealth of large-flowering plants which have taken years to grow. When these are allowed to develop their harvest of blossom, the exterior of the mansion will look at its best. *G. H. R.*

HOW SYNONYMS ARE MANUFACTURED.—I observe in a catalogue of Dutch bulbs, issued by Messrs. E. H. Krelage & Son, of Haarlem, a list of early Tulips, among them one bearing the name of "Brunnhilde (L'Unique), white with golden bars (Award of Merit, 1901)." The correct reading is Unique (syn. Brunnhilde), because for three years past for certain, and probably four, this Tulip has been publicly exhibited by local growers at the exhibitions of the Midland Daffodil Society, at Birmingham, under the name of Unique. It is about four years ago I saw this Tulip in bloom in Mr. Sydenham's garden in the Bristol Road, Birmingham, bearing the name of Unique. Mr. Sydenham, when in Holland a year before, had seen this Tulip in a Dutch collection, and he imported some bulbs under this name, together with Spaendock, and one or two other novelties. I was much struck with Unique—a white Pottbakker, with a yellow flame springing from the base of each white petal, and running half-way up it. When last spring Messrs. Barr & Sons exhibited Unique under the new name of Brunnhilde, I pointed out to the Floral Committee of the Royal Horticultural Society that it had been imported from Holland under the name of Unique, and grown and publicly exhibited at Birmingham as Unique; I also said it was catalogued by Mr. Robert Sydenham under this name. Unfortunately, the Committee turned a deaf ear to my remonstrance, and gave Unique an Award of Merit under the name of Brunnhilde. I appealed to Mr. de Graaf, who was present at the Drill Hall on that occasion, and he (no mean authority) declared that the original name of the variety is Unique. Messrs. E. H. Krelage & Son acknowledge the identity by putting Unique after Brunnhilde. On the occasion when an Award of Merit was made to Unique under the name of Brunnhilde, Messrs. Hogg & Robertson, of Dublin, had the very same variety in their collection of Tulips under the name of "Pottbakker, white and gold." Unfortunately, in the list of early single Tulips, given in their catalogue of bulbs just issued, they announce the variety as "Brunnhilde (syn. Unique, Pottbakker, white and gold)." If anyone will refer to the reports of the Mid-

land Daffodil Society for the past three years, which appear in the *Gardeners' Chronicle*, they will find mention of Unique as having been exhibited in the class for six pots of early single Tulips. I call attention to this matter on public grounds. It is the duty of everyone having reliable knowledge to endeavour to reduce the number of synonyms, and the Floral Committee of the Royal Horticultural Society should be most careful how they consciously lend themselves to the furtherance of such an abuse. *R. Dean.*

FRUITLESS PURSUIT OF MELONS.—I read the note on this subject with much interest, and am not much surprised, as I have known the time, about six years ago when living in Wiltshire, that you could only get about *fid.* return for good Melons at Bourne-mouth. No wonder that Melon-growing has ceased to a great extent. Who would care to grow Melons for profit at that price during the early part of the season, especially at the present cost of fuel? I see the London market prices are now not very encouraging. If Bourne-mouth is without fruit, no doubt the Water Melons keep the price down in London. *G. Fulford, Presdates, Ware.*

WEATHER LORE FOR SEPTEMBER.—

"Season of mist and yellow fruitfulness,
Close bosom friend of the maturing sun,
Conspiring with him how to bless
With fruit the Vine, that round the thatch-
eaves run;
To bend with Apples the moss'd cottage
trees,
And fill all fruit with ripeness to the core."
Keats.

"So many days old the moon is on Michaelmas'
day, so many floods after."
"September blow soft,
Till the fruit's in the loft." *J. C.*

THE ICE APPLE.—The famous Mons. de la Quintinie, who was chief director of all the gardens of the French King during the latter half of the seventeenth century, refers to these as one of the sorts of Apples that are good to eat "raw or baked." He did not prize them so much as the "Gray Pippin, White Pippin, Autumn Calville, the Api and the Violet Apple," but they were "no bad fruit." They were one of the three sorts that are bigger than the others, and more long than flat, and "thicker towards the stalk than towards the head." He says they are so called "because when they ripen, they seem to grow transparent, without being really so. They are altogether greenish and whitish, and make no great figure among any truly curious persons." The same writer refers to the "Violet Ice Apple and the Black Ice Apple." There are many varieties of Apples growing at the Woburn Fruit Farm, but I have not seen any of this variety. The Apples from Kashmir are bearing a fair crop this year. I suppose for the first time in England. They are interesting, but more curious than valuable. If Mr. Castle has any Ice Apples, then perhaps he will tell us. *Charles J. Kilby, Manor Gardens, Milton Bryan.*

FINE PEACHES AT WARLES PARK, WALTHAM ABBEY.—On the occasion of a recent visit paid to Sir T. FORB BENTON'S gardens, I remarked a fine crop of Peaches generally, and in particular on two trees of Sea Eagle and Princess of Wales planted in a span-roofed house. The crop of fruit on these two trees was an unusually heavy one, and the fruits of great size. Some of the latter weighed almost 1 lb. These trees have been planted three years, and are vigorous and healthy. *B. H. P.*

HEMEROCALLIS AURANTIACA MAJOR, &C.—I was interested in reading your correspondent's remarks about *Hemerocallis aurantiaca* major on p. 170, as I bought a plant of it from Messrs. Wallace of Colchester early in 1897. It was, I think, in 1898 that it flowered first. I had to move it that autumn, but it flowered

again the next year, though not in 1900. This year it threw up two flower-spikes with ten blooms on each, some are past, some coming on. The flowers are about 6 inches or more across, and of rich orange-yellow, a most striking flower, carried on stiff spikes about 24 inches in height; some of the leaves are more than 30 inches long. The plant has now four crowns, and is in excellent health, although it gets practically no attention beyond having the weeds kept down, and being afforded water in dry weather. Next to it is a clump of *H. flava*, which also grows well, flowers profusely, and seeds freely. The soil is heavy, but dug some 24 inches deep. I send you herewith two leaves of *Hemerocallis aurantiaca* major, and a bud and flower, the latter much past its best; also two leaves and a flower-spike of *H. flava*, Ernest Bewley, Rathmines, co. Dublin.

BOUSSINGAULTIA BASELLOIDES.—Will you kindly allow me a little space for my experience with *Boussingaultia baselloides*, my plants of which came from India, and were potted up in May 1899. They were kept in snail pots until January, 1900, when I planted some of them against the back wall of an early Peach-house, and they flowered in September, 1901, the soil used being a mixture of peat, loam, and leaf-mould, and a moderate quantity of silver sand. I may say that some of the leaders were quite 30 feet long, and they flowered at the extremities of the side-shoots. The plant likes plenty of water and air, but I did not think it worth its room, so I threw it out. A few degrees of frost will kill it down. *W. Ireland, Gardens, Fota-Beg, Cork.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

AGUST 27. *President.* Dr. M. C. Cooke, in the Chair. Messrs. Chapman, Dreary, Odell, Houston, Worsley, Bowles, Saunders, Rev. W. Wilks, Drs. Rendell and Masters.

Apricot Splitting. Dr. COOKE reported on the Apricot pulp of which was found to be split, and a foreign substance growing upon it. This, however, was nothing but the common blue mould which grows on decaying matter. Mr. Worsley assigned various causes for the splitting of the fruit.

Silver Leaf. Dr. COOKE stated that it was doubtful if there was any essential relation between gumming and the so-called silver-leaf disease of the Plumace. Dr. Cooke doubted whether the fungus called *Coryneum Beijerinckii* has any causal connection with gumming. On the other hand, gumming in *Prunus japonica* had been traced to *Clado-porium epphyllum*.

Miscellaneous Notes. Dr. COOKE stated that he had been unable to find any fungus on the *Crocus-cornus* submitted by Mr. Bowles, nor on the Violet leaves sent from Ireland; the frosted spots were due to the precipitation of the salts from the solution with which the leaves had been sprayed (see *Gardener's Chronicle*, August 21, p. 190, col. 4), where the appearances are attributed to a fungus, *Phyllosticta violet*.

Gambesey Shoots. Some shoots which were shrivelled and dead were exhibited, the assumed cause being the presence of red spider.

Ascus of Apogony. Mr. DREARY exhibited cultures showing developed masses of prothallia on the basal sides of *Althya* (*Althya romana* var. *crispata*) imbrications, raised by Mr. Garnett, of Bowles's, Windsor, mere. A branch of this Fern was exhibited at the recent meeting of the British Pteridological Society, and Mr. Deney remarked at a conference great likeness in make to *A. l. clausiana*, Jones, though it differed from that Fern in bearing long slender, much divided tassels at all tips, rendering it a very beautiful form. On examining the soil they exhibited so strongly the white, woolly character indicative of apogony, that permission was asked and obtained to put some material under culture, the immediate result of which was an extension of the sporangial growth, demonstrating once again that abnormally slender, linear gametes are correlated with apogony. There are some indications also of apical apogony, but not yet definite enough to be determined with certainty. Sexual apogony is, however, beyond a doubt. This represents the fourth instance of apogony in *Althya* (*Althya romana*).

Mr. DREARY also exhibited a culture showing apical apogony in *Lastrea pseudo-mas* apogonia, already recorded; well developed prothallia springing from all the imbricate tips of the crests of the pinnae.

Giant snailmoss on a species of Silver Fir.—A specimen was shown of the swellings produced by a *Cocculus*-like insect (dig. 69). Petroleum emulsion was recommended as a palliative, and destruction by fire of the affected shoots advised.

Medicinal Plants in the vicinity of old ruins.—Mr. HOUSSON asked for information as to any paper dealing with the presence of herbs around mediæval ruins. The presence of *Aristolochia clematitis* around the ruins at Godstow, Oxford, was cited as one illustration.

Poisonous Plants.—Mr. BOWLES alluded to the poisonous effects produced by contact with the so-called *Apoposys* (Hogg), which turned out to be really *Rhus Toxicodendron*.

Mr. MASTERS alluded to many similar cases, all traceable to the distribution from a particular nursery of *Rhus Toxicodendron* instead of *Anaplexis*.

A conversation arose in connection with this subject, Mr. DREARY stating that honey in any form produced

FIG. 105. GATEWAY VIBES AMARILIS.

uneatable scum, with *Aspilota*, and Dr. COOKE alluded to other cases in which *Mus-trochus* produced evil effects upon some persons, and not upon others, who partook of the fruit at the same time.

Andromeda (read out). A Fellow of the Society, present as a visitor, exhibited fine specimens of *Agaricus campestris* var. *valentinus*, which was growing abundantly on the walls of a cave called "Saiding" the walls was recommended as a remedy.

Chomocoma (specimen of a Beech bark) were shown in illustration of the above case of this insect's disease. Unfortunately, the attack was so widely spread that anything in the way of cure was impracticable.

Tata Apple. Mr. HUBERT sent a specimen of an apple in which two Apples were partly fused together at the base, probably from pressure causing mutual grafting in a young state.

Agave and Narcissus. Mr. WORSLEY exhibited specimens of *Bom-citium mac-carum* from South Africa, and of *P. Ruppellii* from Abyssinia. Mr. Worsley also exhibited a *Cocculus*, in which the ordinary ray flowers had been replaced by regular tubular ones.

Andropogon (read out) in *Clavaria*. Mr. WORSLEY also stated that since his previous communication on this subject, he had found that the seedling plants of *C. yunnanensis* exhibited the same peculiarity.

Two-fold Helianthus. Dr. MASTERS exhibited shoot of *Helianthus* "Mr. Mellish" of two forms, from the same stock, one short, erect, green, and robust in habit, the other slender, deep purple and greatly resembling the shoots of *Helianthus rigidum*, exhibited for comparison.

EASTBOURNE HORTICULTURAL.

AG-USE 21.—The annual show was held on this date in the fine grounds of Compton House. This is one place in the South where may still be seen the fine specimen plants of bygone times, and now so rarely to be seen at exhibitions, and the competition in those classes is keen. The foliage plants of Sir A. LAMB, Bart, and Messrs. P. A. EAGLES and WARREN were almost too large to be accommodated in the tent.

Roses made a special feature, and Mr. WILL TAYLOR, nurseryman, Hampton, Middlesex, showed splendid blooms.

Tables laid out with fruit and set off by plants, &c., were another welcome feature, fruit being expected to be the most prominent objects, and in Mr. F. W. THOMAS exhibited this was happily the case. A word of commendation must be accorded Mr. Gore, the Superintendent of the tents, for the excellent arrangement he had made; to the Secretary, Mr. H. J. Capon; and a very helpful body of committeemen.

PLANTS.

For stove and greenhouse plants in eight kinds, Mr. T. Portnell, gr. to Sir A. LAMB, Bart., Beauport, Hastings, was a good 1st, with grandly flowered *Almandra*, *Polypodium*, *Bougainvillea*, *Ficus*, *Lapageria rosea*, and *Staph. Gilberti*. Mr. A. Gadd, gr. to P. A. EAGLES, Esq., Hollington, was a close 2nd, and J. WILKIN, Esq., Hand cross, Park, gr. Mr. OLFER, 3rd. In the smaller classes, in all kinds, the same exhibitors took the prizes in the order of their names, but in the large foliage class, J. WILKIN, Esq., was a easy 1st, having splendid specimens, Mr. PORTNELL 2nd, and Mr. GADD 3rd.

For six foliage plants, Messrs. OLFER and PORTNELL were the winners.

The class for exotic Ferns brought large specimens, and Mr. OLFER took the premier prize with beautiful specimens of Tree Ferns, Mr. GADD was 2nd.

For eight species, distinct, Messrs. OLFER and GADD were again the successful competitors.

Groups of plants arranged for effect brought severely my competition, and the 1st prize went to Mr. H. T. DIXON, gr. Woodside, Huddersham, and the best arranged group of Ferns was that staged by Mr. T. PORTNELL, who had an easy win.

LET FLOWERS.

For thirty six varieties, distinct, of Roses, Mr. WILL TAYLOR, Hampton, had very fine blooms, considering the late date, and worthily took the 1st prize; 2nd, Messrs. BROOK & SON, nurserymen, Eastbourne; and Mr. H. HARRIS, gr., Deane Park, Horsham, was 3rd.

The best twelve blooms of any one variety were shown by Mr. W. TAYLOR 2nd, Messrs. SLAUGHTER, JARVIS, and STENNING, and 3rd, Mr. H. HARRIS.

The best collection of animals came from Mr. E. RIPLEY, gr. to Miss VICKER, 2nd, Mr. W. PETERS, gr. to A. J. HALL, Esq., St. Leonards.

The competition in the classes for Dahlias brought exhibitors from a distance, and some capital blooms were shown. For show varieties, Messrs. PETERS and STENNING were 1st and 2nd respectively; and for cactus varieties, Messrs. STENNING, RIPLEY, and PETERS took prizes in the order of their names. Messrs. STENNING and GREENSDALE were 1st and 2nd respectively for Pompons.

Herbaceous perennials-as cut flowers were well shown by Mr. RIPLEY & Mr. PETERS, and cut blooms of stove and greenhouse by Messrs. OLFER, PORTNELL, and WILKIN respectively, who took 1st, 2nd, and 3rd, in the order of their names.

The best decorated dining table in the open class was that shown by Messrs. DREARY & YOUNG, Eastbourne. They had in the centre of it three large bowls of mixed flowers, a rather heavy looking feature. Mr. W. STURDY, Eastbourne, was 2nd, his materials consisting of Sweet Peas. The ladies' tables were better and more lightly arranged, and there was more competition in their class. Mrs. PARKIN, St. Johns, Withdean, Brighton, was 1st, Miss SCOTT WALKER, Eastbourne, 2nd, and Miss JENNER, Bath 3rd. Some other tables, not in the prize list, were very effective and much admired.

FRUIT.

The leading feature, as has been stated, was the decorated tables, and the 1st prize was won by Mr. THOMAS WANSBOK, whose materials consisted of masses and *Cocculus*, well finished Grapes in much variety, and splendid Peaches, Nectarines, a Melon, and other fruits. Mr. GREGG, gr. to Lord Ashburnham Ashburnham Place, Bath 2nd, his best fruits were not quite ripe. Mr. THOMAS was 1st with bunches of table was rather too much crowded with heavy looking plants. Mr. PENROSE, Windmill Hill, was 3rd. This last exhibitor used Tomatoes freely, which would have been better left out.

In a dessert fruit competition, the Black Grape class was a good one, although some of the larger bunches were not quite ripe. Mr. THOMAS was 1st with bunches having large, well coloured berries; and Messrs. HAYGAR and COLGATE were 2nd and 3rd respectively.

The any other Black Grape class brought good fruit, Messrs. TUGWELL and PENROSE being 1st and 2nd.

White Grapes made a poor show and only a 2nd prize was awarded, viz. to Mr. CLARSON. Figs were splendid and rarely anywhere excepting

at Brighton are such fine fruits to be seen. Messrs WELLES, THOMPSON, and BLACKMAN were the winners.

Best-set Apples were good. Messrs GRIGG, MARTIN and WILSON took 1st and 2nd prizes; and for culinary varieties, Messrs THOMAS, COLGATE and CLAYSON were respectively 1st, 2nd and 3rd.

For Peas, Messrs THOMAS and WHITING showed the best.

There were splendid Peaches and Nectarines, Messrs. COLGATE, STILES and EAST winning for Peaches, and Messrs. THOMAS, TWISSELL and GRIGG for Nectarines.

The chief awards for collections of vegetables were taken by Messrs. RAHEY, GOLDSMITH, and COLGATE; and for Tomatoes, by Messrs. WADDELL, EAST, and PENROSE.

MISCELLANEOUS.

Messrs. CHAM, & SONS, Crawley, showed Dahlias splendidly; as did Mr. CHARTTON, Tunbridge Wells; and Mr. SHERWOOD, St. Leonards.

Mr. H. T. DIXON showed Sweet Peas. Mr. THOMAS had a grand bank of Begonias. Mr. MAY, gr. Compton House, had a splendid decorative group, beautifully arranged, and a group came also from Mr. G. T. SCOTT, Eastbourne.

THE NATIONAL HORTICULTURAL SOCIETY OF FRANCE.

August 22.—The French National Horticultural Society held in Paris an exhibition of flowering plants on the above date. This was successful, although not very remarkable. There were some excellent Cannas given by M. VILMORIN-ANDRIEU, well grown, and including small, dwarf, and well-flowered specimens of some of the best varieties. There were no new sorts; apparently Cannas have reached the maximum of beauty, and the limit cannot be passed.

Messrs. CAVEYX & LE CLERC, of Paris, showed some fine Gladioli, as did M. GRAVEREAU, of Neuville, and MM. VILMORIN-ANDRIEU. The most remarkable Gladioli had rounded stems, and the flowers are set all round the axis. Messrs. CAVEYX & LE CLERC sent some fine perennial Phlox and hybrid perennial Delphinium.

M. MOUBERT-BREUVAL, of Boulogne la Reine, showed a series of fruits of small-fruited pomegranate plants, intended for ornament (Crataegus, Berberis, Sorbus, Cotonea, Koehreuteria, Symphoricarpos, &c.), and flowering branches of Yucca Agaves, Castus, Tamarius, and Polygonum sachalinense.

M. AUBRIOT, of Bouisy St. Leger, showed some fine seedling Carnations, with large flowers and erect stems. Among the other exhibits, some fine fruit was noticeable.

There will be another flower and fruit show held by the Society on September 26, and an autumn exhibition, chiefly of Chrysanthemums, on November 12. It is not known where this will be held. The marquee erected annually in the Tuilleries proves expensive, and the floods of rain last May showed the inconvenience of this temporary arrangement. The spring exhibition, in consequence of the accident, was a financial failure, and complaints were so numerous as to result in the resignation of the President of the Organisation Committee. For the autumn exhibitions one of the proposals left to the Universal Exhibition of 1903 is proposed—probably the glass-houses of Cours-la-Reine, or the Palais des Arts, at Evreux; the latter is particularly likely to be used for the Chrysanthemum show.

Alterations are being made in the rules of the Society. Hitherto, novelties brought before the committee received 1st, 2nd, and 3rd class certificates of merit. It is decided that there shall be one class and one certificate, as it has been found that some firms, for trade purposes, falsify their "certificate of merit," and do not notice the class.

The last number of the *Journal de Societe Nationale d'Horticulture* has published the Report of the 1901 Horticultural Congress, and also some "Memoires Preliminaires," by various writers, which will serve as a basis for discussion, and so should be published before and not after the Congress.

Among these notes, or some interesting communication elsewhere referred to, dealing with artificial fertilisation, and also general notes by M. L. Henry, on *Stylocis* and *Lagustrina*; by M. Germain, on *Rosea*; M. Denante, of Grignon, on *Peas*; and by M. S. Mottet, on *Eranthis*. The Society at the same time has also published the programme since the 1902 Congress, thus giving six months' notice to those who may wish to prepare papers; therefore it is to be hoped that information concerning these papers may be made known the year previous to the Congress.

In this programme such interesting questions are proposed as—A Study on Glass-houses; on the Influence of Daylight on the Growth of Vegetation; the Society continues to invite the authors of monographs proposed last year, excepting those on the genera already dealt with in 1901.

The Organisation Committee also announces two subjects of discussion for the 1903 Congress, one dealing with the Uses of Plant-foods; and the Committee is wise to have given a long time for the consideration of so important a subject. *H. T. GRIMMOND.*

ROCK FERRY HORTICULTURAL.

August 23.—It was a bold effort on the part of the committee of this newly-formed Association to offer such a splendid prize list on the occasion of their first show, which was opened on Friday last in St. Peter's Hall, a by-no-means suitable place to display the grand produce brought together. Every room and balcony was fully taxed, and a large marquee erected in which to hold the allotment exhibits, the money alone given in the latter classes amounting to over one hundred pounds. The committee asked that all exhibits might, as far as possible, be named; but there was much looseness in this respect among the vegetable classes.

For a group of miscellaneous plants arranged for effect, Mr. HENRY GIBSON, of West Derby, had an easy 1st; a large amount of Maidenhair Fern formed the pillars and groundwork, changing do-plants of the Crotons, Caladium argenteum, Orchids, &c. being used sparingly, but get judiciously. A fair 2nd was put up by Mr. K. Roberts, gr. to G. C. PATON, Esq., The Poplars, Beblington.

In the smaller group, Mr. E. Stokes, gr. to J. H. KENSON, Esq., Egerton Park, Rock Ferry, used a less pretentious style, a tall Palm surrounding the whole, and the flatness was relieved by some well-flowered plants of *Onchidium variegatum* Rogersii. Mr. J. BRYAN, gr. to ERNEST PEELE, Esq., "The Redlands," Rock Ferry, was placed 2nd.

STOVE AND GREENHOUSE PLANTS.

Mr. BRYAN was also successful in the classes for stove or greenhouse plants, a typical Begonia, and a well-flowered *Pinnulago capensis* being attractive, for a *Lantana borbonica*, two *Fuchsias*, and three zonal Pelargoniums. Three excellent *Pyramidal Colons* came from Mr. E. STOKES, the best two exotic Ferns from Mr. R. ROBERTS, and tuberosus Begonias from Mr. J. BRADSHAW.

CUT FLOWERS.

These throughout were of a most superior order, the floral display 1 feet by 2 feet being secured by Mr. H. GIBSON, with a light arrangement of mixed Sweet Peas and grasses, the 2nd prize being awarded to a choice collection of various Dahlias flatterly arranged.

Tomatoes were not of great merit, but the twelve bunches of out-door flowers from Mr. JOHN LEE were the perfection of arrangement, and brilliant in colour.

The chief Rose prize was taken by Mr. LITTLE, gr. to G. H. PILKINGTON, Roby.

Mr. C. A. YOUNG, of the Floral Nursery, West Derby, had a remarkably good 1st prize collection of Carnations and Proteas, arranged with their own foliage, more conspicuous from the fact of the many beautiful own raised seedlings noticed.

The various table decorations were most elegant, Miss ISABEL KENDALL 1st, Mrs. W. H. KENDALL 2nd, and Miss KENSON 3rd.

FRUIT.

Every class was fully contended, the quality being admirable. For the collection of six dishes Mr. FERGUSON, gr. to Mrs. PATERSON, Rock Ferry, had a splendid lot, consisting of Black Hamburgs, a choice Alexander Grapes, Greenage Plums, and Mincet of Boyenne d'Été Peas, and Pinnepale Nectarines. Mr. C. Irvine, gr. to P. C. D. CASTLE, Esq., was placed 2nd.

Mr. CASTLE also put up fine samples of out-door fruits. Mr. J. RICHARDS had his fine Black Hamburgs, a long open pear of highly finished Madresfield Court, and three bunches of Mincet of Alexander Grapes; the remaining prize for any other white-fleshed fruit, Morgan, gr. to M. HARVEY, Esq., Rock Ferry, who also scored with Elrige Nectarines. A grand dish of Belle-garde Peaches was put up by Mr. A. CRISP, gr. to W. PATERSON, Esq. From Mr. T. THOMAS, gr. to T. W. OAKSHOTT, Derby House, Rock Ferry, came *Compendio di Bologna* as the best green-fleshed Melon; Mr. HARVEY struck a very unusual score.

Barely fruits were noticeable in every way.

VEGETABLES.

The best twelve came from Mr. G. TAYLOR, Little Sulton, but as they were without names comment is almost needless. Mr. PATERSON, Rock Ferry, had a splendid lot, consisting of Purple Windsor cabbages, and International as the best three dishes of Potatoes, and excellent Onions and Celery. Mr. W. MULLINSON carried off the Tomato prize.

In concluding, it may safely be said that the Rock Ferry Show is likely to become permanent. *R. P. GRIMMOND.*

HORTICULTURAL EXHIBITION AT BRUGES.

August 24, 25, 27.—The fine square Market Square of Bruges was, on this occasion, transformed into a beautiful garden, and the ancient halcyon looked down upon a novel sight, for nurserymen and amateur-vied with each other in friendly rivalry where an years gone by they a sanguinary contest was fought.

The Royal Horticultural Society of Bruges (the oldest horticultural association in the world, founded in the

sixteenth century) and the Society of Gardeners united to make this exhibition, under the auspices of a very influential society, known as "Bruges on Avani."

M. le Comte d'Ursel, Governor of the Province, said at the opening ceremony, "I had looked for an experiment, but you have made of your first exhibition a masterpiece." The exhibits came from Bruges only, but their number and importance show how greatly the nursery of the district have increased of late years. A very influential jury, kindly invited by the committee, representatives of eight nationalities being present; Great Britain was represented by the following gentlemen:—Messrs. Wm. Garraway, Peter Veitch, Arthur Turner, Robt. P. Ker, Fred. Boyle, J. Bruckhaus, and M. K. Dross.

The main display was in the Grande Place, but an important part was held in the Hall of the Belfry, and in the Government Building, which also faces the Square.

The most striking specially in the cultures of Bruges is that of the Bay Trees. Over 2,000 were shown, varying from 50 year old specimens to small plants of 2 and 3 ft.

In the centre of the square is the statue to two patriots in the troubled days of old. At the base hung a gigantic Laurel wreath some 15 feet in circumference, decked with red and white ribbon, the colours of the town.

A large proportion of the Bay Trees was exhibited by Messrs. F. SANDER & Co.; in fact, this firm contributed very largely to the general success of the exhibition, having brought an immense number and variety of plants.

M. VINCKE DEBARDIN showed some of his big specimen Bay Trees in several forms; and Mlle. KANAFER DE GLASS sent eight very beautiful columns, 10 feet high, of *Eugenia australis* in flower. These and the Bays stood round the beds of *Pentstemon*, *Asters*, *Lilies*, &c., shown by JELES CRAM, Pelargonium plantum from VEIHBACH-BAV, and others.

Not less effective were the beds of Begonias, such as *Lafayette Surpassé*, *Daviesi*, *Perfection Rose*, shown by Messrs. SANDER, whose double Begonias were well-nigh perfect. The colours well separated in a star-shaped pattern.

The fine groups of Myrtles were shown by Mr. STRIMMEZ and VAN PAU. Further on were large masses of *Phoradendron*, *Euryas*, *Araucarias*, besides many other good decorative plants. The 1st prize for *Ducenas* fell to the Société "Flandria"; and from VAN WALKER came good collections of *Conifers*.

Very beautiful was the garden thus laid out in the very heart of the city, the numerous squares around which were decked and bedged on the occasion. The some what uneven paving stones were covered with sand, and good paths thus enabled the visitors to promenade in comfort and listen to the excellent military band, which was supplemented in the intervals by the carillons on the celebrated Belfry Bells.

In Belfry Hall were the exhibits of the Society of Gardeners, consisting of the most useful decorative plants in commercial sizes. Worthily of special mention were the Bay Trees from LINDBO, *Lantana* from SOMERLINCK and VANDEN BOSS, *Kentias* from VAN PAU.

Very striking was a group of *Lantana borbonica aurea*—a splendid golden Palm, shown by Mr. STRIMMEZ, for which he was awarded the large 6th Medal. A number and variety of other Orchids was shown by M. VINCKE-DEBARDIN, in which were several good varieties of *Cattleya Gaskelliana* and *gigas*, and a new hybrid *Cypripedium* "Vincet 2."

The Société "Flandria," and Messrs. SANDER, showed fine groups of twenty-five distinct Palms. The latter received the 1st prize. Their group contained very fine specimens of *Leucodia grandis*, *Kentia Sommeriana*, *Gladiolus*, *Phoradendron*, *Eugenia australis*, *Gladiolus* and *Cantabrigiana*, *Calamita Alberti*, *Linosydis Petriknigge*, &c.; and above all, a *Kentia* which is quite unique, with eighteen leaves of 6 to 7 ft., hanging down in a dense mass.

Fruits, vegetables, and flowers were also shown, but there was nothing special in this department.

In the evening, the entrance of the Government building, vases and garden requisites were exhibited, whilst Messrs. SANDER filled the hall with rare and interesting plants. In the foreground of their collections stood a new and unique Palm, *Linosydis Leopoldi*, never shown before. An immense plant of *Monstera deltoidea*, in fruit and flower, attracted great attention from the general public. In the centre was a group of *Nepechima* and *Alseodora* plants always interesting. *N. mixta*, Sander's var., has longer pitchers than any other excepting *N. Rajah*.

On the right, a group of various new and rare foliage and flowering stove and greenhouse plants contained some 150 specimens. *Anturium*, both *Andromeda* and *Schezerianum*, were here in great variety, and *Isosiphon* (the singular), *Peperomia*, *Polka*, *Polka*, *Polka*, *Polka* (new), *Acalypha insipida*, on 3 feet stems, *Yucca*, *Crotons*, &c.

A group of new and rare Palms on the left contained some fifty varieties, including *Kentias* and other remarkable species. The end of this hall was filled with a magnificent display of *Orchids*. A dozen grand varieties of *Vanda coerulea* formed a beautiful group, and on the other side was the peerless *Cypripedium callosum* Sanderi, also some good *Lettia Cattleyas*, the

this fine Grape than of other varieties, as only two exhibitors competed in the class specially for it.

Two bunches of any other Black Grape.—In this class the variety *Albwick Seedling* was shown superbly by Mr. THOS. LESTER. The bunches were long and heavy, but these were not their best points, for in quality and finish they were perfect. The 2nd prize was won by Messrs. D. & W. BUCHANAN, with two unnamed bunches, besides Cooper's Black; and, W. H. DOBBIE, Esq., Dollar Mez, Dollar (gr. Mr. Jno. Waddie), with Gros Maroc. There were Muscat Hambourg, Cooper's Late Black, and others shown in this class, in which there were fourteen entries.

Two Bunches any other White Grapes.—The 1st prize was awarded to extremely large berried bunches of Duke of Buccleugh, shown by Mr. JOHN LESTER. The berries needed just a few more days to get the best colour; 2nd, Foster's Seedling, shown well by THOS. HINSHIELD, Esq., Kenyhill House, Glasgow (gr. Mr. Peter Young); 3rd, also Foster's Seedling, from Mr. JAMES DAVY. The varieties *Raisin de Calabre*, Empress of India, a new variety referred to above, *Chasselas Napoleon*, and *Canon Hall Muscats* were also shown in this class, in which twelve entries were made.

One Bunch of a White Grape.—Prizes were offered in this class for the heaviest bunch shown, and the 1st prize went to a bunch of *Graciosa*, weighing 8 lb., shown by Mr. JOHN LESTER; 2nd, to A. A. WALLACE, Esq., Houston House, Johnstone (gr. Mr. James Brown), who had *Trobbiano*.

One Bunch of a Black Grape (earliest).—Mr. JOHN LESTER also won 1st prize in this class, and showed a wonderful bunch of *Alicante*, which weighed 8 lb. One of the shoulders was quite as large as a fairly-sized bunch of this variety. The berries were also of good size, hardly well coloured, but by a little thinning the bunch could be made to appear very satisfactory for so heavy a specimen; 2nd, Messrs. D. & W. BUCHANAN, with unnamed bunch (probably *Alicante*), weighed 6 lb. 2 oz.; 3rd, Sir D. C. BUCHANAN, Drumpepher, Coatbridge (gr. Mr. A. Aiklen), who also had an unnamed bunch.

MELONS.

The best three fruits of a green or white-fleshed Melon were of the variety "Best-of-All," shown by D. SCOTT FERGUSON, Esq., Thayston, Kirtoukirk (gr. Mr. Thos. Christie), they were small fruits, in perfect condition, and of good flavour. The 2nd prize was won by Mr. LESTER, whose fruits were distinct, and included the varieties *Hero of Lockinge*, *The Countess*, and *Royal Sovereign*; 3rd, the Earl of HOME, K.T. (gr. Mr. W. F. Archibald).

The best scarlet-fleshed Melons were *Scarlet Premier*, shown by Mr. JAS. McINDOE; whilst *Kingdike*, from Mr. THOS. CHRISTIE, was 2nd.

Figs.

The best Figs shown came from so far south as Goodwood, being shown by Mr. R. Parker, gr. to the Duke of RICHMOND AND GORDON; they were some of the largest fruits of Brunswick we have seen; 2nd, Mr. JAS. DAVES, also from the south; and 3rd, Mrs. JOHNSTONE, *Combe Cottage*, Kingston-on-Thames (gr. Mr. David Gibson).

PEACHES AND NECTARINES.

There was a first class show of these in four classes. The 1st prize for twelve fruits in two varieties was won by A. CAMPBELL, Esq., Craigie House, Ayr (gr. Mr. Robt. Blair), who had magnificent specimens of *Prime of Wales*, and good ones of *Bellegarde*; 2nd, Mr. RICHARD PARKER; and 3rd, J. A. WALLACE, Esq., Bridgend Cottage, Cairnryan (gr. Mr. Wm. Downie).

The best dish of six fruits was shown by Mr. Robert GRINDROD, gr. to G. BATES, Esq., Whitfield Gardens, Hereford, who showed very large fruits of *Sea Eagle*; 2nd, the Earl of CAIRNROY, *Hughlere Castle*, Newberry (gr. Mr. W. Pope); and 3rd, Mr. D. BUCHANAN.

The best dozen Nectarines was from Mr. THOS. LESTER, and they were some of the best developed, highest coloured specimens of *Eldrige* and *Pine-apple* we have ever held; 2nd, Mr. DAVID GIBSON, with the same varieties; and Mr. DAVID MURRAY, with *Spencer* and *Pine-apples*. These exhibitors were awarded equal 2nd prizes.

APRICOTS AND PLUMS.

The 1st prize for twelve fruits of Apricots was won by Mr. W. Smith, gr. to the Earl of STRATH, *Oxenford* Castle Gardens, Dalketh. These were the only samples shown.

The best dozen of Gage Plums was shown by Mr. JAMES DAVES, who had very large and excellent specimens of the variety *Jellison*; 2nd, Mr. W. POPE, with *Raynston Gage*; and 3rd, Mr. DAVID GIBSON, with *Green Gage*.

The best yellow Plums were magnificent specimens of *White Magnum Bonum* from Mr. POPE; 2nd, Earl of LONDON, *Galston* (gr. Mr. J. W. Robertson), with the same variety; 3rd, Mr. JAS. McINDOE, also showing the same variety.

For red or purple Plums, the best was *Kirke's Seedling* from Mr. ROBT. BEATTIE; 2nd, Mr. W. SMITH with *Pond's Seedling*; and 3rd, JSD. MALCOLM with *Victoria* and *Kirke's Seedling*.

PEARS.

The best three dishes of Pears, distinct, grown in the open air, came from H. J. YOUNGER, Esq., Benmore, Kilnmuir (gr. Mr. Robt. Greenlaw), who showed *Doyenne du Comice*, *Pittaston Duchess*, and *Beurré d'Amanlis*; 2nd, Mr. JAS. GIBSON; and 3rd, Mr. W. ROE, gr. to E. W. CRODICK, Esq., *Caradair, Ross*.

The best three dishes of Pears cultivated under glass were shown by Mr. THOS. GORDON, gr. to WALTER NEILL-ROSS, *Evenfield, Ayr*, who had very nice and nearly ripe fruits of *Magnate*, *Louise Bonne de Jersey*, and *Durondeau*; 2nd, Mr. ROBT. GREENLAW; and 3rd, Mr. D. KIDD.

In the larger class, for twelve dishes of Pears in twelve varieties, there were numerous collections of good fruits. The 1st prize was won by Mr. THOS. GORDON, who showed *General Tollehen*, *Beurré dié*, *Marie Louise d'Uccle*, *Beurre Bose*, *Durondeau*, *Beurré d'Amanlis*, *Louise Bonne de Jersey*, *Doyenne du Comice*, *Magnate*, *Conference*, *Beurré Superin*, and *Clapp's Favourite*. The 2nd prize was awarded to Mr. ROBT. GRINDROD, and the 3rd to Mr. JAMES McINDOE.

APPLES.

Were shown numerously, and generally they were good. The 1st prize for a collection of twelve distinct varieties was won by Mr. ROBT. GRINDROD (Hereford), who had capital fruits of fine colour and considerable size; 2nd, Mr. DAVID GIBSON, *Kingston-on-Thames*.

In a class for twelve varieties of culinary sorts, Mr. RICHARD PARKER won 1st prize with very large fruits; 2nd, Mr. Jno. Kelly, gr. to CAMPBELL & GETTING, *Gleweston, Ross*; and 3rd, Mr. ROBERT GRINDROD. There were twelve entries in this class, and two equal 4th prizes were awarded in addition to the collections referred to above.

The best collection of six dishes of dessert Apples came from Mr. John Kelly, gr. to CAMPBELL & GETTING, *Ross*, and he showed very finely coloured fruits of *Lady Sudeley*, *Warrington*, *CON'S Orange Pippin*, *Beauty of Bath, &c.*; 2nd, Mr. DAVID MERRIA, *Ayrshire*; and 3rd, Mr. JAMES DAVES, *Leadbury*. There were fifteen entries in this class.

COLLECTIONS OF VEGETABLES.

There were numerous collections shown in a class for the following thirteen varieties, the chief inducement being a Veitch Memorial Medal and £5 offered by the trustees of the Veitch Memorial Fund. None but gardeners and amateurs could compete. The collection was required to include dishes of six Cauliflowers, six heads of Celery, six Leeks, six Parsnips, six Carrots, six Beet, six Turnips, four early Cabbages, two Vegetable Marrows, twelve Onions, twelve Potatoes, fifty pods of Peas, and fifty pods of French Beans. There were as many as fifteen entries in this class, and the 1st prize was won by Mr. CHAS. TRAILL, gr. to JSD. MARSHALL, Esq., *Asbridge, Kilwinning*. He had good *Lion Giant Leeks*, *Winningsdale Cabbages*, *Veitch's Autumn Giant Cauliflower*, *Moor's Cream Marrow*, *Miller's Beautiful Potato*, *Crauston's Excelsior Onion*, fine *Golden Ball Turnips*, *Celery, &c.*; 2nd, Mr. JAS. BROWN, gr. to A. A. SPERS, Esq., *Houston Gardens, Johnstone*; 3rd, Mr. James Dymock, gr. to WENTWORTH VERNON, Esq., *Stoke, Stoke Braemar Park, Towcester*; 4th, E. Beckett, gr. to Lord ALDENHAM, *Elstree House Gardens, Hertfordshire*.

In a similar class for which prizes were offered by Messrs. SUTTON & SONS, Reading, the 1st prize was won by Mr. JAS. GIBSON, gr. to R. H. HUDSON, Esq., *Dunstable, Marlow, Bucks*. This was a grand collection, and included *Pritzaker Leeks*, *Standard Bearer Celery*, *Sutton's Autumn Mammoth Cauliflower*, *Tender and True Cabbage*, *New Intermediate Carrots*, *White Vegetable Marrow*, *Ailsa Craig Onions*, *The Student Parsnips*, *Sutton's Satisfaction Potato*, *Duke of Albany Peas*, *Spawhall Turnips*, *Canadian Wonder French Beans*, and *Sutton's Black Beet*; 2nd, Mr. Jno. Waddie, gr. to W. H. DOBBIE, Esq., *Dollar*; and 3rd, Mr. James Brown, gr. to A. A. SPERS, Esq., *Houston House, Johnstone*; 4th, Mr. W. POPE.

A smaller class for nine dishes of vegetables was won by Mr. JOHN GEMMELL, gr. *Flakfield, Chapelton*, 2nd, Mr. HUGH WATSON, *Crossford, Carlisle*; and 3rd, Mr. COLIN K. MACPHEIL, *Ardeer House, Dumbarton*.

There were plenty of Potatoes shown, and a large number of good tubers were staged in a class for twenty-four varieties. The best lot was shown by Mr. JOHN GEMMELL, gr., and the tubers were remarkable for a clean appearance and good even size; 2nd, Mr. JAS. SEBRICK, *nurseryman, Maxwellton, Dumfries*.

The best collection of twelve varieties of Potatoes came from Mr. ALLAN CALDWELL, gr., *Hill Hill, Polmont*. These were also very good indeed; 2nd, Mr. JAS. BROWN, gr. to A. A. SPERS, Esq., *Houston House, Johnstone*; and 3rd, JESSIE GENTLEMAN, *Craigmarrie, Armadale*.

There was a special competition for flavour in Tomatos, and in this class the winning fruits were *Dobbie's Champion* and *Holmes' Supreme*, both red varieties, shown by Mr. James Martin, gr. to Mr. SWINBURNE, *Wincheombe*.

A splendid collection of Tomatos was shown by Mr. HUGH BENNIE, *Looms Nurseries, Troon*; a large number of dishes of medium-sized fruits of good *Perfection* shape were shown amidst a groundwork of *Smilax* foliage; 2nd, Mr. John Hood, gr. to T. G. BISHOP, Esq., *Dalmore, Helensburgh*; and 3rd, Mr. ROBERT MORTON, *Braidwood, Carlisle*.

Carrots, Beet, and Parsnips.—The best exhibit of six roots of each was shown by Mr. W. HEWITT, *Temple Saw Mills, Glasgow*, and the comparative quality of his roots may be judged when it is known that there were thirty-four entries in this class; 2nd, Mr. W. Downie, gr. to J. A. WALLACE, Esq., *Cairnryan*; 3rd, Mr. James Hattie, gr. to JAMES MANN, Esq., *Orchard House, Carlisle*.

In the smaller classes the vegetables were of generally good quality, and the following were the principal prize-winners:—For *Cucumbers*, Mr. W. POPE, Mr. John Wood, gr. to T. G. BISHOP, Esq., *Dalmore, Helensburgh*; *Tomatos*, Mr. JOHN WADDIE and Mr. JOHN WOOD; *Onions*, Mr. ED. BECKETT, who had immense specimens, and Mr. ROBT. F. KAK, *Guthlows, Roxburgh*; *Leeks*, of which a very large number was shown, Mr. JOHN HOOD, and Mr. DAVID PITT, *Eccles, Kelso*; *Celery*, Mr. James Miller, gr. to Mr. C. S. STUART, *Castlemilk, Rutherglen*; and Mr. E. BECKETT.

NON-COMPETITIVE EXHIBITS.

Messrs. LISTER & SON, *Rothsay, N.B.*, showed a large quantity of Tomatos of the variety *Lister's Prolific*. There were thirteen whole plants cut off at ground level, bearing an exceedingly prolific crop of fruits, also numerous bunches of fruits, and gathered fruits upon plates. The variety is a red one, of good *Perfection* shape, and remarkable for its abundant cropping qualities.

Messrs. SMITH & SIMONS, 36 and 38, *West George Street, Glasgow*, exhibited a collection of fruits, including Apples, Peas, Peaches, Tomatos, Grapes, Apricots, Plums, &c. From the same firm was shown a group of ornamental foliage plants.

Messrs. DOBBIE & Co., *Rothsay*, in addition to refurbishing their permanent exhibit in the exhibition with fresh vegetables and cut flowers, also showed Tomatos, in thirty varieties, and a number of ornamental Gourds. A variety of the *Curran Tomato*, with racemes of fruit more than 2 feet long, and some with three branches, formed part of this exhibit.

A magnificent collection of Grapes, grown in the *Channel Islands*, was shown by Mr. FRED LE POIDEVIN, *La Porte, Catel, Guernsey*. These were shown as packed for market in cross-handled baskets, there being four baskets of *Black Alicante*, two of *Hamburg*, and one of *Muscats*. There were also good Melons and Tomatos.

Very much larger quantities of Grapes, also from *Guernsey*, and packed similarly in baskets, were shown by Mr. JAS. GATTENS, *The Bazaar, Glasgow*; Mr. ROBERT LEPPIN, *Condleriggs, Glasgow*; Messrs. L. & H. WILLIAMS & Co., *Bazaar, Glasgow*. In this case the origin of the Grapes was not stated, but presumably they were grown in the *Channel Islands*.

Messrs. STROX & SOSS, *Reading*, made a very imposing exhibit of horticultural produce, representative of the specialties of the firm. The exhibit took the form of a great ground in the centre of a large fruit tent, and had a promenade all around it. At the top of the mound were Palms, and a number of varieties of *Lilium speciosum*; also excellent *Salpiglossis*, very rich in their colouration; *Tydeas*, *Achimenes*, variegated *Maize*, *Begonia Gloire de Lorraine*, *Asters*, &c. Then below, on shelves, there were pots of *Lilies of the Valley*, *Chinese Asters*, *Dianthus*, *Begonia Gloire de Lorraine*, tuberous-rooted *Begonias*, *Gladioli*, cut flowers of varieties of herbaceous *Phlox*. Of vegetables, there were fine Tomatos, red and yellow; Onions, Celery, Leeks, Beets, Parsnips, Carrots, Beans, Marrows. There

were also good Melons. The whole exhibit was furnished with a delightfully green edging of Sutton's Lawn-grass, shown in small boxes.

Messes. GEO. BRYNARD & CO., Maidstone, showed a collection of seventy dishes of hardy fruits, amongst which were noticed grand examples of the following Apples:—Peagood's Nonsuch, St. Edmund's Pippin, Duchess Favourite excellent in colour, Ecklinville seedling, Duchess of Oldenburg, James Grieve's the prettiest Apple in the exhibit, Worcester Pearmain, James Welsh, Arlington Pippin (very fine), Lady Sudeley, Gold Medal, Early Rivers, and Cellini Pippin. The best Pears included Souvenir du Congrès, Williams-Bon Chrétien, Clapps Favourite, Dr. Jules Guyot, Marguerite, Marillac, Grégoire Bourdillon, &c. There was also a selection of Grapes, a few Plums, &c.

Exhibits of fruits and vegetables were made by Messrs. ALEX. CROSS & SONS, Ltd., 19, Hope Street, Glasgow; and the LUTHERIC GRASS CO., Ipswich, for the purpose of showing the effectiveness of their respective artificial manures.

The SCOTTISH MUSHROOM CO., Edinburgh and Dundee, exhibited three dishes of Mushrooms grown in the well known Scotland Street Tunnel, Edinburgh. The samples were first-class, and as clean looking and more heavy than good field Mushrooms.

Messes. CAMPBELL & GETTING, Glasgow Fruit Plantation, Ross, Herefordshire, exhibited through their agents Messrs. SIMONS, JACOBS & Co., Glasgow, a quantity of Apples of the varieties Warner's King, Lord Sudeley, Worcester Pearmain, Ecklinville Seedling, and Lane's Prince Albert.

Messes. D. & W. BUCHANAN, Forth Vineyards, Kippen, exhibited a fine collection of Grapes, and among them several new varieties, such as Diamond Jubilee, with Cooper's Black and Black Morocco for comparison. Empress of India, having large bunches with long berries, in shape something like Black Morocco, colour greenish-yellow, tinted with red towards end of berry, and Queen Victoria, a very large-berried white Grape, which promises to be a good variety. The bunches shown needed rather better colour, which probably they would attain to with a little longer period to ripen. We cannot speak for the flavour of these new grapes, but are alluding only to their appearance. The bunches of Diamond Jubilee shown had berries less long than Black Morocco, but rather longer than the round berries of Cooper's Black, and the bunches were not quite the same in shape as those of Black Morocco. The berries of Diamond Jubilee would appear to have something of the character of Madresfield Court in them. Whether or not it is distinct from all black Grapes, it seems to be cultivated more easily and colours more quickly than does Black Morocco, at any rate at Kippen.

Awards
Were made as follows:—

SPECIAL AWARD OF MERIT.
Sutton & Sons, Reading.
Geo. Bunyard & Co., Maidstone.
Dobbie & Co., Rothsay.
Alex. Lister & Son, Rothsay.
D. & W. Buchanan, Kippen, and to a grower of Grapes in Gurnessy.

HIGHLY COMMENDED.
Smith & Simons, Glasgow.
Campbell & Getting, Ross.
Alex. Cross & Sons.

MARKETS.

COVENT GARDEN, SEPTEMBER 5.

Table with 2 columns: Item and Price. Includes plants in pots like Adiantums, Ferns, and various flowers like Carnations and Tulips.

CUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower type and Price. Includes Asparagus Fern, Carnations, Cattleya, and various lilies.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit type and Price. Includes Apples, Grapes, Figs, and various berries.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Vegetable type and Price. Includes Artichokes, Beans, Cabbages, Carrots, and various leafy greens.

REMARKS.—Only a few Coburns make 2s. per dozen, and only a few Coburns 7d. per lb. Plums in variety, from 9d. per sieve or half bushel, these comprise Egg Plums, Victorias, Primes, Black Diamond, and others. Maze Cobs 1s. per dozen. Supply plentiful; the demand however is slow.

POIATOS.

Bedfords, and others, 6s. to 7s. John Bath, 3s. 6d. 21, Wellington Street, Covent Garden.

ENQUIRIES.

"AMERICAN PLANTS." How is it that this expression has come in common parlance in England to mean Rhododendrons, Kalmias, and a few pret-lying plants? Where could such a curious synecdoche have originated? Vermont.

NURSERY WORK IN SOUTH AFRICA.—Will the writer of an article on South Africa which appeared in the Gardeners' Chronicle last October, under the signature of "D. G. Ricard, London (late of S. A.)," kindly give Gerald W. Davidson his present address, or that of anyone likely to afford him information about nursery work and prospects in that country?

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period August 25 to August 31, 1901. Height above sea level 24 feet.

Table with multiple columns: Date, Direction of Wind, Temperature of Air, Temperature of Soil at 9 A.M., Rainfall, etc. for days from Sun 25 to Sat 31.

Remarks.—The first part of the week was wet and stormy, the latter part fine but dull, with cool wind, and a heavy rain on the 31st.

THE WEATHER IN WEST HERTS.

The past week has been, on the whole, cool for the time of year. The temperature in shade on no day rose higher than 68°, and on the coldest night the thermometer exposed on the lawn fell to within 6° of the freezing point. The soil temperatures have declined, but are still respectively 2° and 1° warmer at 1 foot and 2 feet deep than is reasonable. Rain fell on two days, but on each occasion the amounts deposited were only sufficient to moisten the surface of the ground. The effect of the previous week's rain is, however, apparent in the percolation through the bare soil gauge, which amounted to 1½ gallons during the week. The sink shown on an average for nearly six hours a day, which is a good record for the time of year. The air has been cooler than for any week since the end of July.

AUGUST.

There have been only three Augusts in the last sixteen years which were warmer than the past month. This is rather surprising, for although the days were, as a rule, warm, the night temperatures, on the other hand, continued with low exceptions low for the time of year. Only once before (1899) in the same sixteen years has the soil at 2 feet deep been as warm. At 1 foot deep, however, the warmth was not as exceptional. No doubt the great heat in July, and the depth to which it penetrated the ground, was, in some measure, accountable for this. Although the total rainfall fell short of the average for the month by only about half an inch, this August must, I think, as regards its effect on vegetation, be regarded as a very dry one. The fact is, only about one-third of this total fell (equivalent to a watering of less than 3 gallons on each square yard of surface was deposited during the whole of the first twenty-four days. The sun shone on an average for 77 hours a day, or for nearly two hours a day longer than usual. The winds were, as a rule, singularly light, indeed, it was not until after the 25th that the mean rate of movement of the air exceeded in any hour 15 miles. At no time, taking the month as a whole, was dry.

THE SUMMER.

This was a very warm, dry, and exceptionally bright season. The only two summers in the last sixteen years in which the duration of sunshine has been greater were those of 1887 and 1899. J. M., Berkhamstead, Sept. 6th, 1901.

ANSWERS TO CORRESPONDENTS.

BOOKS: *A. B. Fruit Farming for Profit*, by Mr. Geo. Bunyard, nurseryman, Maidstone (F. Bunyard, 29, Week Street, Maidstone). *Fruit Culture under Glass*, by W. Thomson (Blackwood & Sons, Edinburgh and London). *Floral Decorations for Dwelling Houses* may be met with at the second-hand booksellers.

CATERpillars: *C. B.* We find no trace of them here.

CHRYSANTHEMUM SHOOTS: *A. Young Gardener*. Please send further specimens. We cannot see anything wrong.

CORRECTIONS.—In our report of Reading Show, appearing in our last issue, Mr. C. Sage, gardener at Dropmore, Maidenhead, gets the credit of obtaining a 2nd prize for six dishes of fruit. Mr. Sage now writes to say that his ticket from a dish of Peaches got put upon this lot of fruit, hence the mistake made by our reporter.—On p. 172 of our last issue, near the bottom of the left-hand column, under "Awards of Merit," it is stated that *Laelio-Cattleya Robin Measures* var. *Ena* came from Mr. Measures; this is not correct, as the plant belonged to Messrs. J. Veitch & Sons, Ltd., and was shown in their group.

CECILIA LEAVES SPOTTED: *J. H.* and *H. Jackson*. The spots are probably caused by drip; from being sprinkled with some irritating liquid; or from being exposed to the fumes from water impregnated with artificial manure of some kind, sprinkled on the hot-water pipes; and perhaps by faulty ventilation, or some other point in the cultivation which has not been what it should be. Similarly injured leaves have been common this year.

CURBANT LEAVES: *J. T. S.* We find no insect or fungus, and infer that your leaves have been scorched by the sun, perhaps when "wet with dew or rain."

DISEASED BRENDAIA: *Correspondent*. The injury is caused by a fungus, *Gleosporium lineolatum*, Sacc., which is often very destructive to various Anaryllidaceous plants. It is most frequently present on newly imported plants along with which it presumably comes. Washing the scapes with soft-soap and potassium sulphide checks the spread of the fungus. Stems that are destroyed by the disease should be burned. *G. M.*

GLOBE ARTICHOKEs: *Jackson*. The flower-heads must be cut for culinary purposes before they open. The surest guide in this matter is the condition of the stalk just below the flower-head; for if this be brittle and very readily cut through or snapped across, the head is well grown and fit for use; if, on the contrary, it is in the least degree tough and woody, the head will be stringy and poor eating. Globe Artichokes need large quantities of manure and manure-water in order that the plants may make quick growth, and the heads be juicy and succulent.

EARLY PEARS GOING SLEEPY: *M. B. M. Jargonelle*, William's Bon Chretien, Summer Pear, Reat, Souvenir du Congrès, and Clapp's Favourite, should be gathered as soon as the flesh can be indented by very slight pressure of the thumb applied about half an inch down from the stalk, and the fruit should be eaten within one or two days from the time of gathering. As soon as a Pear on being raised by the hand parts from the stalk it is, if of these varieties, in a proper condition for eating, and there is no need to indent it.

GRASS: *G. D. W.* The grass is the Cocksfoot *Dactylis glomerata*, which generally occurs when the soil is too rich in nitrogen, therefore do not apply farmyard-manure or nitrate of soda or ammonia. A dressing of kainit (potash), or basic slag (phosphatic) would be beneficial. Unfortunately, the same manures which would be prejudicial to the Cocksfoot would favour the Clover. If the Cocksfoot

grass is not very abundant, it might be spudded out, the holes filled in with loam, and re-sown with seeds of the finer grasses, or mended with fine turf.

LAYERS OF LAUREL, ACCURAS, DAPHNE, ARBOR VITAE: *C. B.* They will not be fit for removal from the plants in less time than one year; the last two probably in not less than eighteen months or two years.

LIME-TREE LEAVES: *T. R.* The Nail Gall, the work of a mite. It may or may not spread on the trees, and may disappear for a number of years. There is little probability of the galls increasing in number this year.

NAMES OF FRUITS: *G. P.* Mère de Ménage.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*E. C. P. D.* *Loasa hispida*, introduced from Lima in 1830; an annual.—*No letter, specimen tied into a cigar-box, post mark Stanmore.* *Tecoma radicans.*—*J. H. O.* *Tropaeolum speciosum.*—*J. S.* *Rhamnus catharticus*, the common Buck Thorn. It makes good underwood and hedges, but we do not know whether the berries act in the same way on birds as they do on human beings.—*Jackson.* Herbs, not "weeds." 1, *Origanum vulgare*, Majoram; 2, *Melissa officinalis*, Balm; 3, *Artemisia Dracunculoides*, Tarragon; 4, *Rosmarinus officinalis*, Rosemary; 5, *Marrubium vulgare*, Horchound; 6, a Labiate herb, too much withered to be recognisable.—*R. C. B.* *Rubus lasiocarpus* Sm.—*T. W. R.* *Ciothra albidifolia.*—*An Assiduous Reader, Geneva.* Not Yarrow, but *Potentilla reptans.*—*J. T., Durlford.* *Cattleya Gaskelliana.*—*E. E. J.* 1, *Platyloma falcatum*; 2, *Asplenium bulbiferum*; 3, *Cyrtium caryotidum*; 4, *Onoclea sensibilis*; 5, *Polystichum angulare*; 6, *Polypodium venosum.*—*C. Fildesol.* 1, *Phaius bicolor*; 2, *Anthericum lineare variegatum*; 3, *Asparagus tenuifolius*; 4, *Asparagus plumosus.*—*P. R., Wantage.* Omitted last week—*Sambucus racemosa.*

POTATO MALFORMED: *H. Turner*. It arises from injury to the "chats," and consequent production of adventitious buds.

SAMPLE OF MELON SOIL: *Caetus*. The sample is not what we should call a "good" Melon soil, being too friable and light. Some clayey loam would improve it as a Melon soil, it added to the extent of one-sixth. In any case, soil of the description of that which is sent would have to be made very firm. It would answer well for Melons in pots, as then it would be practicable to ram it firmly.

SEEDLING HEALTH: *A. W. S.* The common ling, *Calluna vulgaris*, which has come up from seed in the peat.

SHRUB FROM A WELSH ABBEY: *A. Workshop*. *Staphylea pinnata*, Job's Tears, St. Anthony's Nut. It is a shrub rather than a tree. The plant is a native of the South of Europe; and we should much doubt if the monks brought seeds of the plant from Nineveh to this country in the middle ages. If you wish to sow the seeds, do so now, or in October, in loamy soil in pots or seed pans, and keep in a cold pit, and they will germinate in the spring. The soil must be kept moderately moist.

SMALL VEGETABLE GARDEN: *F. W. K.* A totally inexperienced amateur should, when he has entered on possession in September, trench the land; it will doubtless at the place named allow of this being turned up two spits deep and the shovellings; but if it be very sandy, gravelly, or a very stiff clay, be satisfied with one spit (a good one) for

one or two years. Beyond heavily manuring and digging, but little can be done before February, unless you sowed Broad Beans in November, and planted late sown Cabbages, and hardy Brown Bath Cos, and Hammer-smith, and all the year round Cabbage-lettuces. If the house and land are your own, you should plant fruit-trees as espaliers and cordons, and fruit-bushes (small fruits). Strawberries might be planted, and they would get established before the winter, but there would be no fruit from the plants before the summer of 1903. If you fancy flowers in the garden, plant as soon as you can Hyacinths, Crocus, Snowdrops, Scillas, Tulips, Daffodils, and Narcissus, Anemones, Ranunculus, and obtain some plants of *Myosotis sylvatica*, Wallflowers, Silene pendula, Canterbury Bells, Evening Primroses, &c. More and more varied plants can be got in February. We would, however, advise you to obtain our *Cottagers' Calendar* of the publisher, price 3s., which will afford just the information needed.

TOMATOS: *G. A.* The "sleepy disease," for which we know of no cure.—*R. M. B. S.* No fungus or insect, but the result of faulty cultivation, which has doubtless affected the other plants in the house that you have specified.

VARIETIES OF ASTERS THAT CHANGE COLOR AS THE BLOOMS AGE: *O. P.* Why not Chameleons Asters?

VINES: *G. A.* The leaves show warts, due to want of balance between the moisture in the air, and the ventilation. No phylloxera.

WEED ON LAWN: *C. B.* The plant is *Prunella vulgaris*. It is generally an indication of poverty of soil. Try a top dressing of manure in the winter, or apply in spring any fertilizer, such as sulphate of ammonia in small quantities, that will encourage the grasses.

WILLOWS TO REMAIN A RIVER BANK: *Alpha*. If the banks are much undermined by the action of the water, they should be protected by wooden slabs set on end, or by means of faggots with stout stakes driven into the river bottom in the front of or through them. Having done this, cuttings of the yellow-skinned Willow, made 1 to 5 feet in length, and consisting of at the least two-year-old growth, should in the winter be dropped into holes made with a crowbar at 12 feet apart, 2 feet deep, and a yard back from the edge of the stream; or at 1½ feet apart thrust into the face of the bank, and allowed to grow together so as to form a hedge. Plant brushwood and reeds against the bank where the erosion is greatest. If the Willows that are planted a yard distant from the river be allowed to grow to tree size, they can be pollarded every fourth or fifth year. The common Willow is also a very suitable plant.

WOOLICE AND WALL-FRUIT: *T. M.* To endeavor to lessen the plague of woodlice without first filling up their hiding-places in the walls is almost wasted labour. We cannot advise you to use other than the means you have hitherto used, and to set traps for them of slates, tiles, boards, &c., raised above the ground about a ½ of an inch, examining these every day, and scraping off the insects found on the damp under-surfaces into a vessel containing scalding water. In the autumn let the walls be freshly pointed on both sides.

COMMUNICATIONS RECEIVED.—*H. Bowles*, letter forwarded to the secretary.—*H. Havelock*—*E. M.*—*R. J. A. R.*—*D. W. K.*—*S. A.*—*E. J.*—*Harrison*—*Wen*—*R. Newstead*—*D. R.*—*Untraveled*—*W. P. THE FOOD OF SOME BIRDS INHABITING AN ORCHARD.

THESE remarks are exclusively confined to observations made during the month of August, the locality selected was a typical old turf-covered orchard, chiefly of elder fruit, situate in the West of England, about five acres in extent, and well isolated from the farm premises to which it belonged. It is only fair, therefore, to assume that the food obtained by the birds was only such as was provided by nature. The trees were all of them very old—possibly a hundred years. The majority of them had long since seen their best, and some had quite decayed, and the limbs were stripped of their bark by woodpeckers. Many, however, were the pictures of health and vigour, although they bore scarcely any fruit. The dense foliage of the "Huff Cap" Pear, and the thick old hedges which bounded the orchard on two sides, afforded excellent retreats and roosting places for the birds. The only plants of importance which grew beneath the trees were the grasses which formed the turf, and the Dog's and Marsh's Thistles, which were thickly dotted amongst

it. The Brambles were ripening in the hedges, and there were also fruits of the Elder and Dogrose. The grass had been grazed by cattle, and their dung was lying here and there throughout the field.

In this comparatively small retreat eleven species of birds could generally be seen and heard at any time of the day; and there were, besides, occasional visits by other birds; but my observations will be confined to those species which were more or less residents of the orchard.

Provided with an excellent pair of Triller binoculars, I sat beneath the shade and watched the habits of the birds. Some were busy in the trees and hedges, others among the grass; but one and all seemed bent on the one object—the almost ceaseless search for food. What was it they found to eat? was the one question I wished to solve. Insects, I presumed. But this was too vague, and I set myself the task of going the round of trees, grass, thistles, and dung, "beating" the branches produced very little indeed; there were scarcely any caterpillars, but a few plant-bugs and an occasional weevil fell to my net. The thistles, however, attracted the common species of humble bees; the numerous soldier and sailor beetles; edible weevils; and numbers of a beautiful little flea-beetle, of the most brilliant coppery-red, sweeping the grass—produced hundreds of two-winged or dipterous flies of the house-fly type, and also weevils of the genus Sitones and Otiorynchus; while deep down in their burrows under the dung were scores of large dung-beetles, and nearer the surface were many of their smaller relations. Wasps, too, were unusually abundant; but the only nest, near the orchard, was one night unearthed and eaten by a badger.

So far this was satisfactory; but how could one tell which of all these, or what other insects were eaten by the birds? Only one course was open, that of making *post-mortem* examinations when it was otherwise impossible to tell. And although I dislike taking the life of a bird, I trust that those which fell to my gun may serve to enlighten us as to the exact nature of their food. Of the commoner species, two examinations were made of each; of the rarer species only one, the results of which are here given:

SO-SO THRESH (Turdus musinus, Lin.). This species was unusually common; on one of my visits I counted over thirty individuals in one portion of the orchard. I also found them equally abundant elsewhere in the district, but they seemed more particularly attached to the older orchards. They were chiefly birds of the year, and, like their congener the Blackbird, were remarkably shy. They fed chiefly out in the open, but on the slightest alarm flew up into the trees, where they could scarcely ever be detected. Two examples were found to have fed upon the following: Many maggots of small flies; grubs of small moths; weevils; ants; a small species of land-shell; and wire-

worms. Most of these are more or less noxious species, and the wireworm is of course a great enemy to the horticulturist as well as to the agriculturist, and it is quite refreshing to find it has a new enemy in the thrush.

BLACKBIRD (Turdus merula, Linn.). This persistent fruit-robber, which has won for itself a name of unenviable notoriety, was not quite so numerous as the preceding species, but was very common. One of the two examples examined had the stomach filled with pieces of hard, unripe Pear. I also found the following insects: Numerous remains of weevils; earwigs; two species of ants; one caterpillar of a noctuid moth, and the remains of a humble-bee.

As there was no water near at hand, it is just possible that the Pear had been taken in lieu of it. I am quite certain their attack on the fruit was not general, as I failed to find any trace of injured fruit in any part of the orchard excepting in one instance, and this was attributable to the rook. The weevils and the earwigs may be classed among the worst of pests. Almost all kinds of insectivorous birds devour the former, but the latter has, so far as my experience goes, decidedly fewer enemies, and it is at least interesting to know that the blackbird devours it. Previously I had never known the blackbird to eat bees, and the record is of interest.

FLY-CATCHER (Musciopora grisola, Linn.). There were at least two families of this useful little migrant, and it was equally common in an adjoining orchard. The habit of this species is to perch itself upon some conspicuous place in the orchard, generally a comparatively naked branch projecting below or beyond the rest. In such places it awaits a passing insect, which it invariably takes upon the wing, returning again and again to its place of vantage. I have occasionally seen it give chase to a butterfly, but never saw it make a successful capture. Not that the bird had any difficulty in overtaking the insect, but when apparently within easy reach it seemed to hesitate, as if there was something to fear, and the insect invariably escaped. One of the specimens examined contained a humble-bee, and there were besides numerous minute fragments of other undeterminable insects. The second example contained wasps; fragments of ichneumons, and a blow-fly. Truly an extraordinary mixture, and not only of economic importance, but also of great biological interest. Here, I believe, we have the first recorded instance of a British bird feeding upon wasps. How far they enter into the dietary of this bird it is not possible to say. There can be no doubt, however, that wasps form part of its regular food supply, as the bird could not have been pressed by hunger to eat the wasps, seeing that other orders of insects were swarming at the same time. At first sight the blow-fly does not appear of much importance, but when we come to consider the ravages its larvae inflict upon sheep, often with loss of life, we may be thankful it has at least one natural enemy besides man, R. X.

NEW OR NOTEWORTHY PLANTS.

SILENE FORTUNEL*.

We are indebted to Mr. Amos Perry, of the Hardy Plant Farm, Windmore Hill, for a specimen of this pretty plant, which, though gathered by Staunton in China in 1793, and by many subsequent collectors, and introduced into botanic gardens as long ago as 1847, has not found its way into our gardens generally. We noted it, however, some few years since from Kew. It is a branching annual or perennial (?), covered with glandular viscid hairs, with slender, wiry branches. The upper leaves are sessile, viscid, narrowly oblanceolate, about 3 cent. ($1\frac{1}{2}$ inch) long, 4 or 5 mill. broad, and sharply pointed. The numerous flowers are in loose, erect, panicle cymes; each flower is about 1 cent. ($1\frac{1}{2}$ inch) long, with a long tubular, striated calyx, dividing at the top into five rounded obtuse, membranous lobes; petals five, half the length of the calyx, lobes, each with a long claw, expanding into a wedge-shaped limb, dividing at the apex into three or four deeply lacinate lobes. It is a nearly ally of our wild Nottingham Catchfly, which occurs on the cliffs near Dover, but the present plant is more ornamental.

CYRILLA RACEMIFLORA (see fig. 61, p. 199).

Messrs. James Veitch & Sons rendered good service recently by exhibiting a flowering specimen of this rare shrub. It can hardly be considered as a novelty, seeing that it was introduced from the Southern United States as long ago as 1765, according to Nicholson. That may be so, but few can have seen it out of botanic gardens. It was figured in the *Bot. Mag.*, t. 2456, and in London's *Arboretum*, iv., 2577. It has many claims on our notice. It is an elegant greenhouse shrub, which possibly might prove hardy in our southern counties. Its botanical structure is such that botanists are still puzzled where to place it, and its geographical distribution is remarkable, extending as it does from Brazil through the West Indies, and northwards from Florida to N. Carolina, and westward to Texas.

Cyrilla racemiflora, says Sargent, in his *Silva*, "is found from the coast region of North Carolina southward to about latitude 30 in Florida, growing inland in South Carolina and Georgia, at least as far as the neighbourhood of Augusta. It re-appears on the keys of southern Florida, extends westward along the Gulf coast to the valley of the Neches river in Texas, and has been found in Cuba, Jamaica, Dominica, Demerara, and Brazil.

Cyrilla racemiflora inhabits rich shady river-bottom lands, the borders of sandy swamps, the shallow ponds of the coast Pine belt, and high sandy exposed ridges rising above streams near the Gulf Coast. In such situations as the last it attains a real arboreous habit, and its largest size, usually growing with the Cliftonia and Yaupon, with Water Oaks and Gum-trees.

Cyrilla often occupies, with the Water Gums, the Cliftonia, and Andromeda nitida, the shallow ponds so common in the Pine forests of the Gulf coast, where the water stands to the depth of 4 or 2 feet during three-fourths of the year. In such partially aquatic situations its mode of growth is peculiar. Fifty or a hundred stems of all sizes, from half an inch to a foot in diameter, spring from a common root and spread in all directions like the stalks of a tussock of Sedge, interlocking and forming a dense, impenetrable thicket 30 or 25 feet high. The leaves are often only an inch or an

inch and a half long, oblanceolate, rigid, and more persistent than those on plants growing in drier soil. This variety, which is not rare in the coast region from Florida to Louisiana, was first noticed by Dr. A. W. Chapman near Apalachicola, Florida, and is mentioned in his *Flora of the Southern States*, 272.

"Cyrilla racemiflora was first noticed by Dr. Alexander Garden, a resident of Charleston, who, in 1765, sent it to Linneus. Two years later it was, according to Aiton, introduced into England by a Mr. John Cree; it flowered near Paris, in the garden of J. M. Cels, in 1786. Cyrilla racemiflora, although valuable as an ornamental plant, on account of its handsome lustrous foliage and graceful and abundant inflorescence, has probably seldom been cultivated except in botanic gardens.

"According to Nuttall (*Sylva*, l.c.), Cyrilla racemiflora proved hardy in John Bartram's garden at Kingsessing, near Philadelphia, where, in 1810, he found a specimen 20 feet high, with a trunk 26 inches in diameter. This plant disappeared many years ago. Cyrilla flowered in the Loddiges' nursery at Hackney, near London, in 1824, and the figure in the *Botanical Magazine* was made from this plant." *Sargent*, l.c.

As shown by Messrs. Veitch, it forms a small shrub, with slender, somewhat angular branches, with prominent leaf-scars at remote intervals. From the centre of each scar a raised line runs down the branch almost to the next scar beneath. This line causes the branch to be somewhat angular.

The young leaves are at first crowded in tufts at the ends of the shoots, but as growth goes on the shoot elongates, the internodes become separated, and eventually the old leaves fall, leaving merely the scars, and a tuft of new leaves at the apex of the shoot. In the tropics, the leaves are said to be evergreen; in colder climates they are deciduous, and assume a bright red colour in autumn. The petioles are very short (about 1 cent.) and are encircled at the base by a fleshy cup, which proceeds from the cortex of the shoot. The blade of the leaf is somewhat leathery, glabrous. A small leaf measured 5 cent. long, 15 mill. broad; but most of the leaves were larger, all oblanceolate, tapering gradually towards the stalk, acute at the apex, quite entire at the margins. Racemes numerous in tufts at the end of the "old wood," pendulous, many flowered, each about 7 centimetres long, snow-white, like the bracts and the parts of the flower. Pedicels slender, recurved, triangular, springing from the axil of a lanceolate bract nearly as long as itself, and bearing at the apex two short linear bracteoles. Flowers 4 to 5 mill. long, rather longer than the pedicels. Calyx syncarpous, cup-shaped at the base, dividing below the middle into five valvate, deltoid, acute segments; corolla polypetalous, twice the length of the calyx, of five oblong, obtuse petals twisted in the bud. Stamens five-hypogynous, free springing from the outside of an hypogynous disc, with flattened, awl-shaped filaments attached to the back of the small subglobose, two-lobed anthers, which open longitudinally, and mature before the stigmas. Pollen grains as observed by Mr. Worthington Smith, simple elliptical.

Disc encircling the base of the ovary, deep green, fleshy, cup-shaped. Ovary flattened, or somewhat triangular, 2-celled, with a short blind style. Ovules two, pendulous from the inner corner of each cell. Fruit described as capsular indehiscent. Seeds pendulous, with fleshy albumen.

The poly-petalous nature of the corolla, with the twisted revivification of the petals, the hypogynous stamens, the deep cup-shaped

disc, and the position of the ovules, form a combination to which it is very difficult to assign the correct position. Some say the Cyrillaceae are like the Ericaceae, indeed there is a general resemblance in our plant to Clethra. Others place them near Ilicineae and Celastraceae. Lindley suggested an affinity with Olacaceae, to which they are evidently nearly allied. The presence of a thick nectar-forming disc, and the circumstance that the anthers open before the stigma matures, suggest that the flower is fertilised normally by insect agency, the white colour of the inflorescence and of the flower serving to make the flowers conspicuous. It is singular that the artists who have drawn the plant should so many of them have omitted to represent the green disc which is so conspicuous in the fresh flowers.

The manner in which the racemes are formed at the end of last year's wood, encircling the terminal bud, which lengthens into a shoot before the flowers expand, and the branches denuded of their leaves give a peculiar appearance to the shrub.

It is not necessary to cite all the authorities who have written on this order; it will suffice to mention some of the more recent ones:—

Baillon, *Hist. Plant.*, xi. (1892), p. 211 (sub-Illicaceis).

Sargent, *Silva N. Amer.*, vol. ii. (1891), tab. 51 (Cyrillaceae).

Bailey, *Cyclopaedia of American Horticulture*, vol. 1. (1900), p. 439.

Cyrilla was a Professor of Botany in Naples in the middle of the eighteenth century. M. T. M.

A MIDLAND GARDEN.

(Continued from p. 177.)

I AM fond of the Hornbeam tree, and have usually included it among my plantings. I like the expression of the tree; it implies a strong, determined, resolute, and somewhat rugged character which will just do its duty through all the storms of life, and come up smiling even to the end. Very little grown, and rarely seen in this part of the country, it thrives here nevertheless, making a good shade tree, and keeping its brown autumnal leaves far on into the winter. For the latter reason, and because it will stand cutting and chopping and twisting, hedges are made of it in some districts; it is worthy, however, of a nobler fate. Content with any situation, and any soil except chalk, wind and storm and frost have no effect upon it; it grows slowly, but the wood it makes is hard and tough, and one of the best for fuel. The Hornbeam in this garden is 25 feet high, and has a trunk 8 feet in diameter after twenty-five years' growth. In the month of May it decks itself with pretty tassels of the male and female flowers separately, of which the female are the prettier, as they should be.

In consequence of something I have said in one of these papers, I have had several private inquiries as to the best method of educating and training a young gardener. For a mere gardener's labourer much education is, of course, not necessary. Anybody can learn to dig and hoe and get up Potatoes; it is a matter of practice only. But a man who has higher aspirations, who means to be head-gardener on some great estate, or at some public institution, or a professional

* *Silene Fortunata*, *Viviani, Hort. Picta*, (1-17), ex *Linnao XXIV*, 181, fide *Hemslay in Jour. Linn. Soc.*, vol. XXXI., p. 95.

nurseryman on an important scale, must prepare himself by a fair, all-round education. He ought to have some knowledge of Greek, Latin, French, and German, for all these languages are necessary to the comprehension and pronunciation of plant names. In science he wants some acquaint-

it can teach him, he may by hard work get the rest for himself. Self-education is the most thorough after all. In finding things out for yourself, you get so much collateral knowledge, and have it more deeply impressed upon the memory. It is real education, whereas school work is often no more than instruc-

practical art of gardening in all its many branches—the growing of vegetables, of fruit, and of flowers in the open garden; the management of the frame, the greenhouse, the stove, the vinery, the orchard-house; the various methods of propagating by budding, grafting, layering, and striking

FIG. 61.—CYRTIA RACEMIFLORA; GREENHOUSE SHRUB; FLOWERS WHITE. (SEE P. 198.)

ance with geology, chemistry, botany, entomology, and oöithology. These, of course, in addition to the "three R's," and the ordinary English curriculum. To get all this he must be at school till he is fifteen at least, and he will be a clever lad if he gets all he wants by that time at any average school; but if his school is not below the average, and if he diligently learns all that

tion. "Where there's a will there's a way," says the proverb. If a man means to get himself sufficiently educated, he can generally do it; and if he does not, he must aspire to a somewhat lower position than that of a first-class head gardener. When he leaves school, he must still devote much of his leisure to his studies, and his working days to acquiring the

cuttings; each of these has to be distinctly learnt, and books alone cannot teach them. It is probably impossible to get an all-round knowledge of these various branches in less than ten years. Schools of Gardening are now beginning to be established, and if they are well arranged, a year or two at one of them might be well spent. But the best method, as things now are, is to get employ-

ment as an under-gardener at some good establishment, and as soon as the student feels to have learnt all he is likely to learn there, he should change to another place where the work is different. A clever young fellow who prepares himself in this way ought, by the time he is 25, to be worth £3 a week. But will he get it? *Ed.*] If he can raise a little capital, he may make more money by establishing a business as a nurseryman, a seedsman, or market gardener, and an established business is a heritage for a man's family, but it is not everyone who has the genius for business, and the work is in some points less agreeable. *F. T. Mott, F.R.G.S., Birstall Hill, Leicester.*

FLORISTS' FLOWERS.

CHRYSANTHEMUMS: RIPENING THE WOOD.

THIS is a matter in which many gardeners fail, in their desire to produce perfect blooms, by not getting the wood ripe. Undoubtedly, the thorough ripening of the wood is most essential to the highest development of the flowers, and it is more apparent in incurved Chrysanthemums than in others, because in the former the depth and solidity of blooms are very essential matters, and these are only to be obtained when the wood (shoots) are well ripened. Ill-ripened shoots will produce flowers of large diameter, but they will be lacking in depth and inferior in form. There are three chief causes which tend to the production of immature growth, *viz.*, loose potting, which allows of the roots readily rambling into the soil, and thus resulting in shoots of a soft nature; secondly, a too rich potting soil, or the excessive use of manures, such as nitrate of soda, which induce luxuriance of growth. This luxuriance may please those who do not understand its effect on the blooms, but it is nevertheless deceptive, for the tissues never get well solidified; thirdly, crowding the plants together, so that the shoots get attenuated and the leaves ill-developed. Plants that are huddled together in huge bundles, with their shoots encircled by raffia and tied to a stake, cannot obtain that exposure of the shoots to the sun and air that is so desirable. By the time that the plants are in bloom, the shoots should be almost of equal hardness to a piece of Oak, and the colour of the bark should be of a rich brown, with a rough, uneven surface. The leaves of such plants assume in September a bronzy tint, some varieties indicating this characteristic more than others. There is no such thing possible as growing the plants of great strength and then ripening the wood suddenly, so to speak, by withholding water so as to check further growth. The growth must be gradual throughout, from the cutting stage till the flowers expand.

Many a disappointed exhibitor has found fault with the judges when he has staged blooms extremely large in diameter, but what is known as "thin" in their "build." Not only is this thinness apparent at times in incurved varieties, but in the Japanese, and from the same causes. The blooms from unripened wood do not retain their freshness, either upon the plants or in a cut state, in nearly the same degree as those produced by thoroughly matured wood. There is yet time to correct any mistake in the training of the plants and crowding the branches together, or allowing the laterals to grow to an undue length before removing them. This is a detail for which there can be no excuse. Promptly

remove all surplus shoots, decaying leaves, and train the shoots or branches thinly, never allowing the leaves of one shoot to overlap those of its neighbour.

Plants of varieties that are late in forming flower-buds, or which are weakly in growth, may be assisted by a dose of nitrate of soda, dissolved in water at the rate of half an ounce to 1 gallon of water; giving the plants one dose of this will accelerate growth, and perhaps make up for lost time in bud-formation. Any plants that show a tendency to a loss of chlorophyll, or colouring matter in the leaves, may be improved by a dose of sulphate of iron, given at the rate of an ounce to 1 gallon of water.

In some localities, plants are often pale in colour in their leaves, owing in some cases to the large quantity of lime in the soil. Lime is an essential to success in Chrysanthemum-culture, brightening the colour of the blooms; but it is present in excess in some soil. Plants with leaves pale in colour are not unhealthy when it is caused by the reason stated, nor are they less healthy when the cause is attributable to the application of water obtained from wells dug in the chalk. Plants constantly watered during the summer with such water cannot but be pale in colour; yet when they are placed under cover in the autumn, requiring less water at the roots, and that given to them being from stored tanks, really rain or soft water, it is surprising how quickly such plants assume their proper tint.

I mention this loss of colour in the leaves with a view of reassuring the inexperienced, who may happen to have plants affected in this manner. *E. Molyneux.*

ORCHID NOTES AND GLEANINGS.

ARACHINANTHE LOWEI.

A NOBLE specimen of what is commonly known as *Vanda Lowei*, with several tall stems bearing altogether about a score of its pendulous flower-spikes, which vary in length from 3 to 7 feet, is now in flower at Messrs. F. Sander & Co.'s nursery at St. Albans. It is a very stately and remarkable Orchid, and would well repay a visit from anyone who has not seen this species in bloom. The plant is a fine variety from out of the original importation from Borneo to the Luddemann collection at Paris, and it affords striking proof that Orchids do not necessarily die or degenerate under cultivation, if properly cared for. The flowers are yellowish-white, heavily barred with dark brownish-red, and a remarkable and striking feature is observed in the flowers, those on the bases of the flower-spikes being quite dissimilar from the others, being broader in the segments, and of a dark yellow colour spotted with crimson.

CATELEYA HARDYANA LINDENI.

Flowered by Messrs. Linden of Brussels in 1894, and illustrated in *Lindena*, x., p. 75, of the same year, this natural hybrid was very much admired, and doubtless realised a good round sum. It is now in flower with Henry Little, Esq., Baronshalt, Twickenham (gr. Mr. Howard), and its flowers show an improvement, when compared with the illustration to which allusion is made, the flowers being larger and of a much finer colour. The sepals are light purplish-rose, with a slight creamy-white freckling, and silvery mid-rib. The petals, which are also light purplish-rose, have similar white mid-ribs, and a delicate veining of silvery-white between the colouring. The lip is of a glowing purplish-ruby-crimson, with rich gold veining on the side lobes, and

pitches of chrome-yellow on each side of the middle portion. There is a fine collection of *C. Hardyana* and *C. aurea* at Baronshalt.

THE ROSARY.

SINGLE ROSES.

AMONGST the developments which have taken place in Rose-culture during the past few years there is none that can be more warmly welcomed than the taste for single Roses, and it is more than probable that we shall see much progress in this direction before long; some of those which we now have are distinct species, while others are the results of the efforts of the hybridiser. Some of our most successful hybridisers have already given us the results of their work, and doubtless others will follow on in the same direction. The increased culture of single Roses is due to the desire to have something that will make our gardens gay and beautiful without the stiffness and formality that attaches to large-flowered Roses, and as most of them are of rambling or climbing habit they are admirably adapted for covering walls, fences, out-houses, or for training as pillars; and here again, as in so many other things, we are indebted to Japan and the far East for many of our most valuable additions; many of them are, indeed, of such rampant growth that, unless ample space can be afforded, they will soon absorb everything. I remember seeing at my late friend's (Mr. T. W. Girdlestone) a plant of the single R. polyantha which covered a space of 10 ft., and I believe would have gone on for 10 ft. more if it had been allowed to have its way; and I had one myself which I was obliged to cut away altogether, because it had intruded most obtrusively among other Roses which I was anxious to retain. I think it is useful to proceed cautiously in this matter, and not, because we advocate their growth, disparage those beauties, such as the Hybrid Perpetual, Hybrid Teas, Teas, and Noisette-classes, which have given us such pleasure, and will, I hope, continue to do so; for I am quite sure of this, that had it not been for the exhibition of these fine show varieties, the zeal for Rose-culture would have long ago cooled; and it is idle, I think, to run down these boxes of big blooms, which have led so many to cultivate them in the various sections which now solicit the care and affection of the Rose-grower. Years ago the Hybrid Perpetual Rose absorbed nearly all the care and affection of the Rose-grower; Tea and Noisette Roses were few in number, many of them also were delicate in habit, while others created disappointment by being budded on the Manetti stock, which was too strong for many of the varieties, and so oftentimes the stock flourished while the Rose died. I do not propose to speak of all the single Roses, but select a few which will I feel sure give satisfaction. I have already noticed the single Polyantha, which I believe will repay those who grow it; then there is *Rosa macrantha*, a most beautiful white single Rose, with a cluster of golden-yellow stamens in the centre. Although very rampant in growth and very free flowering, it can hardly be described as a climber; it is one of the most delightful of the single Roses.

Paul's Single White (Paul & Son).—Very fine flowering, evidently of Noisette origin; in some way in size and colour it is very like the preceding, but with dark stamens instead of golden ones. Blooms of it can be often had in the autumn.

Carmine Pillar (Paul & Son).—A most vigorous and free-flowering single Rose, producing large

bunches of flowers from 3 to 4 inches across: a beautiful bright carmine. The plant will grow from 10 to 12 feet high, and makes an admirable pillar Rose.

Royal Scarlet (Paul & Son).—A single-flowered H.P., brilliant in colour, probably the most scarlet of all our Roses; it is also well suited for bedding.

Waltham Climber, No. 3 (William Paul & Son), a dark crimson climber, very vigorous, free flowering, and sweet-scented.

There is another Rose of most brilliant coloring, but not quite single, though it will frequently come so—*Bardon Job*. It generally

Irish Glory.—A large flower, brilliant in colour, its beautiful veining rendering the inside of the petals of a lovely marbled silvery-pink, while the outside of the petals being crimson, the contrast of the golden anthers renders it a striking flower. It is very sweet, and a good grower.

Irish Modesty.—Another very beautiful variety: colour a delicate pink, the base of the petals suffused with pale golden-yellow, with delicate straw-coloured anthers; the blooms are large and plentiful.

These three make excellent border plants, while their vigorous habit renders them admir-

able as the ground falls more than 195 feet from north to south, the formation of a cricket ground, as well as a level space for boys' and girls' playgrounds, gymnasiums, &c., has involved the moving of a great quantity of earth.

A series of small lakes connecting with miniature waterfalls, form a striking feature. A very handsome fountain, which is erected near the main entrance, is fed from the lowest lake.

The new park was formerly the Oak Hill estate, and with the mansion comprises 28½ acres. The spacious mansion and the original garden about it are retained; the former is to be the home of the public free library, while the garden has been entirely renovated.

FIG. 62. PLAN OF WHITAKER PARK, AT RAWTENSTALL, LANCs.

attracts the attention of any visitor. All these single Roses, however, have one defect—they only bloom once; that is, they are not perpetual; but those well-known Irish growers, Messrs. Alexander Dickson & Sons, have endeavoured to remedy this defect by the production of three Tea single Roses, which follow the habits of that class by blooming up to a very late autumn. In my own garden I have some of them now (September) still in flower.

Irish Beauty.—Pure white in colour, with bright golden anthers, which give it a very distinct appearance, borne in clusters of very fragrant flowers. Being very large, sometimes 5 inches across, the plant is very vigorous, but not rampant.

ably suited for this purpose. It will thus be seen that we have already some very beautiful single Roses, combining fragrance, delicacy of colouring, and vigour of growth, *Wild Rose*.

WHITAKER PARK, RAWTENSTALL.

A public park, 22 acres in extent, was opened on August 3 at Rawtenstall, in Lancashire, by Mrs. Whitaker, the wife of the donor of the park, who not only gave the site, but provided the money for the laying out. The park (see fig. 62) was designed, and the groundwork and planting carried out by Messrs. William Barron & Son, of Elvaston Nurseries, Borrowash. The park is situated on the side of a hill sloping to the south, and

FOREIGN CORRESPONDENCE.

DENDROBIUM CORNUFUM.

ASKED by your issue of August 31, just received, that this Dendrobium has just flowered in Major Joicey's collection. With me it flowered in March last year, and again at the same time this spring, together with "D. glomeratum," only it is a few days later in coming into bloom. I also received it with "D. glomeratum." I sent the bloom for identification to the *Orchid Review*, and the answer was "Dendrobium, allied to 'D. glomeratum,' species unrecognised, see F. 96, 'Correspondence.' It is a delicate plant, and does not make the vigorous growth of its companion—'D. glome-

vatum." I grow both on the east side of my hottest house. H. J. Ross, Poggio-theriardo, Florence.

NURSERY NOTES.

PHLOX DRUMMONDI'S AND SNAPDRAGONS AT READING.

VERY recently I had to wait an hour at Reading, and to utilise it profitably went up to Messrs. Sutton & Sons' Portland Road nursery to see what I could there. Whilst the houses were, as usual, full of Begonias, Gloxinias, Streptocarpus, Achimenes, Gesneras, and many other plants, the potent attraction for me was found in the truly wondrous and beautiful collections of annual Phloxes and Snapdragons growing out in the open ground. To describe the beauty seen in these plants would be impossible. In both there seem to be three distinct types—very dwarf, medium height, and tall. Of the Phloxes, the medium seem to be the most perfect of summer-flowering plants to be seen. Single ones, 12 inches over and 6 inches in height, were the most complete floral masses conceivable. Would that the firm could grow a few score in pots, and show them at the Drill Hall, as I saw them at Reading! What glories, yet what varied colours! What perfectly formed flowers! and all easily to be had from a few packets of seed, sown in gentle warmth in the spring. In the very compact or dwarf sorts, as in the old free-growing forms, colours are legion. To select properly, the varieties should be seen in bloom. Of Snapdragons, the tall, that is plants reaching when in bloom 30 inches in height, seemed to be the most attractive. Amongst these are some flowers of novel and very lovely colours, quite fresh to me. What remarkably beautiful effects could be got from these Snapdragons were the dwarf white, yellow, red, or crimson forms—some 2 inches in height, and very even, used for carpeting, with selected lines of the tall forms planted in the beds. Those who are on the look-out for bedding novelties should make a note of this suggestion. A. D.

The Week's Work.

THE ORCHID HOUSES.

By H. J. CHAPMAN, Gardener to R. L. MEASTERS, Esq., Cambridge Lodge, Floddon Road, Camberwell.

Vanda acroten.—This is one of the most attractive of the autumn-flowering Orchids, and its lovely pale blue flowers are always appreciated, and useful in decoration. I am aware of the difficulty that is experienced in keeping this species in vigour for any great number of years after importation, and I have tried several different methods of cultivation. The most successful one which I have followed for several years is to remove the plants when this is carried out with other Vandas in the spring; I then suspend them in the lantern-roof of the Phalaenopsis-house, and at the warmer end of the East Indian-house, the plants growing equally well in either. During the season of growth water is afforded abundantly at the root, and the atmosphere is kept very moist till the flowers are removed from the plants, and then much less water is applied at the roots, and they are removed to the colder end of the Cattleya-house, or one of the intermediate houses, and kept in a fairly dry state during the winter months, just as much water being afforded as will keep the leaves plump. The seasons have much influence upon the flowering of the plants, and in a bright summer like the last, flowers are more abundant than in a season of little sunshine. Strong sun-light when the flowers are developing has a considerable effect on the

depth of the colour in the blossoms, as is observed in flowers that expand early, the colour being of a more intense tint.

Current work in the Houses.—The plants in the cool divisions should now be repotted forthwith; and the roof-glass and woodwork washed on both sides. All staging and the pots should be cleansed. Where the plants have been entirely removed from a house, it is advisable to place at intervals about the steps and on the pots small quantities of brewers' grains or dry bran, as a trap for slugs and snails, placing it on pieces of glass or tiles for ease of removal. By making an examination at night with the aid of a light, many can be caught and destroyed. The gardener cannot be too careful in this respect, nothing being more annoying to employer and gardener than to find the young flower-spikes have been devoured, and the work of a year lost. A small piece of cotton-wool twisted around the base of the spike makes it more difficult for slugs to climb, and often prevents them from reaching the tender points of the flower-scape. With the drier condition prevailing owing to colder nights and the use of fire-heat, a sharp outlook should be kept for red-spider, a most detestable pest at this season. The plants most likely to be attacked by it are Cymbidiums, the *Chimera* section of *Masdevallias*, *Lycastes*, *Stanhopeas*, *Catasetums*, the smaller-growing *Zygopetalums*, and other Orchids with tender leaves. When remarked, carefully sponge the leaves with weak soapsuds made with soft-soap. Any tender plants which have been removed to the Odontoglossum-house, and especially *Miltomia vexillaria*, should be transferred to the cool intermediate-house forthwith, the cool, damp condition prevailing in the Odontoglossum-house being apt to cause spotting of the leaves. The floor in the cool division should now be damped sufficiently early to allow of the moisture becoming dispelled before the evening. Cold draughts should be carefully guarded against.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HESSEY PARK, Esq., Prestwood Hall, Loughborough.

The Conservatory.—With diminished light and shortening days it will be very necessary to keep the climbing plants thin and open so far as may be possible, so as to impede the light as little as possible. The abundant growths of *Passiflora* now past flowering should be reduced in number, and the rest tied in loosely, only in sufficient quantity to give a finished appearance to the rafters, &c. Most of the plants of *Campanula*, *Fuchsia*, *Colosia*, *Coleus*, *Balsam*, being now past their best may be removed, and their place filled with *Lilium lancifolium*, *speciosum*, *roseum*, *rubrum*, and *album*, early-flowering *Chrysanthemums*, ivy-leaved and zonal *Pelargoniums*, late-blooming *Fuchsias*, and *Begonias*, *Achimenes* which are shabby-looking should be replaced with later successions, or be replaced by baskets filled with *Asparagus Sprengeri*, which will make an agreeable change. Continue to afford a small quantity of ventilation at night, and keep the atmosphere of the house dry. Fire-heat will not be required for some time longer.

The Greenhouse.—With the thermometer at 31°, as was the case on September 1, the need for housing the plants will have become apparent. The first to place under cover are *Ericas*, *Euphrasias*, and *Clivias*, *Camellias*, *Azalea indica*, and the greenhouse varieties of *Rhododendrons* may be left outside a week or ten days longer, unless the weather should alter for the worse. The glass and woodwork, &c., should be cleansed or painted, and clean gravel spread on and beneath the stages. Let every pot be thoroughly cleansed, and see to the drainage of all the pots. Afford plenty of air in the house day and night, so long as the indoor temperature does not fall below 40°. If there are no permanent occupants of the house, let a handful of flowers of sulphur be burned in the house before bringing in the plants, in order to kill fungus and insects.

Winter-flowering Zonal Pelargoniums.—The first batch of these plants may now be brought indoors, affording the plants a light position in an airy house. They must not be coddled, and the highest temperature that should be afforded them at nights is 45°, and ventilation at all times. Discontinue to pick off the blooms, allowing the plants to perfect their flower-trusses. Afford nature-water up to the time when the first flowers open. Given later than this, it tends to make the flowers loose. If damp weather prevail a little fire heat may be applied. Avoid affording the plants much water, and do not damp the paths, or spill water about the house more than can be helped, and have the floors dried before evening.

Violets.—It is essential that towards the middle of the month Violets in frames should be planted. If the pits or frames can be heated by a flow and return hot-water pipe, the plants will not be affected by damp, which is the greatest foe to successful Violet culture. Failing any means of heating, portable frames should be prepared by making up beds of well-fermented manure, which has been frequently turned over. Make up the beds to the height of 3 feet at the back, and 2 feet in the front, and in a sheltered position facing south, and thoroughly mix the material whilst making the beds, tramping it evenly and regularly well as the work proceeds. Having built up the bed, place frames on it, and then put into each light some spent Mushroom-bed dung or decayed leaves, filling the lights to within 1 foot of the glass with loam, road-grit, and leaf-soil, in about equal proportions, and allow this to settle and the violent heat to be dispelled before the plants are set out. When the whole has sufficiently subsided, and before planting, mix a small quantity of artificial manure with the surface soil. When each plant is lifted dip the foliage into a mixture of Gishurst Compound Soap—or carbolic soft-soap—made at the rate of 2 ozs. of the soap to 1 gallon of rain-water, in order to destroy red-spider, which has been prevalent this year, and rinse in clean water. Convey the plants on a handbarrow or flat tray, and set out the plants so that they nearly touch each other. I plant from seventy to eighty of them in an ordinary two-light frame. Make the soil firm, keep the large plants towards the back of the frame, and finish at the front with the smaller ones. Apply water copiously, and shade from bright sunshine for a few days. In about a week remove the lights, and do not make use of them except in bad weather. If the lights must be put on to the frames tilt them at the back and front night and day during mild weather.

THE HARDY FRUIT GARDEN.

By C. HERRIN.

Pears.—In order to secure a regular supply of ripe pears, the trees of the early varieties should be examined at intervals of three or four days, and the largest and forwardest specimens gathered a few at a time, which will generally ensure a constant supply, and prolong the season of certain varieties. Besides Williams' Bon Chrétien, which will soon be over, small gatherings of Souvenir du Congrès, Fondante d'Automne, Madame Treve, Beurré d'Amabilis, Doyménil-Boussocq, and even a few of Louise Bonne of Jersey may be gathered if desired; but those fruits should be selected that from their appearance and size ensure their being the forwardest specimens. By gently lifting the fruits, it will be seen which will come away easily from the spurs.

Out-of-door Vines.—To facilitate the ripening of the fruit, the surplus growths should be kept closely pinched back, which will have the effect of exposing the bunches to the sun and air. The long period of bright summer weather has been very favourable for the maturing of out-of-door grapes, and they should now be ripening fairly well. Protection should be afforded from wasps and flies, which are now troublesome. For this purpose thin muslin bags are best, or thin brown canvas ones, which may be pur-

chased cheaply from the horticultural sundries-man. Wasps and flies will continue to be troublesome until the arrival of colder weather. Many may be trapped by double handlights and a little damaged fruit placed beneath them as bait. Place a handlight, having a square of glass removed from the top, on four bricks, one at each corner, and upon this place a second handlight, making it fit closely round the sides, which should be floored with a little moss, or such-like material. Plums make an enticing bait. Those insects which get into the upper handlight are trapped, as they seldom find the exit. If the borders are dry, a heavy application of water should be made.

FRUIT UNDER GLASS.

By G. MALCOM MONTYLE, G. S. GARDNER to SIR CHARLES KNAXAT, The Glen, Inverleithen, Peeblesshire.

Late Grapes.—The spell of dry and hot weather will have done much to hasten the ripening of late Grapes, which, in many instances, were rather backward to please those who like the fruit to be well ripened by the end of the present month, for unless quite ripe by that time they are almost sure to be of inferior quality, and keep badly, although Gros Colmar will still keep adding to its colour for six weeks. Too much shade is objectionable; Grapes grown under a heavy canopy of foliage frequently have very tender skins, therefore, remove all sub-lateral growth, leaving nothing but the primary leaves, and even these may, in many cases, especially where there are no bunches on the laterals, be drawn in closer to the main rods so as to admit of more sunlight to the Vines and bunches of white Grapes. In each and every case admit abundance of dry air by day, and a moderate amount of both front and top air by night; the highest temperature, which should seldom fall below 70°, being kept where Muscat Grapes are ripening. Gros Colmar is usually one of the first to commence and the last to finish colouring. If not over-spread, and if the foliage is in a healthy state, the colour will continue to improve till the end of October; but if either from over-cropping, or the maintenance of too high a temperature, the berries are now of a foxy colour—nothing will remedy this blemish. Net that those are necessarily deficient in quality, but they are of far less value in other respects. Faulty ventilation is responsible for numerous failures to colour and ripen Grapes properly, and it has also very much to do with their being kept in good condition after they are ripe. Muscats still require fire-heat accompanied with a free circulation of air till the fruit is thoroughly finished; they should have the foliage rather thin; indeed, the leaves may be tied aside, as it is necessary that the fruit may get abundance of light and air. Keep the night temperature at 65° to 70°, with a fall of 5° through the night, attending to the fires in good time in the morning, so as to allow of the temperature being raised to 70° to 75° to insure a long ripening day. When the temperature is raised to 80° or 85° from sun-heat, afford a free circulation of air, and even 90° to 95° will do good, the heat being maintained at a high figure by reducing the amount of ventilation as the sun declines. The temperature should be allowed to gradually decline at night, only keeping enough warmth in the hot-water pipes so as to allow of the top and bottom ventilators being left open to a slight extent, in order to prevent moisture condensing on the berries. This kind of treatment should be continued till the Grapes are thoroughly ripe, when a gradual reduction of the temperature should take place, otherwise the fruit will shrivel. Extremes of temperature ought always to be avoided. The border, especially the inside one, should not be allowed to become dry. If there is any fear of this happening, a good application of water should be made on a fine morning; the border should be covered with dry material, straw, bracken, &c., to keep down moisture. Although good rather than harm results from damping down a viney in the morning of fine clear days, it should not be practised in dull weather, nor in the afternoon, what-

ever the weather. When the Grapes are approaching maturity, the best and the only remedy to keep Muscat Grapes from shrivelling is to hasten the ripening process. Muscats that are now fully ripe will probably keep much better than those not so forward by a month. A temperature of 50° to 55° is necessary for keeping Muscat Grapes in good condition after they are ripe, and other houses of late thick-skinned varieties will require a similar temperature for the benefit of the Vines.

Figs.—Fig-trees planted out in houses not infrequently make very strong shoots, with the result that the crops of fruit are scanty. In that case root-pruning should be resorted to, and the roots confined to a border 3 or 4 feet in width. A trench dug out at this distance from the stem after the fruit is gathered will check the tendency to make growth late in the year, and help to ripen the wood. If the drainage is not good, it will be necessary to lift the trees as soon as the leaves commence to fall, and to put into the bottom a layer about 1 foot in depth of rough stones, and on the top of this a layer 3 inches thick of mortar-rubble freed from pieces of wood and wood-shavings, strong turfy-loam mixed with a sixth part of finely-sifted old mortar or plaster, a fourth part of calcined oyster-shells, and a bushel of bone-meal to every cartload of 30 bushels of loam, and well mix all together. In replanting ram the compost, well incorporated, thoroughly about the roots, spreading the latter out evenly at different levels, adjust to the surface. Should the drainage be good, it will only be necessary to cut back the roots in the manner described. Confine the roots to that space, removing some of the exhausted soil from about them, replacing it, and top-dressing the whole with the above-mentioned compost. A border for Figs may be 2 feet deep. Plants in pots, which have already yielded a second crop, should now be set outside in a sunny, dry position, and afforded water so long as the foliage remains on them. A year which has been resting may be top-dressed with a rich compost, or reported into deeper pots, and then be introduced into a fairly brisk heat for aborning winter Figs.

THE KITCHEN GARDEN.

By J. MANNING, BECKETT, and HON. MAJOR ROLLER, 10, KINGS LANE, DEVONPORT.

Peas.—The inches of Beauty of Hebron, Early Regent, Snowdrop, and White Elephant, the haulm of which has died down, should be lifted, sorted, and stored as previously advised for the earliest varieties. It is advisable to change the "seed" every second or third year, and if the soil of the garden is light and friable, the seed should be obtained, if possible, from a heavier soil, and the present season is a proper one in which to purchase fresh "seed" for next year's planting, for if purchase is deferred till late in the spring, the sets obtained are often smaller than is desirable, and the price higher than now. These remarks are applicable to the later varieties that will be lifted in October.

Carrots.—As soon as large enough to be handled, prick out the seedlings 4 to 6 inches apart on well-prepared ground in an open position, as the hardier they are treated during the next two months, so much more likely are they to pass through the winter unharmed. In about five or six weeks after pricking out, the plants will be ready to be planted in their winter quarters.

Cabbages.—In most gardens the plants that were planted last October are allowed to remain to supply sprouts during the winter and early spring; and where this is the case, they should be cleared of all decaying leaves, and the soil of the weeds and rubbish, and a moderate dressing of nitrate of soda scattered between the rows and hoed in.

Manure.—It is now time to set about preparing manure for use during November and December, and as hot, dry weather is all

against getting this in order, nothing is gained by deferring this work. Scrawny litter from the stable-sand should have twice or more of its bulk of partly-decayed leaf-soil that has done duty for hot-beds added to it, and the whole thoroughly mixed together, drenching it with liquid-manure, or foiling this with clear water. In about one month the whole must be turned and moistened as before, in the absence of heavy rain.

Hoing.—The last week in August and the first week of the present month brought strong east winds, rendering a good deal of water to be necessary with late-planted Lettuce, Endive, Cabbage, Parsley, &c., and to break the crust that will have formed, the Dutch hoe should be constantly plied.

THE FLOWER GARDEN.

By T. H. STARR, Gardener to Lord Poltmore, Poltmore Park, Exeter.

Flower Borders.—The summer bloomers are rapidly passing out of bloom, and must be cut down, or in the case of annuals, removed altogether. Sometimes merely the flower-heads should be removed, and the foliage, being in presentable condition, may be left, more especially when entire removal would leave much bare soil. If the gardener possesses spring-flowering plants in quantity, these bare places may be dug and manured, and planted with suitable subjects. The rest of the borders should be hoed and raked, to give them a tidy appearance. Hapalliums are now very bright and effective; Kniphofias are flowering very profusely this season everywhere in this garden. Michaelmas Daisies will make the borders gay in a week or two, and must be neatly staked, to make them presentable and preserve them from injury by wind.

Roses.—The plants promise well for late display. Several of the newer varieties have proved very satisfactory this season, viz., Mrs. Sharran Crawford, a Rose with a fine bold bloom of a lovely shade of pink, but, like so many new Roses, deficient in fragrance; H. T. Papa Reiter, said to be a yellow Caroline Testout, is a poor Rose with us, and the yellow colour entirely absent. If this variety were as good in every way as Caroline Testout, it would be a welcome addition to the H. T.'s for quantity and freedom to flower. The Teas are much the better; at this season a good variety for massing is Dr. Grill, a flower of a shade of salmon-pink, remarkably free to bloom, and a robust grower. It forms a good companion to Marie Van Houtte, Madame Lambert, or Perle des Jardins. Empress Alexandra of Russia is a novel shade of colour, and quite distinct, but the flower-stems are weak and the flowers droop, and it is not, therefore, an effective Rose in beds or as a standard. Enchantress, H. T., is a pleasing shade of buff, of a nice shape, and a good grower. Aurora, H. T., is a sturdy grower, resembling C. Testout, but with the fragrance of La France. The blooms on our plants are deficient in size, which may be due to the plants being young. All flowers of Roses as they pass their best should be removed, and before the petals drop, as the latter give an untidy appearance to beds if allowed to fall to the ground. Strong growths on dwarf Roses should be secured against the wind, but do not shorten them; it is yet too early, for there would be a risk of the lower buds breaking into growth.

General Remarks.—The propagation of bedding plants should be continued, especially of bedding Pelargoniums. Varieties that have made but little growth will not afford many cuttings, and some of the plants will have to be potted for stock purposes. In showery weather, cuttings of a soft nature standing in cold frames require water to be carefully afforded, and the cuttings allowed plenty of air in the forenoon, any water required being then applied. The runners of Violets should be removed as soon as they are noticed, and the soil stirred between the plants, and cold frames should be prepared for the winter and spring-flowering plants.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions, or to return the unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelliances of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

SALES FOR THE WEEK.

MONDAY, SEPT. 16.—Large consignments of Dutch Bulbs, &c., at 12.30, at Stevens' Auction Rooms, Covent Garden.

WEDNESDAY, SEPT. 18.—Large consignments of Dutch Bulbs, &c., at 12.30, at Stevens' Auction Rooms, Covent Garden.

FRIDAY, SEPT. 20.—Imported and Established orchids at Protheroe & Morris' Rooms, at 12.30 o'clock. Dutch Bulbs every day, except Saturday, at Protheroe & Morris' Rooms, at 11 o'clock.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick—57.8.

ACTUAL TEMPERATURES:—

LONDON.—September 11 (6 P.M.): Max. 62°; Min. 54°.

September 12—(Full), warm.

PROVINCES.—September 11 (6 P.M.): Max. 61°; W. Ireland; Min. 53°; N.E. Scotland.

In the bad old times of the Society at South Kensington, the *Journal of the Horticultural Society*, if it did not fall altogether into abeyance, at least was published at very irregular intervals. Many were the complaints that reached us on the subject. Since the rejuvenescence of the Society, the *Journal* has, like the Society itself, taken a new lease of life. It is to us a matter of regret that many who advocated the improvement of the *Journal* are no longer among us to witness what has been accomplished in this way by the present indefatigable editor.

At the time we speak of, although some advocated the more punctual publication and the general improvement of the *Journal*, foreseeing that it might be one powerful means of advancing the interests of horticulture, and the welfare of the Society; yet others thought that few of the Fellows would care for it, or read it if they got it. All realised but too painfully the financial difficulties in the way. Times have changed. The *Journal* has become a most important factor in the development of the Society. Like the Conferences, it will have value when the mere records of ephemeral flower-shows will have ceased to have any interest.

We are induced to make these comments as the number just issued contains some special features, to which we are desirous of drawing attention. In the first place, there is the full text of MENDEL'S paper on hybrid plants, which is exciting so much attention now, though overlooked at the time of publication. We shall have an opportunity

of attending to this at greater length on another occasion.

Another new departure which we hail with great pleasure is the publication of brief abstracts from the various European and American horticultural journals. These abstracts are made by experts, and though brief, are furnished with references which will enable the student to pursue the subject further should he desire to do so. The students of the American horticultural colleges are trained to make abstracts from the various publications of past years, as well as of those that are recent. If the Chiswick students could be set to work with some definite purpose of this kind, the literature of any given subject would be rendered easily accessible. But we have no space now to discuss this matter fully, our present object being to point out what excellent value the Fellows of the Royal Horticultural Society obtain for their guinea subscription, and to congratulate the editor on the zeal and success of his efforts.

Kinging of
Herbaceous
Plants.

A RECENT number of the *Comptes Rendus* contains the following note by M. LUCIEN DANIEL:—"Annular decortication, or ringing, is an operation known from the most ancient times. It is applied exclusively to woody plants (fruit-trees and Vines) to make fructification more sure, and the fruits larger. As it had not previously been practised on herbaceous plants, the results of the following experiments with Cruciferous and Solanaceous plants are interesting:—

"1. *Cruciferous Plants.*—I operated upon different varieties of Cabbage, Brussels Sprouts, Kohl Rabi, Swedes, &c. In all these Cabbages the removal of the ring to a depth of about a fifth of an inch was made 2 inches from the ground, below the first leaves, and on young plants that had been pricked out into position a fortnight previously. Some hours after the operation, the leaves faded. After several days the lower, older leaves turned red, then yellow, and at last fell. If their environment was damp, the young organs rotted, and the plant died of too much water. If, on the contrary, it is kept sufficiently dry, the plant does not rot, and after a period of more or less noticeable deterioration the wounds heal, and the edges are wholly or entirely reunited. But in nearly all the specimens the height of the decorticated specimens remains less than that of the un-ringed or check plants. In time, changes in the outward form were manifest, but differed according to the varieties. Thus, in the Brussels Sprouts the heart is more open, less close, and smaller. In the Kohl Rabi, the tuber formed well above the incision, but was gourd-shaped instead of rounded. In the Swedes, operated on below the rosette, the leaves lengthened and the tuber was drawn out, while the radicles formed a full fringe. Finally, the flavour of the decorticated Cabbages was modified; it was less agreeable, and in the Cabbages the leaves and stem became brittle. These changes in height, form, taste, and resistance of the tissues perfectly reflected certain alterations noted, but not fully understood in certain grafted varieties of Cabbage. Evidently the cause was the same; that is, the modifications are due to the temporary check and to interruption of the liberian functions, as in both cases the liber was cut through when the wood, sliced in grafting, is spared in annular decortication.

"2. *Solanaceous Plants.*—In this family M. DANIEL experimented on the very large Aubergine from New York, and on Tomatos, attempting to obtain larger fruit. The Aubergine used for comparison bore fruit weighing about a pound; on the decorticated Aubergine he obtained a fruit weighing over two pounds. The Tomatos operated upon yielded fruit in a much larger quantity than did the check plant, but as the operator omitted to prune the tops to facilitate the growth of the first fruits, he obtained but a slighter increase compared with that of the Aubergine, although this increase was quite noticeable on many of the specimens. The fruits obtained were somewhat modified in flavour; they were more insipid, and less highly flavoured. From these experiments the chief conclusions arrived at are:—

1. Ringing of herbaceous plants is of practical interest. It is possible, by careful manipulation, to cause a marked increase in the size of the fruits of Solanums used as food, and probably in those of other families which yield eatable fruit.

2. Ringing is of physiological importance, as by using it in connection with grafting, at the same time and on the same kinds of plants, the origin of certain variations of general nutrition induced by grafting (decrease in height, modifications in form and flavour, delicacy of the tissues, enlargement of the fruits, &c.), can be determined."

LÆLIO-CATTLEYA DIGBYANO-MENDELI, VEITCH'S VARIETY.—Our illustration (fig. 63) represents the fine hybrid of *Lælia Digbyana* and *Cattleya Mendeli*, for which Messrs. JAS. VEITCH & SONS, of Chelsea, received a First-class Certificate at the Royal Horticultural Society's meeting on August 27, and which was adjudged to be the finest *Lælia Digbyana* cross yet flowered. It differs from other forms in having larger flowers, which are of an uniform bright purplish rose tint, instead of the pallid whitish lilac of forms previously flowered. Veitch's variety here illustrated is 8 inches across the petals, the finely fringed lip is 3 inches wide, the base of the lip being of a reddish tinge, and the disc of the lip bright yellow.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The usual monthly committee meeting of this Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. C. H. CHRIS presided. The minutes of the last meeting were read and passed. Three new members were elected. Five members are receiving sick-pay; three others have been on the sick-list and off again since the last meeting. The treasurer stated that he had invested £500 in Cardiff Corporation Three per cent. Stock for £485 15s. The annual dinner will be held on Wednesday, October 9, at 6.30 P.M., at the Holborn Restaurant, on which occasion Mr. PETER E. KAY, V.M.H., will preside.

DISEASE OF THE POTATO.—At a meeting on August 26 of the Paris Academy of Sciences, M. G. DELACROIX contributed a paper on a bacterial disease of the Potato, and our contemporary, *Nature*, thus epitomises his observations:—"The disease in question, which is very prevalent in the centre and west of France, is due to a bacterium which appears to be identical with the *Bacillus Solanacearum* of E. F. Smith. It possesses the same characteristics on cultivation, and the symptoms of the disease observed in the United States on Potatos and Tomatos are similar to those observed in France. The only suggestion that

can be put forward as a remedy is a triennial variation in the crops in order to clean the soil, which appears to be the vehicle of the disease, from the pathogenic organisms which it contains." Another paper read before the meeting was concerned with the "invasion of streams of water in the department of Hérault by *Jussiaea grandiflora*, and on the growth of this species in France, by M. P. CARIÉS. The growth of this plant in some districts is so great that it forms true aquatic prairies. It has been stated that this plant could not fructify in France, but this is now shown to be inaccurate, since in the month of September, on the river Orb, the fruit was formed in the shape of capsules about 29 mm. in length, each capsule having five divisions containing about fifteen seeds. It is by these seeds that it multiplies so abundantly."

PRESENTATION TO THE TSAR AND TSARINA.—On the occasion of the visit of the Emperor and Empress of RUSIA to France, certain of the French horticulturists who took part in the St. Petersburg Exhibition in 1899, have decided to offer to their Majesties a souvenir of their kind reception at that date. The presentation is to take the form of some of the finest flowers and fruits grown by the donors. A committee has been formed, and includes among its members M. HENRI MARTINI, who was Commissary-General for the French Government at St. Petersburg in 1899; M. VÉRY, M. CH. MARON, M. LÉON DEVAL, M. ÉUGÈNE DELAVIER, and other prominent horticulturists.

PARIS EXHIBITION. Our much esteemed contemporary, the *Revue Horticole*, regrets, as we do, that our horticulturists took no part in this great undertaking, and points out that to wait at home for customers is not the way to do business, and that those who do attend these exhibitions will naturally get the preference over the absentees. There is some truth in this, no doubt; but, on the other hand, our contemporary forgets that the heavy duties levied by France on English fruit have killed the trade that once existed. Protection may be desirable for the French nation on that point we can offer no opinion—but it certainly offers no hospitable reception to importations from other countries. There were other reasons why self-respecting Englishmen refrained from exhibiting, but these are best forgotten.

DIAMOND JUBILEE GRAPE.—We are requested by Messrs. D. & W. BUCHANAN, of the Forth Vineyards, Kippen, by Stirling, N.B., to print the following expression of opinion concerning this new variety of Grape.

"We, the undersigned, have examined fruit and foliage of Diamond Jubilee Grape, exhibited by Messrs. Buchanan, Forth Vineyards, Kippen, and fruit and foliage of Black Monro Grape from Easton Castle Gardens, at the great fruit show held at Glasgow on September 1 and 5, and are confident that both are distinct varieties; and desire to express our opinion that the Diamond Jubilee Grape is a distinct acquisition, of commanding appearance and splendid flavour.

George Binyard, V.M.H., F.R.H.S., Chairman, R.H.S. Fruit Committee, James McIndoe, V.M.H., F.R.H.S.	James Hunter, Lambton, Judge, James Whytock, Bideketh, Judge, James Dawes, Biddulph Grange, Congleton, David Murray, Culzean, Maybole, James Hamilton, Mander- ston, McIntyre, The Glen, Innerleithen."
---	--

STOCK-TAKING: AUGUST.—The Trade and Navigation Returns for the past month show a falling off in both imports and exports as compared with those for the same period last year. The decrease on imports is £1,159,919, and £779,054 on exports. The falling off in imports is to be found in tea, sugar (refined and unre-

finéd), and in wines. The other and principal decline is in the values of raw materials used in sundry trades and manufactures. The loss in exports is spread over nearly all the sections. The following are our usual exports from the summary table of imports:—

IMPORTS.	1900.	1901.	Difference.
	£	£	£
Total value	42,477,056	40,967,119	-1,510,937
A. Articles of food and drink—total	15,997,223	14,029,129	-1,968,094
B. Articles of food and drink—total	4,256,353	3,703,199	-553,154
Raw materials—total	11,875,717	11,287,711	-588,006
Raw materials—total	1,258,347	9,785,292	+8,526,945
A. Manufactures—total	11,233,396	11,302,555	+69,159
B. Manufactures—total	10,975,049	11,741,000	+765,951

Possibly in the matter of sugar, we have reached the close of the pre-Budget rush for a market. The figures relating to the imports of fruits, roots, and vegetables are this month exceedingly interesting, especially in the matter of "minims" quantities. They are as follows:—

IMPORTS.	1900.	1901.	Difference.
	QWTS.	QWTS.	QWTS.
Apples, fresh	1,016	1,095	+79
Apricots, fresh	108	179	+71
Blackberries, fresh	258	24,047	+23,789
Cherries, fresh	2	5,218	+5,216
Citrus fruits, fresh	1,041	1,041	—
Guavas, fresh	2	14	+12
Oranges, fresh	1,075	110,826	+109,751
Pears, fresh	1,130	131,158	+130,028
Raspberries, fresh	1,130	1,220	+90
Strawberries, fresh	1,158	9,314	+8,156
Walnuts, fresh	144	7,477	+7,333
Berries, fresh	1,047	129,810	+128,763
Plums, fresh	1,099	1,099	—
Stoned plums, fresh	146	146	—
Unstoned plums, fresh	1,088	18,725	+17,637
Other fruits, fresh	1,099	11,062	+9,963
Apples, dried	1,099	1,099	—
Vegetables, raw—total	1,099	1,099	—
Onions	1,099	1,099	—
Potatoes	1,099	1,099	—
Tomatoes	1,099	1,099	—
Vegetables, raw—total	1,099	1,099	—

That much more good fruit would find a ready market goes almost without saying, and our friends across the Atlantic are making preparations for an endeavour after a bigger share of our custom. Choice British fruit will ever be first in the field, and growers will ever find their reward in improving their cultures as far as possible. The figures for the import values of the past eight months foot up at £316,318,351, against £397,967,068 for the same period in 1900, or an increase of £8,351,285. In the matter of

EXPORTS.
We have to acknowledge a fall of £779,051—£24,205,569 against £24,981,623 for the same period last year. As we have said, this reduction is divided amongst eight of the eleven sections, three showing an appreciable increase. For the eight months the loss as compared with the same period last year is placed at £6,521,206. Every now and again we are promised a "boom" by some speech-making

men in authority. This cannot well take place whilst matters remain as they are in South America, the Cape, China, and elsewhere.

"FLORA OF TROPICAL AFRICA."—We are pleased to notice that the publication of this valuable work is now proceeding steadily. The newest section, vol. viii., part 2, deals with *Ardisceae* (continued), *Lenneaceae*, both by Mr. X. E. BROWN; *Alismaceae*, by Mr. C. H. WRIGHT; *Naiadaceae*, by Mr. ARTHUR BENNETT; *Eriocaulaceae*, and *Restiaceae*, both by Mr. X. E. BROWN; and *Cyperaceae*, by C. B. CLARKE.

PLANT BREEDING CONFERENCE, 1902.—The following preliminary programme of subjects for the proposed International Conference on Plant Breeding and Hybridisation, to be held in the fall of 1902, by the Horticultural Society of New York, has been issued over the signature of Dr. BRITTON, the Chairman of Council. The exact dates for the meetings are not yet decided upon, and the programme as given is subject to alteration:—

1. *Results of Hybridisation and Plant Breeding in Canada.* (Illustrated by specimens.) WILLIAM SAUNDERS, Director of the Experimental Farm, Ottawa, Canada.
2. *Notes on Plant Breeding in California.* E. J. WICKSON, horticulturist, Agricultural Experiment Station, University of California.
3. *Plant Breeding in New Jersey.* (Illustrated by specimens.) B. D. HALSTED, Professor of Botany in Rutgers College, New Brunswick, N.J.
4. *Hybrid Plants.* F. A. WATSON, horticulturist, Vermont Agricultural Experiment Station.
5. *Variations in Hybrids Not Appearing in the First Generation, but Later.* E. S. GORT, horticulturist, Agricultural Experiment Station, University of Wisconsin.
6. *Results in the Breeding of Species of Ricinus.* E. MARY MILTON, botanist, Oklahoma Agricultural Experiment Station.
7. *On Orchid Hybrids.* (Illustrated by specimens of the parents and progeny.) OWENS AMES, Ames Botanical Laboratory, North Easton, Mass.
8. *The Wild Hybrids of the North American Flora.* (Illustrated by specimens of the parents and progeny.) DAVID GEORGE, Museum Aid, New York Botanical Garden.
9. *Hybrid Beans.* R. A. EMERSON, horticulturist, Agricultural Experiment Station, University of Nebraska.
10. *Cytological Aspects of Hybrids.* W. A. CANNON, Columbia University, New York City.
11. *Correlation Between the Fruit and Other Parts of the Plant in Form, Colour and Other Characteristics.* (Illustrated by specimens.) S. A. BLANCH, horticulturist, New York State Experiment Station, Geneva, N.Y.

Other papers, the titles of which have not yet been communicated, are also promised from various experimentalists. Further particulars will be made public as arrangements are concluded. For information relative to the Conference, address all correspondence to the Secretary, LEONARD BARRON, 136, Liberty Street, New York, August 21, 1901.

Mr. W. BATESON, M.A., F.R.S., and Mr. GEORGE NICHOLSON, V.M.H., have consented to represent the Society at the Conference.

MEETING OF THE GHENT CHAMBRE SYNDICALE.—At the meeting, on September 2, of the Chambre Syndicale des Horticulteurs Belges et Société Royale d'Agriculture et de Botanique of Ghent, the following Certificates of Merit were awarded:—For seedling *Heliotropes*, from M. VAN DRIESSCHE; *Dracena Vanden Berghel*, from M. ARTHUR STANDAERT; *Catseum fibri-ferum* (var. *Cogniauxii*), from Count J. DE

HEMPTINNE; for *Cattleya aurea* (*par acclamation*): *C. Eldorado alba*, and *C. granulosa* var. *Byssenianna*, and for *C. Wavriniana* (*C. gigas* × *C. granulosa* Schofield (*à l'unanimité*)); also for *Laelio-Cattleya elegans*, for *Cattleya Patrovini* (hyb. nat. *C. Lodigesi* × *C. guttata* var. *Leopardina*), for *C. Ella* (*C. bicolor* × *C. gigas* (*par acclamation et avec félicitations du jury*)); *C. Warszewiczii* (*gigas*) var. *Gloxy*, *C. Fowleri* (*C. guttata* var. *Leopoldi* × *C. Hardyana*), *C. granulosa* var. *aurea* (*à l'unanimité*), *C. Eldorado alba*, and for *C. guttata pernambucensis*; all these *Cattleyas* being from the Marquis DE WAVRIN. A Certificate of Merit was also given for *Odontoglossum* hyb. var. *Theodore Panwels*, from M. TH. PANWELS. Awards for cut flowers were allotted:—for *Lilacs*, from M. F. VAN DRIESSCHE; *Cactus Dahlias*, from M. BÉVENICHE, père (*à l'unanimité*); and for *Cactus Dahlias*, from M. FRANÇOIS NAGELS, of Wilryck, Antwerp (*par acclamation et avec félicitations du Jury*). Certificates for cultivation and flowering were awarded to M. F. VAN DRIESSCHE, for *Datura alba*, and for six varieties of *Thunbergia alata*. M. L. HENXO-DELBOSSÉ, of Tonnai, received Honourable Mention for cut flowers for his *Cactus Dahlias*. M. F. VAN DRIESSCHE, Honourable Mention for cultivation and flowering for *Salvia splendens* compacta, and for two *Eupatoriums*; and M. J. VANDE KERCHOVE for *Persea gratissima* avocetier grown in a bottle.

HOME CORRESPONDENCE.

STRAWBERRY ELEANOR.—We hear and read so much nowadays regarding the merits of new varieties of Strawberries, that we are apt to forget the good qualities of many of the older ones. We now depend at Stoneleigh for our chief supply upon Royal Sovereign and Sir Joseph Paxton, and as a late one, on Eleanor, which is far in advance of other late-fruited varieties. Laxton's Latest-of-All is practically over with us before Eleanor is at its best. We have a border on the north side of a wall planted with Eleanor, which affords many good dishes after Latest-of-All has ceased to fruit, and both varieties are treated alike in every respect. The flavour of Eleanor is very good, though somewhat sharp, but this acidity is not disliked, especially as the fruit comes to table at a time when the Strawberry season is practically past. The fruit is soft, hence it requires to be carefully handled, and each fruit must be wrapped in a soft leaf if sent to a distance. I can confidently recommend this good old variety. *H. T. Martin.*

MANURING.—Any contribution from the pen of such an able authority as Mr. J. J. Willis on horticultural soils and manures is always especially valuable. I read his notes on Basic Slag recently with much interest. There is, however, one portion which I think calls for some further remarks, he says: "In some cases, where the application of basic phosphates has not seemed to produce any marked effect, we think it probable from the results obtained in the grass experiments at Rothamsted, that the soil is deficient in potash," and he supplements this by comparing results obtained from experiments between a plot manured for four or five years, one with basic slag alone, and another where basic slag and sulphate of potash has been applied. This is very well as far as it goes, and may apply to lawns, meadow lands, or grass orchards, under certain conditions, but perhaps not so much to general garden practice. During last July and the early part of August, a discussion on "Manuring," between Professor Wrightson and Dr. Bernard Dyer, appeared in the pages of the *Agricultural Gazette*. Professor Wrightson says: "The greater abundance of potash in soils, as compared with phosphoric acid, and the fact that hay, straw, haulm, and

artificial foods contain it in abundance, are the principal reasons why experiments with potash salts seldom give satisfactory results. Potash salts seldom do good, and sometimes do harm. As a rule, good ordinary managements, liberal feeding, and the use of phosphates and nitrates, fulfil all the conditions for successful manuring. Even nitrates may be dispensed with, where oil-cake is fed, and a great head of stock is main aimed. The great art of manuring is therefore reduced to two principal parts, namely, plenty of live-stock, and the use of phosphates." He also says, "These two classes of artificial manures may be called the right and left arms of the system of artificial manuring. Phosphates and nitrates divide the field, and there is comparatively little room for potash as a manural substance." Professor Wrightson was dealing with farm-manuring; but farm and garden soils and manures are so closely allied that almost the same conditions apply to both. The garden has the advantage over the farm in deeper and better tillage, and generally in the more liberal supplies of fold-yard manures. Such soils are rich in available potash, possibly without the addition of further supplies; but basic slag could with advantage be added, not only on account of its phosphoric acid, but also the larger proportion of caustic lime which it contains would act beneficially on such soils as these, except, perhaps, those of the shallow limestone. It is, therefore, a question whether the addition of artificial potash manures to fairly good supplies of fold-yard manure is productive of good economical results; that is, as far as the supplies of potash are concerned. With the exception of Potatoes, very few elaborate manural experiments are being carried on in this country on garden crops. I hope this will be remedied in the near future, as we have yet much to learn in the way of economical garden manuring. I have before me some tabulated results of experimental manuring of agricultural crops, and I particularly notice that the application of artificial potash manures with fold-yard manure gives very little increase of crops over that of fold-yard manure alone, or fold-yard manure with other artificial fertilisers, excepting potash; in others there is a marked decrease where potash has been added. I am comparing results from a number of experimental stations and different soils. These vary very much. The different varying conditions in soils, position and climate, possess great influence upon results obtained from experimental manuring, that it is very difficult to generalise. Perhaps economy in garden manuring may often be only a secondary consideration, but where the application of any artificial fertilisers to the soil has been shown to be sometimes harmful, as Professor Wrightson says of potash-salts, and as various experiments show, great care should be exercised in using them. *Alfred Gant, Leeds, 61, Belle Vue Road.*

DESTROYING WASPS.—When I penned my few remarks on my method of destroying wasps (see p. 128), I thought they might be of service to your correspondent, Mr. Simpson, but it appears he has a plan of his own, which differs from mine, inasmuch as the wasps destroy his Peaches, Grapes, &c. (see p. 111), and in my case the wasps lay dead in thousands, and the fruit is practically intact. As to the time it takes, it only occupies ten minutes of my time every morning to replenish the vessels. I did not recommend the advertised wasp destroyers, as I have had no experience of them, but only my own preparation and the manner of applying it. I have noticed that some of the wasps only remain sipping a few seconds, and in order to ascertain if they returned, I have, on their departure, dredged them with flour, but not one returned. This is a good way to discover the direction in which their nests lie, for they can be seen more readily, and for a greater distance, and in some instances followed home, as their movement is not rapid after being floured. I do not know if the wasps eat their comrades that

may happen to reach home to die, but, since writing to you on the subject, I watched a wasp devour a poisoned fly, after first clipping its wings as if with a pair of scissors, and it crawled till it died. If the wasps are allowed to make a good start on a houseful of Grapes or other fruit, it takes longer to entice them to the mixture, and I have seen where bottles containing all kinds of tempting mixtures (including honey) have been hung up, the wasps have been as attentive to the fruit as before, and this seems to be Mr. Simpson's experience. A week ago they commenced to devour the Green Gages here; though not half ripe, three fruit were already shelled. I immediately hung a vessel in the tree, picked the damaged fruit, and put them in it, for they like something to alight on in the liquid, and in a couple of hours there was scarcely a wasp to be seen on that tree. I may add that I have tested the wasps with bones and scraps of fish placed side by side all kinds of sweet things, and have had to move the former to the vessels to get them to the mixture. *W. P. Roberts, Uerden Hall Gardens, Preston.*

THEFT OF APPLES.—It may interest judges at flower shows to know, that last Saturday night somebody went into my garden, and carefully took from two trees of Peasgood's Nonsuch a dozen or so of the very finest of the Apples. They were specially good samples, and it is probable that they were only taken to be sent to a show somewhere, as the thief most carefully selected those without any blemishes, leaving the rest of the trees. I know that in many shows growers have to vouch that the fruit they exhibit is their own, and grown by themselves, and I therefore felt that it would be well to give these facts to any of your readers who may be judging, and have any doubts of a lot of the above Apple. *C. J. Morgan, Hulswood, Durlford, Kent.*

HOME GROWERS AND WATER MELONS.—One gets such an unpleasant experience of Melons at the Fruit Committee's table at the Drill Hall, that I hesitate to partake of the Water Melons sold so cheaply in shops. But recently, when in Edinburgh, Mr. Metlattie, with whom I was taking tea, invited me to partake of one, and so nicely flavoured and generally good was it, that it greatly exceeded scores that come to the Drill Hall as seedling crosses for awards. The very best home-grown Melons I ever taste, whether new or old varieties, are from plants grown in very limited ranges of soil in houses where there is ample light, some ventilation, no excessive damping, yet no red-spider is in evidence. Were all imported Melons as good as the one I tasted, I fear few Melons would be grown at home. *A. D.*

SWEET PEAS IN THE NORTH.—Very remarkable to me, remembering how we had suffered from drought in the South, were the Sweet Peas in the nurseries at Rothsay, for they were over 6 feet in height, in every case green and vigorous, full of bloom with buds from bottom to top, and almost seedless. Surely Rothsay must be for the Sweet Pea a perfect paradise. Messrs. Dobbie & Co. had overcome the difficulty of obtaining proper branch sticks in a locality not overwooded, by fixing along the rows at intervals stout supports, to which were fastened lengths of large-mesh wire, 6 feet deep. A larger mesh than 4 inches would have been preferred, but it was not obtainable. However, a first-rate form of support was thus obtained, the Peas enclosed in the wire sides being secured from the strongest winds. *A. D.*

"THE ROYAL HORTICULTURAL SOCIETY'S JOURNAL."—The recipients of the latest issue of this valuable work should be greatly gratified by the addition thereto of a voluminous series of pithy extracts or abstracts from the home and foreign horticultural and botanical press, which forms a very practical index to the more recent discoveries and interesting records. These are arranged alphabetically, according to the plant or plants or particular

branch of research concerned, and hence, by simply glancing through the sub-headings, every specialist can perceive what has been done in his particular line during the three

months covered by the periodicals concerned. The numbers and pages of these being also given in conjunction with the author's name, and the pith of the matter published, reference to same for further details is rendered easy. No idea could be conceived which is

better calculated to bring the horticulturists and botanists of the world into closer communion, and their thanks are certainly due to the indefatigable secretary of the Society, the Rev. W. Wilks, not merely for conceiving the idea, but for the very practical way in which he has arranged the matter provided by himself and the numerous gentlemen who have kindly volunteered to assist him. The names, which are given, as well as the long lists of cosmopolitan publications from which the abstracts are taken, demonstrate not merely that the matter is thoroughly and intelligently selected, but also that their field of research is an ample

FIG. 63. CATTLEYA PUBERULA (MENDLE); A ROSE-COLOURED FLOWER WITH A YELLOW BLOSSOM AT THE BASE OF THE LIP. (SEE P. 201.)

months covered by the periodicals concerned. The numbers and pages of these being also given in conjunction with the author's name, and the pith of the matter published, reference to same for further details is rendered easy. No idea could be conceived which is

better calculated to bring the horticulturists and botanists of the world into closer communion, and their thanks are certainly due to the indefatigable secretary of the Society, the Rev. W. Wilks, not merely for conceiving the idea, but for the very practical way in which he has arranged the matter provided by himself and the numerous gentlemen who have kindly volunteered to assist him. The names, which are given, as well as the long lists of cosmop-

opolitan publications from which the abstracts are taken, demonstrate not merely that the matter is thoroughly and intelligently selected, but also that their field of research is an ample

contact with each other, and by the consequent exchange of views which results. Each one reaps some knowledge from the others, and this interchange of views undoubtedly frequently brings about those combinations of ideas from which many of our greatest discoveries have sprung. A mass of information is brought together, the individual quotas of which, when isolated, constitute mere natural enigmas which the single specialist is unable to solve. The conjunction of many, however, reveals coincidences and agreements which often give the clue to theories which eventually, by the research thus guided into distinct channels, resolve themselves into laws of the utmost importance. The abstracts and short articles on research which we are considering go very far in this same direction. Hitherto, to achieve the same end by individual search through contemporary records was practically impossible, since it involved the necessity of the reader being in every case master of several languages, apart from the fact that several scores of publications (some of them expensive) require to be perused attentively, while the items of particular and individual interest may be like the proverbial needles in a bottle of hay. Another special feature of the issue under consideration is the opening translation of Mendel's paper on the "Law of Hybridisation," a paper which, unfortunately, almost fell into oblivion entirely, owing to its form of publication, though, as will be seen by perusal, it is of such an epoch-making character, that the Royal Horticultural Society richly merits the thanks of all Englishmen for facilitating their knowledge of it by the translation given. To whom I refer for details, *Chas. T. Druery, F.R.S., V.M.H.*

A VETERAN FLORIST.—When visiting a few days since at Rothsay I had the pleasure of meeting that octogenarian florist, Mr. James Dobbie. The old gentleman is now in his eighty-fourth year, and is surprisingly robust, vigorous, and full of energy and vivacity. He resides in a handsome villa on the Craigmore side of Rothsay, from whence a splendid view of the noble bay of that name, the harbour, and the lofty hills beyond and far in front are seen. He still employs much of his spare time in the cultivation of flowers and vegetables, especially Kalea and Leeks. No longer associated with the big business now built up, and which retains his honoured name, he is still an enthusiastic florist and gardener. We may well honour these veterans of horticulture, of whom Mr. Dobbie is not the least famous. *A. D.*

IRIS KÄMPFERI.—When calling recently at Haddon House, Exeter, the seat of J. F. Bannatyne, Esq., my attention was directed to a fine mass of this Iris by Mr. Elliott, the genial gardener there. The plants under notice are growing just below a small stream, and Mr. Elliott informed me that they were imported direct from Japan, and planted about eighteen months since; they flowered profusely this summer, many of the blooms measuring 11 inches. There was ample evidence of this from the quantity of flower-stems, and a few blooms on the plants at the time of my visit. The plants were the picture of health, some 3 feet or more in height. They are growing in the natural soil—light loam—to which was added equal parts of leaf-soil and peat. They were flooded by a small trough from the stream near by a fortnight before flowering, this being the only artificial watering given them, and mulched last winter with some stable-manure. A glance through the vinerys showed some good bunches of Black Hamburgs, and also Muscats, on the young Vines planted during the past four years which would make Mr. Elliott a formidable opponent if placed on the exhibition boards. There is a decided improvement in the place generally since it was acquired by the present owner. *Paul T. More.*

THE AUTUMN SQUILL (SCILLA AUTUMNALIS).—It will be of interest for botanists to learn that this rare plant is still to be found wild in

the London district. Yesterday I saw a single colony of probably fifty specimens; but, unfortunately in another station it has become extinct through the formation of golf links. As this plant is unknown in Scotland or Ireland, and only crops up in a few stations in southern England, its London home is all the more cherished and zealously guarded. It frequents the most arid, staked verdure. Another equally rare plant, *Sphranthes aestivalis*, supposed only to occur in the New Forest, is also to be found wild in the London radius, and in such quantity as to preclude the possibility of its becoming exterminated for some time at least. *A. D. Webster, September 9, 1901.*

MR. ROBERT FENN.—I had the pleasure of seeing this old Potato-raiser at his Sulhamstead home a few days since. I found him exhibiting a marvellous condition of recovery from his broken-leg accident of last year, for he is now, even at the great age of eighty-four, as active and energetic as at any time. Since he has been at Sulhamstead, neither age nor accident has in any way withered his intense Potato enthusiasm, for he is still raising new varieties, and curiously enough from a species which has apparently never before been so utilised in England. It is many years since that the famous American raiser, Mr. Pringle, sent over to Mr. Fenn small tubers of the North American Solanum Fendleri, indeed the date is about fixed because accompanied by one tuber of Snowflake, a once famous American variety. Some seventeen years elapsed ere it was possible to obtain a cross with that species, and then a cross was secured with Rector of Woodstock. Then later was effected a further cross, the species being the seed parent with pollen of Woodstock Kidney, and from these crosses have come some capital dwarf top early seedlings. One especially, provisionally named Kate, a flat-tish kidney, is exceedingly promising and handsome. Four years ago Mr. Pringle sent seed of yet another and comparatively unheard of species, which bore the comprehensive appellation of Solanum bulbocastanum (Danal, native of Guadalupe, Old Mexico). This gave plants having dwarf tops, and Sego-like leaves. Crosses were effected with one or two garden varieties, and the produce in numerous seedlings is now being grown and tried in Mr. Fenn's garden. How they will turn out time alone will show. Top growth varies considerably, some being dwarf and early, some tall and of rather wild aspect. It is interesting to note that there are good growth and crops associated with some of the old Woodstock Seedlings, that have been grown in the same ground for twenty-five years. *A. D.*

LILIUM AURATUM.—I enclose a photograph of a *Lilium auratum* now in flower in garden at Aubrey Villas, Penzance; as you will perceive, an extraordinary specimen, so much so that it has drawn the attention of all the gardening people here, and many others interested in horticulture. One bulb only, purchased at a local nursery for 2s., was planted where it is now four seasons ago. No particular attention was given it at the time or since; it has never been disturbed, and nothing done to it except staking. The first season it threw up one stalk carrying twenty-five flowers, the second and third seasons two stalks with seventy-five flowers, and 8 ft. 6 in. high; this, the fourth season, it has three stalks of about equal size and height, and carrying 112 flowers; it is clothed in glossy dark green foliage from bottom to top, the leaves being 10 inches long by 2 inches wide, the girth of the stalk is $4\frac{1}{2}$ inches, and the plant 10 feet 2 inches in height. You will notice in the photograph the figure of a man who is 5 feet 8 inches, thereby showing the comparative height of the plant. It is thought here generally that no such specimen is likely to be seen again in this country. I may add the perfume from it scents the whole neighbourhood, especially at night. *Henry Heath.* [An excellent specimen, but as others even more remarkable have been figured in

our columns on various occasions we do not think it necessary to reproduce the photograph our correspondent has been good enough to send us. Ed.]

A NEW WORM-KILLER.—Mr. John Freeland, a gentleman well known and esteemed in fishing circles in Aberdeen, has just come forward with what not a few think is a very valuable suggestion. As is well known, the jelly-fish of the sea is considered to be a nuisance by fishermen in general, including salmon fishers; but, nevertheless, Mr. Freeland holds that the jelly-fish has very great value, and is surprised that the benefits to be derived from it have not ere this time been recognised. Grub and worms have been a source of annoyance to gardeners from time immemorial, and it is for the benefit of the latter that Mr. Freeland puts forward his suggestion. He holds that the jelly-fish taken from the sea and applied to the land will have the effect of exterminating worms of all kinds. Of course, jelly-fish alone will be too strong, and must be mixed with earth or some other ingredient. Anyhow, Mr. Freeland wishes some enterprising gentlemen to take the matter up, and for his part he will be delighted to give all the information his experience and practice of the sea have put in his power. His address is Torry, Aberdeen. *W. Killy, Aberdeen.*

PLANTING POTATOS.—Some time in the early spring, I wrote it was just possible that the size of the tubers of the Potato might be lessened by the habitual selection of small-sized tubers for seed or planting. Acting on this belief, I caused a row of full-grown large ones, and another of the usual "seed" size, to be placed side by side. The sort selected was one known about here as Snowdrop, and a good cropper. As is well known, the season has been exceptionally dry—so much so that the yield has been very poor, and the return unprofitable, most of the tubers being so small as to be only saleable for poultry or stock-feeding. However, I was agreeably surprised to find that the row of the larger tubers not only much exceeded the smaller in the strength and growth of the haulm, but the crop was more, and the tubers of a far better size, with fewer small ones; while, also, the row of the small seed Potatoes seemed to suffer more from the drought, which my man said was "accounted for by there being more moisture to feed on in the bigger ones." Be this as it may, there was a decided difference, and this in favour of the larger "sets." I merely mention this, not so much as a proof, for on so small a scale it is not that, but as a tried experiment, and that for the consideration of others as to whether they will follow it up another year. *Harrison Weir.*

LILIES FROM SEED.—About three months ago, at a meeting of the Scientific committee of the Royal Horticultural Society, a question was raised whether Lilies ever grew from seed to flowering size without making any leaves above ground. I said that I believed this had happened in my garden in the case of *L. monadelphum*, and that I hoped careful observations on the subject would be made. I have now collected about half a pound of seed of *L. monadelphum*, and will send a packet of it to everyone who may be willing to spare a square yard of their garden to sow it in, and to make continuous observations of the surface during spring and summer for the next four years, keeping it clear of weeds. The seed will be sent on application to me. *C. Wolley Dod, Edge Hall, Malpas.*

ENQUIRY.

WILL some fellow-reader advise me what to plant in a wilderness near the riverside, flooded in winter time, baked in summer, soil alluvial, resting on London clay? Plants of bold aspect, like the Gunners, and of proved hardihood, are required. *X.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 12.—The Drill Hall, Buckingham Palace a much greater appearance than on the occasion of the previous meeting; the exhibits were of greater general interest, and the number of visitors greater. The chief features were hardy herbaceous perennials, which seem to get more popular every year. Dahlias of Cactus varieties, Ferns, and Selaginellas, of which latter there was a remarkable exhibit from Mr. GREENE FOWLER, and hardy fruit.

Floral Committee.

President.—W. Marshall, in the chair, and C. T. Dreyfus, H. B. May, H. Selvie Leonard, R. C. Nottent, E. Molyneux, J. F. McLeod, J. Jennings, C. Dixon, W. Bain, C. Jenkins, C. E. Pearson, H. Cutbush, H. J. Jones, E. J. Jenkins, W. J. James, G. Paul, C. Black, J. W. Hill, J. Walker, G. Nicholson, J. Hinds, H. P. Roberts, and J. Ed. Mawley.

TABLES.

H. CANNELL & SONS, Swanley, Kent, occupied the entire length of a long table on one of its sides with bunches of Cactus Dahlias in great variety. The most of voluted-petalled flowers predominating. We may mention, among many pretty flowers, Camellia Crested, a deep crimson, Lovely Egneston, orange-colored, Major Weston, velvety crimson, Mrs. John Pully, W. Treseder, white, standard Boreas, scarlet, W. Jovett, similar in tint; Mrs. Sanders, lemon yellow, Vestal, rosy carmine; Eclair, orange-scarlet; Cornucopia, soft cerise, Mrs. Carter Page, crimson, Falke, and J. W. Fife, rich narrow gold Medals.

MR. R. C. NORCELL, Wood's Nursery, Woodbridge, showed a number of varieties of Cactus Dahlias, most of which were new.

Messrs. J. CHEAL & SONS, Lowfield, Singley, Crawley, showed a number of Pompano, single-flowered and Cactus Dahlias. Many varieties obtained Awards of Merit, and the descriptions of these flowers are given in our award list.

HERBACEOUS PERENNIAL AND BI-COLORED PLANTS.

MR. PRICHARD, Christchurch, Hants, showed a quantity of handsome hardy herbaceous perennials, Ac, which grow so luxuriantly in the rich friable soil of Christchurch. Of novelties, mention may be made of *Gladolus* Baron J. Hubot, a purple self and a pink variety, named *Vesuvius*, *Rudbeckia purpurea*, the pretty *Veronica exaltata*, which has flower spikes inches in length, *V. submissa*, *Helianthus collis*, *Rose Souvenir de Catherine Guillot*, a flower of salmon buff tint, *Colonia obliqua* alba, *Buddha varabalis*, *Boltonia longata*, *Rudbeckia Lyallii*, of a bloom of a soft tint of yellow, and numbers of handsome shrubby *Phloxes* (Silver Bankian Medal).

MR. THOS. S. WARE, Hale Farm Nurseries, Feltham, Middlesex, showed hardy plants in great variety. We noted, among the rarer subjects of merit, *Stokesa cyanea*, *Lithum speciosum purpureum*, and other varieties, *Arantia grandifolia*, the flower of a deep blue colour, *Gladolus* Fane Buchanan, of a pale lawn tint, varnished with a new rose-colored stripes, the light blue flowered *Delphinium Bellodiana*, a shrubby *Phlox* with bright tints, *Milla bellifera*, flower grasses of *Polygonum Baldschuanum*, the whole being backed by plants of Bamboo in pots. The exhibitor had numerous cut spikes of China, but no special award was made (Silver Flora Medal).

Messrs. BAIRD & SONS, King Street, Covent Garden, W. C., had arranged a very extensive exhibit of hardy flowers, consisting of many perennial and annual Asters, *Gladolus*, *Amargilly*, *Bellodiana*, *Nymphalids* floating in vessels of water, of which we may notice *N. Robinsoni*, a flower of a deep cream tint, which is darker at the centre; *N. Andreama*, *N. James Brydon*, a new form; and *N. Froebel*, very fine dark colour, but not of large size. *Clematis Ville de Lyon*, *Helianthus* *de Moon*, a fine thing, not so rampant, it is said, as some of the *Sunflowers*, *Gladolus Nuccioans*, *Paella* of a brilliant cerise colour, a number of quite fresh flower spikes of *Kuphobia Pfitzeri*, *Gladolus Lemmonia Proprietas*, white with blood red patch. The firm also showed some plants in a pair of *Patera* repens in fruit (Silver Bankian Medal).

MR. AMOS PEARCE, The Hardy Plant Farm, Wincmore Hill, showed extensively in the hardy herbaceous plant line, and had many good subjects, of which we may mention *Gentiana Andrewsii*, with very dark flowers, appearing in compact terminal and axillary corymbs,

German *concolor*, a large plant, *Chrysanthemum virginicum*, a dwarf plant, with yellow blossoms of the size of a shilling; *Eucos* *isopetala*, an old-fashioned plant; *Calliopsis* *Barnwelliana*, *C. liguriana*, *C. chinensis*, *Liatris scariosa* (ragwort), a showy, purple-flowered species; *Perovskia atriplicifolia*, a grey-leaved plant, with twaxy branched spikes of minute blue flowers; *Sonchus pulcher*, *Chelone Lycop*, rosy purple (Silver Bankian Medal).

FERNS, &c.

Messrs. J. HILL & SONS, Barrowfield Nurseries, Lower Edmonton, Middlesex, exhibited a large collection of exotic Ferns, including many that are rare in gardens, and all of them showing excellent cultivation. Good plants were observed of *Brama muscivora*, *Pteris Chelidii*, *Anemia rotundifolia*, *Avallia fijiensis elegans*, *Asplenium marginatum*, *Oxyphium aurantium*, &c. (Silver Flora Medal).

J. GREENE FOWLER, Esq., Ghebeldans, South Woodford gr., Mr. J. DAVIS, exhibited a very excellent collection of Selaginellas. The plants included most of the species and varieties to be found in trade lists, and were in excellent condition. We may mention such rare species as *S. Griffithii*, *S. Bruma*, *S. peregrinus*, *S. vialla*, *S. erythra purpurea*, *Victoria*, *S. idemita*, *S. aranea*, *S. scandens*, *S. pinnatifida*, *S. flaccidifolia*, *S. Lobbii*, *S. Schottiana*, &c. The exhibitor spoke well of the cultural skill of Mr. Fowler's gardener (Gold Medal).

MISCELLANEOUS.

Messrs. W. PAUL & SON, Witham Cross, exhibited beautiful baskets of *Fo. Roses*, in fine condition, considering the season, such as *Bounty*, *Fairy Queen*, *Redbird*, *Queen of May*, *Excelsior*, &c. (Silver Bankian Medal).

MR. H. J. JONES, Royal Nursery, Lewisham, S. E., showed a collection of Mr. J. H. DAVIS, growing in pots of some inches, and in which the plants mostly with numerous flowers still unopened, so that they did not admit of description. They probably do not do so very pretty and pleasing as *Aster Nov. Belin*, *patula*, *pinnaefolia*, *gladius rosea*, *Novae Angliæ*, *N. A. Mrs. J. F. Layner*, rosy purple, a large flower, umbellatus, flowers creamy white, and good for cutting, *Noxæ Angliæ*, *Proceris*, purple, &c. This useful class is certainly taking the place it deserves in the border, and as pot or rather tub plants.

Messrs. W. WELLS & CO., Earlswood, Reilly, showed flowers of the so-called flowered *Chrysanthemum* *Milford* (various), and those of open ground, the flowers being white, with yellow, blue, and measuring 4 inches in diameter.

J. WARRIS, Esq., Head of Park, Crawley, Mr. A. other, showed a large and well-edged *Deucalia*, named *Chloe*. The plant has a general resemblance to *D. rotundifolia*, but the red tinge in the stripes are more marked than in that variety. The plants were well grown, 2 feet high, and clothed with leaves to the base.

Messrs. J. VETTER & SONS, LTD., The Royal Exotic Nurseries, Chelsea, showed a number of plants of *Lithum Henryi*, a deep rose-colored, much reflexed flower, the stems measuring 2 to 4 feet in height.

JOHN LAING & SON, FINE FINE Hill, London, S. E., showed a massive group of well-flowering *Chrysanthemums*, and forty-eight cut Rose blooms of fine quality, H. P. & Co. (Silver Bankian Medal).

MR. JOHN RUSSELL, Royal Exotic Nurseries, Richmond, Surrey, arranged in a corner of the hall a pleasing group of woody plants, consisting almost solely of foliage subjects, such as *Codæa*, *Abrotanus*, *Dicentra*, *Diethelmiaebus*, *Begonia*, *A. diels*, *Caladiums*, *Pahus*, *Helleborus*, and a quantity of small-growing species as a margin to the group (Silver Bankian Medal).

FINEST CLASS CEREALIAES.

Nyctelia Decolorata.—A flower 7 inches in width, of a bright pink colour throughout, and the petals expanding to the fullest extent. Grown out of doors at Burford. Shown by Sir THOMAS LAWRENCE, Bart., Burford gr., Mr. W. BAIN.

Kochia scoparia, noticed in a previous issue. Shown by Messrs. CANNELL & SONS, Swanley.

AWARDS OF MERIT.

Tree Carnation P. Crowley.—A deep pink self Carnation, with a Peacock edge. Shown by Mr. H. J. JONES, Ryecroft Nursery, Lewisham.

Chrysanthemum Tomber's Crimson.—A chestnut brown flower, well built, with reflexed florets, 6 inches in diameter, rather flat, with a full centre. Shown by Messrs. W. WELLS & CO., Earlswood, Reilly.

Chrysanthemum Orange Mrs. C.—A semi double flower, of an orange or rather buff colour, and with slightly

no living florets. Shown by W. WELLS & CO., Earlswood, Reilly.

Trio Rose Salmon.—Pink, with a frunter tint in the centre, very free. Shown by Messrs. W. PAUL & SON, Waltham Cross.

Cactus Dahlia Modestus Linnæ.—With yellow and orange-colored florets. Shown by Messrs. J. CHEAL & SONS, Crawley.

Cactus Dahlia Escudæ.—A flower of a crimson colour and thread like florets. Shown by Messrs. J. CHEAL & SONS, Crawley.

Præcox Dahlia Cæsus.—A neat, light purple-colored flower, the interior of the florets being silvery white. Shown by Messrs. J. CHEAL & SONS, Crawley.

Cactus Dahlia E. W. Bolding.—Oranges-carlet florets, having creamy-white tips. Shown, like all the following five varieties, by Mr. J. STRICKWICK, Silverhill Park, St. Leonards-on-Sea.

Cactus Dahlia Alpha.—Florets white, spotted and striped with crimson.

Cactus Dahlia Richard Dean.—A flower with scarlet coloured florets having white tips.

Cactus Dahlia Linnæ.—A flower having lilac-colored florets tipped with white.

Cactus Dahlia Mrs. Westoby.—A brilliant scarlet coloured flower.

Cactus Dahlia Khalis.—A flower of a deep orange colour.

Cactus Dahlia Ophir.—An orange-colored flower, turning to yellow towards the centre. Shown, with the three following, by Messrs. WILLIAMS & CO., Salisbury.

Cactus Dahlia Amazon.—A flower of salmon pink and yellow tints.

Cactus Dahlia Mrs..—A soft tint of crimson.

Cactus Dahlia Gabriel, of scarlet and white.

Cactus Dahlia Mrs. H. J. Jones.—A flower with imbricated horn like florets, white at the tips, and scarlet below, a striking variety. Shown by Mr. J. T. WEST, Brentwood.

Cactus Dahlia Spillius Queen.—A pure white flower of pleasing build. Shown by Mrs. J. T. WEST, Brentwood.

Solo Dahlia Media.—A variety of a vivid scarlet tint, the finest form, and very regular. Shown by Mr. C. T. BAKER, Royal Nurseries, Slough.

Pycnostachya coccinea rubrovariegata.—An *Amulo* like grass or reed, with foliage boldly striped with long thin bands of white, a height of stems, as shown, about 4 feet. Shown by Messrs. BAIRD & SONS, King Street, Covent Garden.

Helianthus collis.—A single flower *Sunflower* growing to a height of 5 feet, and flowers 2 to 4 inches in diameter, of a soft yellow. The whole plant pubescent, and having a greyish-green appearance. Shown by Mr. AMOS PEARCE, Wincmore Hill, London, and Messrs. WATTS & CO., Colchester.

Trio Rose Madama Berlay.—Colour creamy white, and fringed with pink. Shown by Messrs. PAUL & SONS, Chesham.

Cornua Rubra *Kochian*.—*Facet Hohendolke*.—A flower of a yellow colour, and large size. Plant of dwarf habit. Shown by Sir THOMAS LAWRENCE, Bart., Burford Lodge, Burford.

Behæradiastrum grandiflorum.—Shown by Lord MANTON of Dottedock, Lochgilphead, N. B.

Orchid Committee.

President.—Harry J. Veitch, Esq., in the chair, and Messrs. Jas. O'Brien (not seen), De B. Crawshaw, H. M. Pallett, W. Cobb, E. Hill, T. W. Bond, H. J. Chapman, W. H. Young, W. H. White, J. W. Potter, and J. G. Fowler.

At this meeting no groups of Orchids were staged, and but few exhibits were entered to go before the committee.

J. GREENE FOWLER, Esq., Ghebeldans, South Woodford gr., Mr. J. DAVIS, showed *Lælio Cattleya* *elegans*, "Ghebeldans variety," a showy form, with flowers shaped like those of *L. C. × schilleriana*, but having the rose and purple tints of *L. C. × elegans*; *L. C. × elegans* "J. Davis," a large-flowered form, with a dark rose-colored labellum; and a good variety of *L. C. × Nya*.

A. SEED SMITH, Esq., Silvermere, Cobham, showed *Lælio Cattleya* *× Zephyra* (*L. xanthina* *× C. Mendelii*).

DE B. CRAWSHAW, Esq., Rosefield, Sevenknights gr., Mr. STABLES, showed cut spikes of *Miltonia Regnellii crinita*, differing from the type in having citron yellow sepals and petals; and *Miltonia* *× Crawshawana*, supposed to

be a natural hybrid between *M. Regnellii* (Crim.) and *M. Clowesii*, a supposition favoured by its bearing brown bars on the yellow sepals and petals, and a slight contraction of the purple lobe when in the middle, indicative of the influence of *M. Clowesii*.

WALTER COBB, Esq., Bickton, Tisbury, Wilt. gr. Mr. J. HOBBS, showed flowers of two very large *Cypripediums*.

Awards.

Cult. in *Hydrum* *Roburiflorum*, from Mr. THOS. ROCHFORD, Turford Hall Nurseries, Brockhampton, Herts.—A very handsome and remarkable variety, with the general appearance of a fine *Cattleya* variety, with white sepals and petals. Among previous-year awarded varieties of *C. x Hardyana*, it comes nearest to the fine *C. x Hardyana* *Statterman*, which received a First-class Certificate, September 29, 1892, and was figured in *Lindley's*, vol. 1, p. 77; but in Mr. Rochford's variety the golden colouring in the lip is confined to the veins, as in *C. Bowiana aurea*, and the median patches of yellow shown in the variety *Statterman* are not present. Sepals creamy-white, with a very slight flush of rose colour. Petals 2½ inches long, and 2½ wide, white, with a very neat freckling of rose toward the tips. Lip broad and finely ruffled, purplish-crimson, with rich gold veining from the base to the centre. First-class Certificate.

Cult. in *Geranium* *granulosum* *Schofieldianum*, *Barbyana*, from Messrs. CHARLES WORTON & Co., Balton, Bradford, Yorks.—A very distinct hybrid, showing a remarkable form of lobe when the distinctly divided lobes, as in *C. granulosum*, which is characteristic of all hybrids with that species. The sepals and petals cream-white, delicately tinged and veined with rose-lilac. The lip has the side lobes of a pale rose colour, the front lobe is projected on a well-defined isthmus, purple, with a lighter shade between the veining, and a slightly granular surface. Award of Merit.

Sophia-Lola *Andrea* *Laelia* *tendrosa* *Sophia*, *nits* *grandiflora*, from Messrs. CHARLES WORTON & Co., Balton, Bradford.—A richly-colored hybrid, with flowers strongly like those of *L. tendrosa* in shape, though much smaller. Sepals lanceolate, purplish-red, tinged with orange colour; petals ovate, acuminate, and similar in colour to the sepals; lip purplish-red, with purple veining. The blending of the colours gives a glowing appearance to the flower, and renders it very attractive. The plant was a small one, flowering for the first time. When stronger, the flowers will improve in size. Award of Merit.

Epithymum pinnatifidum, from J. T. BENNETT-POE, Esq., Holmwood, Chesham, Berks.—An ornamental plant with cylindrical stems, bearing bright green leaves on the upper part, and a terminal three-branched inflorescence of white fragrant flowers. Botanical Certificate.

Fruit and Vegetable Committee.

Present, J. CHEAL, Esq. (in the Chair); and Messrs. C. HEPP, W. BARR, S. MORTIMER, W. RATES, A. DEER, G. KELCH, E. BECKETT, H. BARKMAN, J. WILLARD, J. BASHAM, J. SMITH, G. NORMAN, F. Q. LANE, W. POUQUET, J. H. VACHEL, E. S. BLAKER, and G. WILKS.

There were numerous subjects for notice. From Mr. J. CHOOK, Froble Abbey Gardens, Chind, came in its of POWELL'S Late Apple, rather overripe (Vote of Thanks). Mr. W. F. COBBETT, Exmouth, sent fruit of his new cooking Apple, Venus Pippin, to which an Award of Merit had previously been given.

Mr. C. ROSS, gr. to Captain CALVERT'S, Newbury, sent Apple Ruby, very red in colour, but now over ripe, also Plum "Crump," medium size, pale red in colour, and a cheshnut.

Messrs. JAS. VENN & SONS, Chelsea, put up fine Fruits of the Jules Guyot Pear, which were of poor flavour; also the very large handsome Crab Miss John Seaton, and Langley Damson, in fine form, heavily fruited. The fruits are of the size of those of Rivers' Prolific, but seem to lack Bourjois flavour.

A boxful of fine Diamond Peaches came from Mr. W. CANN, gr. to Captain FORESTER, Battle Abbey (Vote of Commendation).

Mr. E. D. MANNING, Isle of Wight, sent a good-sized Melon, unnamed. Mr. BISHOPP, Dorset, had very fine samples of Williams' Bon Chretien, Renette d'Anjou, and Souvenir du Congrès Pears. Cultural Commendation.

From Mr. J. QUARTERMAN, gr. to A. SMITH SMITH, Esq., Silverdale, Cullum, came well-ripened fruits of *Passiflora edulis*. Vote of Thanks.

Chipp's Favourite Pear, very fine sample, was sent by Mr. BARR, gr. to Sir THEOBALD LAWRENCE, Burford Lodge, Dorset (Vote of Thanks).

Mr. WIGGILL had from the Royal Horticultural Society's Gardens, Chiswick, a rather small Plum, Redrage, but it had little merit.

From Mr. J. HAWKE, gr. to the Earl of JERSEY, Osterley Park, Middlesex, came fine Dr. Hoeg and Grosse Magnonne Peaches, and Souvenir du Congrès Pears. Cultural Commendation.

Mr. G. NORMAN, gr. to the Marquis of SALISBURY, sent fruits of that somewhat spars-fruited Pear Bourne de l'Assomption. A sample of the same variety from Chiswick, when tasted, showed that it lacked flavour (Vote of Thanks).

Mr. SLADE, gr. to Lord PORTMORE, Exeter, had very fine Lady Sudeley Apples and Renette d'Anjou Pears (Cultural Commendation).

Mr. D. S. MELVILLE, gr. to Lord MALCOM, Dalhousie, N.B., sent branches of a very fine Blackberry (Vote of Thanks).

Four dishes of late Peas, to show usefulness, were sent up by ALDERMAN WALKER, of Huddersfield. These comprised Alderman, Captain Cull, No. 10, Ultra, and Sutton's Late Queen (Vote of Thanks).

COLLECTIONS OF FRUIT.

An unusual one of these came from the Society's gardens, Chiswick, and it included seventy-six dishes of Peas, most of them of good size, clean, and handsome, and twenty-five dishes of Plums. The latter included most of the best varieties in cultivation. The exhibit reflected the highest credit on Mr. G. T. WIGGILL and the Chiswick staff. A Vote of Thanks was the only award that could be made. We were delighted to see this exhibit from the old garden, and hope to see many similar.

Messrs. W. PAUL & SONS had a very interesting exhibit in a collection of some twenty-four fruit trees in pots, all well cropped, and many dishes of Plums and Apples. Among the fruit trees were Morella Cherries, full of fruit; Pears, Apples, and Plums. The Hogg Model was unanimously voted to this collection.

From Mr. E. NEAL, gr. to Mrs. NIX, Fillingham, Essex, came a very large representative collection of fruit, pretty set up, including grapes, pears, chutney, Apples, Apples, Apples, and Muscat of Alexandria, very good, also four Melons, numerous Plums, Apples, and Peas, also Morella Cherries, Red Currants, &c. silver gilt Knighting Medal.

Mr. G. KELLY, gr. to Miss ADAMSON, South Lodge, Regent's Park, had a nice collection of fruit, including good Alicante, Black Hamburg, and Abbot of Alexandria Grapes, several good Melons, Peaches, Pears, &c. all of great excellence. Silver Knighting Medal.

Messrs. J. PAUL & SONS, West, Newport, had a very nice collection, comprising fifty-four dishes of good Apples, Pears, and Plums. Many of the latter were the samples. Silver Knighting Medal.

From Messrs. JAS. VENN & SONS, Chelsea, came a superb lot of Plums and Peas, and with these a collection of out-of-door Tomato plants, all heavily fruited, and comprising no fewer than twenty-eight varieties (Silver Knighting Medal).

A collection of some thirty dishes of vegetables was put up by Mr. WILKES, gr. to Lord GERRARD, Eastwall Park, Ashford, Kent; some of the pots, especially carrots, Parsnips, and Beets, showed the effects of the hard soil in which they had grown. There were some good Excelsior and Ailsa Craig Onions, several varieties of Peas, Runner Beans, fine Cauliflowers, &c. silver Banksian Medal.

The Lecture.

The subject of the lecture on this occasion was the "Cactus Ballia and its Evolution" treated by Mr. HUMPHRIES, of Keynes & Co. The lecture was valuable, but would have been more interesting if the speaker's remarks could have been illustrated by reference to some of the many varieties exhibited in the hall on this occasion. Mr. HUMPHRIES sketched the history and progress of the Cactus Ballias from the first mention of the Bolba (Anjou), as explained by Mr. CANNELL, and named with a descriptive notice in our columns, October 4, 1879, up to the present year. The varieties of each year were specified, and mention made not only of the work of Messrs. Keynes & Co., who have themselves raised 10,000 seedlings, but also of the labours of Messrs. CANNELL, Ware, Turner, West, Cheal, and others.

Mr. HUMPHRIES objected to the term Cactus Ballias; but it is too late now to attempt to make a change, and after all, the name is less objectionable than many popular names.

The form of the bud was alluded to as showing differentiating characters between the varieties. No doubt the Cactus Ballias are all varieties of the

Mexican *D. variabilis*, and they form a delightful break away from the rigid exclusiveness of the old-fashioned florists, who saw no beauty outside their own arbitrary and irrational standard of properties.

ROYAL HORTICULTURAL OF ABERDEEN.

At 10.15 P.M., 23. 24.—The exhibition was held in Robert Gordon's College grounds, situated in the centre of the city on the dates named. The entries this year were some 200 in excess of last year.

PLANTS IN POTS.

For the best table, measuring 8 feet by 4 feet, of store or greenhouse plants, Mr. J. PROCTOR, gr. to Sir WILLIAM HENDERSON, Devalia House, Aberdeen, was 1st. His central plant was a fine *Cocos*, with two fine plants of *Onidium myrtilloides* depending at either side, the other plants being fine specimens of *Isora Wilmsiana*, *Eriogonum grandiflorum*, with twenty flowers-pikes, a fine *Pandanus variegatus*, *Aloe vera*, *metalloides*, *Cyanophyllum magnifolium*, and *Psychotria latifolia*, the last two being among the finest specimens of foliage plants in the show. Dwarf orange-trees in fruit, and other plants set in a bed of Alantium, made a pleasing picture. Mr. A. GIBSON, gr. Fairfield, took 2d prize; his collection was certainly shown off to better advantage than Mr. Proctor's, but the plants of which the collection consisted were hardly of the same class. Nevertheless his exhibit attracted much attention, and proved a worthy 2d.

In the competition for the best table of greenhouse plants Mr. A. GIBSON was 1st. His display of *Begonias*, *Pelargoniums*, and *Campanulas* being excellent.

Mr. JOHN SMITH, gr. to Mr. MURRAY, Glenmuir Park, was 1st for stove or greenhouse plants; while Mr. PROCTOR was 2nd with a fine show of *Pelargoniums*.

Mr. WILLIAM KILGOUR, gr. to Mr. WOLSTON, of Edinburg, won in the competition for the best flowering Orchid, with a handsome specimen of *Disa grandiflora*.

In the class for best foliage plant, Mr. PROCTOR was again 1st. Of the others who occupied well deserved 1st honours were Messrs. A. HOWIE, gr. Drumtochilly Castle; JOHN SIMPSON, gr. Varul Bank, Aberdeen; and JAMES ANDERSON, Aberdeen.

Among the working-class exhibitors in this division, Mr. GEORGE PRINCE, Woodside, gained the silver medal presented by the Lichthene Gaitano Company, with a most interesting entry.

CUT FLOWERS.

In the section for *non-gymn.* Messrs. ADAM & CREAGHEAD, Aberdeen, were 1st for Roses; beating Messrs. D. & W. GIBSON, Dundee. The local firm led in named Tea Roses, and the Dundee firm was a creditable 2d. There was a splendid display of Cactus Ballias, and a grand show of herbaceous perennial plants. In the professional gardeners' classes there were fine displays of Carnations and Pansies, and similar terms may be applied to the show of Sweet Peas. In the amateur and working-man classes generally the display was a most creditable one, some of the entries being worthy to compete in any division. In the gardeners' classes, the leading places were taken for Roses, by Mr. G. McLENNAN, Fettesross Castle, Stonehaven, Mr. W. COCHRAN, Ellon; and Mr. J. ANDERSON, Aberdeen. For Ballias, Mr. J. CHAFFER, DUPRIS; Mr. A. GIBSON, Fairfield; and Mr. W. HIRN, Garscube, and for Gladioli, by Mr. J. GIBSON, Maryhill, Ellon; and Mr. G. McLENNAN. For the best collection, twenty varieties, of cut flowers and bedding plants, including annuals best adapted for flower garden decoration, Mr. A. GIBSON was 1st, with a creditable entry.

FRUIT.

The warm, bright summer has had an excellent effect on fruit—so much so that the seasons now practically over, and the display, though a small one, was a good one. Amongst amateur growers were Messrs. A. HOWIE, Drumtochilly Castle; E. KENNEDY, Broadhill; G. TAYLOR, Invergowrie; A. KING, Bainsford; J. GRANT, Rothiemoran; W. COCHRAN, Ellon; A. BREMER, Dalhousie; W. HARPER, Tullochton; A. GIBSON, Fairfield; and JOHN GIBSON, Maryhill, Ellon.

VEGETABLES.

These formed a most creditable and excellent show, Potatoes being an outstanding feature. For the best display among professional gardeners, Mr. G. McLENNAN, Fettesross Castle, was a worthy 1st. Mr. J. GRANT, Rothiemoran, proving a good 2d.

Mr. ALEXANDER PALFREYSON, Rothiemoran, carried off the chief honours for best box of vegetables exhibited by market gardeners.

MISCELLANEOUS.

There were several tents containing special displays by nurserymen and seedsmen, and their contents were greatly admired by the crowds of visitors. Messrs. BRS. REID & Co. had a fine display of flowers and plants. Messrs. JAMES COCKER & SONS, Aberdeen, had also a fine display of flowering foliage plants, and Roses.

MS. THOMSON CAMPBELL, 18, Riecliff Place, Edinburgh; and the 2nd, for one consisting of Sweet Peas, to Mr. DUNCAN FOX, of Duns.

PLANTS.

There were some very good plants shown, notably the two *Columbus* and other foliage plants by Mr. LUNT Ferns and Lillies were also well shown and the various Begonias were good.

VEGETABLES.

These were extensively and well shown in quite a number of classes devoted to single dishes.

See a Collection of Twelve Sorts, Mr. Wainwright, 25, W. H. Dowie, Esq., Dullar, was 1st, showing very fine Cabbages, Cauliflowers, Leeks, Onions, Carrots, Tomatoes, Cucumbers, and Turnips, as the best dishes. Mr. Bagge, to Major SCOTT, K.R., Sunlaw, Kelso, was 2nd, with a fine collection; and Mr. B. Stewart, gr. to the Earl of LAURENDALE, Thirlestane Castle, was 3rd.

MISCELLANEOUS.

From Mr. JOHN FLEMING, Bawleuch, 2nd series, David, came a grand stand in which were presented one 2nd of 600s. of Carnations, several spikes of named varieties of Hollyhock, with stands of Hollyhock blooms; five Pentstemons, East Lothian stocks, Anemones, etc. and a small group of Begonias, and one Mr. ROWAT of ASSURIE, Glasgow, had a grand stand Pentstemons, and Phloxes. Messrs. LINDSAY & SONS, Bonnyrigg, showed a group of herbaceous plants, with good *Violas* and *Dahlias*, and examples of *Perennials* Prof. LITTLE TOMATO, Messrs. CH. THOMAS & SONS, Leith, had a fine display of Pentstemons in variety, the best of which of French Phloxes were very pleasing. Delphiniums with a nice lot of flowers of herbaceous perennials. Messrs. KEIR BROS., Dumfries, contributed a like group, consisting largely of *Baldias*, Sweet Peas, and herbaceous perennials.

Messrs. DUNSON & Co., Waterloo Place, Edinburgh, contributed a table of *Baldias* flowers, including *Baldias* and *Dahlias*, together with decorative plants.

LAING & MATHIE, Kelso, showed *Perennials*, *Violas*, Carnations, and *Cactus* *Dahlias*.

From Mr. E. K. AND WING, came a table of 1st class of Sweet Peas, including Mr. Wainwright's, also one dark blue-colored variety, also some *Violas*, as Eckford's strain of *Veronica*, now one more becoming popular in flower gardening.

Mr. DOWNS, Murrayfield, Pinkhill, set up a very nice group of hardy herbaceous perennial plants, and also a large ornamental group, oblong in form, with rounded ends, consisting of three groups of central one an architectural structure, composed of cork, and finished with Ferns, Aspidistras, foliage plants, and *Violas*, and two end parties with *Violas*, *Delphiniums*, *Columbus*, *Caladiums*, *Begonias*, *Dracenas*, and others of the usual character made use of for decorative purposes. The group covered about 500 sq. ft.

Messrs. R. B. BAIRD & SONS, Pinkhill, had a group equally large, very artistically arranged, and also covering largely the formation of the central one, a graceful *Delphinium* and *Palafox*, with good named *Columbus*, *Lilium*, *Geraniums* in variety, and *Dahlias*, etc., being amongst the material employed. A structure of glass, crossed by a rustic bridge, cut the composition in twain.

Mr. PHILLIPS, Granton, showed a circular group of *Violarums* and *Gemmas*.

Messrs. D. McHAY & SONS, Leith Walk, had a large wall group of plants, the general effect was very *Lilium*, *Geranium* and *L. lanceifolium* were largely employed, besides *Linum*, and a free admixture of large plants were contained in it, and it was enclosed by an edging of *Caladium*, *Argemone*, and *Hieronymus*, *Geranium*.

Messrs. J. & B. RICHANSON, Kippon, Stirling, showed baskets of *Violas*, glossy *Violas*, *Delphinium*, *Geranium*, Cooper's *Black*, *Grass*, *Morac*, *Black*, *Amey*, *Grass*, *Colman*, and a new variety from the same class as *Dugand* *Julior*, and named *Portia* *Vineya*. They also showed *Tomatoes*.

Messrs. CUNNINGHAM, FRASER & Co., George Bank, Edinburgh, set up a circular table of *Violas*, and another furnished with hardy plants, including some good *Violas*, *Caladium*, *Delphinium*, *Lilium*, *Geranium*, *Tomatoes*, *Grass*, *Amey*, *Grass*, *Colman*, *Forbesii*, and *Neptunia* *depressa*.

Mr. CUMBERSON, Bonnyrigg, contributed a table rather prettily arranged, wholly of hardy plants—*Violas*, *Delphinium*, *Geranium*, *Grass*, *Amey*, *Grass*, *Colman*, *Forbesii*, and *Neptunia* *depressa*. He also showed some good heads of *Viola*, *Cultivar*, *Amey*, *Grass*, *Colman*, *Forbesii*, and *Neptunia* *depressa*.

Messrs. GREEN & SON, Diding, Edinburgh, showed a capital lot of Sweet Peas, *Violas*, and other *Baldias* flowers.

Messrs. COCKER & SONS, Aberdeen, in their usual attractive manner presented a group of very ornamental plants of the best strains, and some of them with *Cactus*, *Dahlias*, and a variety of charming hardy *Violas*.

Messrs. CAMPBELL & SONS, Blairdyre, set up some good specimen *Dahlia* *Idiom*, with *Gladioli*, *Koel*, in great variety.

ENTOMOLOGY.

PLANT LICE.

APHIDES—THEIR NATURE—STRUCTURE—HOONEYDEW—METHODS OF PROPAGATION OF APHIDES—MEANS OF DESTRUCTION.

EVERY lover of plants, whether he grows only a few Pelargoniums in his window, or possesses a garden in which to grow his vegetables, whether he grows plants of all kinds for the market, or is a farmer who cultivates very extensive fields for crops, must often have noticed plant lice upon the leaves, stems, or even on the roots of the plants he is growing. Here these small, soft-bodied insects, with long legs and feelers, are seen in crowds, steadily engaged in pumping the sap through their thread-like beaks. Plant-lice are not the friends of the farmer, gardener, or horticulturist, and to obtain some results from their labour, the latter have in some cases continually to fight the intruders. Dr. Otto Enggler, the Entomologist and Botanist of the University of Minnesota, has recently given a comprehensive and thorough account of these insects, enabling us to understand this family of pests very much better than in the past.

There are a great many species of plant-lice, the largest measuring less than one quarter of an inch, while the great majority are very much smaller. Up to very recent times these insects have not received the attention of the entomologist that they deserve, and the life-history of very many species is still shrouded in mystery, and no wonder, for they have a most peculiar life-history, quite different from that of all other insects.

In shape the body is usually more or less pear-shaped. The winged forms have two pairs of delicate transparent wings, these are furnished with a few simple veins, but the venation is more extended than in some other families. The first pair of wings is larger than the other, and the two wings of each side are usually connected by a compound hooklet. The beak is two-jointed, and varies greatly in length; sometimes it is longer than the body. The compound eyes are prominent, and the ocelli are also usually present. The antennae are from three to seven-jointed. On the dorsal aspect of the sixth abdominal segment there is, in many species, a pair of tubes, through which a sweet transparent fluid is excreted. In some genera these organs are merely perforated tubercles, while in still other genera they are wanting. The fluid which is excreted through the abdominal tubercles is the substance known as honey-dew. It is sometimes produced in such quantities that it forms a glistening coating on the leaves of the branches below the plant-lice, and stone walks beneath shade-trees are often densely spotted with it. This honey-dew is fed upon by bees, wasps, and ants. The bees and wasps take the food where they find it, paying little, if any, attention to its source; but the ants recognise in the plant-lice useful auxiliaries, and often care for them as man cares for his herds of cows. In addition to honey-dew, many aphides excrete a white substance; this may be in the form of a powder, scattered over the surface of the body, or it may be in large flocculent or downy masses—every gradation between these forms exists.

The plant-lice are remarkable for their peculiar mode of development. The various species differ greatly in the details of their transformations; but the following generalisations can be made:—

At some period eggs are produced by impregnated females. This ordinarily occurs in the

autumn, in which case the eggs do not hatch till the following spring. From the fact that these eggs are fertilised, they are frequently referred to as true eggs, in contradistinction to pseudova. These true eggs are also known as winter eggs.

From the winter eggs there hatches in the spring a generation of aphides in which there is no distinction of sex. All are females, and each has the power of reproducing without the intervention of a male. Such reproduction is termed agamic reproduction, or reproduction by budding. And this term is also applied to the individuals that reproduce in this way. Usually, the agamic generation produced by the winter eggs is wingless. The agamic female which hatches from a winter egg, being the starting point from which arises the generations that intervene between this egg and the production of other true eggs, is termed the stem-mother.

The offspring of the stem-mothers are wingless, or winged, or both, and are agamic. In many cases they are born alive. This can be seen by examining almost any colony of plant-lice during the summer time. While an agamic mother is unconcernedly feeding or walking about, it may be giving birth to a young louse; the latter can be seen with the unaided eye, but better with a lens, emerging from the caudal end of its mother, tail first, and kicking vigorously, even before its head has been delivered. In other cases, the agamic form produces egg-like bodies, which are termed pseudova, to distinguish them from the fertilised or true eggs; and, in still other cases, they produce living young, which are enveloped in a pellicle, from which they emerge in the course of a few minutes.

The number of agamic generations that may follow without the intervention of sexual forms varies with different species, and, in some cases at least, varies in the same species, depending upon temperature and other conditions. Thus, Kyber, in the early part of this century, succeeded, by keeping the insects in a warm room, in raising a series of agamic generations of two species of aphides, which extended through four years without the intervention of sexual forms.

As already indicated, the agamic generations are of two forms, wingless and winged. Each of these has a peculiar function in the economy of the species. The wingless generations, which are usually the more numerous, by their great fecundity, provide for the enormous and rapid multiplication of individuals, which is so characteristic of these insects. But this great increase of individuals would be disastrous to the species, by the destruction of the infested plants, and the consequent starving of the insects, were it not supplemented by other powers. We find, therefore, interspersed among these wingless sedentary generations, generations which are winged and migrating. Thus the spread of the species is provided for.

Generally, on the setting in of cold weather, or in some cases on the failure of nourishment, the weather being still warm, there is produced a generation including individuals of both sexes. The males may be either winged or wingless; but, so far as is known, the females that pair with the males are always wingless. These females, after becoming impregnated, produce the winter eggs; this is completed the cycle of changes through which the species passes. In many cases, at least, the individuals of the agamic generation that immediately precedes the sexual one, produce but few pseudova. From these pseudova the sexual individuals emerge, not as larvae, but as

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending Sept. 7, and for the corresponding period of 1900, together with the difference in the quotations. These figures are based on the Official Weekly Return.—

Description.	1900.		1901.		Difference.
	s. d.	q. d.	s. d.	q. d.

Barley	25	8	25	1	-0 7
Oats	17	10	17	6	-0 4

AN INCH OF RAIN: *Young Gardener*.—An inch of rain is equivalent to $4\frac{1}{2}$ gallons per square yard, or 27.151 gallons, or 101 tons per acre.

BIGNONIA RUST: *W. L. and L. S. R.* The mischief is due to a mite. Syringe the leaves with tobacco-water.

BOOKS: *J. H. N. The Forcing Garden*, by Sannel Wood (Crosby Lockwood & Co., Stationers' Hall Court, Ludgate Hill, E.C.) We are not aware of a new edition having been published since the work appeared in 1881. *Villa Gardening*, by Ibbotay. Published by Macmillan & Co., St. Martin's Street, Leicester Square, is a useful general manual.—*W. P. How to lay out a Garden*, by E. Kemp. Published by Bradbury, Agnew & Co., Ltd., 11, Bouverie Street, London, E.C.; *The Art and Craft of Garden Making*, by T. H. Mawson. Published by B. T. Batsford, 91, High Holborn, London; *Art and Practice of Landscape Gardening*, of the author, H. E. Milner, Dulwich Wood, Norwood, London, S.E.; or of Simpkin, Marshall, Hamilton, Kent & Co., Ltd., Stationers' Hall Court, London.

DIANTHEA NIGRA: *H. B.* Only to be got rid of by high mowing to favour the growth of the grasses. As far as possible, cut off the flower-heads to prevent the dispersion of seed.

PHYRSANTHEM RUST: *H. H. M.* Try a solution of potassium bisulphide— $\frac{1}{2}$ oz. to a gallon of water.

COAST SITES FOR ESTABLISHING A MARKET GARDEN: *W. R. L.* Fogs are less prevalent in Sussex and Kent than along the coasts of Hants, Dorset, and Devon; or what amounts to the same thing, the first two enjoy, as a rule, more sunshine the year through, with perhaps the exception of the district about Torquay.

DOUBLE MESHROOMS: *J. A. G.* The accidental union of two individuals when very young. Specimens are frequently sent to us.

BURN DAMAGED FRONDS COILED: *G. F. Scott Elliot*. Scale insects. You might try petroleum emulsion, used with a moderately hard tooth-brush. You may buy this at the florists, or make it yourself, with one quart of warm water, one ounce of soft-soap, and a table-spoonful of petroleum. It must be kept stirred while being used. Ferns once much infested with scale are seldom quite freed from the insects till the fronds have died down or removed, and then the root-stock and coiled-up new fronds are difficult to deal with. Repeated vaporising with XL All would have the best effects on these, it being impossible to remove them with washes and brush.

FOREST SCHOOL: *T. & Son*. Apply to the Indian Engineering College Forestry Department, Coopers Hill, near Staines. The Forest School at Nancy, France, is excellent, and there are numerous German schools.

GALL ON OAK: The cherry-like gall on the leaf is caused by an insect, *Dryophanthe folii*.

GRAPE: *M. J.* Your Grapes are "spotted" with a fungus—*Gleosporium*. Burn the berries.

LILIUM GIGANTUM: *W. Clark*. Immediately on arrival, if it be open weather, plant them in a warm, sunny, well-drained position, in a moderately enriched loamy soil, containing a considerable proportion of road grit or coarse sand. Put the bulbs into the soil, which should be made firm beneath and around them, with the tops of the bulbs 5 to 6 inches under the general level, and not less than 3 feet apart. Having done this and made the soil level, afford a mulch of spent dung or leaf-mould, and if you have hand-glasses or cloches, put one over each bulb, keeping it on in wet, snowy, and frosty weather, but removing it early in the spring. This is one of those Lilies that is benefited by having planted thinly around it some shrubs or summer-flowering plants, growing to a height of 2 feet or a little more, which will afford shade to the soil and to the stems of the Lilies. If the bulbs arrive during a term of hard frost, plant them in smallish pots, keeping a cold pit free from frost (plunged in tree leaves, litter, or coal-ashes), afford little or no water, and plant in the open in March, or earlier, according to the weather, without breaking up the balls.

MALFORMATION OF ROOTS OF CHELIDONIUM MAHRS VAR.: *B. & S.* The dense growth of adventitious masses of roots is caused by irritation of the roots, set up by ants. *G. M.*

MELONS OUT-OF-DOORS: *F. Dent*. Taking the seasons generally, the summer heat is not great enough in this country to ripen off the fruit, and then there is always the risk of heavy rain causing the fruit to crack, and become worthless. Our varieties of Melons, which grown out-of-doors in Southern Europe, suffer in this manner from rain.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Wills*. 1. *Quercus rubra*, so far as we can tell from the leaf only; 2. gall on Oak, the work of a Cynipis; 3. *Quercus*, not known; 4. *Juniperus virginiana*; 5. *Juniperus virginiana*, var. *Schottii*; 6. *Saponaria officinalis*.—*C. R. P.* 1. *Colicium* (Croton) trilobum; 2. *Colicium* irregulare; 3. *Selaginella rubricaulis*; 4. *Celsia erectica*; 5. *Odontoglossum Coradii*; 6. *Odontoglossum odoratum*.—*H. C.* 1. *Anthericum lineare variegatum*; 2. *Anthericum lineare marginatum*; 3. *Reineckia carnea variegata*; 4. *Bambusa Fortunei variegata*; 5. *Draena ornata*; 6. *Erigeron bellidifolium*.—*W. D. 1.* *Acalypha mucronata*; 2. *Selaginella denticulata*; 3. *Hieracium aurantiacum*; 4. *Tecoma jasminoides*; 5. *Polystichum aculeatum*; 6. *Davallia elegans*.—*Baerum*. 1. *Lysimachia nummularia*; 2. *Oxalis Bowei*; 3. *Erigeron bellidifolium*; 4. *Sedum telephium*; 5. *Spiraea callosa*; 6. *Hibiscus syriacus*, the so-called *Athaea frutex*.—*G. C.* 1. *Eurya latifolia*; 2. *Thuja gigantea aureo-variegata*; 3. *Thuja occidentalis*; 4. *Cupressus Lawsoniana*; 5. *Thuja occidentalis aurea*; 6. *Thuja orientalis* var. *J. K.* 1. *Clematis tubulosa*; 2. *Ceratogon coccinea*; 3. probably *Pinus excelsa*; 4. *Quercus rubra*; 5. *Acer erio-carpum*; 6. *Picea Maritima*.—*J. H.* *Alnus glutinosa* var. *laciniata*.—*W. J. R.* *Clematis tubulosa*.—*J. J.* One of the many forms of *Lilium auratum* near *rubro-vittatum*.

NOTICE TO LEAVE SERVICE: *H. S.* A month's notice under ordinary circumstances in the case of employer and gardener.

OAK-GALLS: *J. C. G.* Oak-spangles, the work of an insect, *Nouroterus lenticularis*.

PLANTS FOR A SMALL GLASS-COVERED YARD HEATED WITH AN OIL STOVE IN HARD WEATHER: *Subscriber*. You could safely grow *Camellias*, hardy hybrid *Rhododendrons*, *Pittosporums*, New Zealand shrubby *Veronicas*, New Zealand Flax, *Myrtles*, *Eugenias*, Himalayan *Rhododendrons*, *Bignonia radicans*, *Loniceras*, common Garden flower, *Fuelias*, *Magnolia fuscata*, *Aralia papyrifera*, and *A. Sieboldii*. Ferns, such as *Adiantum capillus veneris*, *Osmunda regalis*, *Woodwardia radicans*, *Woodsia alpina*, *W. ilvensis*, *Trichomanes radicans*, *Scelopendrium vulgare* in great variety, *Pteris aquilina* common Bracken, very beautiful when grown under glass protection; *Polystichum angulare*, many forms of this; *Polypodium Dryopteris*, *P. phegopteris*, and numerous forms of *P. vulgare*. *Laetrea filix Mas* (male Fern), and its many forms; *Cystopteris* in variety, *Athyriums*, such as the many forms of *A. filix-femina* (the Lady Fern). The above named Ferns are mostly British, and quite hardy, or capable of enduring green-house treatment. *Cyrtium falcatum* (Holly-Fern) should not be omitted.

POTATO MALFORMATION: *Dicksons and W. J.* See reply to H. Turner in our issue for September 7.

RED-SPIDER ON VIOLET PLANTS: *A. T. B.* There is nothing better than to thoroughly wet the plants with a syringe having a rectangular nozzle, holding it close to the ground so as to reach the undersides of the leaves. It should be done night and morning for a week, and then only once a day, morning or evening, accordingly as the weather is wet or dry. Red-spider cannot endure a continued state of moisture, and they will leave the Violets for more congenial quarters. On naturally dry soils, this is the only way in which violets can be kept healthy.

* * * In spite of an extra number of pages in this week's issue, we are compelled, much against our will, to omit many communications and illustrations for which space cannot be found.

GARDENING APPOINTMENTS.

M. E. PIERCE, for the last three years Gardener at May Place, Newcastle, Staffordshire, as Gardener to Mrs. LAYTON, Melford Hall, Stafford.
M. E. PIERCE, for the last two years Gardener at The Tower, South Gledstone, Surrey, and previously for over twenty years Gardener at Watersfield Towers, Pillingborough, Sussex, as Gardener to Mrs. J. H. LARCHE, Bartlett House, Salisbury.
Mr. A. W. COATES, for the past three and half years Foreman in the gardens at Denton Manor, Grantham, as Gardener to H. SPAFFORD, OBFERS, Esq., Rathmore Park, Walsley, Northamptonshire.
Mr. I. JEFFREY, for the last four years Gardener at Grove Hall, Knottingley, as Manager for J. T. BECKTON, Esq., Fairfax Nursery, Cemetery Road, Brentford Hill, Wiltshire.
WILLIAM DINGWALL, for the last four years Head Gardener at King's Oak, High Beech, Loughton, Essex, as Head Gardener to EDWARD SHACKAY, Esq., Audley, Newmarket, entering on his duties Sept. 24.
Mr. E. BELLS, for ten years Foreman in the Gardens, Caldecote Hall, Nuneaton, Warwickshire, as Head Gardener to E. H. ATHERLEY, Esq., Rodwell Hall, Trowbridge, Wilts.
Mr. HENRY SHARMAN, of Purley Hall Gardens, Pangbourne, and formerly at Broomfield Hall, Sunningdale, as Head Gardener to ALFRED C. HAINSWORTH, Esq., Edinwood, St. Peter's, Kent, entering upon his duties, September 23.
Mr. W. WARD, for the past two years Gardener at Norfolk House, Brandon, as Gardener to H. FRANKS, Esq., Chesild, Hampton Wick, Middlesex. [The postal order sent with announcement of your appointment has been paid to the Gardeners' Royal Orphan Fund.]
Mr. F. CLARKE, for the past thirteen years at Teddesley Park, Penkridge, Stafford, as Head Gardener to Lord BAILEMAN, Shobdon Court, Shobdon, Herefordshire.

FRUIT AND VEGETABLE DRYING.

A NEW GLOUCESTERSHIRE INDUSTRY.

MR. JAMES HARPER, a well-known cider merchant, of Ebley, Stroud, Gloucestershire, who, a few years ago, delivered a series of lectures on cider-making, under the auspices of the Gloucestershire County Council, has for the last three or four years been devoting considerable time and attention to the question of the drying of fruit and vegetables, and this year he is making extended experiments with Plums, later on in the season with Apples, and later still with vegetables. Amongst other varieties, he has successfully dried "Black Diamonds," "Victorias," "Green Gages," "King of the Gages," "Orleans," and Damsons. After carefully testing the different dryers, Mr. Harper considers that the "Invicta Ryder Dryer," as sold by Messrs. L. Lumley & Co., the Mimories, London, is the best for the purpose. The machine in question is known as the No. 3 (a) type, and the cost is about £50. This machine dries from 15 cwt. to a ton of Plums per day, and from a ton to 23 cwt. of Apples in the same time. Small machines, capable of drying 45 lb. weight of fruit a day can, however, be purchased of Messrs. Lumley & Co. at as low a figure as

35s., and the work turned out by these small machines is, in Mr. Harper's opinion, quite equal, if not superior, to that of the larger apparatus.

In the course of an interview, Mr. Harper said that in France it was the custom for the small grower to dry his own fruit. Ovens are used there, but his own experience told him that dryers were preferable, because while the oven not only dried the moisture, it dissipated some of the flavour, the dryer dried equally well, but concentrated the flavour. The French grower took his Plums into the market in a dry condition, and the purchasers who were the "finishers," bought from him during the months of October, November, and December. That is the system he would like to see adopted here. At the present time Mr. Harper does the whole of the drying process himself, but owing to the difficulty when buying in a fruit market of getting the fruit in a suitable condition of ripeness and properly assorted, he should much prefer to do the work of the "finisher" only. In America, said Mr. Harper, Plum and Prune-growing for drying is enormously on the increase, and so also is it in France. In these countries, when there is a great glut of fruit, there is universal jubilation amongst the fruit-growers. On the other hand, in England, when there is a great glut of fruit on the trees, there is something approaching universal despair—that is, from the point of view of the grower

as the prices are so low. Having, however, proved the absolute possibilities of the drying process, there is no reason at all why this state of things in England should not be altered. His hope and belief is that growers of perishable products, such as fruit and vegetables, would be able, by adopting the plan he suggests, to profitably increase their production, instead of having, as at the present time, to deplore bad markets and poor prices whenever there is a greatly increased yield of fruit or vegetables.

Coming to the financial aspect of the question, Mr. Harper said that English Plums lost from two-thirds to three-fourths of their original weight in the drying process. Put it at the extreme figure, three-fourths, and that would mean that the initial price of the fruit had to be multiplied by four. The price at which he had recently bought the finest "Victorias" he had ever seen in the Gloucester fruit market averaged under 1s. per pot of 8 lb., which is equivalent to 5s. 6d. per cwt. That would mean that the fruit when dried would cost about 22d. per lb., or 22s. per cwt. Putting the cost of drying at a penny per pound on the dry product, which was excessive, he claimed that the fruit would be worth to the "finisher" at least double. Dried fruit not one bit better than that which he had alluded to, and of foreign growth, was to his knowledge sold at a leading shop in Birmingham at 1s. per lb. All fruit which he had come across grown in England, when dried was equal to, and in many cases superior to, that which was grown abroad.

Dried fruit will keep for any reasonable length of time, and he had tasted Plums that were grown eight years before, and had been dried in England with excellent results. Not long ago he partook of an Appert made of fruit which was staged at the Windsor Show and dried in this country in 1887.

Mr. Harper has not confined his attention to fruit, but has successfully dried Potatoes, Parsnips, Carrots, French Beans, Peas, and Turnips, by the aid of the same apparatus. "When it is considered that the importations of dried vegetables are enormously on the increase, and that His Majesty's Government are buying all the dried vegetables for the troops in South Africa—amounting to many tons per day—entirely from Germany, because there is a lack of sufficient enterprise to do the same thing in England, the vast importance of the subject will be manifest to every thoughtful person." Wherever it is not possible for the system to be carried out by individual effort, Mr. Harper advocates that the work should be done on co-operative principles.

THE FOOD OF SOME BIRDS INHABITING AN ORCHARD.

(Continued from p. 197.)

MARSH TITMOUSE (*Parus palustris*).—Curiously enough, this was the commonest member of the Paridae observed. I only saw the commoner blue and great tit once or twice during a week's close observation. My first acquaintance with *P. palustris* was at the commencement of my observations, when I accidentally came across a little fellow clinging to a ripe old Thistle head, from which I presumed it was taking plant-lice, or some other insect. To my surprise, however, I could find no trace of insects of any kind upon the plant. Subsequently I frequently saw them frequenting the heads of the Marsh Thistle, and with my glasses could distinctly see them extracting the seeds after the same manner as the goldfinch. The only individual examined was found to contain a quantity of the seed, besides fragments of plant-bags, ichneumonids, and beetles. Members of the tit family are almost omnivorous, but I was not aware before that they would eat the seeds of Thistles, although I had recently seen them feeding upon the partly ripened fruit of the sunflower.

NUTHATCH (*Sitta caesia*, Mey.). This species was common, but generally occurred singly, and although the summer was far advanced, the breeding song was often repeated. The bird examined had been feeding upon earwigs, small beetles, and a plant-louse; all, with the exception of the earwig, were in too fragmentary a condition for identification.

GREEN WOODPECKER (*Picus viridis*). This useful species was wisely protected throughout the year. Every few hours one of these birds would pay the orchard a visit, but rarely stayed for more than a few minutes. Almost all kinds of wood-boring beetles and their larvae, or apparently any insect which frequents the bark of trees, are devoured by these birds; but they subsist very largely upon ants, of which they devour great quantities. Referring to some of my earlier *post-mortem* examinations of this species, I find that one individual taken in August contained twenty-three earwigs, and a large quantity of ants. This record will therefore serve as an illustration of what the birds are likely to obtain in an orchard at this period of the year.

GOLDENCH *(Carduelis elegans, Sc.)*. This delightful little songster was also protected in the same area throughout the year. During the Thistle season they seem to subsist

entirely upon the seeds of these plants. One of the most beautiful sights I ever witnessed was about 5 o'clock one morning, when I accidentally came across a small flock of these birds feeding below me on a huge bed of giant Thistles. Occasionally one would utter its familiar twitter; but they were unusually quiet, and when the birds flew from one Thistle head to another, the silent flight, and the brilliant yellow band formed by the primaries, reminded me more of huge hawk-moths than birds. I have never seen the species so abundant elsewhere. They constantly visited the orchard, and were altogether as common as the house-sparrows in the same district.

BULLFINCH (*Pyrrhula europæa*, V.).—This bird is much less common than the goldfinch, and confines itself more to the rough hedges. An immature bird, which was found dead, contained a quantity of the seeds of the common Elder, and also a few of the Blackberry, which conclusion proves they had been feeding upon the fruits of these plants.

BUTTER-BIRD OR SHRIKE (*Lanius collaris*, Lin.).—It gives one pleasure to be able to say that this interesting bird was quite common—two families frequented the orchard and surrounding fields. They were also freely met with in other parts of the district, but they confined themselves chiefly to the tall rough hedgerows, where they could be constantly seen feeding their fully-fledged young. Strange to say, I searched in vain for their "larders," although I have frequently found them in districts in North Wales, where they are comparatively rare. Humble-bees enter very largely into their dietary, and they are also fond of the larger species of beetles.²⁶ The remains of the insects supplied to the young birds may be found at the bottom of their nest.

ROOK (*Corvus frugilegus*, Lin.).—A small party of these birds came very early in the morning, but cleared off so soon as the workmen came about. They were searching chiefly among the comparatively fresh dung for beetles, upon which they very largely subsist at this period of the year. One morning, at 4.55, I saw several of these birds suspiciously engaged among the branches of an early Pear-tree. I got a long shot at one of them, which I found on dissecting had filled himself with the fruit and with one large dung-beetle.²⁷ On examining the tree, I also found some fruit had been broken from the tree, and showed unmistakable evidence that the whole party had been feeding upon them. Subsequently I was informed that in the previous year almost the entire crop had been taken by these birds and carrion crows. As a warning, I tied the unfortunate victim to a branch of the Pear-tree, which, I am glad to say, entirely put a stop to their depredations.

LONG-EARED-OWL (*Asio otus*, Lin.).—A pair of these birds had taken up their abode in a deserted carrion crow's nest, and, judging from its condition, they had either reared a brood there, or frequented it as a resting place. Under the nest I got a number of "pellets," and I also found others under the adjacent Pear-trees. The birds were remarkably shy during the day-time, and invariably flew from tree to tree on near approach. One sunny morning, about 6.30, one of them

flew quite away from the orchard, and across several fields, until out of sight—a rather unusual habit for this species. The "pellets" referred to consist of the undigested portions of the food—bones, fur, feathers, &c., and they give an exact record of what the birds feed upon. The examples I found contained the remains of the following:—mole, common shrew, long-tailed field-mouse, blackbird (one), but quite 25 per cent. consisted of the remains of large dung beetles;²⁸ some pellets being entirely made up of them and grass. I should add that the species of beetle referred to was exceedingly common. I dug as many as fourteen examples from under one heap of dung, and in the evening one could hear them buzzing about all over the place.

I have nothing further to add, and must ask the reader to judge of the merits or demerits of the species dealt with; but I trust that the few records which I have been able to make will give us a better understanding as to the exact nature of the food of birds found inhabiting an orchard in August, and show us what an important, though subtle, part they play in reducing the number of insects which feed upon the products of the orchard or farm. Necessarily the food would vary according to the season, and soft-bodied caterpillars would enter very largely into the dietary of nestling birds. R. V.

NEW OR NOTEWORTHY PLANTS.

We have received from Mr. Henkel, of Darmstadt, specimens of the following plants, many of which are new to our gardens. We append short descriptions of the specimens, but we take the names as Mr. Henkel gives them to us, as, although we have been able to verify the nomenclature in some, we have been unable to do so in other cases.

DELPHINIUM SCOPULORI, Gray.*

A tall-growing species, slightly puberulous, with the usual very deeply cut orbicular leaves, and spikes of moderately sized, intensely blue, glabrous flowers, with a spur double the length of the sepals. The plant has a very ornamental character.

It is a native of the Rocky Mountains from New Mexico to British America.

GERANIUM INCISUM, †

A tall-growing, loosely-branched perennial, from North-west America, with the stems covered with viscid glandular pubescence, as if to prevent access of undesirable insects. Leaf-stalks of cauline leaves, $\frac{3}{4}$ inch (5 mill). Cauline leaves 1½ in. (4 cent.), roundish, deeply 3-5-lobed, central lobe longest, oblong, ending in three short lobules. Peduncles spreading, 2½ in. (6-7 cent.), long, dividing into two pedicels about 1½ in. (4 cent.). Flowers 4 inch (15 mill) across. Sepals herbaceous, oblong obtuse, apiculate, covered with glandular hairs. Petals purple, obovate, entire, thinly beset with long white hairs. Styles and ovary thickly covered with glandular hairs.

CASTILLEJA INTEGRÆ, †

A perennial species from New Mexico, with thin pubescent, loosely branched stems; cauline leaves 3 inches long (7½ cent.), sessile, linear three-nerved, villosulous, especially on the under surface. Flowers in dense terminal spikes, each subtended by a boat-shaped, orange-scarlet, three-nerved bract, 1 inch long (nearly 3 cent.); calyx tubular beneath, dividing above the middle into four lanceolate, one-nerved segments, at first green, but which ultimately become scarlet. Corolla tubular below, tube narrow, curved, limb

* *Geotropes stereocariis* and spinger.

† See Gray, *Plant. Wright*, ii. 9, ex Coulter, *Manual of the Botany of the Rocky Mountain Region*, 1855, p. 11; Brewer & Watson, *Botany of California*, 1850, p. 11.

† *Geranium incisum*, Nuttall, ex Torrey and Gray, *Fl.*, i. 206; Brewer & S. Watson in *Botany of California*, i. 180, p. 91.

† *Castilleja integræ*.—A Gray in Torrey, *Mexicana Botany*.

hooded, two-lobed, upper lobe erect, narrow, compressed, partly green, partly orange, lower lobe abortive, of three small green lobes. Stamens five from the middle of the tube of the corolla; filaments equal, glabrous; anthers linear; ovary ovoid, conic, short glabrous, terminating in a long, thread-like, white style.

The plant is as remarkable in structure as it is attractive in appearance, the orange-scarlet bracts rendering it very conspicuous. It is a nearly of our common Eyebright. All the flowers we examined had five equal stamens, instead of four didynamous ones, as is customary in the genus, but whether this is a constant peculiarity we do not know. Many of these plants are partially parasitic on the roots of other plants, for which reason they are likely to be difficult to cultivate.

PELISTEMON VIRGATUS.

A herb, with straight descending somewhat fleshy roots. Basal leaves tufted, 4 to 5 inches (to 13 cent.) long, narrow, linear acute, tapering to a broad base entire, somewhat conduplicate, greyish-green, covered with very minute whitish scales. Stem, 20 to 22 inches (52 to 56 cent.), erect, terete, green upper leaves, 1½ inch (4 cent.), sessile, linear acute. Flowers loosely arranged in long, loose, erect racemose cymes; lower pedicels as long as the leaves, upper ones longer. Calyx cup-shaped, of five green ovate lanceolate sepals, 5 mill long, with white membranous edges. Corolla ½ inch long (2 cent.), pale lilac, irregularly funnel-shaped, with a two-lobed limb, upper lobe with two, lower with three, rounded lobes. Stamens included glabrous filaments, provided at the apex with a knob-like process, anthers deflexed, purplish; style filiform, white, ovary glabrous.

Presumably this is the *P. virgatus* of A. Gray, in Torrey's *Botany of the Mexican Border*, but we have not verified it.

PELISTEMON SPICATABILIS,*

A tall-growing species, with glaucous, fleshy, ovate-oblong dentate leaves, about 3 ins. (7-8 cent.) long, rounded near the base, and tapering abruptly into a leaf-stalk about 3 cent. long. The uppermost leaves are comate at the base, forming a cup around the stem. Flowers in loose racemose cymes; pedicels slender, 1 cent. long; calyx shorter than the pedicel, of five long, tubular, tube narrow beneath, obliquely distended above, limb two-lobed, upper lobe with two, lower with three, obtuse subdivisions; sterile stamen, with a tuft of hair at the base.

This is one of the handsomest species, and has long been known in our gardens, having been figured in the *Botanical Magazine*, tab. 5286. It is a native of California and Arizona.

ASTER CARINOSUS, Hort. Henkel (not of Gray).

A straggling, loosely branched plant with slender glabrous branches; cauline leaves, 3 inches (7 to 8 cent.), linear entire, sessile, glabrous, upper leaves much smaller; flower-heads about 2 cent. across, with a many-rayed involucre of linear bracts recurved at the tips; rays violet, disc orange.

This is a pretty species, but the name given to it requires confirmation, as the characters do not agree with those of the *Aster carinosus* of Asa Gray, *Synoptical Flora of North America*, 1854, vol. 1, part 2, p. 202.

ASTER MULTIFLORUS, Gray.†

A much-branched species, with ascending, wiry, glabrous branches; cauline leaves, 2½ inches (6 cent.), sessile, linear, rough; upper leaves much smaller; flower-heads solitary at the end of the branches, 1 cent. deep, involucre of many rows of linear oblong apiculate bracts, recurved at the tips, rays flowers whitish.

A species widely distributed throughout the north-east and north-west United States, extending south as far as Texas and Arizona, and varying much in consequence.

ERIGERON NEO-MEXICANUS, †

A perennial (or sparingly biennial) with coarse hairs, remotely branched, with spreading wiry branches. Cauline leaves 2 to 3 inches (5 to 6 cent.) long, nearly glabrous, oblong, pinnately lobed; lobes remote, linear obtuse, terminal lobe largest; upper leaves gradually diminishing in size. Flower-heads loosely panicle, 2 cent. across. Involucre of many rows of linear, acuminate incurved hairy bracts, increasing in size from without inwards. Ray florets linear white recurved; disc florets tubular yellow; pappus faintly pubescent, receptacle flat. The plant is a native of hill-sides in New Mexico and Arizona.

POLYGONUM AMPLEXICAULE ALBUM.

This is sufficiently indicated by its name. The very long tubular "ocreate" stipules are very remarkable, and the long dense spikes of white flowers are not devoid of attractiveness. It is a native of Nipal.

BRUGES.

We are enabled this week to lay before our readers an illustration (fig. 64) of the recent show at Bruges, for report of which see p. 192 in our issue for Sept. 7. The central square of the delightful old town was on this occasion transformed into a garden of delight. The old Belfry has looked down on many a stirring sight, but never on a more pictorial one. We gave a report of the show in a former issue, and now give a view in the market square in the hope that the example so spiritedly set may be widely followed. Of course, the tender plants were exhibited under cover.

being the name of the white Grape staged. The Peaches consisted of Crimson Galande, the largest tree of which was about ten years old, growing in a pot 18 inches in diameter, 10 feet high, and carrying about five dozen large, highly coloured fruits; the foliage being large for trees of the size indicated, and restricted at the roots to the limits of an 18-inch pot, and perfectly clean. Dagmar, General Lee (an American variety), about 8 feet high, and carrying a good crop of large fruit, fine in size and colour. The same remark applies to the several fine specimens of the Dagmar and Champion Peach, the trees

unmistakable evidence of high cultural skill having been bestowed upon them during the whole period of their growth, from the annual autumnal potting up to the date of the trees being exhibited. This exhibit, notwithstanding the fact that the Messrs. Rivers may have had hundreds of pot trees of the kinds indicated to select from, was the finest of the kind hitherto seen by the writer. The Peach and Nectarine-trees, too, presented a graceful and natural appearance, owing to the fact of the young bearing shoots of the previous year's growths having been only shortened back a little; in the process of pruning the

FIG. 61.—HORTICULTURAL EXHIBITION IN THE MARKET SQUARE, BRUGES.

FRUIT-TREES IN POTS.

ONE of the features observed at the recent Shrewsbury Show was Messrs. Rivers & Son's exhibition of fruit-trees in pots, an exhibit which justly enough commanded a great deal of attention, and excited the admiration alike of the numerous expert fruit-growers present at the show, as well as of the general public appearing thereat in their thousands—some 70,000 to 80,000 people on both days of the show. The exhibit in question consisted of Peaches, Nectarines, Pears, Plums, Cherries, Apples, and Grape-vines, black and white varieties. The Vines were two-year-old canes, trained round and over a flat trellis about 4 feet high from the pot, these being wide and round on the top, and narrowing down to the diameter (12 inches) of the individual pots. Each Vine of which there were several specimens of each kind had about a dozen good even-sized bunches as a crop, "Gradiska"

from 6 to 8 feet in height being in pots ranging from 12 to 15 inches in diameter. They were pyramidal in shape, the top 2 or 2½ feet of growth constituting the pyramidal forms consisting of the current year's make. The Nectarines consisted of Dryden, bearing a good crop of large, well-coloured fruit; and Rivers' Orange, also carrying a good crop of high quality fruit. The white Bigarreau Cherry was well represented. Pears Louise Bonne of Jersey, in 10-inch pots, had twelve large fruits each, which for small trees was a good crop; Dr. Jules Guyot bore a like number of large, long, green fruit of the Pitnaston Duchess type; Conference was also in evidence. Plums Swan, round, red, large fruit of the Sultan form; and Belle de Louvain, fruit very large and good. A small tree of Peasgood's Nonsuch Apple had several fruits of immense size on it, these being fine in form and handsome in appearance.

One and all of the trees in this exhibit bore

superfluous growths having been cut clean away, and in some cases spurred hard back. Thus treated, the trees are not only more graceful in outline, but produce larger and finer all-round fruits, and remain in a more vigorous, healthy, and fruitful condition much longer than trees which have been spurred in like an Apple or Pear at pruning time.

That such trees had copious and frequent applications of liquid-manure at the roots, in addition to frequent and judicious top-dressings with some approved fertiliser, before applying clear water at the roots during the whole period of active growth, but especially during the time they were swelling their fruits, goes without saying. Could the trees but have been endowed with speech, they would doubtless have told the admiring thousands of people, whose mouths their luscious, tempting-looking fruit made water at Shrewsbury, of the generous and skilled attention which had been bestowed upon them almost hourly during

the last six months, between the hours of sunrise and sunset, in the orchard-house at Sawbridgeworth, the birthplace of so many grand varieties of the Peach, Nectarine, Plum, &c.; including, of course, their thorough washings overhead with clean water every morning and afternoon, and the abundance of fresh air which they receive between their "washings." *H. W. Ward, August 26, 1901.*

ORCHID NOTES AND GLEANINGS.

CATASETUM FIMBRIATUM.

SEVERAL good specimens of this singular and rather showy species are in bloom with *J. Forster Alcock, Esq.*, Northchurch, Berkhamsted, who intends to cross it with *C. Bungeoethi*, which is also flowering with him. The flowers of *C. fimbriatum* are pale green, with purple spotting on the sepals, petals, and side lobes of the lip. The base of the fleshy labellum is prolonged into a conical sac, the side lobes extended, wing-like, and fringed, the front of the lip being also furnished with a short fringe. The flowers are delicately fragrant.

Mr. Alcock finds the *Catasetums* thrive very satisfactorily when grown in baskets suspended from the roof of the Orchid-house. They require drying off and resting in a cool, airy house when the growths are matured and the leaves commence to turn yellow.

LELIO-CATTLEYA × ELEGANS VARIETES.

The varieties of *Laelio-Cattleya* × *elegans* of the *Turneri* section have been very fine this season in the collection of *Henry Little, Esq.*, Baronshalt, Twickenham (gr., *Mr. Howard*), where there are a number of fine forms of this showy natural hybrid, which have been in flower for the last two months. At present in bloom are two remarkable forms, giving the extremes of variation, both in form and colour. The one is of the shape of the typical *L.-C. × elegans Turneri*, with narrowish segments, and a decided division of the side and front lobes of the lip. This form is almost entirely of a dark purple colour, the sepals having a greenish cast over the purple tint. The other is in form more like *L.-C. × Schilleriana*, with a more ample labellum, not showing the cleft between the front and side lobes. The sepals and petals are light rose, the front of the lip carmine-crimson.

Two plants of the pretty *L.-C. Sallieri*, and a fine example of *L.-C. × velutino-elegans* are also in flower.

ÆRANTHES GRANDIFLORIS.

What are known as botanical Orchids often find their way into collections avowedly devoted to showy Orchids only; and when, after being well grown, they flower, they often command more attention than the showier and commoner subjects. An instance of this kind appears in the gardens of *Ludwig Mond, Esq.*, The Poplars, Avenue Road, Regent's Park (gr., *Mr. J. O. Clarke*), where several plants of *Æranthès grandifloris*, imported from Madagascar, are suspended above the *Cattleyas*, &c., on the stage of the house. For several months the plants have been giving their singular ivory-white, fragrant flowers, with inflated green spurs, borne on slender, drooping flower-spikes from 1 to 2 ft. in length. The flowers, which are borne in succession one or two at a time on each spike, are about 2 inches across, and wax-like in texture. In some stages they have a greenish tint, and when passing off they are yellowish. The effect of their flowers on stalks almost invisible at a distance is very curious.

LELIO-CATTLEYA AURORA.

A flower of a very finely coloured variety of this hybrid between *Cattleya Loddigesii* and *Laelia Dayana* is sent by *Mr. Stafford, gr.* to *Fred Hardy, Esq.*, Tyntesfield, Ashton-on-Mersey, who ascribes its fine quality to the fact that both its parents were selected for their fine colour. The flower, which is nearly 4 inches across, has sepals and petals of a bright purplish-rose colour. The lip, which has the front lobe elongated and crimped, is whitish at the base, with some raised dark red lines suggestive of *Laelia Dayana*, and a yellow blotch in the centre. The front lobe and edges of the side lobes are dark reddish-purple. It is a showy dwarf hybrid, and superior to the continental form of the same parentage called *L.-C. × Blesensis*.

SILVER-LEAF IN PEACHES.

THIS disease of the foliage in species of *Prunus* has been a puzzle and a mystery for nearly a quarter of a century, and is still almost as mysterious as ever. The leaves retain their normal form, and are neither spotted nor blistered, but are deprived of a large portion of their chlorophyll, assuming a silvery appearance, and the whole tree becomes of a sickly habit, and unproductive. No spots or pustules are detected on the leaves, and no fungus mycelium in the tissues, and yet the disease appears to be communicable.

The only solution which appears to me to be feasible is, that the present disease is closely allied to the "Peach-yellows" of the United States, and possibly a modification of that disease, and should be studied in connection with the literature of that pest. The latest developments seem to indicate that the primary cause is bacteriosis, which demands close and patient investigation. In that case, if proven to be true, the remedy will be almost as far off as ever, since fungicides cannot be effectually applied to such a deep-seated malady. *Edwin F. Smith*, of the U.S. Department of Agriculture, says that "at present Peach-yellows seems nearest allied to that phenomenon in plants known as variegation. It is now recognised that variegation (pachenchure) in many plants is a disease manifesting itself in stunted growth, imperfect assimilation, hastened development, and feeble vitality." In a note it is added that "there is also, as in yellows, an abnormal ratio of the ash constituents, both potash and phosphoric acid being in excess, and lime deficient."

There have been several suggestions, and even assertions, that "Peach-yellows" is caused mainly by bacteriosis, and this feeling seems to have grown stronger in later years, although in 1894 *Mr. Edwin Smith* was of opinion that "it is almost certainly not a bacterial disease." If later writers are correct in assuming that the disease is bacterial, there is almost equal presumption that "silver-leaf" belongs to the same category.

What has been said of "Peach-yellows" is true also of "silver-leaf." "With our present knowledge, the cure of Peach-yellows appears to be impossible." All the preventive measures resolve themselves into extirpation, and can be summed up in two lines: "The only thing which can be done is to cut out and destroy all trees as soon as any of the signs have made their appearance. It is best to burn the diseased trees, roots and all, if possible."

Both in Pennsylvania and Connecticut, laws are in force "to prevent the spread of the

disease in Peach-trees known as the yellows," whereby it is enacted that "it is unlawful for anyone to knowingly or wilfully keep any Peach, Almond, Apricot, or Nectarine-tree infected with the contagious disease known as the yellows," &c.

This, then, is the only remedy which the American Boards of Agriculture have been able to adopt for Peach-yellows, and we fear that it is equally applicable to "silver-leaf." *M. C. C.*

THE ROSARY.

AUTUMNAL ROSES.

THERE are many admirable varieties of the Rose, even among so-called Hybrid Perpetuals, which though they bloom profusely during the summer, seem incapable of achieving anything in the floral direction during the autumnal months. It is possible that many of these flower so luxuriantly in June and July as to exhaust their strength; but this cannot expressively be said of such Hybrid Perpetuals as *Duke of Edinburgh* and *Horace Vernet*, which however impressive by reason of their almost matchless beauty, do not give us more of it even in summer than we could desire to receive. As a general rule, however (with the exception of the Austrian, Persian, and Penzance Briar Roses, and such varieties as *Crimson Rambler*, *Paul's Single White*, *Carmine Pillar*, and the *Ayrshire Rambler*), those which do not bloom well in autumn, flower in summer somewhat late. It is generally about the beginning of August that *Duke of Edinburgh*—at least in my garden—is seen in its full beauty; and *Charles Lefebvre* may be similarly characterised. *A. K. Williams*, on the other hand, which here flowers very early, is a fine autumnal bloomer; its earliest productions are often veritable miscarriages, with hard and hopeless buds; but this grand Rose, so luminous in aspect, is seen in its integrity when autumn with its coolness and clearness has come. At that period, also, Roses are more valued, though they have many formidable rivals in our gardens. Such, for example, as the magnificent *Cactus Dahlias*, and those superbly beautiful *Oriental Lilies*, *Lilium auratum* and *Lilium speciosum*; but even the august presence of these does not affect very materially our interest in the Rose. It is exquisite, nevertheless, to see them in our gardens, growing in perfect harmony side by side.

Of all autumnal Roses, the most fascinating are the Teas and Hybrid Teas. Conspicuous among these are *Anna Ollivier*, *Madame Lambert*, and *Marie Van Houtte*, these three Roses being extremely prolific, and of the highest artistic capability; *Bon Edith Gifford*, which is also very productive of its flesh-coloured flowers; the venerable *Souvenir d'un Ami*, and its lovely derivative, *Souvenir de S. A. Prince*, which has, during this unique season, been exceptionally fine; *Clara Watson*, an extremely vigorous and free-flowering Hybrid Tea, and an incomparably beautiful Rose when adequately grown (but it is not everywhere that this superb variety succeeds); *Viscountess Folkestone*, famous for its productiveness, its charming colour, and delicate fragrance; the tenderly tinted *Grace Darling*, worthy of bearing such a flower-like name; *Marquis of Salisbury*, and *Grass and Teplitz*, a new crimson beauty of brightest hue; *Madame Pernet Ducher* and *Gustave Regis*, chiefly attractive in bud form, or when only half-blown; *Madame Jules Groslois* and *Madame Cadeau Ramey*, recent French Roses of charming colour, raised by *Guillot* and *Pernet Ducher* respectively.

Older and more familiar Hybrid Teas are the incomparable La France, and its near relative, Augustine Guinoisseau, Caroline Testout, more reliable in autumn than either of these: White Lady, Marquis Litta, and the primrose-coloured Kaiserin Augusta Victoria. Exquisite (Wm. Paul & Sons), Bessie Brown and Lady (Lanmorris (Messrs. Alex. Dickson & Sons, Newtownards), are recent introductions of considerable merit, though not likely to supersede such varieties as Clio or Margaret Dickson.

The great majority of the Hybrid Perpetuals make some attempt to bloom during the autumn, but, as I have indicated, their efforts are not always supremely successful. Among those that flower most freely at this season of the year are A.K. Williams, Captain Hayward, Marie Baumann, Cranston's Fragrant Crimson

dug up. In the meantime, I raised some seedlings, and eventually planted them in large pots in a greenhouse, at first filling the pot half full with a compost of mould, road-grit, and leaf-mould, and as they grew, filling up the pot. Under this treatment they were quite manageable and fruitful. The fine sample of the fruit I showed on July 13 at the Drill Hall meeting was from these pot-plants. The soil in the pots soon became a mass of roots, and the restriction of the pot checked their over-luxuriance, and gave the fruit size and fine flavour. On hot days they required water twice a day, and once a week I gave them guano-water, a trowelful of guano to 2 gallons of water, and each dose was diluted again with an equal quantity of water. I think this mode of growing the

ting it, and many varieties would soon be evolved. It is a new fruit in this country, with an unique and very pleasant flavour. Then there may be the prospect of its becoming crossed with the allied *Physalis Francheti*, and the possible variations. *E. Bonaria, M.D., August 18, 1901.*

BOTANIC GARDENS, MONTREAL.

We do not expect to find in Canada botanic gardens to rival those of Peradeniya, Calcutta, or even of Australia. Nevertheless, Montreal, now visited by T.R.H. the Duke and Duchess of Cornwall, is not entirely unprovided with gardens of this character (fig. 65). Botanic gardens nowadays mostly serve two purposes, one scientific and educational, the other decorative and recreative. Those of us who remember the old continental gardens attached to universities for teaching purposes only, will recognise how vastly they have been improved, even for scientific purposes, by an infusion of the decorative element. Neither should be sacrificed, but each should cooperate with the other. In large towns where there is an ample provision of parks and recreation-grounds, the scientific element may naturally be principally confined to the botanic garden proper; but in any case, good cultivation, so often neglected in the old continental gardens, should be insisted on in all cases.

Another point we would respectfully urge upon our colonial friends is to make the gardens representative of the local flora and of local conditions, and not servile imitations of European gardens and European methods. We do not want to see European bedding-plants predominant in Canada, nor Chrysanthemums in Australia. They have their place, no doubt, but should be subordinate to the relatively much more interesting local flora.

Again, we should like to see each small botanic garden interesting itself particularly in some one specialty—Succulents at the Cape, Asters and Solidagos in Canada, Aecias and Eucalypts in Australia, wherever space is no object. To know a plant thoroughly, it must be watched in a cultivated condition. Herbaria are of supreme importance for botanical purposes, but the information they afford requires to be controlled by, and supplemented by, the knowledge to be obtained from the living plant in all stages of its growth. Such knowledge is all important to the cultivator.

HARDY CRINUMS AND THEIR CULTURE.

SEVERAL beautiful Crinumms, one or two of them at least as fine as any in the genus, are sufficiently hardy to admit of cultivation in the open border, provided some protection can be given to them during very severe weather, and certain conditions with regard to soils can be secured. With these, as with many other plants rather too tender to resist our winters unharmed, the mechanical conditions of the soil in which they are to be grown will make all the difference between success and failure. The soil for Crinumms must be rendered light and rich, rather stony than otherwise, and, above all conditions, it must be well drained by mixing a considerable amount of rubble and soil-siftings with the subsoil.

The best position that can be given to them is the base of a south wall—if in front of a heated house so much the better. The border should be sloped so as to drain the plants as dry as is possible during winter, but in spring a ridge of soil and manure mixed must be laid

FIG. 65.—VIEW IN BOTANIC GARDENS, MONTREAL.
(From a photograph supplied by the Director, Professor Penhallow.)

Bedder, Dupuy Jamain, Baroness Rothschild, Clio, Mrs. Sharman Crawford, and Margaret Dickson.

Of climbing Roses, the truest perpetuals are Gloire de Dijon, not yet quite superseded; Bouquet d'Or, deeper in colour, and more perfect in form; Cheshunt Hybrid, Climbing Perle des Jardins, and Belle Lyonnaise. When those Roses cease blooming, we know by instinct that winter is nigh. *David R. Williamson.*

THE CAPE GOOSEBERRY.

I HAVE been trying further experiments with this interesting fruit, with its unique flavour. Last year I had some plants in pots in a greenhouse. At the end of the season I found they were throwing up new shoots from the base of the stems, so I cut down the old stems, and planted the young ones in the ground in a hot-house, to see what they would do. They grew rampantly, and soon reached the glass, and became quite unmanageable. They tended to shade and smother everything, so after collecting what fruit was on them, I had them

Physalis peruviana, for its fine flavoured fruit, is a good one.

I also, as soon as the frosts were over, planted some in the open ground. The seedlings were raised in a hot-house in small pots. Then they were transferred to a greenhouse for some time, and finally planted in the open ground. At first they took some time to start, but as the days became warmer, they grew with great luxuriance. The difficulty in growing the Cape Gooseberry in the open ground, is in checking the over-luxuriance of stems and foliage, which shade the fruit too much, and prevent it from ripening early in sufficient quantity. Perhaps the best way of growing it would be at the foot of a south wall, and training it on the wall fan-fashion, so as to expose the whole plant to the sun.

If one had a spare glasshouse, one might also try it trained under the glass, as Tomatoes are trained. The Cape Gooseberry never fails to set, one fruit in each leaf-axilla, along each of the many stems.

If horticulturists were to take up its cultivation, as they did the Tomato, they would soon find out the best mode of raising and cultiva-

around the plants to form a large basin for holding water. The bulbs need not be buried in planting; if the rooting-surface is buried 3 to 4 inches deep, it will be quite sufficient for all of them. They are very thirsty plants when active, and must be heavily watered in early summer, or they will not make much growth before the autumnal rains begin; and such flower-scapes as they may thenceforward produce are likely to be cut down by frost before they are fully developed. A thick layer of leaves strewn over the bulbs is as good a winter covering as any, and if very severe weather prevails, a few Archangel-mats thrown over the leaves will help the plants through. If procurable from a horticultural sundriesman, a few mats of Rice-straw, which the Japanese use for packing Bamboo-canes for export, are better than Archangel-mats, as they form quite a thatch when properly fixed.

One of the best known and most extensively planted of hardy Crinums is *C. × Powellii*, a hybrid between *longifolium* and *Moorei*. It has rosy-red flowers 8 inches long, and 4 to 5 inches wide. It is a strong growing plant, producing several scapes from each bulb in the course of a season, each scape supporting eight or more flowers. There are two distinct varieties, *album*, a pure white form; and *rubrum*, which has soft rose flowers, much paler than those of the type plant. So far as I can make out by comparison, it is very similar to the var. *intermedia* of continental growers. These plants are not very satisfactory when grown in pots, as they much resent a cramped root-run. *C. Moorei* is a more tender plant than the foregoing. Though it will grow with tolerable certainty in a south aspect, it only thrives under the shelter of a heated wall. It is a very strong grower, producing scapes 5 to 6 feet high, bearing ten to twelve rosy-pink flowers, each 6 inches across when at its best. The var. *album* is equally useful as a hardy kind. The flowers are pure white, but when produced at midsummer, a soft blush of pink suffuses the flower, and which greatly heightens the effect they give. The variegated form of *C. Moorei* is too tender for planting out-of-doors; it is a very ornamental plant for the warm greenhouse. In very bleak and cold districts, and in any case north of the Tweed, it is best to lift the plants with as many uninjured roots as is possible to secure, as soon as frost has cut the leaves down, and to store the bulbs in a cellar or frost-proof outbuilding, packed in sand as one would store Carrots or Beet-roots. Bulbs so treated will rest quietly through the winter in a plump state. It is necessary that the bulbs should be stored in an upright position, or the bulb-necks will curve as soon as growth becomes active. The plants are hardy with but little protection south of the Thames. *C. Moorei* is easily raised from seeds, and I have had several seedlings flower early in the third year.

C. Schimperii, a native of Abyssinia, is another hardy species. The plant resembles *C. longifolium* in the flowers, which are pure white, funnel-shaped, 8 inches long, and 4 inches across, averaging six to the umbel. The leaves are erect, Yucca-like, but slightly glaucous, and distichously arranged. The plant is about as hardy as *C. Moorei*. It flowers in August and September.

C. longifolium, though the hardiest of the lot, is found by some to be rather unsatisfactory under cultivation outside, as, owing to its being almost evergreen and tending to grow at all seasons, it resents being forced to rest during the winter by cold. I think, however, that its acknowledged hardiness has led growers to expose it in winter more than is prudent with a plant that does not naturally go to rest. It

will keep in excellent condition through the most severe winter with the protection of a fairly thick mat, applied only when absolutely necessary. It is one of the first to grow, and the young leaves are very liable to injury from cold, cutting winds. The flowers are funnel-shaped, white, with a faint pinkish tint on the inside, and a broad band of pink on the outside of each segment; the leaves are long, glaucous, and very ornamental. It is a fine plant for association with Bamboos, Yuccas, and the doubtfully hardy *Kniphofias*, such as *Rooperi*, *Natalensis*, and *Northiæ*. It is best known in gardens as *C. capense*, and is sometimes confounded with *C. longifolium*, which differs in having green, not glaucous, leaves, and in having flowers without a pink band on the outside of each segment, and in its much shorter filaments.

Another *Crinum*, *C. latifolium* var. *jenense*, is likely to prove as hardy as *C. Moorei*, or even more so, judging from the amount of exposure I have given it for purposes of test in a pot. It has a distinct advantage in being naturally deciduous in winter, and as the bulbs are globose and without a permanent neck, it would be an easy matter to provide it with a frost-proof covering of leaves. Being a native of Arabia, it requires a dry situation. The plant grows about 2 feet high, and bears spreading white flowers with long curved tubes in magnificent umbels of from fifteen to twenty. It generally flowers in August, and but once in a season. Several large importations of this plant have been made by European nurserymen during the past few years, and it is now becoming very cheap. It is a plant everyone would appreciate, the large umbels being out of all proportion to the small size of the plant.

A *Crinum* which will probably prove new has been distributed under the name of *crassifolium* by several continental nurserymen lately. I have not yet verified its reputed hardiness. It does not agree with *C. crassifolium* of Herbert, which Mr. Baker includes as synonymous with *C. variable* in his excellent monograph of the *Amaryllidaceæ*. It is most like *C. longifolium*, much enlarged in the entire plant, but not in the flowers. It is very free-flowering; my plant, which is growing in the open border, has produced three scapes in one season—but as a garden plant it is a long way behind *C. Moorei*, *C. × Powellii*, and their respective varieties in my estimation of its value. *Geo. B. Mallett*.

NURSERY NOTES.

MR. MATRICE PRICHARD'S, CHRISTCHURCH.

It is about a year ago that we had the pleasure of visiting this nursery of hardy herbaceous plants, and giving our readers a notion of the choice, and in many instances rare, species and varieties observed therein. It was late in the season for many species, and the flush of the flora was past. This year we were more fortunate in regard to time. One of the first plants to take the eye, on the visitor entering the nursery from the street, was a large example of *Polygonum Baldschuanicum*, whose panicles of minute white flowers showed with good effect against a dark background. We had seen small flowerless plants, but were not prepared to see a specimen 10 feet in height, and almost as much in diameter. Close alongside of this was a great mass of the bushy, purple-flowered *Vetch*, *Hedysarum multijugum*, which had been in flower. Mr. Prichard informed us, since early

summer, and would continue but little reduced in floriferousness till late in October. Further on in the nursery we came across a new and handsome *Aconite*, *A. californicum*, with a much more elongated hood than the common species, and of a dark shade of blue colour. This plant was about 5 feet in height. *Heuchera bryzoides* ×, likewise a novelty, is a desirable free-flowering, pink coloured variety, and reaches a height of about 3 feet.

A new *Hypericum* (St. John's Wort) named *galloides*, growing 2 feet high, forming a compact bush covered with golden-yellow blossoms, $\frac{1}{2}$ -inch in diameter, habit erect, and linear leaves, semi-evergreen, is a notable plant that originated with M. Lemoine. Another good plant suitable for the back rows of borders is *Liatris graminifolia* var. *dubia*, apetalous, and growing to a height of 5 feet, probably, though the plant remarked was never that height. Of this *Liatris* there are purple, white, and pink flowered varieties. The flower-spikes measured $1\frac{1}{2}$ to 2 feet in length, and the leaves are linear. A rose-coloured variety of that old garden plant, *Monarda didyma*, was also remarked.

Growing in the Water-Lily tanks was a quantity of the *Limnorchis Humboldtii*, with yellow flowers; and making good progress were *Marlia's Nymphaea × flamma*, *N. Signouretti*, a flower with orange-coloured anthers, petals yellow on the inner surface and rose-coloured on the outside—a lovely variety; *N. lucida*, like an enlarged *N. Signouretti*, excepting that the flower, when it fades, is of a darker tint; *N. Richardsonii*, whose petals incurve—it is considered to be the best of the white Water-Lilies. Another white is *N. pygmaea helvola*, a species from China, with small flowers, and the plant of moderate growth; and the finest yellow—*N. odorata sulphurea*. The collection of Water-Lilies is a very extensive one.

To return to the land plants. *Tritoma* (*Kniphofia*), *Lemon-cream*, a hybrid raised by Herr Pfitzer from *T. citrina*, has a flower of a slightly deeper yellow tint than the seed-parent. Several varieties of the showy large-flowered *Gladiolus Childsii* were noticed, the larger of which were Mrs. Beecher, a beautiful soft shade of scarlet; and Princeton, another of a somewhat similar tint; also a large plant of *Buddleia variabilis*, covered with its long racemes of lilac-coloured flowers.

Fine large plants of the rich golden-flowered *Asclepias tuberosa* were in abundant flower; this is a plant everyone should grow who can afford to give it plenty of space, and good soil; as a mass on the lawn, or in a conspicuous spot in a border of mixed plants, it is admirable. A fine showy *Chrysanthemum* exists in *C. atratum*, a white-flowered species. *Hemerocallis Dr. Regel*, a plant sent over by the late Dr. Regel from St. Petersburg eight years ago, has flowers of a rich orange colour, which open one at a time on a spike daily and then close; the flower measures 1 inch across. *Cimicifuga cordifolia*, producing big masses of white flowers, would make a capital solitary subject on a lawn, as would also *Solidago odorata*, a variety of Golden Rod, having the exact fragrance of a *Diosma*; and *S. flexuosa*, a plant of peculiar elegance of habit, and requiring ample space in which to develop to its full size.

Clethra alnifolia grows 4 feet in height, and possess spikes of white flowers 6 inches in length. *Eryngium serra* has flower-stalks 8 feet high, 6 feet of which are flower-panicle, the flowers are white, leaves sharply serrated, $1\frac{1}{2}$ foot long and 2 inches wide; habit caulescent. An Andean species, and therefore per-

feetly hardy. The pretty *Erica vulgaris aurea* was taking on its winter leaf tint.

Mr. Prichard has more than doubled the size of his nursery this year, by taking in adjoining

span-roofed glass-house, and a number of small pits for the propagation and protection of the more tender species of plants, the area being walled in and divided into borders as regards

In the house and pits quantities of young plants were being raised and tended, and everything was prospering. Outside, we noticed two *Montbretias*, with flowers larger than any we have previously observed, namely, *M. aureola*, having a ground colour of orange, the centre creamy-white, with a crimson zone on the ground colour. *M. Messidor* has a canary-yellow flower, paling to white at the centre; it is 3 inches wide.

This small enclosure is a veritable treasury of novelties, of which we shall hear anon; and here good work in hybridising and crossing is being performed by Mr. Prichard and his intelligent helpmates.

A REMARKABLE ROW OF PEAS.

In a season like the present, when good Peas are so scarce, it is somewhat curious to find such a grand row as represented by the accompanying illustration (see fig. 66) in a humble allotment-garden on the Hunger Hills, Nottingham, and cultivated solely by an industrious amateur named John Cox, a bricklayer by trade.

It will be readily seen there has been wonderful pains taken throughout the growing season to supply every want, and to thin, stop, and tie each haulm separately to a single stake some 9 or 10 feet high, and about 12 to 15 in. apart.

The variety resembles *Xc Plus Ultra* in outward appearance; but the Peas are too pale for that variety. They were sown early in April very thinly in well-prepared soil, and every want carefully supplied during the growing season.

They are profusely podded from the ground upwards without the slightest trace of mildew. Although the row is but some fifteen strides long, it would be an easy matter to fill a wheelbarrow without being much missed at the time I saw them a few weeks ago. Peas are not the only well-cultivated thing in this allotment, for Onions, Cauliflowers, Carrots, Apples, Gooseberries, Roses, Chrysanthemums, and Sweet Peas all figure high on the pointing-sheet when adjudicating the valuable prizes given annually by the Corporation of Nottingham. *J. H. Goodacre, Elvaston.*

GERBERA "SIR MICHAEL."

The magnificent *Gerbera Jamesoni*, sometimes called the *Barborton Daisy*, is now so well known to all lovers of good plants, that a perfect idea of this new and valuable addition to our gardens may be conveyed by the information that it is practically the same, except for its beautiful lemon-yellow colour—a difference of great importance from a garden point of view. There are one or two other slight differences; first, in the total absence of purple tint about the leaf-stalks, and possibly in a greater obtuseness of the leaf-segments. The paler coloration of the leaf is not botanically important, and is, of course, in correlation with the absence of red in the flower; while the obtuseness of the leaf-segments, above referred to, can also be found in *G. Jamesoni*, though with less frequency. The inflorescence is quite identical, except in the yellow colour of the ray-flores; but this is strongly in contrast with the flame-red of *G. Jamesoni*.

The seeds of this novelty were sent to me fifteen months ago by Mr. W. R. Adlam, with the request that the plant, if new, should be named after Sir Michael Foster. A specific distinctness was, I think, in view; but though this fails, and even the position of botanical variety, I have still the pleasure of carrying

FIG. 66.—A REMARKABLE ROW OF CULINARY PEAS.

meadow-land, and great breadths of the more saleable plants occupy the land. We observed a large patch of the showy *Sunflower*, *Helianthus orgyalis*. Still further removed from the original nursery garden, he has erected a

the unoccupied space. Here we found two young gardenesses in charge, with whose work the proprietor is very well satisfied, and the operations carried on in the department are such as exactly suit feminine fingers.

out Mr. Adam's request in the English form of name properly adopted for good variations of similar degree. This, indeed, may be the first of a series of variations which can no doubt be obtained by crossing. I am hoping, too, for good results from hybrids I have made between *G. Jamesoni* and a quite distinct species with w flowers which is more easily grown, but in itself not so fine. The beauty of *Gerbera* "Sir Michael" or *G. Jamesoni* "Sir Michael," may be imagined, when I mention that the first flower-head on a seedling plant, with stalk about a foot high, was $3\frac{1}{2}$ inches in diameter, equal in form to the finest *G. Jamesoni*, and of the purest possible colour. The seeds were gathered near Barberton, in the Transvaal, at an altitude of from 2000 to 3000 feet. *R. Irwin Lynch, Botanic Garden, Cambridge.*

FOREIGN CORRESPONDENCE.

TULIP BRUNNHILDE.

We have catalogued the early Tulip Brunnhilde, which received an Award of Merit this spring, for nearly a quarter of a century, under the name of "Pott-bakker, white and yellow," and by this latter name the Tulip is generally known in Holland. It is the only name which would have any right of priority, but is not pleasing, and has a more or less provisional character, to be explained by the origin of the Tulip, which is indeed a sport of the Pott-bakker class, just as *Grace Darling*, formerly known as "true scarlet Pott-bakker," and *Queen Emma*, formerly "Pott-bakker, white, striped red."

The name *Unique* has never been used in Holland, or in catalogues of Dutch bulbs, unless by one or two firms. We therefore had no objection whatever to adopt Messrs. Barr's name of Brunnhilde, under which it got an Award of Merit, and has been registered in the official reports of the Floral Committee of the Royal Horticultural Society.

We object to changing names of flowers, and have always tried to give special attention to correct and reliable nomenclature; but in the present case the new name has such a decided advantage on the original name (Pott-bakker, white and yellow)—the name *Unique* cannot yet be considered to be recognised—that we had no objection to allow an exception from the rule.

Inventing appropriate names for varieties of garden flowers is no easy task, and the present case again proves how important the matter is, as a thoroughly appropriate name—short, well-chosen, suggestive, and inoffensive—would have no chance of being replaced by another name. *E. H. Keelage & Son, Ilarlem, September 7.*

THE LAKE AT SHERBORNE CASTLE.

Has any reader of the *Gard. Chron.* a true comprehension of what is meant by 100 acres of Water Lilies? Yet this is the area of the lake at Sherborne Castle. To most of us it would convey the idea of a lovely picture of peerless white blossom showing above a sheet of dark green foliage, the display lasting for months. In reality nothing is further from the truth, for the Water Lily foliage is in a state of perpetual decay, and the decayed brown leaves coil up above the water-level, making the surface rough-looking and odious to the sight, and unpleasantly odorous also. Only a few flowers can be made out near the shore, those 30 yards distant being

invisible among the leaves; that is the summer aspect of the lake. In winter this is all changed. The Lily stems and leaves have decayed and sunk to the bottom, and the lake fed by the clear waters of the river Yeo is at that season a lovely sheet of water, perfectly bright and clear, reflecting the magnificent Lebanon Cedars and other fine trees growing on its banks, and its surface only disturbed by the wind, or by flights of wild duck, water-hens, and herons, as they fly across it. At that season a boat may be sailed or rowed over it, which in summer and autumn are impossibilities, so dense is the growth of the Water Lilies.

CONTINENTAL NOVELTIES.

STRAWBERRY JOHANN COUNT HARRACH.

A CROSS between *Marguerite* and *Laxton's Noble*, effected by Herr Landhofer, garden director to Count Harrach, President of the Imperial and Royal Horticultural Society of Vienna, which is likely to remain a valued variety. The plant is of moderate growth, foliage hairy, and said to be quite proof against mildew and red-spider. The fruit is conical, of the middle size, in colour dark red, with flesh of a lively tint, and of a pleasant, sharp flavour. When forced it flowers ten to twelve days earlier than the parent varieties, and requires no artificial fertilisation. A figure of a plant in fruit is given in August-September number of the *Wiener Illustrirte Garten-Zeitung*.

The Week's Work.

PLANTS UNDER GLASS.

By D. ROBERTS, Gardener to HESSEY PACE, Esq., Prestwold Hall, Loughborough.

Chrysanthemums.—After the 20th of the current month, it is neither safe nor advisable to keep the earliest Japanese varieties out-of-doors, owing to the risk of injury from wind. Heavy rains and dews are also injurious to the flowers of the earlier varieties. Sometimes, owing to the desire to possess new varieties, and a reluctance to throw away older varieties, more plants are grown than the gardener has space to properly accommodate, or than he could do justice to, the consequence being that the plants are crowded together in peaches, vinerys, and other houses. Under such treatment mildew is sure to infest the plants. Wherever placed, it is indispensable that the plants have all the light obtainable. It is essential also to use the heating apparatus in damp weather to dispel damp; this should always be applied by day. At all times a constant current of air should circulate freely among the plants. In bright weather the plants should be very slightly dewed over with the spraying syringe in the morning, all moisture being dried up by the evening. Let the pots be cleansed, and dead foliage removed. A beginning should be made by honing the forwarder Japanese varieties, following on with the incurveds and pompoms, and forwardest of the single-flowered and decorative varieties. Late varieties of the type of *W. H. Lincoln*, *Nivcum*, and *Lord Canning* may remain out-of-doors till a later date, means being taken to protect them from injury by frost. For this purpose, make a framework of strong stakes, light, and with cross-pieces of lath and wire, so as to cover the plants with tarpaulin to the end of the next month. Continue to apply manure-water to all the plants till the colour of the flowers is observed, after which time its use should be discontinued, and rain-water only be afforded.

Richardia orthiopicum.—The recent rain has had a good effect upon these plants out-of-doors, and growth is very promising. Those plants which were divided and planted out

should now be potted up, and if large plants are wanted, three strong plants should be potted together in 10-inch pots. The best results, however, are obtained by potting the strongest crowns into 6 and 7-inch pots, and this affords a ready means, by potting into the last-mentioned pots, of dividing the stock of plants into successional batches. If these plants are vigorous, they will usually afford three blooms each. The drainage should be ample, *Richardias* being plants that require much moisture. A compost consisting of loam two parts, leaf-soil one part, and some rotten manure and a small quantity of bone-meal and sifted mortar rubble, will be suitable for their requirements. Frequent applications of diluted liquid-manure water will be beneficial when the plants show their spathes. Place newly-potted plants in pots or frames, and syringe lightly for some time. The variety *R. Elliottiana* will be sufficiently matured in growth, and water, which has gradually been withheld, may be dispensed with entirely. The plants may now be laid on their sides beneath the greenhouse stage.

FRUITS UNDER GLASS.

By MALCOLM McINTYRE, Gardener to Sir CHAS. TENNANT, The Glen, Innerleithen, Peeblesshire.

Strawberries in Pots.—Although these plants when standing in the open do not suffer from long-continued rain, yet they may be seriously injured by needless applications of water. Enough water should be afforded as will avert the flagging of the leaves, the soil being allowed to become moderately dry before any is afforded. This applies more particularly to varieties intended for early forcing, which must soon be put into cold frames, but only using the lights in frosty weather or to throw off heavy rains and snow, and ventilating freely at all other times. Plants that remain wet for any length of time should be turned out and the cause ascertained. This is usually defective drainage—due to worms or other causes. Wherever worm-casts are observed on the soil, apply clear lime water and put the drainage in good order. The crowns of the plants are more numerous with some varieties than others—especially is this the case with *Vicomtesse Héricart du Thury*, a number of small ones clustering round the central crown. Remove the small crowns sideways with a bit of wood shaped like a wedge, and thus concentrate the vigour of the plant on a single crown; and then, although there will be fewer trusses of bloom, the crop of fruit will be no less. Keep the surface soil loose, as then the soil cannot leave water between the ball and the sides of the pot. Top-dress the plants with dried horse-droppings or cow-manure rubbed through a $\frac{1}{2}$ -inch meshed sieve; remove the manure as soon as it appears, and afford the plants plenty of space so as to expose the foliage to light and air as fully as possible.

Cucumbers.—Seeds may still be sown for affording plants to fruit in December and later, but the end of August or first week of this month are more suitable times for sowing. The old trustworthy variety *Telegraph*, when obtained true, is still one of the best as a winter fruiter; and seeds may be sown singly in 3-inch pots and plunged in a bed having a brisk bottom-heat, and as soon as the plants are well through the soil, raise the pots to the light; but still keep in a rather strong heat, the aim being to keep them sturdy. Shift them into 6-inch pots as soon as the roots touch the pots' sides, and support them with neat stakes. A close outlook must be kept for insect pests, this being especially necessary when the plants are raised in the stove, a clean start generally ensuring successful fruiting. It is scarcely possible to clean plants of large size of thrips, black aphid, mealy-bug, and red-spider, without greatly damaging them by the process. If there are strong *Cucumber*-plants now ready for planting in pots or on ridges, they should forthwith be planted, nothing being worse for the plants than for them to become pot-bound; besides,

it is of importance that an early-start be made, in order that the plants may be of large size before fruits are allowed to form, it being certain that they will move very slowly afterwards.

Tomatos.—It is the better practice to cast out the plants when the summer crop is taken; yet, if they are fairly clean, and are trained up the roof, it pays well to lay in young growths, which they are constantly pushing out all over the leading stems, and these soon developing bunches of flower, a good set is often secured. By this means a continuous supply of fruit may be obtained throughout the winter and spring months; but the roots must be well attended to as well as the top. If the border is in the least degree deficient in moisture, let the surface be loosened lightly, and afford tepid water, followed by liquid-manure; and top-dress it with turfy loam and old Mushroom-manure, the dressing being repeated when it is seen that the first one is exhausted. The same holds good if the plants are in pots; the latter may be plunged in a bed of soil.

THE KITCHEN GARDEN.

By J. MAYNE, Gardener to the Hon. MARK ROLFE, Bleton, East Budleigh, Devonshire.

Jerusalem Artichokes.—These plants have with us this season grown very tall, and for fear they might be blown over, the stems have been cut back a little. I do not care to shorten them much, so long as the stems remain green, although some gardeners cut them nearly half-way back, thinking thereby to assist the swelling of the tubers; but I have found that doing this has just the contrary effect.

Globe Artichokes.—The ground on which these are growing should be well supplied with water, and hoed frequently, that the young shoots may be strengthened, and stand the winter better than weakly ones.

Leeks.—Continue to add small quantities of soil to Leeks growing in trenches, affording treatment similar to that advised for Celery. Those Leeks which were planted a month or longer ago have not made much headway owing to the drought, and any that are at a standstill should have water applied weekly, stirring the soil the day after.

Cauliflowers.—If Autumn Giant is turning in, apply liquid-manure, well saturating the ground between the plants. Search the plants for caterpillars every day at the base of the curd, or in the leaves folded over it.

Salad.—Sowings of Mustard and Cress should be made under handlights or in cold frames or boxes, and of Radishes in a sheltered spot or in a cold frame placed on a disused hot-bed, but the lights should not be put into use before cold nights occur. Lettuce plants of sowings made about the 15th of last month may now be planted on south borders or at the foot of a south wall, at about 8 inches apart. I have a number of these pricked out in front of a Peach-house as advised with Parsley. A mistake is made in planting Lettuces too deeply, with the result that decay sets in at once, and the plants die. Let the plants be afforded water in dry weather till they have become established, and hunt for slugs and snails. Where Tripoli Onions have come up very thickly, single them out so that they stand just clear of each other. Some gardeners transplant as soon as large enough, but I prefer to wait till February or even March, when, if transplanted, they grow away freely.

Tomatos.—Plants that have been prepared for winter-fruiting, which are now standing out-of-doors, will have several trusses of fruit set, and will soon need the protection of a glasshouse. When taken indoors the plants should be placed where they will obtain full sunlight, with the stems within 1 foot of the roof, training them similarly to Melon plants. A temperature at night of 60 to 65 will be suitably high for the present, affording plenty of air during the day, with a smaller amount at night in mild weather. When colder weather

arrives, the temperature should be lowered 8 to 10°. Gather the fruits from out-of-door Tomato plants as they ripen, remove lateral shoots once a week, and afford weak manure-water twice a week if the weather is dry.

Spinach.—The plants of the last sowing thin out to about 8 inches apart. Spinach severely thinned with-stands the inclemency of the winter better when allowed a reasonable amount of space for development. A fresh sowing be lightly sown between the rows, keeping it clean of the leaves, and hoeing it after the thinning is finished, much benefit will follow. Hoe the spinach-beds regularly till the leaves have spread over the ground, rendering further hoeing inadvisable.

THE HARDY FRUIT GARDEN.

By C. HEARX.

Raspberry Plantations.—Remove by cutting away at the ground level the canes which bore fruit this season, in order to allow more light to reach the young canes whilst sun-heat is of use in ripening the wood. If more young canes have been retained than are required, let the surplus be removed forthwith, leaving only three or four of the strongest on each stool. These canes should be loosely fastened to the stakes or trellis, as the case may be. If growth has not been satisfactory this season, afford the land weak liquid-manure water, which will assist the plants should the weather remain warm and dry.

Strawberry Plantations.—If a mulch of short stable-dung was applied to the new plantations of Strawberries, much of the moisture in the land will have been retained in it; still, a heavy application of water may be necessary in the event of the weather keeping dry. Pinch off the runners made by the young plants forthwith, and if mildew should appear upon the foliage, apply a wash of Gishurst Compound Soap, or ordinary soap-suds and sulphur, at the rate of 2 oz. of soft-soap and 1 oz. of sulphur to 3 gallons of rain-water; first dissolving the soap in a small quantity of hot water, with which mix the sulphur, afterwards adding clear water to the required strength, giving it an occasional stir up while being applied with the syringe. As it is not good practice to take runners for forming new beds from the plants that have borne fruit, provision should be made for furnishing the necessary quantity of runners in 1902, by planting forthwith young plants in some convenient quarter for brushing layers of which each plant may be reckoned upon to produce three or four strong ones. Narrow fruit-tree borders may be utilised for the purpose, as on such the layering can be conveniently carried out. All flower-trusses should be pinched out as soon as they appear. Potato-land may be utilised without further preparation, other than levelling and making it firm, if borders are not available. Set out the plants at 1 foot in lines, drawn at the least 2 feet apart, so as to give plenty of spare for layers. Should this year's forced plants of Vicomtesse H. de Thury and Royal Sovereign have been planted out in the early summer, a partial crop of fruits will be ripening and in need of protection from birds. Later, handlights may be placed over the beds to hasten the ripening.

THE ORCHID HOUSES.

By H. J. CHAMBERLAIN, Gardener to R. T. MANSFORD, Esq., Cambridge Lodge, Foulden Road, Canterbury.

Applying Water.—One of the most important matters in the cultivation of Orchidists, at this season, the proper application of water to the various plants. There can be no doubt that many failures in Orchid cultivation are due to lack of knowledge, and to carelessness in affording water at the root, and more especially at this season. Gardeners are apt to forget the fact that the sun's evaporating power in northern latitudes is waning daily, and to afford water to a plant in the same degree as was done quite recently in warmer weather is quite wrong, the longer hours of darkness, and the moister conditions prevailing

outside, causing great injury to Orchids that are kept very moist at the roots. The spotting of the foliage that often results from this cause is a permanent disfigurement to the plants, even should it not extend further than the leaves. Again, the pseudo-bulbs of Cattleyas, Lælias, and Odontoglossums, may appear one day in perfect condition so far as outward signs go, and the next day the leading growths will be found a mere mass of pulp, and often the total loss of the plant occurs. In view of these mishaps, the application of water needs the fullest consideration on the part of the gardener. Local conditions vary greatly, and no exact rule can be laid down that will suit everyone. I find that it is better to wait until the potting compost is thoroughly dry before affording water, provided the pseudo-bulbs do not shrink in size; and when a plant is in active growth, or the pseudo-bulbs have about reached their full size, they are very apt to be thus affected if the supply of moisture be partially cut off, and in order to avert any mishaps, such plants should be examined daily. If a day can be chosen for applying water it should be a bright one, the water being applied in the early morning hours, and the moisture dried or mopped up before the evening. The damping of the floors, &c., should be carried out at such times as will reduce the actual condensation of moisture on the foliage of the plants during the colder hours between light and darkness.

Thunias, of which the growth is thoroughly ripened and the foliage has dropped, may be placed in a cool but fairly dry place, and afforded a long rest; and only in this way will satisfactory strong breaks be obtained in the spring.

Deciduous Dendrobiums.—Any of the plants the growth of which has reached maturity, should be gradually inured to a condition of rest, and those plants whose growth is backward, should be placed at the warmer part of the stove and in a sunny position, so as to get the growth matured before the winter sets in.

Evergreen Dendrobiums should have the full-benefit of the strong sunlight and free ventilation when ever the outside conditions permit, no shading being applied.

THE FLOWER GARDEN.

By T. H. SIMS, Gardener to Lord Poltimore, Poltimore Park, Exeter.

Golden-leaved Privet.—This useful shrub is so very effective that I am surprised at seeing it so seldom planted; it is of evergreen character [not always, Ed.], and few small shrubs afford a yellow colour in the winter. It may well be planted in pleasure grounds that are overdone with evergreens of a sombre hue, and with some annual pruning with the knife it needs little attention. The colour of the foliage is deepest two years after planting, and if the position is a sunny one the golden hue will be more pronounced than in a shady place. Some plants should always be grown in the home nursery; and as it roots readily from cuttings easily obtainable at this season, there need be no difficulty about getting up a stock of the plant. The cuttings should be made to 15 inches in length, and with or without a heel, and inserted in the soil 3 inches in depth and 12 inches apart in rows 18 inches apart. The cuttings should rest on firm ground and be trodden firmly in the rows.

Vinea variegata major.—This is a most useful spreading plant, and very suitable for planting where the Privet might not succeed. The plant is easily increased, the rambling shoots quickly forming roots at the joints which soon strike into the soil. The best plants are obtained by propagating the strong shoots that spring from the centre of established plants, which may be treated in the same manner as the Privet. The variety named is the best form for general planting, the variety *Vinea v. elegantissima* being smaller in the leaf and not so strong in growth.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, SEPT. 24. — Royal Horticultural Society's Committees at the Drill Hall, Buckingham Gate, Westminster.

SALES.

MONDAY, SEPT. 23. — Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 24. — Dutch Bulbs, at Protheroe & Morris' Rooms. — Beneficial Interest in Lease, and whole of Stock of Palms, &c., by order of Trustees, at 256, Peckham Rye, by Protheroe & Morris, at 12.30.

WEDNESDAY, SEPT. 25. — Dutch Bulbs, at Protheroe & Morris' Rooms. — Farming Stock, Store and Greenhouse Plants, at Caen Wood Towers, Higgate, by order, by Protheroe & Morris, at 12.30.

THURSDAY, SEPT. 26. — Dutch Bulbs, at Protheroe & Morris' Rooms. — Clearance Sale of Nursery Stock, Greenhouses, &c., at the Rose Nurseries, Stanley Road, Boxeth, Harrow, by Protheroe & Morris, at 12.30.

FRIDAY, SEPT. 27. — Orchids and Dutch Bulbs, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years at Chiswick — 55.9

ACTUAL TEMPERATURES.—

LONDON.—September 18 (6 P.M.): Max. 67°; Min. 53°. September 19 — Dull, mild, some rain.

PROVINCES.—September 18 (6 P.M.): Max. 90°, Scilly; Min. 49°, Shetland.

A FULL translation of GREGOR MENDEL'S paper, which is given in the latest issue of the *Journal of the Royal Horticultural Society* (vol. xxvi., parts 1 to 3, pp. 1 to 32), with an introduction and foot-notes by Mr. W. BATESON, M.A., F.R.S., should be of great interest both to botanists and horticulturalists. It was published in 1865, and embodies the results of eight years' systematic hybridisation and observation, concentrated upon about thirty-four distinct varieties of Peas (*Pisum sativum*, quadratum, saccharatum, and umbellatum), and the formulation of a law, now generally known as the Mendelian law, which he deduced from said results, and which, so far as this special genus of plants is concerned, he certainly fully established. It is true that in a subsequent paper on Hieracium he observed and recorded unconfirmable cases; but where a law is found to emerge so unmistakably from such an immense mass of data, covering many thousands of plants, and numerous generations, its validity is in no wise overthrown by the discovery of exceptions which may quite well arise through the interaction of other laws which have yet to be discovered. The law of variation, independent of crossing, is as yet a sealed book, and until this is discovered or determined with some clearness, the hybridist is liable to find his most systematic trials vitiated by its interposition. In any case, as Mr. BATESON well observes, "However much it may be found possible to limit or to extend the principle discovered by Mendel, there can be no doubt that we have in his work not only a model for future experiments of the same kind, but also a solid foundation from which the problem of heredity may be attacked in the future."

That a paper of such importance should have seen the light in 1865, and should have remained practically a dead letter until quite recently, when the work of DE VRIES, CORRENS, and TSCHERMAK in the same direction drew attention to its value, is certainly remarkable. Like other important discoveries, it appeared before the world was

ripe for it, and that it was not followed up sooner by further trials on like lines, may, we think, be accounted for by the great rarity of men who, however well qualified for, or inclined to, such a task, have the leisure and opportunity for concentrated culture and observation on a similar scale. As MENDEL points out in his introduction, no one, until he undertook the task, had carried out experiments on adequate lines since the study of a comparatively small number of plants is likely to lead to false conclusions, and it is only when immense numbers are concerned, and all of them studied, that the underlying principle reveals itself. It was also no simple matter to select a genus, or a series of species or varieties which at once presented a number of definite characters, and at the same time could be systematically crossed without risk of accidental fertilisation, which would utterly vitiate the results eventually aimed at. As he says:—

"The trial plants must necessarily—

"1. Possess constant differentiating characters;

"2. The hybrids of each plant must, during the flowering period, be protected from the influence of all foreign pollen, or be easily capable of such protection."

Both these qualifications he found to be possessed in the highest degree by the genus *Pisum* (Pea), for the reason that the fertilising organs are closely packed within a protecting keel or cover, while the anther bursts within the bud, covering the stigma with pollen even before the flower opens. This enables the operator to remove the keel and stamens at an early stage, while the latter are still immature, and then to introduce the foreign pollen with a fair certainty of its sole action. Hybrid Peas, also, are fully fertile, another essential factor for subsequent culture and study of their offspring; they possess a number of distinctive characters which can be easily noted; and, finally, are of the easiest possible culture. Thus observation could be directed to:—

1. The difference in form of the ripe seeds, round or wrinkled.
2. The difference in the colour of the seed-coats, which is easily observed, as their coats are transparent.
3. The difference in the colour of the seed-coat.
4. The difference in form of the ripe pod.
5. The difference in colour of the unripe pod.
6. The difference in the position of the flowers.
7. The difference in the length of the stem.

In all these we have obvious and clearly discernible characters, especially as the differences are well marked.

As a start, each two of the differentiating characters were crossed together. The crosses were also made reciprocally, i.e., the pollen plants in one set of trials were made the seed-bearers in a second set; and it may be here remarked that one of the outcomes of MENDEL'S investigations was that this made absolutely no difference in the subsequent results—it was quite immaterial which parents bore the seed. The first set of trials involved 287 fertilisations on seventy plants, embracing seven crosses, and in each of these the hybrid character of the offspring resembled one of the parental forms so

closely that the other parental type was practically imperceptible. This, however, is no evidence at all that crossing has not been effected, as superficially would appear to be the case, it simply means that what MENDEL terms "dominant characters" assert themselves in this generation, while "recessive" or latent characters are externally suppressed, only to reappear later in subsequent progeny. These dominant characters in *Pisum* are found to be—

1. Round or rounded seeds without shallow depressions;
 2. Yellow-coloured seed contents;
 3. Grey, brown, and leather colour of the seed-coat, correlated with violet-red flowers and red-spotted leaf-axils;
 4. Inflated form of pod;
 5. Green unripe pods, stems, leaf-veins, and calyx;
 6. Distribution of flowers along the stem;
 7. Greater length of stem;
- while the other characters are recessive or less assertive.

That these latter latent characters are existent in the plant system is clearly shown by the progeny of these hybrids presenting them fully developed, and it is in the proportions of this reappearance that the Mendelian law begins to be demonstrated, the dominant characters appearing constantly in the proportion of three to one as compared with the recessive, *without any transitional forms appearing*. It is impossible in the limited space here available to give details of the results, but summarising them it may be stated that out of 4,612 plants, the dominant appeared in 3,453 cases, and the recessive ones in 1,159 = 248 to 1.

In the next or second generation precisely the same ratio of three to one resulted, whence, quoting MENDEL, "It is now clear that the hybrids form seeds having one or other of the two differentiating characters, and of these one-half develop again the hybrid form, while the other half yield plants which remain constant, and receive the dominant and recessive characters in equal numbers."

In the subsequent trials extending over a period of eight years in all, this same ratio came out from the analysis of an immense mass of data for which we must refer to the paper itself, and from the facts observed MENDEL deduces the principle that in hybrids the ovules and pollen-grains do not contain a heterogenous admixture of potencies, but throughout retain their individuality, and combine with each other on well defined lines, the eventual combinations of characters being strictly confined to the number of combinations which may be possible between the original ones, these really retaining their integrity through all transmissions. The further deductions which MENDEL emphasises are the following:

"That the offspring of the hybrids in which several essentially distinct characters are combined, represent the components of a series of combinations in which the developmental series for each two different characters are associated.

"The relation of each two different characters in hybrid connection is independent of the other differences in the two original parental stocks.

"The constant characters which appear in various forms of a plant group may be obtained in all the associations which are possible according to the laws of combina-

tion by means of repeated artificial fertilisation."

The principles thus defined and established by MENDEL, at any rate, as regards the species with which he dealt, throw considerable light on the phenomena of reversion, the possibility of which, as his experiments show, can hardly be entirely eliminated from the systems of the plants concerned, though the chances of reappearance may be many thousands to one.

The paper also constitutes a guide and a model (as Mr. BATESON points out) for further experiments; but it is probable that the complexity introduced by accidental fertilisation from alien sources, and that inherent tendency to vary possessed by most plants, would in course of time render the law altogether untraceable in distant generations, uncontrolled and uncontrollable with the assiduous care which Abbé MENDEL could devote to his cultures in the seclusion of his convent garden.

None the less, the thanks of the world are due to him for his labours, and the masterly way in which he has proved the existence of a defined law where hitherto all seemed chaos. [Students should peruse this paper in conjunction with the dissertations of THOMAS ANDREW KNIGHT, and the much more recent observations of THOMAS LAXTON, both of which are included in the publications of the Horticultural Society.]

ORCHID-FLOWERING CANNAS (see Supplementary Illustration).—Italy and Austria were among the first of this distinct section of Cannas, and these created quite a sensation for a time; but though the flowers were of great size, they were found wanting in substance, and did not make such good heads of bloom as the Crozy section. However, I have had a number of new varieties added since, and I may yet get further improvement. Miss Kate Gray is one of the latest and best; it is of American origin, and shows a great advance on anything I have observed, the growth being short and sturdy, and the flower-stems are comparatively short, with good heads of bloom. I have not yet tried it planted out, but as a pot-plant it is decidedly one of the best Cannas that we have. Plants received from America last autumn were started, or rather kept growing, for they had made a good start on the voyage. They have since thrown a number of offshoots (or suckers), some of which have flowered, in addition to all the first growths which had started when received. H. J. J. [A plant of this variety, of which our Supplementary Illustration in this issue affords a good idea of the form and size of the flowers and spike, was shown by Mr. H. J. JONES, of Hither Green, Lewisham, at the Royal Horticultural Society's meeting at the Drill Hall, Buckingham Gate, on July 2 of the present year, and received an Award of Merit. The plant grows from 3 to 4 feet in height, and the flowers are of a brilliant scarlet colour, with yellow markings in the throat. ED.]

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the committees of the Royal Horticultural Society will be held on Tuesday, September 24, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 P.M. A lecture on "Roses for Autumn Blooms" will be given by Mr. ARTHUR W. M. PAUL, F.R.H.S., at three o'clock.

—THE FRUIT SHOW.—The Royal Horticultural Society's great show of British-

grown fruit will take place at the Crystal Palace on Thursday, October 10, and the two following days. Copies of the prize schedule, with entry form, can be obtained on application to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster. Intending exhibitors must give notice in writing not later than Thursday, October 3, of the class, or classes, in which they propose to exhibit, and the amount of space required. On each day of the show, after 10 A.M., Fellows of the Society—on showing their tickets at the turnstile—will be admitted to the Palace free.

ROYAL HORTICULTURAL SOCIETY'S CONFERENCE ON ROSES, 1902.—By permission of the Earl of ILCHESTER, a member of the Council, it has been decided to hold a Conference on and show of Roses in the grounds of Holland House, Kensington, probably in the last week of June. The programme and schedule will be published as soon as possible; but probably the only feature which will require special preparation will be a class for twenty-four climbing Roses, in twelve varieties, shown in pots, so as to illustrate their habit, growth, and vigour. Can anything more delightful for Londoners be thought of than a Rose show in the beautiful grounds attached to this historic mansion? We believe the precise date cannot be fixed till it is known exactly when the Coronation is to take place.

YORKSHIRE NATURALISTS' UNION.—The one hundred and sixty-second meeting will be held at Doncaster, for the investigation of the Don valley from Conisborough to Doncaster, on Thursday, September 26, 1901. Permission has been kindly granted by Miss BEWICK-COPELY, Mr. CHARLES E. ELLIS, and Mr. W. H. BATTLE-WRIGHTSON for their estates to be visited, also by Messrs. WALKER & CRAWSHAW, and Messrs. BLADGON & CRAWSHAW for their quarries at Conisborough and Warmsworth. Scabba Wood is expressly exempted from the permission granted, and is not to be entered. The district embraces that part of the Don valley where the river cuts its way through the Permian Rocks. The natural outline of the left bank has been much changed by quarrying; the right side is less altered. As the river winds from side to side of the valley, steep rocky woods alternate with rich alluvial meadows, forming a bit of country alike attractive to the naturalist and the photographer. All parties will leave Conisborough Station after the arrivals of the trains leaving Sheffield at 10.43 A.M., and Doncaster 11.15 A.M.

—A meeting will be held at Cadeby (near Doncaster), for a fungus foray in the neighbourhood of Melton, Sprotborough, and Warmsworth, from Saturday to Thursday, Sept. 21 to 26, 1901. The business arrangements for this meeting have been made by the Hon. Secretaries of the Union, assisted by Mr. H. H. CORBETT and Mr. M. H. STILES, of Doncaster. All communications with regard to the scientific business of the Mycological Committee to be addressed to Mr. CROSSLAND, its Secretary.

FERNS AT THE ROYAL CALEDONIAN SHOW.—The following were the dimensions of some of the Ferns exhibited on this occasion by P. NEILL FRASER, Esq.:—*Goniophlebium subauriculatum*, fronds, 10 to 15 feet long, 5½ feet across; *Gymnogramma Luteoheana gigantea*, 5 feet 6 inches across; *Davallia polyantha*, 8 feet across; *Phlebodium sporodocarpum*, 8 feet across; *Adiantum digitatum*, 5 feet 9 inches across; *A. Williamsii*, 5 feet 3 inches across; *A. cuneatum*, 4 feet across; *A. c. grandiceps*, 4 feet across.

TWO-COLOURED TOMATO.—We have often seen white and black Grapes on one cane, white and red Currants on one stalk, or others partly red and partly white, but we had never seen a yellow Tomato growing on the same stem as a red one till Messrs. BARR & SONS sent us a specimen from their nurseries at Long Ditton. A plant is like a kaleidoscope; shake it a little, and the component parts rearrange themselves in a different manner.

NATIONAL CHRYSANTHEMUM SOCIETY.—The first meeting of the Floral Committee of the above Society will be held at the Royal Aquarium on Monday next, September 23, at three o'clock. The committee will also meet on the following dates: October 21, October 28, November 11, and November 18, at 3 P.M.; and on October 8, and December 3, at 1 P.M. These meetings will be held at the Royal Aquarium.

THE FRENCH HORTICULTURAL SOCIETY.—The French National Horticultural Society has not yet decided where the autumn exhibition will be held. It was announced, apparently with certainty, that it would take place in the Grand Palais des Champs Elysées, but it has since been found out that this building is engaged for other purposes. M. VIGIER, formerly Minister of Agriculture, and President of the Society, has made personal application to the Minister, and it seems likely that the Chrysanthemum show will, after all, be held in the Palais, but at an earlier date, opening on November 6 or 8, instead of on the 13th, as was previously proposed.

LACHNANTHES TINCTORIA.—This plant is, during the silly season, exciting much attention, even in the *Times*, as an alleged remedy for phthisis. Whatever temporary relief it may afford in the case of certain symptoms, no one but those who pin their faith in the advertisements of quack medicines would believe that it or any other drug could exercise any abiding influence in the "cure" of such a disease as phthisis in its advanced stages; but that is a matter we cannot discuss here. We are only concerned with the botany of the plant. The *Index Kewensis* retains the name of *Lachnanthes*, which dates from 1816, but points out that it had been previously named *Gyrotheca tinctoria* by SALISBURY. SALISBURY'S paper is contained in the *Transactions of the Royal Horticultural Society* in 1812, p. 327; but the name was ignored probably for the very sufficient reason that no description was given, but only the bare name (*nomen nudum*), which gives no right of priority apart from a description or figure. But this is not all. Messrs. BRITTON & BROWN in their valuable *Illustrated Flora of the Northern United States*, have discovered that WALTER in his *Flora of Carolina*, published in 1788, described the plant as *Anonymo (sic) capitata*. In accordance with the very curious but very unsatisfactory plan of adopting a mutilated name, and attributing it (in brackets) to some one who could have known nothing about the name, Messrs. BRITTON & BROWN now call the plant *Gyrotheca capitata* (Walter), Morong, in spite of the fact that WALTER had called it something else, thus violating one of the cardinal principles of nomenclature which forbids us from attributing to any particular author something that he never said or wrote, the putting his name in brackets does not obviate the misstatement. A further complication arises from the circumstance that "*Anonymos*" *capitata* of WALTER is referred in the *Index Kewensis* to *Burmanna capitata*. This illustration shows the inconvenience and inaccuracy that arise when an attempt is made to act upon the strict rule of priority without giving due

weight to all the circumstances of the case. The safest rule for gardeners to follow is to adopt the nomenclature of the *Index Kewensis*, of the *Genera Plantarum*, and of *Nicholson's Dictionary*, until some competent monographer arises on whose critical judgment reliance can be placed. Some will say this is a case where the popular name "Red-root" should be used, and we should concur in this view were it not for the fact that Red-root is an epithet applied to various species of *Ceanothus* and to other plants. The unfortunate plant is a herb 1 to 3 feet high, with reddish roots, tufted, linear-lanceolate leaves more or less pubescent; the flowers are yellow, hairy within, and arranged in a terminal panicle cyme, having superficially much the appearance of a *Cyperus*. It belongs to the order *Hamadoraceae*. It was introduced to British gardens in 1812, according to NICHOLSON.

MESSRS. THOMAS GREEN & SON, LTD.—The old-established firm of Messrs. THOMAS GREEN & SON, Ltd., Leeds and London, have been appointed horticultural-machine makers to His Majesty the KING. Messrs. GREEN were for many years royal tradesmen under the late Queen, and their lawn-mowers were in constant use in the Royal parks and gardens at Windsor, Frogmore, Sandringham, Buckingham Palace, Hampton Court, &c., it seems only fitting they should be the first manufacturers of lawn-mowers to receive the honour of a similar appointment under the KING. Messrs. GREEN also announce that owing to the increase of their business, they have enlarged their London establishment, and to that end have acquired a plot of land in Southwark Street, upon which they have already commenced the erection of new premises, and of which they hope to be in occupation by January, 1902.

A PROLIFIC JARGONELLE PEAR-TREE.—The Rev. WALTER WADDELL, Borthwick Manse, Gorebridge, has just taken 1100 Pears from a tree growing on the manse wall, many weighing two to the pound, while the average would be three to the pound. The tree was planted forty-eight years ago, and Mr. WADDELL has carefully pruned and trained it for forty-one years. It is on a west aspect, and has always been prolific, but this is a record crop.—*The Scotsman*, Sept. 11.

"THE SCOTS GARDINER."—A book referred to by Lord ROSEBURY, in his amusing speech at the opening of the show of the Royal Caledonian Horticultural Society, was made the subject of an article in our columns by Mr. BROTHERSTON some time since.

LORD ROSEBURY, in opening the great flower show in Edinburgh, remarked on the technical terms used in horticulture. Horticulture is not alone in this matter; but, like all specialities, it has its own language. This survives when the more popular nomenclature speedily becomes obsolete or inapplicable, and to that extent justifies its existence. We have only to read a few more sentences of his Lordship's speech to find a long list of "popular" names, many of which are as uncouth and unfamiliar as the "false and barbarous" names of which the speaker complained. The survival of the fittest is here regulated by convenience. The majority of those most concerned find, in practice, that the "false and barbarous" names are the most convenient and trouble-saving. It is in our experience those who do not want to know who make the greatest outcry. Those who do wish to know do not find any special difficulty about the terminology, barbarous as it may be. Many of us like music, but not sufficiently to

induce us to become familiar with the terminology of the real musicians; at the same time, we do not complain of the students of music because they use a special jargon of their own.

BOOKS FOR RECREATION.—Lord ROSEBURY brackets two classes of books as equally suitable for the purpose—those relating to gardens, and those concerning continental travel, as dealt with in the continental *Broadshaw*. We are afraid for the honour of garden literature that only a few of the host of gardening books now issued from the Press have any real interest or value for gardeners, but with the continental *Broadshaw* we entirely sympathise with his Lordship.

FLOWER PHOTOGRAPHY.—The September number of the *Photogram* (Edlingham House, Arundel Street, Strand) contains an illustrated article by Mrs. CALBE KEENE on Fruit and Flower Photography. The pictures of flowers are very artistic, but it is disillusioning to hear they are taken from cut blossoms arranged to seem as if growing. Mrs. KEENE finds that plant portraits taken out of doors are likely to be spoilt by the slightest puff of wind. So her pretty pictures are of her own arrangements, not of natural groups. There are no illustrations of fruit accompanying the article; which is popular and pleasing rather than of scientific value. The *Photogram* is, by the way, an excellent journal, interesting even to those who have no camera.

CIDER.—An instructive article on the manufacture of cider in Normandy is given in a recent number of the *Journal of the Society of Arts*, p. 718. It may be commended to those who desire to encourage the production of this beverage in our own country.

SMALL FRUIT.—Out of a total in 1901 of 56,785,133 acres of land in Great Britain, 32,117,415 are under cultivation (not including mountain or heath land). Of this amount small fruit occupy 74,999 acres, an increase 17 per cent. on the previous year (1900).

OVER-SEA FRUIT CROP.—Through the Board of Trade, we learn that the Canadian Apple crop is estimated to yield 13,834,224 bushels, or a little more than 2 bushels to each tree of bearing age. This is less than 40 per cent. of last year's yield. A "States" authority reckons that Ontario will give 31 per cent., Nova Scotia 75 per cent. of a normal crop. The New England crop of Apples is placed at 25 per cent. of the ordinary crop, other parts of the United States 45 per cent. It will be interesting to note the advance in prices during the season of consumption.

SHOW OF GARDEN PRODUCE AT HEREFORD.—For the past seven years, Mr. J. WILSON, seedsman and florist of the town of Hereford, has held a show of the products of the garden, exhibitors coming from far and near. This year the show was held in the Hereford Market on the 4th inst., a large tent accommodating the various things shown. There were open and cottager's classes, and according to our advice the exhibits were very meritorious. Flowers formed a section of the display, such as Asters, Gladioli, Dahlias, Begonias, &c.

GIFT TO SEFTON PARK, LIVERPOOL.—A handsome aviary, the gift of one of the most popular City Councillors, Mr. J. R. GRANT, was opened to the public on Tuesday last, by Alderman JOSEPH BALL, chairman of the Parks and Gardens Committee, who in his remarks spoke of the educational points such a gift would create. Alderman HOULING eulogised the above remarks, stating from experience

the value of Councillor GRANT's previous presentation of an aviary to Stanley Park. The donor, in reply, said how pleased he was to find his work so much appreciated by the people. The building is erected on the south-east side of the review-ground, has five compartments, a floor-space of 2,300 feet, and is 148 feet in length.

HORTICULTURAL LECTURES IN GLOUCESTERSHIRE: A GOOD SUGGESTION.—In the annual report of the Gloucestershire County Council Technical Instruction Committee, lately issued, W. GUILDEX, F.R.H.S., Frome, Somerset, the horticultural lecturer, states that he has every reason to be well pleased with the progress made during the year. "Not only," he says, "did I receive every assistance from various ladies and gentlemen interested in the welfare of all classes connected with the great agricultural industry, and more especially that part relating to the production of fruits and vegetables for sale and home consumption, but farmers generally are becoming much keener in the matter, and attended both lectures and demonstrations in fairly large numbers. The working-classes are also attending lectures better than formerly, many of them showing by the questions they put and the remarks they made that they take more than ordinary interest in their gardens. The good effect of flower-shows is becoming more apparent each year. In villages where these are held, the best cultivated gardens and allotments are to be found, and the keenest audiences found at lectures." And to further stimulate this good work, Mr. GUILDEX urges that assistance be rendered by the County Council to various deserving, struggling horticultural societies.

GARDENING UNDER DIFFICULTIES.—Garden-lovers will contrive to find a plot wherein to exercise their skill, however unfavourable the circumstances. As a parallel to the back-yard and house-top plantations flourishing in the heart of London, our contemporary, *The Agricultural Economist*, mentions a garden by the entrance of Deptford Creek, which certainly seems an unfavourable situation. "Amidst all the hurry and bustle and noise of the steam winch, there is a garden on the cabin-top of the derrick owned by the General Steam Navigation Company, wherein reside the attendant and his wife. True, its dimensions are small, but it is as pleasing to the gardeners as the best kept garden of the mansion." An illustration shows us the arrangement of the flower-pots and tubs filled with growing and, in some instances, with flowering plants. Such boat-gardens are commonly seen in Holland.

FLIXTON HALL GARDENS, BUNGAY.—Mr. H. FISHER, the head gardener at Flixton Hall, writes that, "In consequence of Sir HUGH ADAIR giving over the Flixton Hall estates to his son, and of a reduction in the garden staff, I leave here October 1, having had charge of the gardens—first with the late Lord WAVENEY, and for the last fifteen years with Sir HUGH ADAIR—altogether over thirty years. During the latter part of the time the gardens have been remodelled, a new kitchen-garden made, and other improvements carried out."

THE SEED HARVEST AT ERFURT AND ELSEWHERE IN GERMANY.—We learn from *Der Handels Gärtner* that so far as concerns summer flowers, namely, Asters, Verbenas, *Dianthus chinensis* and Heddevigii, *Tropeolums*, *Salpiglossis*, Mignonette, good returns are expected if the weather during the present month remains fine. It is to be regretted that on September 4 a sharp hoar frost caused great injury, and amongst other subjects to

Balsams, Mirabilis, Ageratum, Dahlias, and various Cucurbits. From other seed-saving centres it is stated at Halberstadt that Cauliflower seed, also Cabbages and Kohl Rabi will yield a small crop; Spinach seed was a good crop; early Peas were a heavy crop, whereas late Marrowfat varieties, on account of the heat at the end of May and in June, suffered greatly; Runner Beans will afford good crops, and

dwarf varieties are satisfactory; the early varieties, on the contrary, are less satisfactory. Flowering stocks in variety show this year a high percentage of double flowers, and the continued drought and warmth have acted most favourably on the quality of the seed; but this is at the cost of quantity, the plants having remained of small stature, and the seed capsules few in number.

FIG. 68.—PORTION OF FEMALE FLOWER AND FRUIT OF CUCUMBER, SHOWING PROLIFERATION, LATERAL AND AXILLARY, PRODUCTION OF SECONDARY AND TERTIARY FRUITS, AND OTHER CHANGES. (SEE TEXT.)

PUBLICATIONS RECEIVED.—*Report on Natal Botanic Gardens and Colonial Herbarium, January to June, 1901*, by J. Medley Wood. "In consequence of a very favourable season, the trees in the Gardens are looking well." Experiments with Indigo, Mangos, and indigenous medicinal plants were successfully undertaken. This report contains some interesting notes dealing with the early history of the Gardens, and showing what improvements have been made in the last fifty years. As regards the Herbarium, a new and better building is to be commenced as soon as possible, the necessary funds being now available.—*Queensland Agricultural Journal*, July, 1901. This number of the periodical is devoted to chronicling the proceedings of the Bundaberg Conference, which "excelled previous Conferences, both in the number of delegates, in the great extent of country represented, in the zeal and earnestness which the delegates brought to their work, and in the many thoughtful papers on subjects of the deepest importance, not only to the single districts, but to the national welfare itself."—*Agricultural Gazette of New South Wales*, July. With papers on: Barless Medick-seed, Green Crops of Winter Fodder, Wheat in the Drier Districts, Report on the 1901 Vintage, Forests of New South Wales, Paspalum stoloniferum, and Trials of Wheat at Nymba.—*Les Végétaux Considérés comme Pluriomètres Eurogétaires*, par Félix Sahut. (Chez l'Auteur, Avenue du Parc-Juvénal, Montpellier.)—*Minnesota Botanical Studies*, July 20.—*Twelfth Annual Report of the Missouri Botanical Garden*. A record of satisfactory work and progress in 1900. Scientific papers included in the publication are: Disease of Robinia psuda-acacia, by H. von Schrenk; Crotons of the United States, A. M. Ferguson; Agave from Arizona, J. W. Toumey; a cristate Pellaea, W. Trelease; a Pacificslope Palmetto, by W. Trelease; and Garden Beans cultivated as Esculentos, by C. H. Irish, already alluded to.—From the Department of Agriculture and Technical Instruction for Ireland, *Abstracts showing the Average under Crops, and the number of Live Stock in each County and Province, 1900-1901*. In the total area under crops in Ireland there has been in the year a decrease of 28,252 acres. There has been an increase in the area under grass, a decrease in cereals and green crops (with the exception of Mangel Wurzel and Beet-root); and an increase in Flax. As regards the numbers of live stock, there has been a decrease in everything save cattle.—*Agricultural Journal, Cape of Good Hope*, August 1. The contents deal with agricultural subjects in general. In the horticultural section are papers on: Disease in Pine-apples, Tropical Fruits, Cure for Orange-root Rot, and Return of Fruit Export for June, 1901.
